Global Names Recognition and Discovery (GNRD)

build passing coverage 99% code climate 4.0 dependencies up-to-date

GNRD finds scientific names in texts, pdf files, images, web-pages

Testing

You need Docker >= 1.10 and Docker Composer >= 1.6

- Build application's image (needs to be done only if a new gem or new ubuntu package are added)

```
docker-compose build
```

- Start Docker Compose (in the background)

```
docker-compose up -d
```

- Create/update database

```
# run this only if you need to remove old version of db
docker-compose run app rake db:drop
```

```
docker-compose run app rake db:create
```

```
docker-compose run app rake db:migrate
docker-compose run app env RACK_ENV=test rake db:migrate
```

After database and migrations are created, `schema.rb` will be created as well. Next time after restarting containers just running

```
docker-compose run app rake db:setup
```

is sufficient

- Run tests

3/26/2016

anrd/README.md at master · GlobalNamesArchitect

For all tests run

```
docker-compose run app rake
```

or to run a specific test

```
docker-compose run app rspec -r factories spec/lib/some_spec.rb:44
```
