

## EVENT DEFINITION FORM

**Event:** Coronary artery disease  
**Outcome/covariate:** Outcome  
**Version:** 1  
**Status:** Final

**Contributing authors**

authors	Expertise/role	Date
Ilse Kelters (UMCU)	Medical/drafting v0.1	June 24, 2020
Miriam Sturkenboom (UMCU)	Epidemiological review v0.1	June 28, 2020
Ilse Kelters		July 17, 2020
Miriam Sturkenboom	Code review	August 13, 2020
Miriam & Leila Belbachir	Update codes	August 25, 2020
Corinne Willame	Algorithm proposal	September 02, 2020
Miriam Sturkenboom	Final code list	February 14, 2021
Carlos Durán (UMCU)	Review narrow/possible assignment	March 24, 2021
Miriam Sturkenboom	Inclusion of code list used for final report	August 20, 2021

## 1. Event definition

### **European Society of Cardiology (Knuuti et al.)**

Coronary artery disease or ischaemic heart disease describes a set of clinical symptoms due to a inadequate blood supply to the myocardium. This pathological process is characterized by atherosclerotic plaque accumulation in the epicardial arteries, whether obstructive or non-obstructive. This disease can have a long stable period, called chronic artery disease, but also become unstable at any time due to an acute atherothrombotic event. This blockage can restrict blood flow, which causes myocardial ischaemia. When the blood flow is cut off entirely the event is called a 'heart attack' or acute myocardial infarction, which is categorized as acute coronary syndrome.

So, acute coronary syndrome is a subcategory of coronary artery disease, and coronary heart disease results of coronary artery disease. Coronary artery disease is characterized by atherosclerosis in coronary arteries and can be asymptomatic, whereas acute coronary syndrome is always present with symptoms, such as unstable angina, and is often associated with myocardial infarction, which can also occur regardless of coronary artery disease.

#### Acute coronary syndrome

One third of the cases myocardial infarction is not caused by coronary artery disease. A myocardial infarction can also occur in relation to percutaneous coronary intervention or with non-obstructive coronary arteries, called coronary procedure-related myocardial infarction (type 4 and 5) and myocardial infarction with non-obstructive coronary arteries (MINOCA) respectively. If there is no presence of myocardial ischaemia, a diagnosis of myocardial injury should be made. This diagnosis also includes other causes of cardiac troponin elevation, e.g. arrhythmias, heart failure, myocarditis (Kristian Thygesen et al.).

Clinical criteria for myocardial infarction: The clinical definition of myocardial infarction denotes the presence of acute myocardial injury detected by abnormal cardiac biomarkers in the setting of evidence of acute myocardial ischaemia.

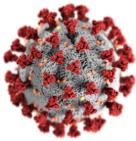

#### Chronic coronary syndrome

CCS are defined by the different evolutionary phases of CAD, excluding situations in which an acute coronary artery thrombosis dominates the clinical presentation (i.e. ACS).

#### Signs and symptoms

The clinical symptoms are a cornerstone of the diagnosis, although objective tests are most often necessary to conform the diagnosis. Clinical symptoms:

- Discomfort/pain
  - o On the chest, located near the sternum, anywhere from the epigastrium to the lower jaw or teeth, between shoulder blades or in either arm to the wrist and fingers.
  - o Pain is described as pressure, tightness, or heaviness.
  - o Symptoms become more severe with increased level of exertion
  - o Relieve of symptoms after using nitrates
  - o Symptoms are unrelated to respiration or position
- These symptoms define the clinical classification:

## 2. Synonyms / lay terms for the event

Atherosclerosis of the coronary arteries

Stenosis of the coronary arteries

Myocardial ischemia

Acute coronary syndrome

Acute myocardial infarction

Coronary heart disease

Coronary thrombosis

Chronic coronary syndromes

Angina pectoris

Angina

Anginal symptoms

Microvascular angina

Vasospastic angina

Heart attack

Ischaemic heart disease

Revascularization

## 3. Laboratory tests that are specific for event

### Acute coronary syndrome

#### 1. Cardiac troponin

Cardiac troponin I (cTnI) and T (cTnT) are biomarkers for the evaluation of myocardial injury. Myocardial injury is defined as being present when blood levels of cTn are increased above the 99<sup>th</sup> percentile upper reference limit (see definition event).

#### 2. Creatine kinase MB isoform

This biomarker is less sensitive and specific than cardiac troponin.

#### 3. Creatine kinase

### Chronic coronary syndrome

There is no specific laboratory test. Laboratory investigations are used to identify possible causes of ischaemia, to establish cardiovascular risk factors and associated conditions. Performed tests are:

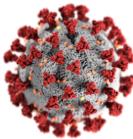

- Whole blood count including haemoglobin
- Thyroid hormone
- Fasting plasma glucose and HbA1c
- Lipid profile including total cholesterol, high density lipoprotein cholesterol, low-density lipoprotein cholesterol and triglycerides
- Renal function
- Cardiac troponin I and T

## 4. Diagnostic tests that are specific for event

### Acute coronary syndrome

#### 1. Electrocardiographic (ECG)

### Coronary artery disease

Acute myocardial infarction is characterized by myocardial necrosis or acute ischemia. Under these conditions one of the following changes in the ECG can occur:

- New or presumed new significant ST-segment- T-wave (ST-T) changes or new left bundle branch block (LBBB).
- Pathological Q waves

Imaging techniques are only useful when biomarkers have not been measured or not at appropriate times. Normal biomarkers at appropriate times measured exclude acute myocardial infarction and takes precedence over the imaging criteria.

## 2. Echocardiography

The strength of echocardiography is the combined assessment of cardiac structure and function, in particular myocardial thickness, thickening/ thinning, and motion. Regional wall motion abnormalities induced by ischaemia can be detected by echocardiography almost immediately after onset when > 20% transmural myocardial thickness is affected. These abnormalities, when new and without alternative aetiology, support the diagnosis of MI when cTn values show a rising and/or falling pattern. Echocardiography also allows detection of non-coronary cardiac pathologies known to cause chest pain, e.g. acute pericarditis, severe aortic stenosis, and hypertrophic cardiomyopathy among others. The technique is useful in diagnosing mechanical complications in patients with MI and haemodynamic compromise (shock), or other potentially fatal entities such as acute aortic dissection or massive pulmonary embolism where the clinical presentation might be similar to that seen with acute MI.

## 3. Radionuclide imaging

Several radionuclide tracers allow viable myocytes to be imaged directly. A strength of the radionuclide techniques is that they are the only commonly available methods for assessing viability directly, although the relatively low resolution of the images limits them for detecting the smallest areas of MI.

## 4. Cardiac magnetic resonance imaging

CMR gives you an accurate assessment of myocardial structure and function. CMR is common used in diagnosis of myocardial injury or applied as imaging technique in late presentation of myocardial infarction.

## 5. Computed tomographic coronary angiography

CT coronary angiography is feasibly but not widely applied because of low additional value of the imaging technique. The diagnosis myocardial infarction cannot be established by CTCA scan alone.

## Chronic coronary syndrome

### 1. ECG

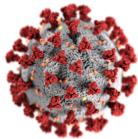

Including a resting 12 lead ECG and ambulatory ECG monitoring.

### 2. Echocardiogram

Echocardiogram is recommended in all patients for: (1) Exclusion of alternative causes of angina; (2) Identification of regional wall motion abnormalities suggestive of CAD; (3) Measurement of LVEF for risk stratification and; (4) Evaluation of diastolic dysfunction.

### 3. Chest X-ray

Chest X-ray is recommended for patients with atypical presentation, signs and symptoms of heart failure, or suspicion of pulmonary disease.

#### 4. Invasive coronary angiography

Consider when (1) there is a high clinical likelihood and severe symptoms refractory to medical therapy; (2) typical angina at low level of exercise and clinical evaluation including exercise ECG indicates high-risk events; LV dysfunction suggestive of CAD.

### 5. Drugs that are used to treat event

#### Acute coronary syndrome

- Painkillers: morphine s.c. or i.v.
- Aspirin/acetysalicylic acid 150-300mg
- P2Y12 receptor antagonist: ticagrelor or clopidogrel
- Low molecular weight heparin
- Vasodilators: nitroglycerine
- Beta-blockers: metoprolol
- ACE inhibitor: perindopril, ramipril
- ARB: losartan, valsartan
- Statins: atorvastatin, simvastatin, rosuvastatin

In the acute moment (during CPR): vasopressors (adrenaline, vasopressin) and antiarrhythmics (amiodarone, metoprolol)

#### Chronic coronary syndrome

Anti-ischaemic drugs: Nitroglycerin, ranolazine, trimetazidine, ivabradine

Beta-adrenergic blockers

Calcium channel blockers

Ace inhibitors: in patients with pre-existing hypertension, LVEF <40%, diabetes or CKD.

Angiotensin-receptor blockers

Diuretics

Event prevention: addition of antiplatelet drugs: aspirin (80mg); P2Y12 inhibitor (clopidogrel, prasugrel); statins,

In case of atrial fibrillation: NOAC

### 6. Procedures used specific for event treatment

Revascularization by percutaneous coronary intervention or coronary artery bypass grafting

### 7. Setting (outpatient specialist, in-hospital, GP, emergency room) where condition will be most frequently /reliably diagnosed

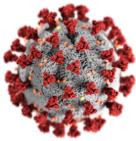

Acute coronary syndrome: Out of hospital/Emergency room

Chronic coronary syndrome: GP or in-hospital depending on the severity

### 8. Diagnosis codes or algorithms used in different papers to extract the events in Europe/USA: seek literature for papers that have studied this event and see how they extracted/measured the event.

ICD-9 410 to 414;

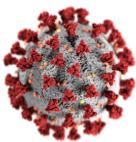

Coronary artery disease

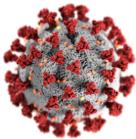

ICD-10 I20 to I25 (includes MI ICD-10 I21 to I22) (Virani, et al).

## 9. Codes used in ACCESS

## 10. Algorithm proposal

### Broad algorithm:

- All concept sets = Any of the codes in any provenance, no prior codes
- Index date: first occurrence of any of these concept sets

### Narrow algorithm (proof of obstruction):

Coronary artery disease

- Concept set = (acute Myocardial\_disorders, unstable angina) mentioning in any other location (no prior codes)
- Index date: first occurrence of any of these concept sets
