

# Research Data Management: The Numbers

500,000 research datasets in the Figshare repository

## The Data Deluge

3,000,000,000,000 (That's 3 trillion)

Estimated value of open data to the world economy

## The Value of Open Data

Less than 50% of clinical trial results are currently published and shared

Only 20% of scientific data from the 1990s is still available

# Lost

## Research Quality and Efficiency

# ?.top

Only 1/3 of findings in high-ranked Psychology journal papers can currently be reproduced

Only 11% of results in 'landmark' oncology papers can be replicated

# 10:1

Every pound invested by Research Councils UK generates a 10 fold Return on Investment

## UK Investment in Research

8 Great Technologies built upon data

- Agri-science
- Advanced Materials
- Energy Storage
- Big Data
- Regenerative Medicine
- Synthetic Biology
- Robotics & Autonomous Systems
- Satellites

£26 billion UK government investment in research and scientific infrastructure over the next 5 years

## Changing culture

50% of researchers are already sharing data!

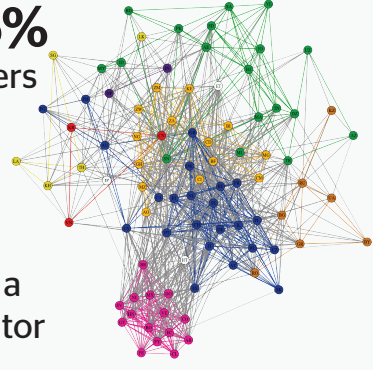

Over half of the top-ranked science and social science journals either mandate or strongly suggest researchers share the data that relates to the publication

61% of recent papers funded by the Engineering and Physical Sciences Research Council were linked to the underlying research data

75% of researchers strongly favour formal citation of data as a reuse indicator

## EMBL-EBI £920 million per annum

Estimated return on investment on future research enabled by the European Bioinformatics Institute

### UK Data Service

The UK Data Service generates £100 million per annum wider benefit to the UK

## The value of Research Data

### How big is big?

1 plain text character can be thought of as (approximately) 1 byte of data.

So 1 normal page (a little more than 525 words)...

333 pages (a stack about 33 mm high—a little more than half a ream) equates to 1 megabyte

333,000 pages equates to 1 gigabyte. Our stack is now about 33 m—the length of a blue whale—high. That's about 1 1/2 CDs of mp3 music tracks (about 150). These days even basic smartphones have a capacity in the 10s of gigabytes.

At 1 terabyte our paper stack is 33 km high.

1 petabyte makes a stack 33,300 km high.

1 exabyte makes a stack 333 million km high. We're talking interplanetary scale distances now—we've got to Mars. A 1 zetabyte stack is 333 x 10<sup>6</sup> km high (or 223 Astronomical Units [AU]—1 AU is the distance from the Earth to the Sun). We've left the solar system! In 2013 the world generated about 3.5 zettabytes of data

Typically, in written English, 1000 characters would equate to about 175 words. This can be thought of as 1 kilobyte of data

...is about 3 kilobytes of data. A typical page is about 0.1 mm thick—the width of a hair

That's the equivalent of a medium sized photo and would fill an old 5 1/4 inch HD floppy disk

We're now 10% of the distance to the moon. CERN produce 30 petabytes of data a year.
