

## Life cycle thinking in nanoform release assessment using GRACIOUS case studies

Nathan Bossa, Camilla Delpivo, Araceli Sanchez, Véronique Adam, Bernd Nowack, Tobias Hammer, Jing Wang, Ana Sofia Godinho da Fonseca, Keld A. Jensen, Emmanuel Ruggiero, Wendel Wohlleben, Apostolos Salmatonidis, Vicenç Pomar, Socorro Vázquez-Campos

---

# Nanomaterials release during their life cycle

- Release of nanomaterials occur during their complete life cycle and have been assessed for a number application.

- Since 20 years, release library is growing, and release database are created with models build on top of it to predict exposure.
- Parameters driving the release which can be link to release process, the NFs property or the product property
- We can start to establish hypotheses and provisional criteria for grouping and guiding principles for read-across

Release **rate**

Release **Form**

Exposure **route**  
and **population**

---

# NFs release: Criteria for grouping

## Parameters driving the NFs release

### Process

- Energy
- Time
- Aging factor

### Nano-Enable Product (NEP)

- Product matrix degradability toward aging factor (Dissolution, UV resistant, permeability, mechanical property,..)
- NFs localization: coating, embedded in the product
- NFs and NEP matrix binding type

### NFs property

- Shape
- Chemistry
- Dustiness
- Size
- Solubility
- State (powder, liquid aerosol)
- ....

## Paint Case study

## Weathering

# Gracious case study

## NMs/ NFs

### Benchmark materials

CNT NM-402  
 CNT Mitsui7  
 BaSO4  
 JRCNM50001a  
 CeO2 NM-212  
 Ag NM-300K  
 SiO2 NM-200  
 ZnO NM-110

### Quantum dots

ZnCdSeS  
 ZnCdSeS-COOH  
 ZnCuInS/ZnS  
 ZnCuInS/ZnS-  
 COOH\_smaller  
 ZnCuInS/ZnS-  
 COOH\_larger

### Cellulose fibers

CNF-50-nm  
 CNF-80-nm  
 Cellulose nanocrystals

### Ag fibers

Ag-NW1\_long  
 Ag-NW2\_short

### SiO2

Silica\_std  
 Silica\_Al  
 Silica\_silane  
 Silica\_anis\_Al  
 Silica\_anis\_std

### Pigment

DPP\_nano  
 DPP\_non\_nano  
 DPP\_premixed  
 CuPhthalo\_halogen  
 CuPhthalo\_nano  
 Fe2O3\_nano\_A  
 Fe2O3\_nano\_B

## NEP

### Paint

Matrix: solid Vit/bas1  
 and Solid Bas 3  
 NMs: Silica\_silane,  
 Fe2O3\_nano\_A and B

### Paper

NMs: Silica\_anis\_Al;  
 Silica\_anis\_std and  
 Fe2O2\_nano\_A and B

### Plastics

Matrix: PU + PA6 +  
 PLA  
 NMs:  
 CuPhthalo\_nano\_A  
 and B

### Plastic film

Matrix: PET  
 NMs: Ag-NW1 and 2

### NEP produced by an industrial partner

- Relevant product
- Information's available on the product, the NF function, the NFs incorporated, the NFs content,..

# Simulating the NEP life cycle stage

## Food contact

## Abrasion

## Landfilling

## Weathering

## Smooth rubbing: Dermal contact

## Incineration

Release **rate**

Release **Form**

Exposure **route**  
and **population**

# Simulating product life cycle: simulating hand contact

Protocol (ISO 105-X12:2016)

- Force of 9 N

Crockmeter have been validated by the US consumer product safety comision (CPSC) for wood playground impregnated with antifungal copper materials

Simulate the release during paint use involving smooth rubbing

- **Hand contact**
- **Paint cleaning**

# Simulating product life cycle: weathering

Climatic chamber

Cycle of UV and rain

The UV energy is used as a way of comparison between experiment and to extrapolate to real life climate

Runoff is collected and analyzed (ICP-MS, Microscopy, size fractionation)

Unaged

TPU-Cu

PA6-Cu

PLA-Cu

Aged

# Simulating product life cycle: Landfilling

Toxicity characteristic leaching **procedure**

**TCLP method:** EPA standard Method 1311

- Batch test
- LS of 20
- Leaching solution:
  - Acid acetic and NaOH (pH: 4,8)
  - MilliQ
- 18H rotative aggitation

Extrapolation ???

Environment

The need for worst case (accelerated) scenario
