

A PID for everything

Helena Cousijn
21-10-2019

What is a persistent identifier?

persistent identifier

an organization
made a promise
to keep it alive

globally unique
string

(known as PIDs to their friends)

How PIDs work (in a nutshell)

PIDs are typically backed by a **registry** that indicates what item is being identified. Different kinds of PIDs have varying degrees of descriptive metadata.

PIDs today are often expressed as **URLs**, and the registry indicates where that URL should ultimately resolve. That PID will always point to the correct item even if the item's location changes.

What kind of stuff gets a PID?

Journal articles. via Crossref (<https://crossref.org>)

People. via ORCID. (<https://orcid.org>)

Data, software, and other stuff. via DataCite. (<https://datacite.org>)

Research organizations. via ROR. (<https://ror.org>)

And others.

For the real answer see FREYA deliverable 3.1 : https://www.project-freya.eu/en/deliverables/freya_d3-1.pdf

... but what can PIDs *do*?

PIDs make research FAIR

- (meta)data are assigned a globally unique and persistent identifier

- (meta)data are retrievable via an identifier using a standardized protocol
- metadata are accessible, even when the data are no longer available

- (meta)data use a formal, accessible, shared, and broadly applicable language knowledge representation.
- (meta)data include qualified references to other (meta)data

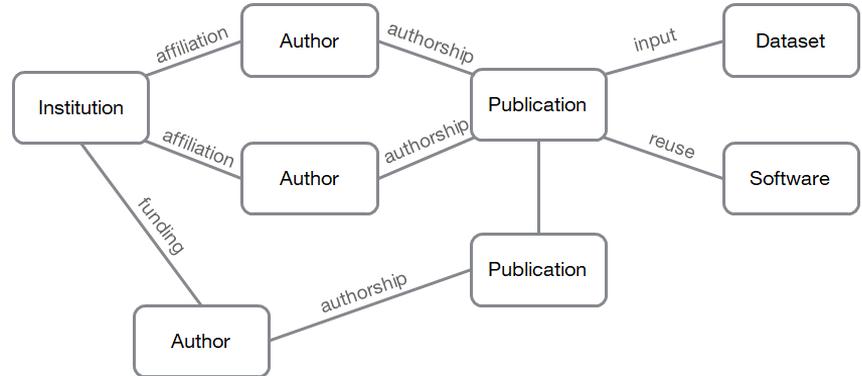

- meta(data) are described with a plurality of accurate & relevant attributes
- (meta)data are associated with detailed provenance

Good start, but we want more

By connecting everything, you can see the true power of PIDs

Researchers, institutions, publications, datasets, and more are already interconnected in real life, and this can be reflected and tracked through PIDs

And what can you do?

Step 1: Give PIDs to your stuff

It's hard to connect things when we don't know they exist.

So get an ORCID iD for yourself → <https://orcid.org>

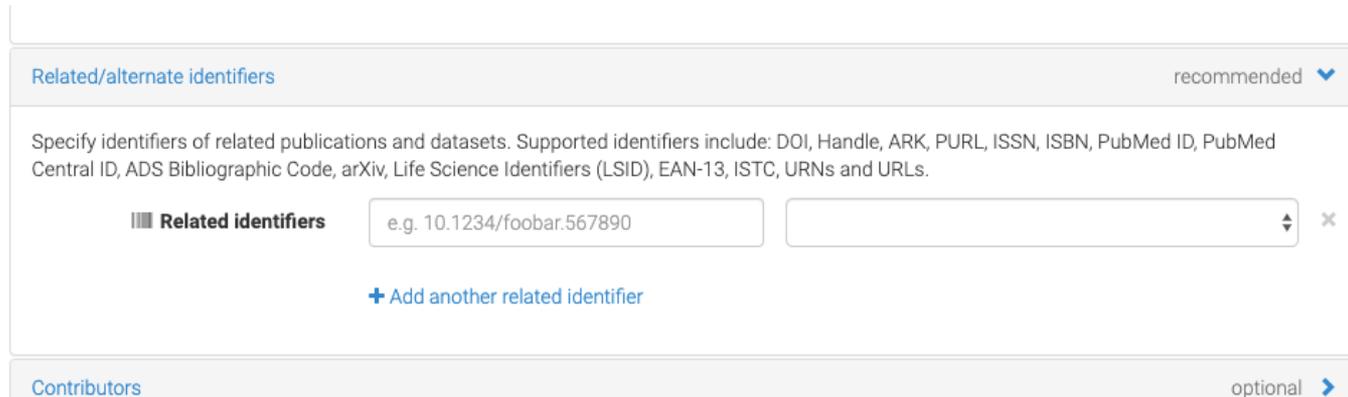

Give DOIs to your data and software → <https://datacite.org>,
<https://guides.github.com/activities/citable-code/>

Put your reports and white papers into a repository that gives out PIDs →
<https://repositoryfinder.datacite.org> or your institutional repository

Step 2: Tell your PIDs about your other PIDs

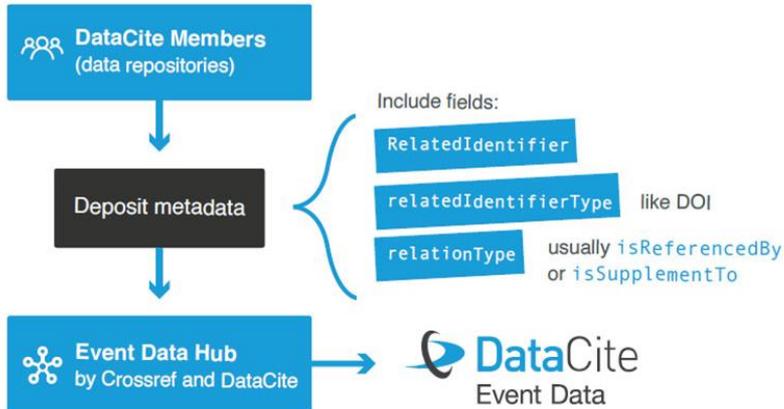

Include relevant related PIDs in the metadata for your software, dataset, and paper PIDs, even if your repository says they're optional.

In Zenodo (for example), it looks like this:

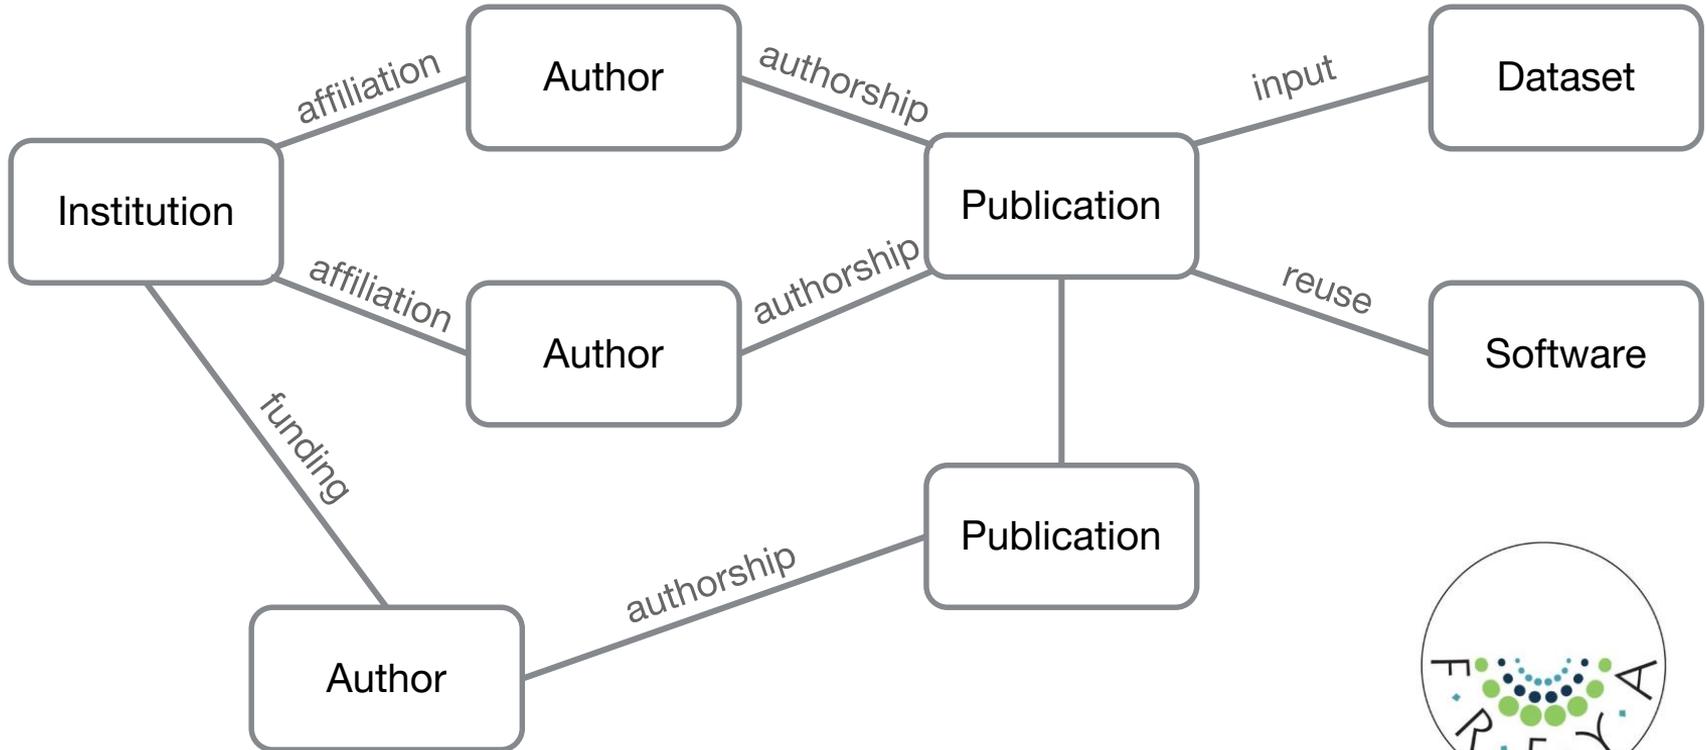

The screenshot shows a web form for adding related identifiers. The form has a header bar with the text 'Related/alternate identifiers' on the left and 'recommended' with a downward arrow on the right. Below the header, there is a paragraph of text: 'Specify identifiers of related publications and datasets. Supported identifiers include: DOI, Handle, ARK, PURL, ISSN, ISBN, PubMed ID, PubMed Central ID, ADS Bibliographic Code, arXiv, Life Science Identifiers (LSID), EAN-13, ISTC, URNs and URLs.' Below this text, there is a section for adding identifiers. It starts with a label 'Related identifiers' next to a small icon of three vertical bars. To the right of the label is a text input field containing the example 'e.g. 10.1234/foobar.567890'. To the right of the input field is a dropdown arrow and an 'x' icon. Below the input field is a blue link that says '+ Add another related identifier'. At the bottom of the form, there is a footer bar with the text 'Contributors' on the left and 'optional' with a rightward arrow on the right.

Step 3: Share these connections with the community

Interested in using this information? Find out more at: <https://support.datacite.org/docs/eventdata-guide>

This all feeds into project FREYA
