Suppl. Table S3: Comparison of summary measures for SATé-MAFFT alignments with emu and Chilean tinamou profile aligned, and for *de novo* alignment of all sequences with MAFFT. Comparisons are given for both the full set of 3679 UCE loci, as well as the subset of 2232 UCEs that do not overlap introns or CNEEs.

Suppl. Table S4: Comparison of summary measures for *de novo* alignment with MAFFT (CNEEs) and SATé-MAFFT alignment with emu and Chilean tinamou profile aligned (introns and UCEs) as used throughout the manuscript, versus alignment following the pipeline described in Jarvis et al. (2014; e.g. SATé-MAFFT alignment followed by filtering to mask unique and poorly aligning sequence, removal of gap-only columns after filtering, and final SATé-MAFFT alignment of the filtered sequences). Summary values are calculated from 3822 CNEEs, 3733 introns, and 3679 UCEs in each case.
