## 1. Plant CC-NLRs form resistosome “death switch”

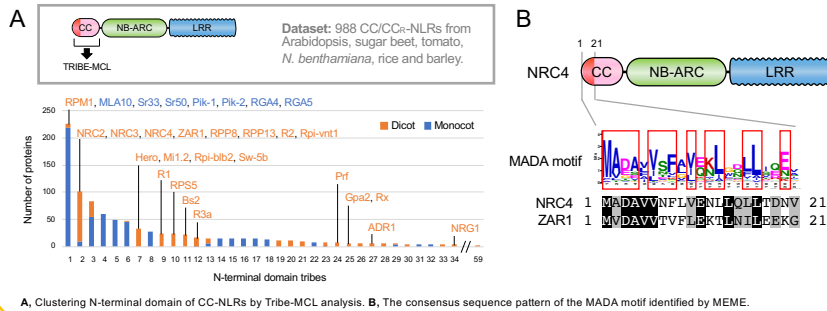

## 2. NLRs form a receptor network composed of functionally specialized “sensor” and “helper” NLRs

## 3. Transposon-based truncation mutagenesis reveals 29 amino-acid region sufficient for NRC4-mediated cell death

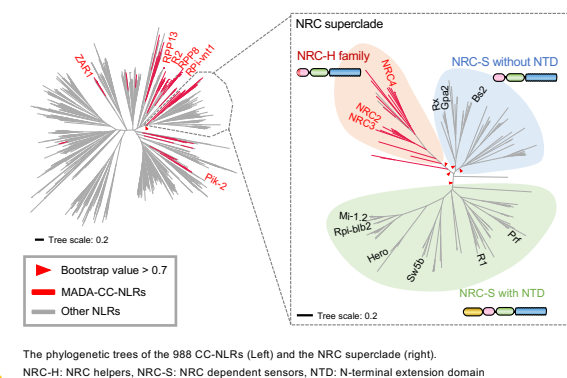

## 4. The MADA motif is conserved at the N-terminus of NRC4 and ZAR1

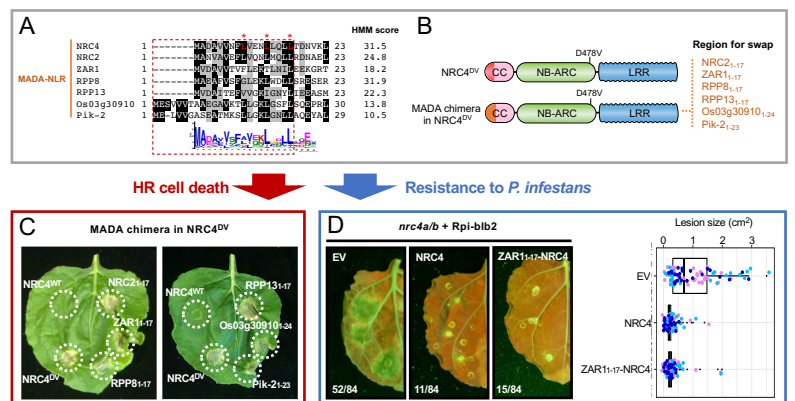

## 5. The MADA motif is present in ~20% of CC-NLRs

## 6. NRC sensors do not have the MADA motif

## 7. The MADA motif is functionally conserved for HR cell death and Rpi-blb2-mediated resistance

## 8. Evolution of NLRs from singletons to networks

## 9. ACKNOWLEDGMENTS

We are thankful to several colleagues for discussions and ideas. We thank Matthew Smoker and other members of the TSL Plant Transformation facility as well as Mark Youles of TSL SynBio for invaluable technical support.
