

Mowgli: Finding Your Way in the DBMS Jungle

This repository contains the accompanying source code of the Mowgli framework (version 0.1) presented at ICPE 2019.

Version 0.1 automates the performance and scalability evaluations of distributed DBMS in multiple clouds.

The source code is separated into the individual Mowgli components where each component contains its own readme.

As the Mowgli framework consists of multiple components there is as well a Docker based deployment option available, see `docker-0.1.zip`.

The setup and usage guideline is contained in the `getting-started-0.1.zip` package and [online](#).

The Mowgli framework will be continuously extended and all components are publicly available: <https://omi-gitlab.e-technik.uni-ulm.de/mowgli>
