NCMRWF

NCUM STASH Vs Grib2

Based on UMRider Version 1.0.1

Arulalan . T

Project Scientist - C

12-Feb-2016

[Abstract: This document contains the NCMRWF-UK MetOffice Unified Model output Units with File Name, STASH code, Variable Name, IRIS Cube Index, GRIB2 Param Code (Discipline, Category, Number, type Of First Fixed Surface), Control File Short Name and grib2 variable SI units, with model output frequency, time and pre-processed before written into grib2 files information. Also included the NCMRWF Grib2 Local Table (which I created to produce grib2 files) at last page of this document.
Acknowledgement: I thank Dr. Saji Mohandas, Scientist-E who made this document initially with STASH codes Vs Variable Name along with model based Units tables.]

Introduction

NCUM model produces output files in fieldfiles or pp file format. We are able to get the STASH code information of every variables / fields from model output files.

NCUM STASH

NCUM model output STASH code and its equivalent variable cf_standard_name will be exactly same as http://puma.nerc.ac.uk/STASH_to_CF/STASH_to_CF.html

Note : For few STASH codes there may be available multiple variables cf_standard_name.

Cf_Standard_Name

All variables of cf_standard_name table v30 can be seen from below link,

V30 http://cfconventions.org/Data/cf-standard-names/30/build/cf-standard-name-table.html

NCEP-WMO Grib2

NCEP-WMO Standard Grib2 Table Parameters link,

http://www.nco.ncep.noaa.gov/pmb/docs/grib2/grib2_doc.shtml

By using all the above 3 links, we can get the **STASH Vs cf_standard_name Vs Grib2 parameter** codes.

IRIS

IRIS v1.9.2 is able to read NCUM fieldfiles/pp file format with STASH and cf_standard_name and write into NCEP-WMO standard Grib2 file format.

https://github.com/SciTools/iris

http://scitools.org.uk/iris/docs/latest/userguide/index.html

UMRider Conversion

UMRider is an in-house development of NCMRWF, which converts NCUM fieldfiles to NCEP-WMO standard Grib2 file format in parallel python.

https://github.com/NCMRWF/UMRider

Standard IRIS may not support for all the variables of NCUM. So in UMRider we included many variables (STASH, cf_standard_name, Grib2 parameter codes, cf_units) such a way that it will be able to convert the 63 out of 110 variables into grib2 format, which are all listed in this document.

But still we are facing the following three issues,

i) There is no cf_standard_name available for few STASH codes (i.e. model fields)

ii) Multiple cf_standard_name available for few (same) STASH codes

iii) There is no grib2 param code (NCEP-WMO standard) available for few model fields

At present (29-Feb-2016), we omitted the fields temporarily (47 out of 110 variables) which are all having the above issues, for NCMRWF's UM model grib2 conversion.

We already fixed the above said problem for 9 variables by creating ncmr_local_table_v1.0 (listed at end of this document).

We are working on fixing the rest of 47 UM variables to include grib2 param code for those variables in ncmr_local_table_v1.1

Fields available in the UM forecast files and grib2 files

All UM filedsfiles format files are available at **/gpfs3/home/umfcst/NCUM/fcst/<date>/00/**

All UM grib2 format files are available at **/gpfs3/home/umfcst/NCUM/post/<date>/**

Legend

Sky Blue Color - IRIS able to read fields and write into grib2 successfully

White Color - IRIS able to read fields, but we need to set grib2 parameters code to write into grib2

Yellow Color – IRIS unable to read the filed from filedsfiles / pp

Red Color – an Instantaneous prognostic fields

Green Color - Time-averaged single level diagnostics fields

Maganta Color - Time-accumulated single level diagnostics fields

Orange Color – UM Model data has been processed further while writing into grib2 files in UMRider Tool

Dark Blue Color – Need ncmr_grib2_local_table to encode grib2 files while using wgrib2 and g2ctl.pl

NCMRWF LOCAL TABLE is kept at last page of this document

Red, Green & Magenta coloured fileds are required and need to be converted from pp filedfiles format to grib2 file format.

IRIS-UMRider able to read 63 out of 110 variables from different fieldsfiles/pp file format and write into grib2 file format.

Updated by Arulalan.T (Project Scientist - C) on 12-Feb-2016.
