SISPEC:2021 ISO 19115 metadata profile - XML encoding

This document defines the technical specifications required for describing hyperspectral measurements of snow surface compliant to guidelines listed by field spectroscopy and snow research communities. This document is not a reviewed standard and may not be referred to as a recognized standard. It is subject to change without notice. However, this document is a draft in preparation for official reviews by international organizations on this particular technology topic. Recipients of this document are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Document type: standard candidate draft

i. Abstract

The SISPEC XML encoding specification is a summary of conventions that supports efficient exchange of hyperspectral measurements performed on snow surfaces.

ii. Keywords

The following are keywords to be used by search engines and document catalogues: snow, ice, hyperspectral measurements, spectral signature, ISO 19115.

iii. Author organizations

The following institutes of the National Research Council of Italy (CNR) prepared this document: Institute of Atmospheric Pollution Research (IIA) and the Institute of Polar Sciences (ISP).

iv. Authors

All questions regarding this document should be directed to the editor or the authors:

Name	Affiliation	email

Date	Editors	Description
10/6/2021	Boldrini E., Salzano R., Salvatori R.	First release

2. Introduction

This document provides a ISO/TS 19115-3:2016 compliant encoding for the SISPEC:2021 ISO 19115 metadata profile. The encoding is based on the XML schema implementation defined in ISO 19115-3, plus newly defined extensions. Schematron rules were defined in addition to XML Schema to express XML constraints not enforceable by the XML schema.

3. XML encoding definition

The XML schema used is exactly the one defined in ISO/TS 19115-3, plus specific extensions/restrictions. In particular new codelists elements as well as the new metadata classes documented in the SISPEC profile document have been implemented in the XML schema.

Additionally, a set of Schematron rules have been defined to enforce SISPEC profile constraints that are not enforceable with XML Schema alone.

The SISPEC XML schema is defined in this section. The new sispec namespace (<https://niveos.cnr.it/SISPEC/1.0>, prefixed as sispec) contains the new metadata classes and codelists defined in the SISPEC profile document. The schema also imports the namespaces from the ISO 19115-3 schema.

3.1 SISPEC.xsd

The SISPEC XML schema, available at <https://essi-lab.eu/schemas/SISPEC/SISPEC.xsd> includes all the implemented metadata classes from the sispec namespace:

- SISPEC_EnvironmentalRecord
- SISPEC_SnowHardness
- SISPEC_SnowSurfaceRoughness
- SISPEC_WetnessIndexOfSurfaceSnow
- SISPEC_DescriptiveCondition
- SISPEC_QuantitativeCondition
- SISPEC_Abstract_SnowGrain
- SISPEC_MachineMadeSnow
- SISPEC_PrecipitationParticles
- SISPEC_DecomposingAndFragmentedPrecipitationParticles
- SISPEC_RoundedGrains

- SISPEC_FacetedCrystals
- SISPEC_DepthHoar
- SISPEC_SurfaceHoar
- SISPEC_MeltForms
- SISPEC_IceFormations

And also the SISPEC codelists:

- SISPEC_ConditionCode
- SISPEC_HardnessCode
- SISPEC_SnowSurfaceRoughnessCode
- SISPEC_WetnessIndexOfSurfaceSnowCode
- SISPEC_PrecipitationParticlesCode
- SISPEC_FacetedCrystalsCode
- SISPEC_MachineMadeSnowCode
- SISPEC_MeltFormsCode
- SISPEC_DecomposingAndFragmentedPrecipitationParticlesCode
- SISPEC_IceFormationsCode
- SISPEC_RoundedGrainsCode
- SISPEC_SurfaceHoarCode
- SISPEC_DepthHoarCode

3.2 Schematron rules for the SISPEC profile

SISPEC schematron rules are available at <https://essi-lab.eu/schemas/SISPEC/SISPEC.sch>

Schematron rules enforce the following constraints, as well as extensions/restrictions:

- Restricted obligation (e.g. optional ISO 19115 elements that change to mandatory in the SISPEC profile)
 - Metadata scope
 - Metadata language
 - Metadata responsible party with role “point of contact”
 - Metadata date
 - Reference system info code
 - Dataset title
 - Dataset creation date
 - Dataset identifier
 - Dataset responsible party with role “originator”
 - Spatial representation type
 - Distribution format
 - Spatial resolution
 - Topic category
 - Dataset extent, geographic element (BBOX)
 - Dataset extent, temporal element
 - Thesaurus date
 - Limitations on public access
 - Conditions applying to access and use
 - Dataset language
 - Dataset character encoding

- Dataset lineage
- Dataset attribute description
- Instrument name
- Platform name
- Instrument properties
- Snow grain percentage
- Metadata extension information
- Restricted domain:
 - Instrument properties: from Any to NCML description
 - Bounding box domain (ISO 19115)
 - Bounding box precision (INSPIRE)
- Codelists validation (as a subcase, validation of codelists is conveniently checked against the linked online codelist catalogues)
- Enforce a correct use of null elements (these are not permitted, unless in case of optional elements along with a nilReason or xlink pointers)
- Additional constraints from:
 - INSPIRE:
 - One keyword from GEMET thesaurus must be documented
 - INSPIRE conformance must be documented
 - SISPEC:
 - The sum of grain type percentages must not exceed 100
 - The “otherCondition” property holding an additional condition name must be documented if and only if condition code is documented as “other”

3.3 SISPEC code list catalog

SISPEC code lists catalog is available at <https://essi-lab.eu/schemas/SISPEC/SISPEC-codelists.xml>

3.4 SISPEC extension information

SISPEC extension information is available here: <https://essi-lab.eu/schemas/SISPEC/SISPEC-extension-information.xml>

3.5 Sample SISPEC metadata document

The following sample SISPEC metadata document is meant to be completed as much as possible, containing all the optional elements that can be documented by this profile.

        <mri:abstract>
            <gco:CharacterString>SISpec is a database containing spectroradiometric, snow and ancillary (environmental and meteorological) data acquired in polar environments. The project is the result of the co-operation of different expertise, and its main objective is to contribute to the knowledge of the interaction between microphysics characteristic of the snow cover and its reflection properties of the solar incident radiation and to study glacial environment and particularly to monitor the snow/ice covers by multispectral remote sensing data. Field surveys were performed in Antarctica, in the region where the Italian research station of Terra Nova Bay is located, the climatic characteristics and the low human impact allow to study snow/ice surfaces without impurities and with different characteristics with respect to those of the Arctic and the Alpine regions, where seasonal melting of the snow cover occur</gco:CharacterString>

        <mcc:description>
            <gco:CharacterString>The surface called "surface" means the lower
boundary of the atmosphere. "Bidirectional_reflectance" depends on the angles of incident
and measured radiation. Reflectance is the ratio of the energy of the reflected to the incident
radiation. A coordinate variable of radiation_wavelength or radiation_frequency can be used
to specify the wavelength or frequency, respectively, of the radiation.</gco:CharacterString>

</mac:MI_Metadata>
```

The sample document compliant with this metadata profile is available here: https://essi-lab.eu/schemas/SISPEC/SISPEC_example_1.1-iso.xml

(it describes the sample data object here available for reference: https://essi-lab.eu/schemas/SISPEC/SISPEC_example_1.1.nc)

It's recommended to use an XML Schema and Schematron aware editor or library while creating new files to be valid according to the SISPEC metadata profile. Such tools will considerably guide the XML drafting process reducing the possibility of encoding errors.

XML Schema + schematron aware editor tool are valuable tools for drafting SISPEC metadata documents. In the image above Oxygen® XML editor shows valid XML element completions.

3.6 INSPIRE validation

At the time of writing the INSPIRE ETF validator doesn't yet support ISO 19115-3 standard, however it is possible to produce a ISO 19139 version of SISPEC metadata document by automatic translation (through a XSLT) to check the validity of SISPEC profile records.

The XSLT able to obtain a ISO 19139 version of a SISPEC profile metadata document is available here: <https://essi-lab.eu/schemas/SISPEC/toISO19139.xsl>

After conversion the produced ISO 19139 document can be tested with the INSPIRE ETF validator at: <https://inspire.ec.europa.eu/validator/>

SISPEC profile has been drafted in order to be compliant with *Metadata (TG version 2.0)* *Conformance Class 2: 'INSPIRE data sets and data set series interoperability metadata'*, so the validation should be successful in case of valid SISPEC profile metadata documents.

The screenshot shows a detailed test report from the INSPIRE ETF Validator. At the top, it displays the test run details: "Test run on 12:01 - 04.06.2021 with test suite Conformance Class 2: INSPIRE data sets and data set series interoperability metadata." Below this, there is a summary table of test results:

Status	Passed	Total Count	Skipped	Failed	Warnings	Manual	Level of detail
Started	04/06/2021 10:02:15 GMT	3	0	0	0	0	All details
Duration	0.944 s	10	0	0	0	0	Less information
		39	0	0	0	0	Simplified

On the right side, there are two dropdown menus for filtering results: "Show" (set to "All") and "Level of detail" (set to "Simplified").

Below the table, there are three expandable sections under the heading "Conformance Class 2: INSPIRE data sets and data set series interoperability metadata":

- Conformance Class 1: INSPIRE data sets and data set series baseline metadata.** (3 items)
- Common Requirements for ISO/TC 19139:2007 based INSPIRE metadata records.** (3 items)
- Conformance Class 2: INSPIRE data sets and data set series interoperability metadata.** (4 items)

At the bottom of the report, it says "Report generated by ETF".
