

Resurrection of the Dead using Time Travel and Reverse Aging.

Abstract

Time travel is the theoretical and science fiction process of traveling back and forth through times using various hypothetical technologies. In recent studies, it's theoretically and mathematically proven that traveling back in time it's just a matter of engineering. So one day it might be feasible to go back in time and save a person that has been deceased and bring him back to the present.

1. First Phase

The first step in achieving the process of resurrection is to technologically create a spacetime loophole and travel back in time at the moment before the person was pronounced dead. After that, we can bring him back to the present time when he is still alive.

2. Second Phase

After bringing him in the present, we can use reserve aging to gradually make that person young and healthy again, just as he was in the past.

Conclusion

The two phases aim to first bring the (deceased) person back in the present and then apply reverse aging to make the person young thus achieving the purpose of resurrection at the fullest.
