Actor constellations and uncertainties in decision-making for accommodating shrinkage

- PHASE B: preparation: empirical work
- PHASE C: empirical and analyticalwork
- PHASE D: empirical work and theoretical nexus

PHASE E: finalize

- literature review
- conceptualization
- theoretical framework
- methodological approach
- case study selection
- find interview partners
- design interview guide
- schedule interviews and on-site visits
- secondment 1: Neimed
- conduct interviews in both case study areas
- transcription
- evaluation and analysis of findings
- secondment 2: Bertelsmann
 Foundation
- discussion of results
- theoretical nexus

- finalize the written part

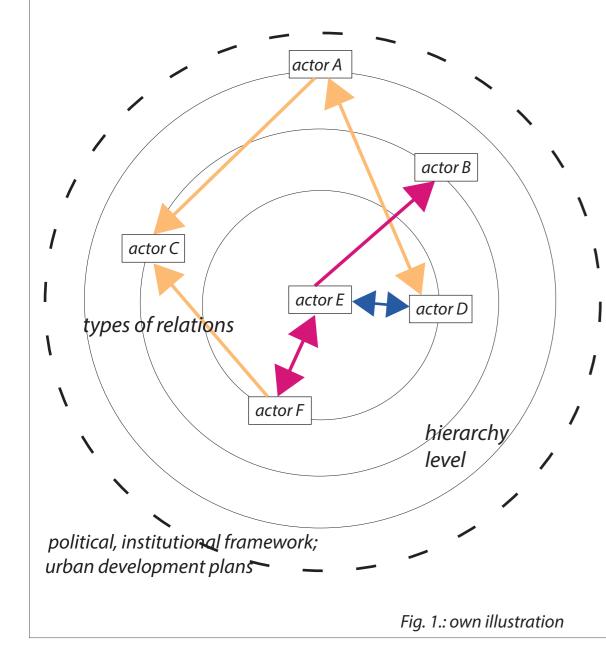

KAISERSLAUTERN

Guiding questions

- I) Who are the actors and stakeholders involved in regenerating shrinking cities?
- II) What are the overarching frameworks guiding regeneration strategies?
- III) To what extent are uncertainties included in the decision-making process for accommodating shrinkage and how do such uncertainties influence decision-making?

Governance in shrinking cities

Visual representation of actor constellations, governance structures and types of relations (idea)

The challenge of shrinkage is a ,complex urban governance process' (Hospers, 2014: 1514). This means that addressing shrinkage requires the involvement of many stakeholders, as these processes transform and affect all parts of people's lives (ibid). Administrative barriers and rigid bureaucraties can be hindering, also, leaving specific actors out of the planning process can cause a loss of sense of belonging and identity. The question of power relations within governance structures in shrinking cities therefore arises and needs to be discussed.

Simultaneously, national and/or local *policy* frameworks and urban development plans set the necessary formal foundation for actions. From an actor-network perspective, such broad frameworks need to be analyzed in order to discuss to what extent actors on the local level are affected by those.

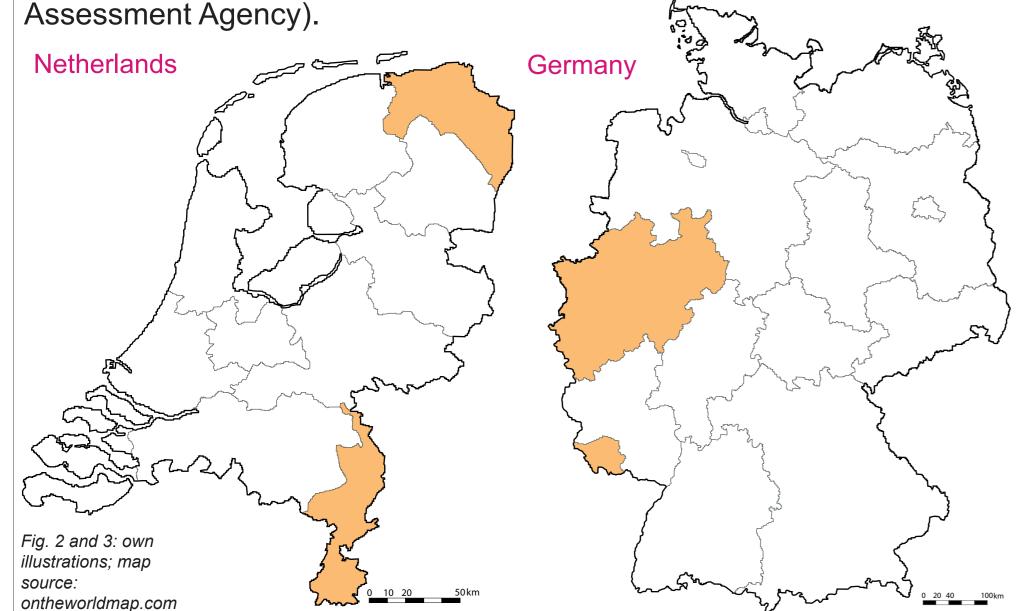

Uncertainties in decision-making

As planners we are confronted with specific uncertainties that can affect urban development in an unpredictable way; such are climate change, technological innovations, political turnovers and/or demographic changes. They particularly affect decision-making when trying to influence future developments (Rauws, 2017). Uncertainties can have many faces: from unexpected and rapid events (natural disasaters, political or social upheavals) to *more* gradual processes of change which contributed to overarching transformations of an area or society. They occur in many domains and on different levels of scale, which adds to the unpredictability of the the future and people's responses to specific policies that aim to address such uncertainties (see Rauws, 2017). But the importance of addressing and dealing with uncertainties is especially important when *planning for longer time periods* (Zandvoort et al., 2019), which is inherent to the planning practice.

Case Studies

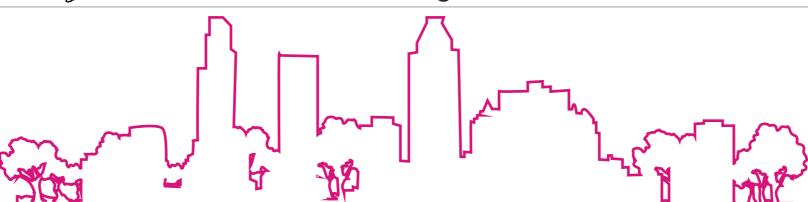

Rauws, W. (2017). Embracing Uncertainty without abandoning Planning. disP - The Planning Review, 53:1, 32-45.

For this research, Germany and Netherlands were selected. In each of the countries two regions have been found suitable and need to be deeper looked into. In Germany, the federal state of Saarland as well as North Rhine-Westphalia constitute possible cases. Parts in these two areas are predicted of being "at risk" considering economy, demographic development and infrastructure. (Institut der deutschen Wirtschaft, 2019). In the Netherlands the Limburg Region in the south and the Northeast-Groningen region are expecting a "strong decline (10% and over)" in population development (PBL Netherlands Environmental

These countries have been selected based on initial literature review on already existing research on shrinkage. The fact that both countries have (had) national strategies which serve(d) as overarching frameworks for action and for the overall governance, was particularly interesting. In Germany, the *Stadtumbau West* program came into action in 2004 as regions in these federal states were struggling with the consequences of economic restructuring and demographic changes (BMI, n.d.). In the Netherlands, the *Dutch "national shrinkage strategy"* and the inter-administrative action plan "*Krimpen met kwaliteit"* have been adopted in 2009 (Elzerman & Bontje, 2015). In terms of analyzing governance structures in these countries and possibly compare them, the criterion of having a national framework for dealing with shrinking cities is particularly interesting.

For this research, qualitative methods will be used. In particular, in-depth guided interviews with actors and stakeholders are imagined.
