## 1. Event definition

### (Chronic) heart failure

HF is a clinical syndrome characterized by typical symptoms (e.g. breathlessness, ankle swelling and fatigue) that may be accompanied by signs (e.g. elevated jugular venous pressure, pulmonary crackles and peripheral oedema) caused by a structural and/or functional cardiac abnormality, resulting in a reduced cardiac output and/or elevated intracardiac pressures at rest or during stress. The current definition of HF restricts itself to stages at which clinical symptoms are apparent (Ponikowski, et al.).

HF comprises a wide range of presentations, from patients with normal LVEF [typically considered as ≥50%; HF with preserved EF (HFpEF)] to those with reduced LVEF [typically considered as <40%; HF with reduced EF (HFrEF)] (Table 3.1). Patients with an LVEF in the range of 40–49% represent a ‘grey area’, which is defined as HFmrEF. Differentiation of patients with HF based on LVEF is important due to different underlying aetiologies, demographics, co-morbidities and response to therapies.<sup>6</sup> Most clinical trials published after 1990 selected patients based on LVEF [usually measured using echocardiography, a radionuclide technique or cardiac magnetic resonance (CMR)], and it is only in patients with HFrEF that therapies have been shown to reduce both morbidity and mortality.

#### Case definition of HF

- (In all cases) Presence of symptoms and/or signs of HF<sup>1</sup>

AND

- A LVEF <40%<sup>2</sup>

OR

- A ‘preserved’ LVEF<sup>2</sup> (defined as LVEF as LVEF ≥50% for HFmrEF or 40–49% for HFmrEF); and
- Elevated levels of NPs (BNP >35 pg/mL and/or NT-proBNP >125 pg/mL); and
- Objective evidence of other cardiac functional<sup>3</sup> and structural alterations<sup>4</sup> underlying HF

<sup>1</sup>

Symptoms and signs typical of heart failure

<sup>2</sup>Assesement of LVEF by echocardiography, the modified biplane Simpson’s rule is recommended

<sup>3</sup>Assesement of functional alterations by cardiac imaging and other diagnostic tests (e.g. echocardiography (see table 4.3), ECG)

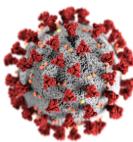

<sup>4</sup>Left ventricular hypertrophy and/or left atrial enlargement

Cohort studies initiated before 2016 have generally used the Framingham criteria on heart failure (McKee et al.), for example the EAHFE Registry (Javaloyes et al.).

### Acute heart failure (AHF)

AHF refers to rapid onset or worsening of symptoms and/or signs of HF. It can present as a first occurrence (*de novo*) or, more frequently, as a consequence of acute decompensation of chronic HF, and may be caused by primary cardiac dysfunction. Acute myocardial dysfunction (ischaemic, inflammatory or toxic), acute valve insufficiency or pericardial tamponade are among the most frequent acute primary cardiac causes of AHF.

There is no universal event definition for AHF. The European society of cardiology classifies AHF syndromes based on clinical presentation (Figure 12.1). This combine clinical classification identifies

four groups of patients that allow initial stratification as guide to therapy and prognosis (Ponikowski et al.). Previous guidelines classified AHF based on aetiologies (table 1; extracted from Nieminen et al.).

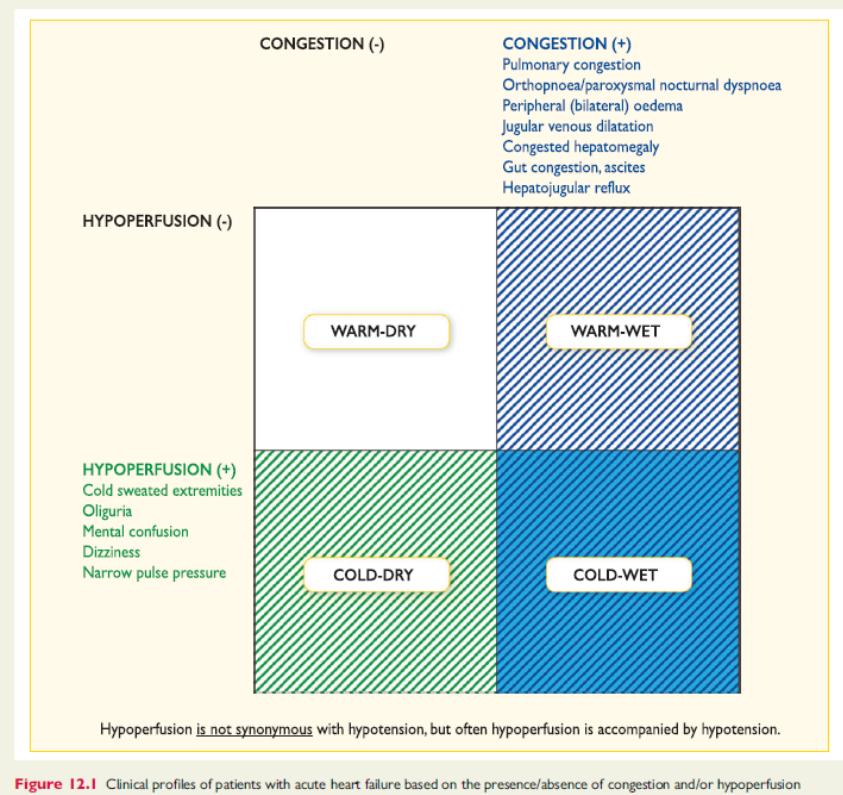

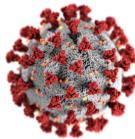

Figure 12.1 Clinical profiles of patients with acute heart failure based on the presence/absence of congestion and/or hypoperfusion

Table 1 Profile of patients (from: Nieminen et al.)

Acute de novo or chronic decompensated HF
<ul style="list-style-type: none"> <li>• Acute decompensated HF (de novo or as decompensation of chronic HF): signs and symptoms of acute HF develop over days and are mild. They do not fulfil the criteria for cardiogenic shock, pulmonary edema, or hypertensive crisis (normal blood pressure, jugular venous distension, and peripheral edema). The ejection fraction is reduced.</li> </ul>
<ul style="list-style-type: none"> <li>• Hypertensive acute HF: signs and symptoms of HF develop abruptly and are accompanied by high blood pressure and relatively preserved left ventricular function with a chest radiograph compatible with acute pulmonary edema.</li> </ul>
<ul style="list-style-type: none"> <li>• Pulmonary edema (verified by chest x-ray) accompanied by severe respiratory distress, with crackles over the lung and orthopnea, with O<sub>2</sub> saturation usually —90% on room air before treatment.</li> </ul>
<ul style="list-style-type: none"> <li>• Cardiogenic shock: cardiogenic shock is defined as evidence of tissue hypoperfusion induced by HF after correction of preload. There is no clear definition for hemodynamic parameters, but cardiogenic shock is usually characterized by reduced blood pressure (systolic blood pressure &lt;90 mm Hg or a drop of mean arterial pressure &gt;30 mm Hg) and/or low urine output (&lt;0.5 ml/kg/h), with a pulse rate &gt;60 beats/min with or without evidence of organ congestion. There is a continuum from low cardiac output syndrome to cardiogenic shock.</li> </ul>
<ul style="list-style-type: none"> <li>• High output failure is characterized by high cardiac output, usually with high heart rate (caused by arrhythmias, thyrotoxicosis, anemia, Paget disease, or iatrogenic or other mechanisms), with warm peripheries, pulmonary congestion, and sometime- low blood pressure, as in septic shock.</li> </ul>

- Right HF is characterized by low-output syndrome with increased jugular venous pressure, increased liver size, and hypotension.

The ESC-EORP HFA Heart Failure Long-term Registry, which is the largest pan-European cohort, defined the following diagnosis criteria according to the ESC 2016 Guidelines(Ponikowski et al.): “A diagnosis of AHF was made by the clinician-investigators at initial presentation and required the presence of signs and symptoms of HF, evidence of cardiac dysfunction, and the need for therapy”(Chioncel et al.). In this study the patients were retrospectively classified into the four profiles according to the 2016 ESC guidelines (figure 12.1)

Xanthopoulos et al. (2019) proposes a new terminology and therefore another classification of AHF, based on the different pathophysiology underlying in AHF. They distinguish acutely decompensated chronic HF (ADCHF) defined as the deterioration of preexisting CHF and de novo AHF defined as the rapid development of new symptoms and signs of HF that requires urgent medical attention (Xanthopoulos et al., Ponikowski et al.).

Chapman et al. (2019) has listed and compared the different clinical profiles at admission for acute heart failure.

## 2. Synonyms / lay terms for the event

Acute heart failure syndrome

Congestive heart failure

Congestive cardiac failure

Left ventricular dysfunction

Heart dysfunction

Diseased myocardium

Abnormal loading condition

Structural myocardial defect

Endomyocardial pathology

Heart failure

Decompensated chronic heart failure

Congestion

Decompensatio cordis

## 3. Laboratory tests that are specific for event

### Chronic HF

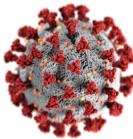

For diagnosis:

- Natriuretic peptides
  - o NT-proBNP  $\geq 125$  pg/mL
  - o BNP  $\geq 35$  pg/mL

For initial assessment

- Haemoglobin and WBC
- Sodium, potassium, urea, creatinine (with estimated GFR)
- Liver function tests (bilirubin, AST, ALT, GGTP)
- Glucose, HbA1c

Heart failure

- Lipid profile
- TSH
- Ferritin, TSAT = TIBC
- Natriuretic peptides

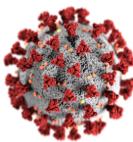

#### Acute HF

- Natriuretic peptides
  - o NT-proBNP (threshold: <300 pg/mL)
  - o BNP (threshold: <100pg/mL)
  - o MR-proANP (threshold <120pg/mL)
- Cardiac troponin
- Blood urea nitrogen or urea
- Creatinine
- Elektrolytes (sodium, potassium)
- Liver function tests (bilirubin, AST, ALT, GGTP)
- Thyroid function (TSH)
- Glucose
- Complete blood count
- D-dimer

## 4. Diagnostic tests that are specific for event

#### Chronic HF

1. 12-Lead ECG
  - In order to determine heart rhythm, heart rate, QRS morphology, and QRS durations, and to detect other relevant abnormalities.
2. Exercise testing
3. Chest radiography (X-ray)
  - To detect/exclude alternative pulmonary or other diseases, which may contribute to dyspnoea
4. Right heart catheterization
  - Done with a pulmonary artery catheter for mechanical circulatory support, to confirm pulmonary hypertension, or evaluation for heart transplantation.
5. Endomyocardial biopsy
  - In patients with rapidly progressive HF despite standard therapy, to evaluate if a specific diagnosis with an available and effective therapy is present.
6. Thoracic ultrasound
  - For conformation of pulmonary congestion and pleural effusion in patients with acute heart failure.
7. Ultrasound
  - For diagnosis and/or aetiology of HF.

## 8. Genetic testing

There is no confirmatory role of routine genetic testing to establish the diagnosis. Genetic counselling is recommended in patients with HCM, idiopathic DCM, and ARVC.

### Acute HF

#### 1. Chest X-ray

Chest X-ray can be useful test for diagnosis of AHF. Pulmonary venous congestion, pleural effusion, interstitial or alveolar oedema and cardiomegaly are the most specific findings for AHF, although in up to 20% of patients with AHF, chest X-ray is nearly normal (ref 519 guideline ESC). X-ray is also useful to exclude non-cardiac diseases.

#### 2. 12-lead ECG

ECG is helpful to identify underlying cardiac disease.

#### 3. Echocardiography

#### 4. Monitoring of the haemodynamic status: transcutaneous arterial oxygen saturation, blood pressure, urine output, ECG, heart rate, heart rhythm, respiratory rate.

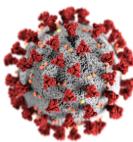

## 5. Drugs that are used to treat event

### Chronic HF/long term

- Angiotensin-converting enzyme inhibitors (or angiotensin receptor blockers if ACEI is not tolerated/contraindicated)
- Beta-blockers
- Diuretics
  - o Mineralocorticoid/aldosterone receptor antagonists: spironolactone and eplerenone
  - o Thiazides: bendroflumethiazide, hydrochlorothiazide, metolazone, indapamide
  - o Loop diuretics: furosemide, bumetanide, torasemide
- Angiotensin receptor neprilysin inhibitor
- Ivabradine
- Digoxin and other digitalis glycosides
- Hydralazine and isosorbide nitrate

### Acute HF/Short term

- Circulatory support: Oxygen, non-invasive positive pressure ventilation, mechanic ventilation, fluids.
- Nitrate vasodilators: isosorbide dinitrate; nitroglycerin
- Inotropic agents: dobutamine, dopamine, levosimendan, phosphodiesterase III inhibitor
- Diuretics
- In case of cardiogenic shock: vasopressors e.g. norepinephrine
- In case of atrial fibrillation: digoxin, beta-blockers, amiodarone

## 6. Procedures used specific for event treatment

### Chronic HF

1. Implantable cardioverter-defibrillator
2. Ventricular assist devices: mechanical circulatory support (LVAD, BIVAD)
3. Heart transplantation

### Acute HF

1. Cardioversion or temporary pacing.
2. Renal replacement therapy. Recommended in patients who fail to respond to diuretic strategies.
3. Intra-aortic balloon pump. Recommended in patient having specific mechanical problems (e.g. interventricular septal rupture)
4. Ventricular assist devices: mechanical circulatory support (LVAD, BIVAD, ECMO, ECLS)

## 7. Setting (outpatient specialist, in-hospital, GP, emergency room) where condition will be most frequently /reliably diagnosed

Chronic: outpatient specialist

Acute: pre-hospital continued in the emergency department.

## 8. Diagnosis codes or algorithms used in different papers to extract the events in Europe/USA:

Note to self: Some studies (e.g. The RICA Study (Huerta-Preciado et al.)) excluded HF secondary to pulmonary hypertension. This also complies with COPD, chronic kidney disease,

## 10. Algorithm proposal

### Broad algorithm:

- All concept sets = Any of the codes in any provenance, no prior codes
- Index date: first occurrence of any of these concept sets

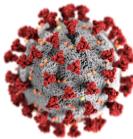

### Narrow algorithm:

- Concept set = (Heart\_failure, Chronic\_Heart\_failure, Neonatal\_heart\_failure) (no prior codes)
- Index date: first occurrence of any of these concept sets

## 11. Background rates

from Groeneweg et al. 2020 (Groenewegen Frans H. Rutten Arend Mosterd Arno W. Hoes. Epidemiology of heart failure <https://doi.org/10.1002/ejhf.1858>)

“The incidence of heart failure in European countries and the USA ranges widely from 1 to 9 cases per 1000 person-years and strongly depends, on the population studied and the diagnostic criteria used. In developed countries, incidence rates have stabilized between 1970 and 1990 and are now thought to be decreasing”
