## **Netherlands eScience Center**

Enabling digitally enhanced research through efficient utilization of data, software and e-infrastructure

- 4 recommendations to encourage best practices in research software
- Practical guidelines

- Do you develop software?
- Do you develop on your own, or together with others?
- How do you share your software?
- What are the + and – of making code and data ‘open’?

## 4 Recommendations

OPINION ARTICLE

### Four simple recommendations to encourage best practices in research software [version 1; peer review: 3 approved]

# 1. Develop publicly accessible open source code from day one

**GitHub**

GitLab

**Bitbucket**

---

## 2. Make software easy to discover by providing software metadata via a popular community registry

*What is useful metadata?*

---

### **3. Adopt a license and comply with the licence of third-party dependencies**

Your work is automatically protected by copyright.  
No license = no reuse by others!

Source code licenses: Apache 2, MIT, BSD, GPL, ...

Data licenses: CC0, CC-BY-4, ODbL, ...

<https://choosealicense.com/>

<https://blog.esciencecenter.nl/a-license-to-science-cd8030a4a145>

---

## **4. Have a clear and transparent contribution, governance and communication processes**

*How can people contribute to your project ?*

*How can they contact you ?*

*How can people ask for new features?*

*Can anyone push changes to your repo?*

## Guide

This is a guide to software development and projects at the Netherlands eScience Center. It both serves as a source of information for exactly how we work at the eScience Center, and as a basis for discussions and reaching consensus on this topic.

### **This Guide is a work in progress**

The source of this book can be found on GitHub: <https://www.github.com/nlesc/guide>

<https://nlesc.gitbooks.io/guide/content/>

- User documentation (README, tutorial...)
- Code documentation:
  - Python: docstring, Sphinx
  - R: roxygen

Use a consistent coding style:

- Python: pep-8
- Install *linters* for your editor (R: [lintr](#))

- Make your code installable
  - Python: setup.py
- On GitHub: version tagging
  - Semantic versioning
- Create DOI: e.g. Zenodo
- Add Citation file
- Distribute your software:
  - Python: PyPi, Conda
  - R: CRAN
  - Generic: Docker

[https://guide.esciencecenter.nl/best\\_practices/releases.html](https://guide.esciencecenter.nl/best_practices/releases.html)

- Write (unit) tests
  - Python: pytest / nose
  - R: testthat
- Continuous Integration: [Travis](#)
  - Automatically runs tests after new commit
  - Different operating systems / versions
  - Can also check code style, test coverage, generate documentation...

## .travis.yml file:

```
1  # Config file for automatic testing at travis-ci.org
2  language: python
3  python:
4    - "3.4"
5    - "3.5"
6    - "3.6"
7
8  # command to install dependencies
9  install:
10     - python setup.py install
11
12 # command to run tests
13 script: pytest
```

Set up empty (Python) project:

- license,
- documentation,
- Readme
- Installation
- etc...
