

The NSF MPS FAIR HACKATHON

Views and Reflections by Maria Cruz
VU Amsterdam

FAIR Hackathon for Mathematics and the Physical Sciences Research Communities 27-28 Feb 2019

The workshop

Organised by University of Notre Dame. Funded by the NSF. Held in Alexandria, VA, USA

- Get expertise from Europe to the US
- Pair FAIR experts with researchers
- Mix of ideas, demonstrations and hands-on sessions
- Gap analysis to accelerate further adoption of FAIR in the US

FAIR Hackathon for Mathematics and the Physical Sciences Research Communities 27-28 Feb 2019

The Participants (52 in total)

- Researchers, mainly from the US and in the areas of
 - Experimental High Energy Physics
 - Chemistry
 - Materials Science
- FAIR experts and service providers
- Librarians and research software engineers
- Funders and program managers

There to share skills, tools and techniques for FAIR research data and software in the physical sciences.

A pair from TU Delft & VU Amsterdam

Maria Cruz

Community Manager Research Data, Library of the VU Amsterdam
Previously worked at the TU Delft Library, Research Data Services
Research background in astronomy and space sciences

Joseph Weston

Research Software Engineer and Data Champion at TU Delft
Research background is in theory and simulation of quantum transport in nanoelectronic circuits

Here we are in action during the workshop!

Some initial impressions

Mikala Narlock
@mikalaraethelib

First day of the [#MPSFAIRHackathon](#) in the books! It was an incredibly busy day, full of meeting brilliant domain-experts and visionary FAIR specialists (who are sometimes both!). Many thanks to [@nkmeyers](#) for helping me get here.

Gordon Watts
@SeattleGordon

Here near DC attending the [#MPSFAIRHackathon](#). Day one really highlighted efforts for various subfields to establish metadata to communicate results digitally. Chemistry folks seem to really have their house in order.

Maria J. Cruz
@gravana

[#MPSFAIRhackathon](#) Aside from FAIR, the word 'triple', as in a semantic RDF triple, may be the word I'm hearing the most in this Hackathon!

And a haiku

FAIR: an ambitious
vision to be achieved
through metadata

The Grand Vision of FAIR Data

The Internet and FAIR Data

"The internet solved the interoperability of heterogeneous networks problem. FAIR data's aspiration is to solve the interoperability of heterogeneous data problem."

-- George Strawn, <https://osf.io/ehk65/>

Shelley Stall
@ShelleyStall

#MPSFAIRhackathon plenary speaker - George Strawn.
"It's all about the data"

2:45 PM · Feb 28, 2019 · Twitter for iPhone

Three eras of computing, according to G. Strawn

- Era one (1951-1995): many computers and many datasets
- Era two (1995-2025?): one computer and many datasets. SUN Computer's line was "the network is the computer."
- Era three (2025?-): one computer and one dataset. The network is the computer and all the data is interoperable

Source: "The Internet and FAIR Data" by G. Strawn <https://osf.io/ehk65/>

George Strawn and Futures . . .

The Internet changed how science and society function; FAIR Data may bring on a science revolution of the same magnitude as the science revolution of the 17th century (by enabling reuse of all science outputs—not just articles)

George Strawn, MPS FAIR
Hackathon Address

. . . moments of convergence require political, organizational, administrative, economic and technological efforts to turn technology into an infrastructure accessible for all

Step back to the present

Majority of researchers do not know about FAIR

Familiarity with FAIR principles

The majority of researchers surveyed as part of a recent study on open data had never heard of FAIR, regardless of their field. Of the 748 researchers that responded to this question, 144 said they were familiar with the principles. Circles are sized by number of respondents.

- I am familiar with the FAIR principles
- I have previously heard of the FAIR principles but I'm not familiar with them
- I've never heard of the FAIR principles before now

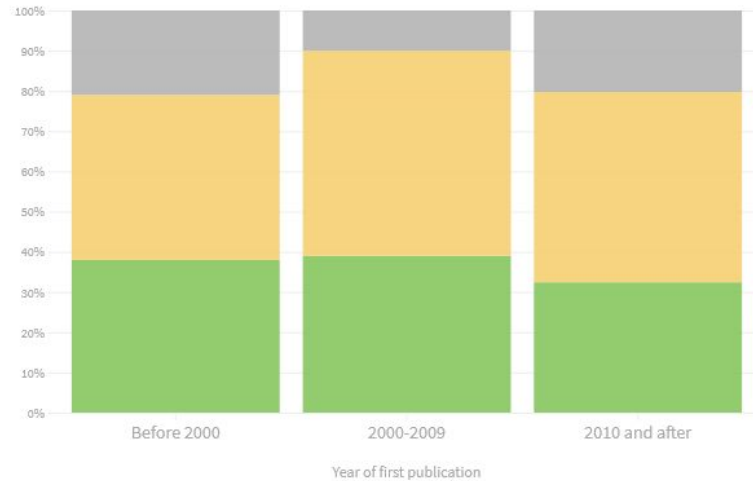

Source: State of Open Data

Made with Flourish

Compliance with FAIR principles

Of the participants who were familiar with FAIR, about a third said that their data management practices were very compliant with the principles. That proportion is similar across scientists at different stages of their career.

- Very much
- Somewhat
- Neutral / Not very much

2016 What is FAIR ?

Data and services that are
findable,
accessible,
interoperable,
re-usable
for machines.

*(and sometimes, in rare circumstances,
maybe even for people)*

2016

FAIR Guiding Principles

Sci. Data 3:160018 doi: 10.1038/sdata.2016.18 (2016)

Findable:

F1 (meta)data are assigned a globally unique and persistent identifier;

F2 data are described with rich metadata;

F3 metadata clearly and explicitly include the identifier of the data it describes;

F4 (meta)data are registered or indexed in a searchable resource;

Interoperable:

I1 (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.

I2 (meta)data use vocabularies that follow FAIR principles;

I3 (meta)data include qualified references to other (meta)data;

Accessible:

A1 (meta)data are retrievable by their identifier using a standardized communications protocol;

A1.1 the protocol is open, free, and universally implementable;

A1.2 the protocol allows for an authentication and authorization procedure, where necessary;

A2 metadata are accessible, even when the data are no longer available;

Reusable:

R1 meta(data) are richly described with a plurality of accurate and relevant attributes;

R1.1 (meta)data are released with a clear and accessible data usage license;

R1.2 (meta)data are associated with detailed provenance;

R1.3 (meta)data meet domain-relevant community standards;

Aspects of FAIR Data

Findable

- Globally unique and persistent identifiers
- **Rich metadata descriptions**
- (Meta)data available in a searchable resource

Accessible

- (Meta)data retrievable by their identifier
- Standard, open communication protocols
- Metadata accessible even when data are not

Interoperable

- **Standard formats for representation**
- **Use of FAIR vocabularies**
- References to other (meta)data

Reusable

- Described with a plurality of attributes
 - data usage licenses
 - detailed provenance
 - **domain-relevant community standards**

Interoperability: the least understood FAIR principle.

Which of the FAIR principles do you think most needs better definition?

Interoperability is the least understood FAIR principle. Some 42% of the 187 respondents who answered this question felt that it needed further clarification.

Source: [State of Open Data](#)

Interoperability is at the core of (the grand vision of) FAIR

“Data that should be readable for machines without the need for specialised or ad hoc algorithms, translators, or mappings.”

“To ensure automatic findability and interoperability of datasets, it is critical to use:

1. Commonly used controlled vocabularies, ontologies, thesauri (having resolvable globally unique and persistent identifiers)
2. A good data model (a well-defined framework to describe and structure (meta)data).” This is process by which a terminology and a framework for the terminology comes together.

PubChem Case Study

“Making Data Interoperable: PubChem Demo/Use Case” by Evan Bolton: <https://osf.io/6mxrk/>

PubChem is an archive of chemical substance information and their biological activities.
<https://pubchem.ncbi.nlm.nih.gov/>

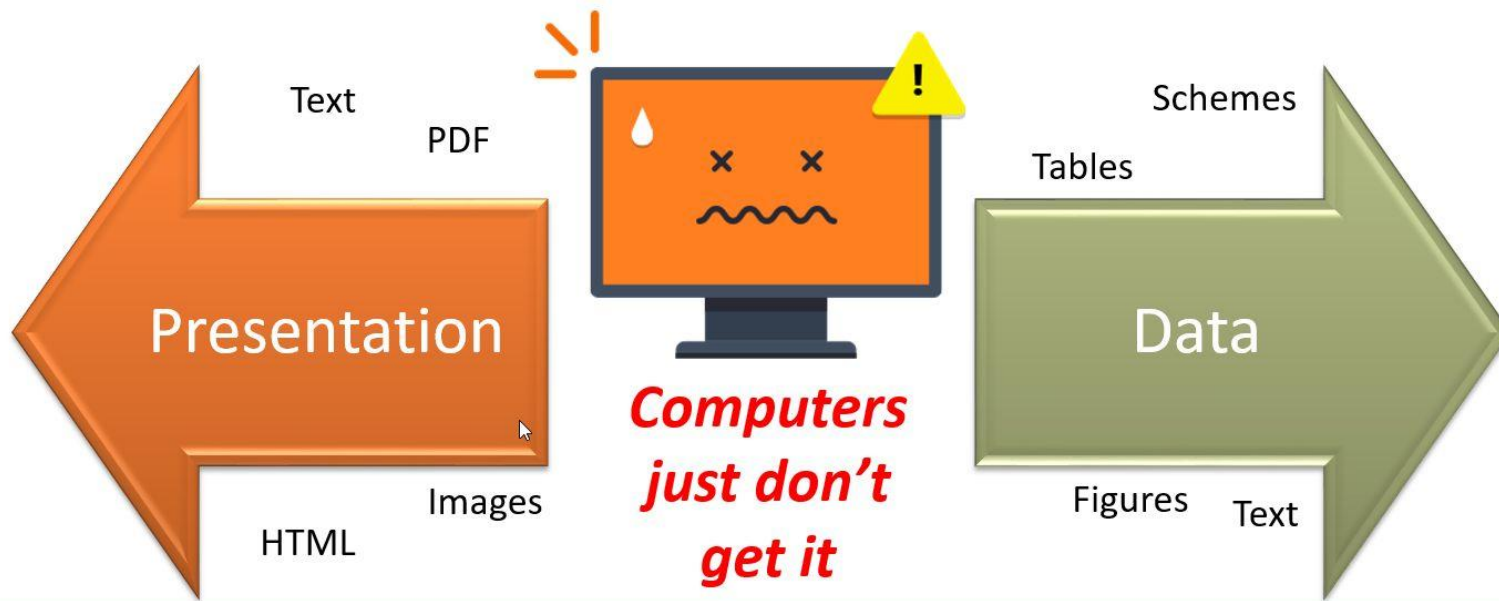

For computers to understand chemistry
they need our help, but our workflows are for humans

Structure/Name - many to many relationships

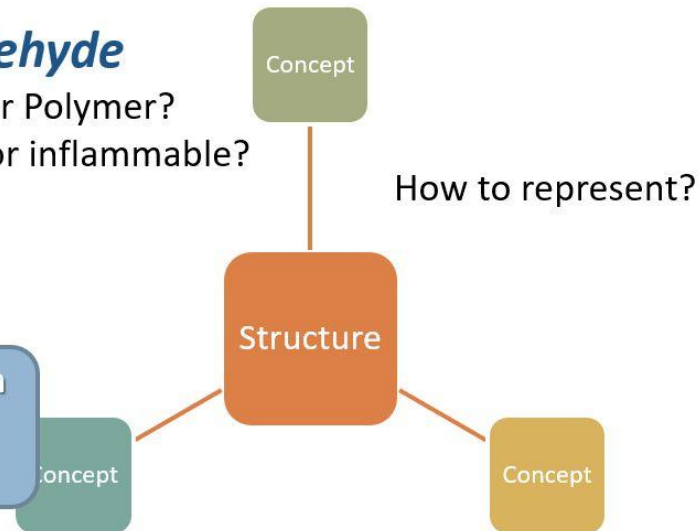

Carbon

Element?
Coal?
Diamond?
Methane?

Formaldehyde

Gas or Liquid or Polymer?
Liquid: flammable or inflammable?

Gleevec

Salt?
Hydrate?
Free base?

This is a really tough problem .. we are working on it

Even elements can be troublesome

- Chemical diagrams often use abbreviations that can be mistaken for something else

Mt = Meitnerium

CID 60016057

Mt indicates Li, Na or K metal.

Patent ID	Patent Title
US7871572	Chemical sensors based on metal nanoparticle encapsulated by mixed ligand and sensor array

U.S. National Library of Medicine

Chasing windmills?

Annotating and FAIR-ifying scientific content can be difficult to navigate:

- Identifiers, licensing/IP, standards, terminologies, normalization, best practices, machine accessibility, scientist education...
- What you can do today may be different from tomorrow
- Everything a work in-progress

Going back to George Strawn and Futures...

“Scientific revolution will come because of FAIR data, but likely not in a couple of years but in a couple decades.”

“The decade of the 20s will be a decade of development. In the 30s there will be enough consolidation and the technology will be a requirement by the society.”

Source: <https://osf.io/ehk65/>

In the meantime how can you contribute
towards FAIR data?

Upload your data to a certified repository

4TU.Centre for Research Data

Get a DOI (persistent identifier) for your data and metadata

Standard metadata descriptions attached to the data; references to other data/metadata

Data and metadata indexed and searchable

License

Access via standard & open protocols

What else could you do?

- Cite and refer to data and software as independent research objects (in the reference list with DOIs).
- If you review papers, request authors to obtain a DOI for their data and software (by depositing in a trusted repository) and ask them to cite data and software according to data and software citation standards.
- Identifiers are also for researchers. Help connecting research and researchers globally by obtaining an ORCID if you don't have one yet.

ORCID

Connecting Research
and Researchers

And finally...

- Befriend your data steward, librarian, research software engineer and your fellow data champions. These are your allies in the road to FAIR.

Important element of culture change is developing a “Community of Practice.”

-- MPS Hackathon Group Notes <https://osf.io/csbnj/>
