COVID-19 epidemiology with big data analytics and SARS-CoV-2 metabolism and genomics

Examining the seasonality of covid-19 with limited data

- much too much talk about 'summer'/heat-humidity-wind speed
- the most obvious, biologically meaningful factor for spread control in the open: UV
- day length = UV can play a key role
- example: North-South hemispheres

paper: <https://f1000research.com/articles/9-658>

Inspired by wildlife observations

- southwestern Indian Ocean, summertime, Réunion and Madagascar
- no coronavirus in 338 samples of seabird nests
- summer sun, sea breeze must keep bird populations in the wild healthy
- how wildlife responds to coronavirus infections with regard to seasons and climate change is unknown

1 October 2013

Absence of Coronaviruses, Paramyxoviruses, and Influenza A Viruses in Seabirds in the Southwestern Indian Ocean

Completely missed opportunity by epidemios

- in 50 years of seasonality research, epidemiologists missed completely the UV factor — WOW?
- only last year, first report on influenza for UV effects
- for covid-19, no direct seasonality factors in May
- for UV, we used as proxy altitude for country with highest UV levels: Peru

CTP as a limiting step in virus metabolism

- not understood that viruses need a huge metabolic load during replication, confusion
- base composition of coding regions from 2574 SARS-CoV-2 strains
- monitored time evolution of CTP reduction during the pandemic
- Cytidine content decreases during SARS2 real-time evolution

A path towards SARS-CoV-2 attenuation: metabolic pressure on CTP synthesis rules the virus evolution

Atypical divergence of SARS-CoV-2 Orf8 from Orf7a

- Orf8 one of the most puzzling, important and unknown genes of SARS-CoV-2
- huge variation, unknown but critical role; restricted only to bat/civet/pangolin SARS lineage (but not MERS)
- homologous to Orf7a and generated by the virus evolution, known origins !
- missed for years from SARS (in two pieces Orf8a/b)...

Lessons learned, relevant to Elixir

- Publishers responded slowly in the crisis
- Publication model collapsed during covid-19
- Preprints dominated the landscape (and still do)
- For critical situations, data such as UV, climate, metadata, very hard to obtain, not open etc. etc.
- Metabolism of viruses in the host not appreciated
- Pangenomes for SARS-CoV-2 not available, why?
- Epidemic disasters/pandemics never really in fashion
