AGU's position statement on data affirms that

“Earth and space science data are a **world heritage**, and an essential part of the science ecosystem. All players in the science ecosystem—researchers, repositories, publishers, funders, institutions, etc.—should work to **ensure that relevant scientific evidence is processed, shared, and used ethically, and is available, preserved, documented, and fairly credited.**”

AGU Strategic Plan: Promoting Open Science and Open Data

“Lead in open science and open data while maintaining high standards of quality and scientific integrity.”

AGU
ADVANCING EARTH
AND SPACE SCIENCE

Researchers, Journals, Data Repositories
NSF Grant 2025364

Accelerating Open and FAIR Data Practices Across the Earth, Space, and Environmental Sciences: A Pilot with the NSF to Support Public Access to Research Data (AGU NSF PAR 2.0)

Partners: Dryad, CHORUS, ESIP, Wiley (In-Kind)

2-year project aimed at implementing FAIR data practices across the Earth, space, and environmental sciences such that, by the end of the project:

- Data citations for data funded by NSF grants are captured in the NSF Public Access Repository (PAR 2.0)
- Knowledge of leading practices and workflows around data citation are well known across the AGU community.

Data & Software for Authors

WHAT IS NEEDED?

AGU requires that the underlying data needed to understand, evaluate, and build upon the reported research be available at the time of peer review and publication. Additionally, authors should make available software that has a significant impact on the research. This entails:

1. Depositing the data and software in a trusted repository, as appropriate, and preferably with a DOI
2. Including an [Availability Statement](#) as a separate paragraph in the Open Research section explaining to the reader where and how to access the data and software
3. And including [citation\(s\)](#) to the deposited data and software, in the Reference Section.

Click on the headings below for detailed information on:

- [Models & Simulations](#)
- [Journal-Specific Data Guidance](#)
- [International Geo Sample Numbers](#)

Most of your questions regarding data and software should be answered by the resources below. Just in case, if you still have questions, you can contact DataHelp@agu.org.

WHAT DATA NEEDS TO BE AVAILABLE?

Primary and processed data used for your research should be preserved and made available.

Generally, the underlying data are considered to be the types of data usually preserved in domain repositories for each discipline. These may include raw data, but are usually the processed or refined data that support and lead to the described results and allow other readers to assess your conclusions and build off your work.

In your paper, cite these data, as well as any data you used from other sources, and include information about access to the data in the availability statement. For **model or simulation data**, follow [journal specific guidance](#) on prioritizing preserved output; in general, availability of software is most important.

Very large data (greater than 1 terabyte or TB) can be a challenge to preserve as there often fees and additional resources required. One option to consider, institutions often offer solutions for data preservation and compliance. Again, refer to the [journal specific guidance](#) for more information or email DataHelp@agu.org.

Implementation

Authors, reviewers, editors, and journal staff sometimes face **gray questions on how to implement policy.**

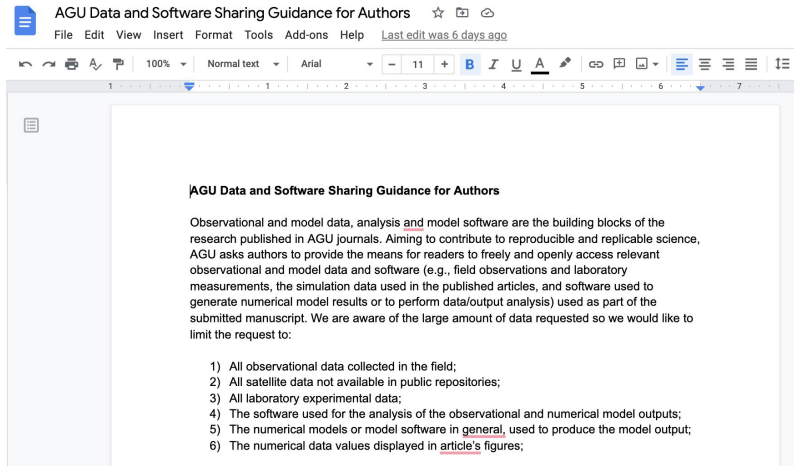

The **questions can vary** from what model information to include to navigating permissions and properly acknowledging use.

Over the span of 4 months we have responded to roughly **200 requests** that land in this gray space.

Data and software sharing guidance in process

Shift from document-based to transparent, collaborative, versioned approach.

AGU Data and Software Sharing Guidance for Authors

Observational and model data, analysis and model software are the building blocks of the research published in AGU journals. Aiming to contribute to reproducible and replicable science, AGU asks authors to provide the means for readers to freely and openly access relevant observational and model data and software (e.g., field observations and laboratory measurements, the simulation data used in the published articles, and software used to generate numerical model results or to perform data/output analysis) used as part of the submitted manuscript. We are aware of the large amount of data requested so we would like to limit the request to:

- 1) All observational data collected in the field;
- 2) All satellite data not available in public repositories;
- 3) All laboratory experimental data;
- 4) The software used for the analysis of the observational and numerical model outputs;
- 5) The numerical models or model software in general, used to produce the model output;
- 6) The numerical data values displayed in [article's](#) figures;

Generalist Repository Comparison Chart

doi:10.5281/zenodo.3946720

This chart is designed to assist researchers in finding a generalist repository should no domain repository be available to preserve their research data. Generalist repositories accept data regardless of data type, format, content, or disciplinary focus. For this chart, we included a repository available to all researchers specific to clinical trials (Vivli) to bring awareness to those in this field.

<https://fairsharing.org/collection/GeneralRepositoryComparison>

TOPIC	HARVARD DATAVERSE	DRYAD	FIGSHARE	MENDELEY DATA	OSF	VIVLI	ZENODO
Brief Description	Harvard Dataverse is a free data repository open to all researchers from any discipline, both inside and outside of the Harvard community, where you can share, archive, cite, access, and explore research data.	Open-source, community-led data curation, publishing, and preservation platform for CCO publicly available research data Dryad is an independent non-profit that works directly with: <ul style="list-style-type: none"> researchers to publish datasets utilizing best practices for discovery and reuse publishers to support the integration of data availability statements and data citations into their workflows institutions to enable scalable campus support for research data management best practices at low cost 	A free, open access, data repository where users can make all outputs of their research available in a discoverable, reusable, and citable manner. Users can upload files of any type and are able to share diverse research products including datasets, code, multimedia files, workflows, posters, presentations, and more. With discoverable metadata supporting FAIR principles, file visualizations, and integrations, researchers can make their work more impactful and move research further faster.	Mendeley Data is a free repository specialized for research data. Search more than 20+ million datasets indexed from 1000s of data repositories and collect and share datasets with the research community following the FAIR data principles.	OSF is a free and open source project management tool that supports researchers throughout their entire project lifecycle in open science best practices.	Vivli is an independent, non-profit organization that has developed a global data-sharing and analytics platform. Our focus is on sharing individual participant-level data from completed clinical trials to serve the international research community.	Powering Open Science, built on Open Source. Built by researchers for researchers. Run from the CERN data centre, whose purpose is long term preservation for the High Energy Physics discipline, one of the largest scientific datasets in the world
Size limits	No byte size limit per dataset. Harvard Dataverse currently sets a file size limit of 2.5GB.	300GB/dataset	Soft limit of 20GB/file for free accounts. System limit of 5000GB/file. Unlimited storage of public data but 20GB storage for private data for free accounts. Email info@figshare.com to have upload and storage limits raised.	10GB per dataset	Projects currently have not storage limit. There is a 5GB/file upload limit for native OSF Storage. There is no limit imposed by OSF for the amount of storage used across add-ons connected to a given project.	If more than 10GB per study data, reach out to us	50GB per dataset, contact us via https://zenodo.org/support for higher limits
Storage space per researcher	1 TB per researcher	No limit	No limit	No limit	No limit	No limit	No limit
Persistent, Unique Identifier Support	DOI, Handle	DOI	DOI	DOI	DOI	DOI	DOI

Availability Statements

■ AVAILABILITY STATEMENT

An Availability Statement, located in the Open Research section of the paper, contains information about your data, software, and other research objects (e.g. notebook) and how readers can access these. The Statement should include:

1. A brief description of the type(s) of data or software
2. Repository Name(s) where they are deposited
3. Version (of software)
4. DOI, Persistent Identifier Link to Data or Software (and Identifier)
5. Link to publicly accessible development platform (in the case of Software, e.g. GitHub)
6. Access Conditions (e.g. if Registration is Required)
7. Licensing/Permissions (e.g. Creative Commons Attribution)
8. In-text citation in References (optional)

Examples: Creative Commons, HPCs

2nd Workshop of the Data Citation Community of Practice

A presentation of use cases identified in the 1st workshop followed by community discussion

Apr 8, 2021

Data Citation Community of Practice Workshop for Earth, Space, and Environmental Sciences Announcement

A discussion on citing large numbers of datasets and assigning credit properly

Goal: In this workshop we want to address the use case of citing a large number of datasets such that credit for individual datasets is assigned properly. Discussion will include the concept of a “**Data Collection**” and the infrastructure and guidance still needed to fully implement so it is easier for researchers to use and receive credit when their data are cited in this manner.

Guidance for AGU Authors - Jupyter Notebooks

Erdmann, Christopher; Stall, Shelley

Jupyter Notebooks are increasingly being used for documenting data science workflows and replicating relevant analyses in research. The following recommendations are available to help guide authors through the process of sharing their Jupyter Notebooks when publishing in AGU journals. Please note that any data used by your notebook must be preserved and cited separately from the notebook to comply with [AGU's data and software guidance](#).

Erdmann, Christopher, Stall, Shelley, Gentemann, Chelle, Holdgraf, Chris, Fernandes, Filipe P. A., & Gehlen, Karsten Peters-von. (2021, May 20). Guidance for AGU Authors - Jupyter Notebooks. Zenodo.

AGU Data Leadership

Announcing the Launch of the AGU Data Leadership Program Website

JUNE 14, 2021

Today, June 14, 2021, we are announcing the launch of the AGU Data Leadership Program website. The website provides the Earth, space, and environmental science community with information on the latest work within AGU's Data Leadership Program as well as highlights and links from other community work around best practices that

Digital Presence - Connect your research for better discovery

JUNE 14, 2021

Connecting your research to your data, software and institution is a proven way to increase discovery of your work to potential collaborators and partners, and receive credit when others use your work.

Using persistent identifiers such as ORCIDs (for researchers), Digital Object Identifiers, and RORs (for organizations) are used to make those connections. Through the checklist and tutorial we very quickly take you through how to optimize those connections.

Get a copy of the *Digital Presence Checklist* from Zenodo: <http://doi.org/10.5281/zenodo.4706119>

Tutorial, 15 min (YouTube): <https://youtu.be/bftzPnFdtHk>

Slides for reference (Zenodo): <http://doi.org/10.5281/zenodo.4706147>

Thank you.
