

# Repeated Digits Selfie Fractions: Two and Three Digits Numerators

Inder J. Taneja<sup>1</sup>

## Abstract

The **addable fractions** are proper fractions where addition can be inserted into numerator and denominator, and the resulting fraction is equal to the original. The same is true for other operations, such as, **addition, subtraction, multiplication, potentiation**, etc. For more details refer author's work [10]. This work brings **selfie fractions** with single and/or multiple representations having repetition of digits using basic operations without subtraction. The numerator values are with two and three digits numbers. The denominator values considered are maximum up to 5-digits. The results are in increasing order of numerator values.

## 1 Introduction

Keith [2, 3] for the first gave an idea of **dottable fraction**. It is a proper fraction where multiplication signs can be inserted into numerator and denominator, and the resulting fraction is equal to the original. Keith's [2, 3] idea was only with multiplication. For the first time, we extended it to other operations also, such as, with **addition, subtraction, multiplication, potentiation**, etc. See below some examples studied by author [5, 6, 7, 8, 9].

- **Selfie Fraction**

- **Addable Fractions**

$$\frac{96}{352} = \frac{9+6}{3+52}, \frac{182}{6734} = \frac{18+2}{6+734}, \text{ etc.} \tag{1}$$

- **Subtractable Fractions**

$$\frac{204}{357} = \frac{20-4}{35-7}, \frac{726}{1089} = \frac{72-6}{108-9}, \text{ etc.} \tag{2}$$

- **Dottable Fraction**

$$\frac{13}{624} = \frac{1 \times 3}{6 \times 24}, \frac{416}{728} = \frac{4 \times 16}{7 \times 2 \times 8}, \text{ etc.} \tag{3}$$

- **Dottable with Potentiation Fractions**

$$\frac{95}{342} = \frac{9 \times 5}{3^4 \times 2}, \frac{728}{1456} = \frac{7^2 \times 8}{14 \times 56}, \text{ etc.} \tag{4}$$

• **Mixed Fractions: All Operations**

$$\frac{4980}{5312} = \frac{4-9+80}{5 \times (3+1)^2}, \quad \frac{3249}{5168} = \frac{(3+2^4) \times 9}{(5-1) \times 68}, \text{ etc.} \quad (5)$$

Observing the above examples, the numerator and denominator follows the same orders of digits in both sides of each fraction separated by operations. These type of fractions, we called **Selfie fractions**. There are two situations. One when all digits appearing in each fraction are distinct and second, when there are repetitions of digits. The idea of **equivalent e fractions** is explained below.

• **Equivalent Selfie Fractions**

Above we have given **selfie fractions** with single value in each case. There are many fractions, that can be written in multiple ways. See below

• **Equivalent: Addable**

$$\frac{1453}{2906} = \frac{1+453}{2+906} = \frac{145+3}{290+6} = \frac{1+45+3}{2+90+6}, \text{ etc.} \quad (6)$$

• **Equivalent: Subtractable**

$$\frac{932}{1864} = \frac{9-32}{18-64} = \frac{93-2}{186-4}, \text{ etc.} \quad (7)$$

• **Equivalent: Dottable and Addable**

$$\frac{1680}{59472} = \frac{1 \times 6 \times 80}{59 \times 4 \times 72} = \frac{1+6+8+0}{59+472}, \text{ etc.} \quad (8)$$

• **Equivalent: Dottable, Addable and Subtractable**

$$\frac{302}{8154} = \frac{30 \times 2}{81 \times 5 \times 4} = \frac{3+02}{81+54} = \frac{3-02}{81-54}, \text{ etc.} \quad (9)$$

• **Symmetric Equivalent: Addable and Subtractable**

$$\frac{645}{1290} = \frac{6-45}{12-90} = \frac{6+45}{12+90}, \text{ etc.} \quad (10)$$

• **Equivalent: Dottable and Addable together**

$$\frac{284}{639} = \frac{2 \times 8 + 4}{6 + 39} = \frac{28 + 4}{6 \times (3 + 9)}, \text{ etc.} \quad (11)$$

• **Equivalent: Mixed - All Operations**

$$\frac{73842}{90516} = \frac{7-3 \times (8-4^2)}{9 \times 05-1-6} = \frac{7 \times (3+8) + 4^2}{90 + (5-1) \times 6} = \frac{738+4+2}{905+1+6}, \text{ etc.} \quad (12)$$

In 2016, the author worked on **selfie fractions** in different ways and with different digits, i.e., without repetition of digits in numerators and denominators. See below resumed work.

- (i) Selfie Fractions: Addable - [5];
- (ii) Selfie Fractions: Dottable and Pontentiable - [6];
- (iii) Selfie Fractions: Addable and Dottable Together - [7];
- (iv) Equivalent Selfie Fractions: Dottable, Addable and Subtractable - [8];
- (v) Equivalent Selfie Fractions: Addable and Dottable Together - [9].

The combined and enlarged version of above five items can seen in author's two recent work [10, 11]. In this work our aim is to bring **selfie fractions** with mixed operations with single or multiple representations, in increasing order of numerator with **repetition of digits**. This paper brings numerator in two and three digits, while next works are in four and five digits in numerators. Moreover, the **selfie fractions** are with denominator up to 5-digits. The work includes all basic operations, such as **addition, multiplication, division, potentiation**, etc. Also the operation of subtraction is not included due to large quantity of numbers. Due to high quantity of numbers, the denominator is only up to 5-digits. In all the cases, the numerator is always less than denominator.

**Remark 1.1.** (i) *The first number of the r.h.s of the fraction are always positive, for example,*

$$\frac{21564}{97038} := \frac{4 + 1508}{7 + 2639}.$$

*The following expression also give selfie fraction,*

$$\frac{21564}{97038} := \frac{-4 + 1508}{-7 + 2639}.$$

*This kind of expressions are not considered as the first members of numerator and denominator are negative.*

(ii) *Even thought, the final expression is positive, but the numerator and denominator are not considered negative, for example,*

$$\frac{21564}{97038} := \frac{2 + 1564}{9 + 7038} := \frac{2 - 1564}{9 - 7038}$$

(iii) *In all the case, the numerator is always less than denominator.*

## 2 Repeated Digits Selfie Fractions: Two Digits Numerator

This section brings **selfie fractions** for the 2-digits numerator values. Due to high quantity of number there are lot of extra brackets like "(...)". These can be removed easily by simplifications. The work is with basic operations such as **addition, multiplication, division, potentiation**, etc. without subtraction. Due to large quantity of numbers the operation of **subtraction** is not included.

### 3 Repeated Digits Selfie Fractions: Three Digits Numerator

This section brings **selfie fractions** for the 3-digits numerator values. Due to high quantity of number there are lot of extra brackets like "(...)". These can be removed easily by simplifications. The work is with basic operations such as **addition, multiplication, division, potentiation**, etc. without **subtraction**. Due to large quantity of numbers the operation of **subtraction** is not included.
