In our current work, we are investigating ethical standards in relation to student subjects in empirical studies (in Software Engineering). To do so, this survey contains a number of questions regarding student use in empirical studies. We ask how you have used student subjects in the past, as well as what kind of study practices (e.g., participation, compensation, informed consent) you find acceptable. In this study, we are not concerned with the validity of studies using student subjects. To participate, it is not necessary that you have conducted studies with student subjects yourself.

The survey consists of four pages (including this page) and should not take more than 15 minutes to answer.

We will use the collected data for research purposes. We will publish both aggregated data and the dataset collected during this survey to allow for quality assurance and repeatability of our study. To avoid that individuals can be identified, and in line with GDPR regulations, we will anonymise data that might serve to identify individuals (e.g., free text answers, demographic data that allows identification). By proceeding, you consent to these means of collection, use, and disclosure of your answers.

In case of questions, please contact the author of this study, Grischa Liebel ([grischal@ru.is](mailto:grischal@ru.is)).
