

## EVENT DEFINITION FORM

**Event:** Myocarditis /pericarditis

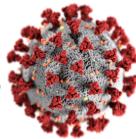

**Outcome/covariate:** outcome

**Version:** 1

**Status:** final

### Contributing authors

Miriam Sturkenboom	Inclusion of codes for final analysis & inclusion of SPEAC Brighton Collaboration pictorial diagrams	09-08-2021

## Myocarditis

Inflammatory disease of the heart muscle, diagnosed by established histological, immunological, and immunohistochemical criteria [1]. Myocarditis is an inflammatory disease of the myocardium caused by different infectious (viral and nonviral) and non-infectious triggers (autoimmune diseases, hypersensitivity reactions to drugs, toxic reactions to drugs, toxics, etc.) [2]. Myocarditis often results from common viral infections and post-viral immune-mediated responses [2].

According to the [draft Brighton Collaboration pictorial algorithm<sup>1</sup>](#) myocarditis would be certified as :

---

<sup>1</sup> <https://brightoncollaboration.us/myocarditis-case-definition-update/>

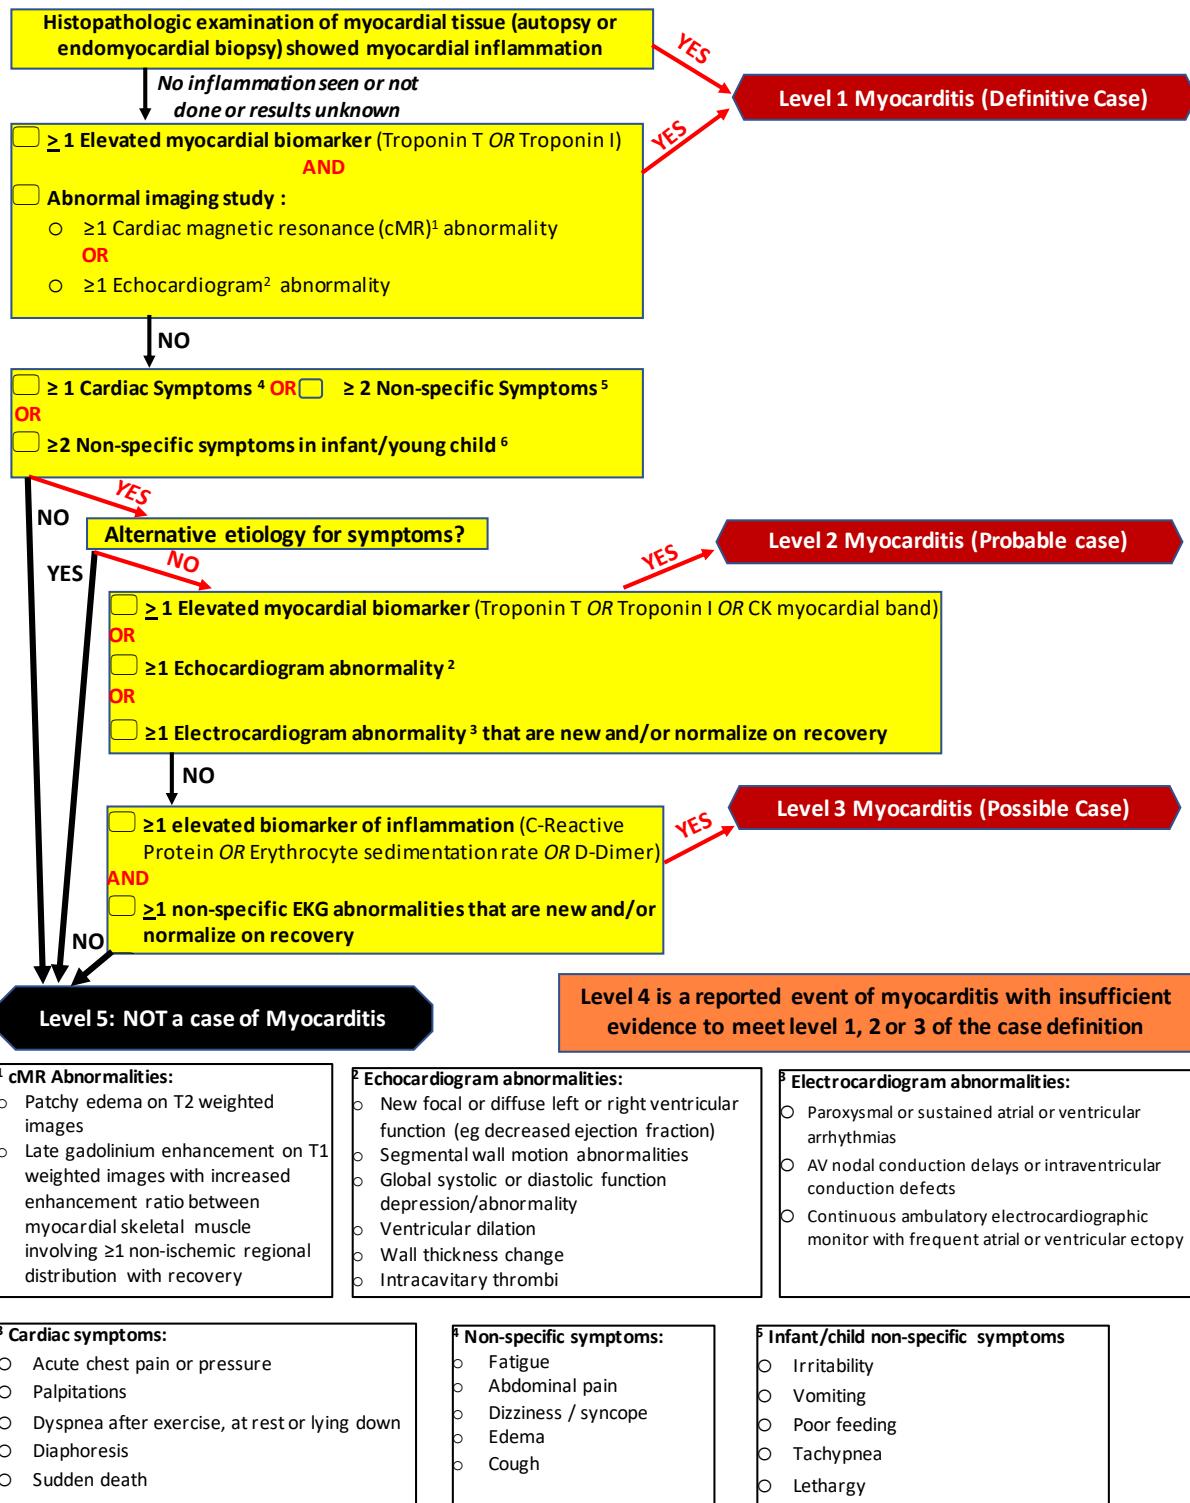

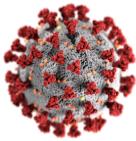

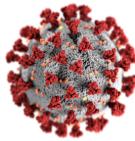

Figure 1: Draft SPEAC/ Brighton Collaboration Myocarditis Pictorial diagram (from <https://brightoncollaboration.us/myocarditis-case-definition-update/>)

## Pericarditis

Pericarditis is the inflammation of the pericardium from various origins, such as infection, neoplasm, autoimmune process, injuries, or drug-induced. Pericarditis usually leads to pericardial effusion, or constrictive pericarditis [3].

According to the [BC pictorial diagrams](#) for determining certainty<sup>2</sup>

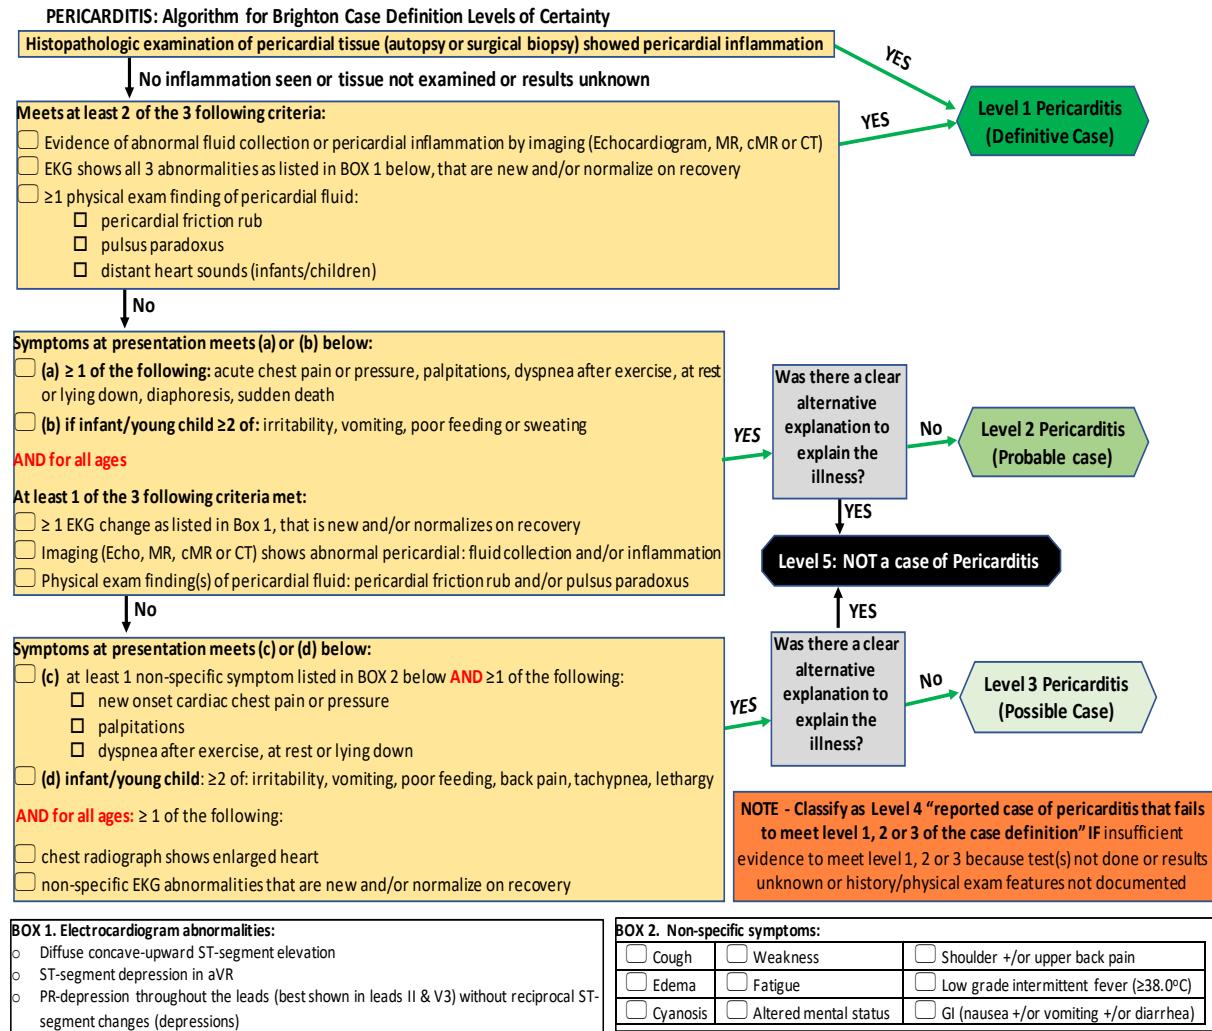

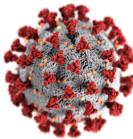

Figure 2 : SPEAC/Brighton Collaboration Pericarditis Pictorial diagram (<sup>1</sup> from <https://brightoncollaboration.us/myocarditis-case-definition-update/>)

## 2. Synonyms / lay terms used

### Myocarditis

Inflammation - heart muscle [4]; heart muscle inflammation (ICD-9); inflammation of myocardium.

<sup>2</sup> <https://brightoncollaboration.us/myocarditis-case-definition-update/>

## Pericarditis

Inflammation of pericardium; pericardial inflammation; inflammation of heart sac (ICD-9); inflamed covering of heart (ICD-9).

### 3. Laboratory tests done specific for event

#### Myocarditis

Myocarditis is suggested by non-pleuritic pain, a rise in cardiac enzymes, conduction abnormalities, arrhythmias, or cardiac dysfunction on imaging, which might be evident only after drainage of an accompanying effusion [5, 6].

**Biomarkers:** troponins or creatine kinase (lack specificity, but may help to confirm the diagnosis of myocarditis). Leukocytes and C-reactive protein can be elevated (but normal values do not exclude an acute myocardial inflammatory process).

**Virus serology:** the utility remains unproven and should not be commonly used for the diagnosis of myocardial infection in patients with suspected myocarditis.

**Antibody assays:** interpretation of antibodies is complicated due to reinfections (example herpesvirus infections) or cross-reactions with Epstein-Barr virus or enterovirus.

#### Pericarditis

The diagnosis of acute pericarditis is a clinical diagnosis based on proper history and the presence of typical symptoms of chest pain, pericardial rub (it is pathognomonic for pericarditis, but is frequently not present) and characteristic electrocardiographic changes.

##### Biomarkers:

Troponin I may be raised reflecting myocardial involvement [5].

Pericardial-fluid measurement of glucose, protein, and lactic dehydrogenase, adenosine deaminase, cell count, microscopy (including gram and Ziehl-Nielsen stain), bacterial (and occasionally viral) culture, and cytological examination.

Immunohistochemistry techniques: antibodies in immune-mediated pericarditis;

Carcinoembryonic antigen concentrations in neoplastic.

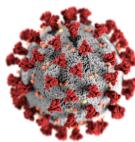

Other laboratory tests may include [5, 7]:

- Antinuclear antibody (ANA)
- Blood culture
- Complete Blood Count (CBC)
- C-reactive protein
- Erythrocyte sedimentation rate (ESR)
- Rheumatoid factor

Leucocytosis, raised C-reactive protein concentration, and sedimentation rate are common findings.

##### Virus serology:

Tuberculin skin test and Viral studies (HIV test, etc).

Serological studies might confirm the cause as infectious or autoimmune pericarditis, but are rarely of clinical relevance.[5]

## 4. Diagnostic tests done specific for event

### Myocarditis

The diagnosis of myocarditis based on the clinical presentation alone is usually not possible.

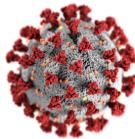

- Electrocardiogram [2].
- Echocardiography [2]: There are no specific echocardiographic features of myocarditis but it is one of the most important tools to rule out other causes of HF.
- Cardiovascular magnetic resonance (CMR) [2]: the most appropriate non-invasive approach.
- Endomyocardial biopsy (EMB) [2]: it is the gold standard in diagnosis of myocarditis. However, because of the lack of available facilities and clinical experience, EMB appears to be infrequently used to diagnose myocarditis. Then, immunohistochemical techniques, PCR and in situ hybridization techniques from EMB can be performed.
- Chest x-ray [4]: MedlinePlus includes also chest x-ray tests to diagnose myocarditis.

### Pericarditis

The following imaging tests may be done to check the heart and the pericardium [7, 8]:

- Chest Magnetic Resonance Imaging (MRI) scan
- Heart MRI or heart computed tomography (CT) scan
- Radionuclide scanning
- Chest x-ray: is frequently normal, but cardiomegaly can be seen in patients who have substantial pericardial effusion.
- Echocardiogram: non-invasive assessment of pericardial and cardiac morphology and the physiological importance of complications
- Trans-oesophageal echo
- Intracardiac echo
- Electrocardiogram: is perhaps the most useful diagnostic test for acute pericarditis
- Tissue doppler imaging
- Colour M-mode of early left-ventricular flow propagation.
- Pericardial biopsy if malignant or granulomatous causes are suspected
- PCR techniques can identify causative viruses and M tuberculosis from pericardial fluid or tissue.

Further assessment is required in order to know whether these procedures can be used as proxies to identify myocarditis/pericarditis.

## 5. Drugs used specific for event treatment

### Myocarditis

#### Specific treatment [2]:

Specific treatment options for viral myocarditis are not established yet, so treatment is symptomatic and based on the clinical presentation.

Specific types of autoimmune myocarditis are treated with immunosuppression, for example:

- giant cell myocarditis: combined treatment with immunosuppressants (cyclosporine and corticosteroids with or without azathioprine or murynomab CDs).
- cardiac sarcoidosis: early immunosuppressive therapy with high-dose corticosteroids (17).

Immunosuppressants or corticosteroid cannot be a proxy to identify myocarditis

#### Heart failure therapy [2]:

Pharmacological treatment of HF should be initiated according to the current guidelines. Standard HF regime includes beta-blockers, diuretics, angiotensin-converting enzyme (ACE) inhibitors or angiotensin-II receptor blockers (ARBs), aldosterone agonists, cardiac glycosides or calcium-channel blockers.

HF treatment can not be a proxy to identify myocarditis.

#### NSAIDs and colchicine [2]:

There is no indication for application of NSAIDs and colchicine in patients with myocarditis

### Pericarditis

#### Specific treatment - Antimicrobial treatment:

If a specific cause is identified, treatment should target the underlying cause (antimicrobial treatment) [5]. Antimicrobial treatment cannot be a proxy to identify pericarditis.

#### Anti-inflammatory treatment:

Non-steroidal anti-inflammatory drugs (NSAIDs) and colchicine (for recurrent pericarditis) [5, 9].

The use of corticosteroid treatment is controversial. Indicated for pericarditis with effusion due to M tuberculosis, in which it reduces the incidence of constriction.

Anti-inflammatory treatment cannot be a proxy to identify pericarditis.

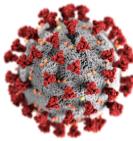

## 6. Procedures used specific for event treatment

### Myocarditis

The benefit of following procedures should be considered [2]:

1. pacemaker,
2. implantable cardiac defibrillator,
3. mechanical circulatory support and
4. heart transplantation.

These procedures can not be proxies to identify myocarditis.

## Pericarditis

The benefit of following procedures should be considered [5]:

1. Intrapericardial administration of steroids.
2. Pericardioscopy for direct instillation of treatments into the pericardial space.
3. Pericardial drainage.
4. Subdiaphragmatic laparoscopic technique, video-assisted thoracoscopic technique, and pericardioscopy to easy drainage of effusion.
5. Pericardiocentesis.
6. Cardiac catheterisation during pericardiocentesis.
7. Balloon pericardial window formation.
8. Instillation of sclerosing agents. Instillation of fibrinolytic agents.
9. Pericardectomy.
10. Further assessment is required in order to know whether these procedures can be used as proxies to identify myocarditis/pericarditis.

## 7. Setting (outpatient specialist, in-hospital, GP, emergency room) where condition will be most frequently /reliably diagnosed

Outpatient specialist, hospital

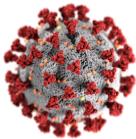

## 8. Diagnosis codes or algorithms used in different papers to extract the events in Europe/USA

Data from PRISM (A systematic review of validated methods to capture myopericarditis using administrative or claims data, <https://doi.org/10.1016/j.vaccine.2013.08.074>.

Nine publications (including one study reported in two publications) met criteria for inclusion. Two studies performed medical record review in order to confirm that these coding algorithms actually captured patients with the disease of interest. One of these studies identified five potential cases, none of which were confirmed as acute myocarditis upon review. The other study, which employed a search algorithm based on diagnostic surveillance (using ICD-9 codes 420.90, 420.99, 422.90, 422.91 and 429.0) and sentinel reporting, identified 59 clinically confirmed cases of myopericarditis among 492,671 United States military service personnel who received smallpox vaccine between 2002 and 2003. Neither study provided algorithm validation statistics (positive predictive value, sensitivity, or specificity).

### Conclusions

A validated search algorithm is currently unavailable for identifying incident cases of pericarditis or myocarditis. Several authors have published unvalidated ICD-9-based search algorithms that appear to capture myocarditis events occurring in the context of other underlying cardiac or autoimmune conditions.

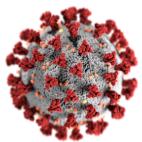

## 9. Experience of participating data sources in extracting the events prior to ACCESS

None provided

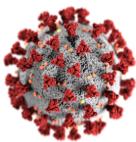

## 10. Proposed codes by Codemapper

### Myocarditis alone (no pericarditis)

## 11. Algorithm proposal

### Broad algorithm myocarditis/pericarditis:

- All concept sets = (Myocarditis, Pericarditis, Pericardium\_disorders) in any provenance, no prior codes
- Index date: first occurrence of any of these concept sets

### Narrow algorithm Myocarditis alone:

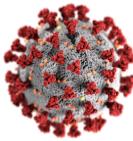

- Concept set = Myocarditis) in any provenance (no prior codes)
- Index date: first occurrence of any of these concept sets

### Narrow algorithm Myocardiitis/pericarditis

- Concept set = Myocarditis, pericarditis narrow) in any provenance (no prior codes)
- Index date: first occurrence of any of these concept sets
