## A FIRST APPROACH TO DECIPHER THE MEGABENTHIC TROPHIC NETWORK IN THE ANGOLAN COLD-WATER CORAL MOUNDS THROUGH STABLE ISOTOPE ANALYSIS

*Vinha B, Rossi S, Pennetta A, Gori A, Mienis F, Huvenne V, Hebbeln D, Wienberg C, Freiwald A,  
Piraino S, Orejas C*

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 818123 (iAtlantic). This output reflects only the author's view and the European Union cannot be held responsible for any use that may be made of the information contained therein.

## SE ATLANTIC

**ONE OF THE MOST UNEXPLORED AREAS IN TERMS OF DEEP-SEA BENTHIC MEGAFaUNA**

- Benguela Current Large Marine Ecosystem
- **Upwelling System** – one of the most productive in the world (0.37 Gt/Year)
- **Oxygen Minimum Zone (OMZ)**

- Recently discovered CWC reef in the SE Atlantic composed mainly by *Lophelia pertusa* and *Madrepora oculata*
- *L. pertusa* CWC reef thriving in:
  - Temperatures ranging :  
6.8 to 14.2°C
  - Low dissolved O<sub>2</sub> concentrations:  
0.5 to 1.5 mL/L

## M122 ANNA on R/V METEOR (2016)

Hebbeln et al., 2017, Hanz et al., 2019, Hebbeln et al., 2020

M122 ANNA on R/V METEOR (2016)

**CWC might compensate low O<sub>2</sub>  
concentrations due to:**

high food availability associated with a  
high quality Organic Matter (OM)

Büscher et al., 2017, Hebbeln et al., 2017, Hanz et al., 2019, Hebbeln et al., 2020

M122 ANNA on R/V METEOR (2016)

## Associated Fauna in the CWC reefs

- Sponges
- Bryozoa
- Hydroids
- Octocorals
- Actiniaria
- Antipatharia
- Crustaceans
- Starfish
- Ophiuroids
- Etc.

Hebbeln et al. 2017, 2020

What is the trophic structure of the Angolan CWC habitat?

### STABLE ISOTOPE ANALYSIS

$\delta^{15}\text{N}$

Trophic Position

$\delta^{13}\text{C}$

Resource use

### MAIN OBJETIVE

To decipher, for the first time, the deep-sea megabenthic trophic network of the Angolan CWC mounds through Stable Isotopes Analysis

# iAtlantic STUDY AREA

INTEGRATED ASSESSMENT OF ATLANTIC MARINE ECOSYSTEMS IN SPACE

M122 ANNA on  
R/V METEOR (2016)

## CWC Mounds

- Anna Ridge
- Buffalo Mounds
- Castle Mounds
- Scary Mounds
- Snake Mounds
- Twin Mounds
- Valentine Mounds

## Angolan Benthic Megafauna

Van-Veen Grab

MARUM ROV SQUID

Cnidaria, Bryozoa, Porifera, Echinodermata, Annelida,  
Arthropoda, Mollusca, and Chordata

**Sampling from 259 to 447m of depth**

**Total of 59 samples collected**  
**Preliminary results for 39 samples**

*Lophelia pertusa*

*Madrepora oculata*

*Echinus* sp.

*Delectopecten vitreus*

Bryozoa

→ **not included**

- Freeze-dried at -80°C
- Stored at -25°C until analysis

Hebbeln et al. 2017

## SAMPLE COLLECTION

### Potential Food Sources

#### Particulate Organic Matter (POM)

- **Sediment**

sampled at 259 and 345m of depth

**Van-Veen Grab**

**Box Corer**

- **Sediment trap material**

sampled at a daily interval  
at 342 and 532 m of depth

**ALBEX Lander (NIOZ)**

Royal Netherlands Institute for Sea Research

- **Suspended Particulate Organic Matter (SPOM)**

sampled over a complete tidal cycle  
at 342 and 532 m of depth

- Stored at -20°C until analysis

Hebbeln et al. 2017

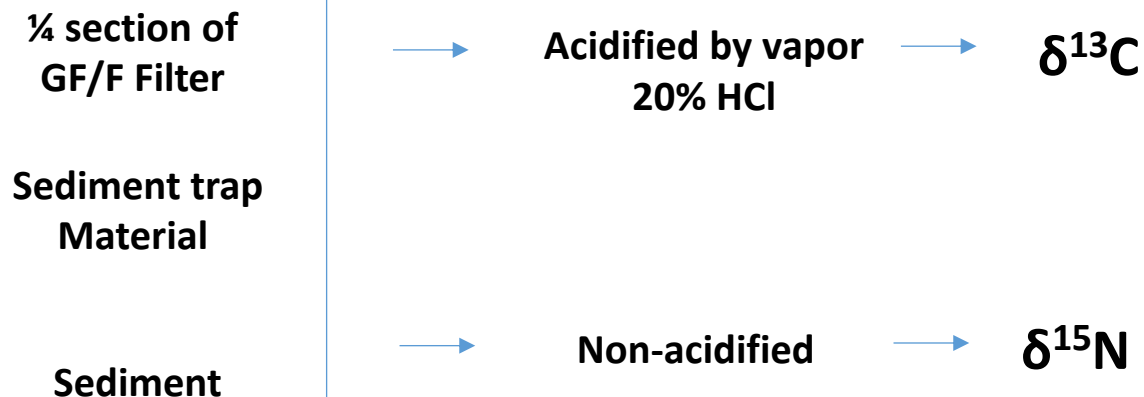

## SAMPLE PREPARATION

### Angolan Benthic Megafauna

### Potential Food Sources Particulate Organic Matter (POM)

# PRIMARY CONSUMERS

Fish, Crustacean, Polychaeta

Monterey Bay Aquarium  
Research Institute • ©MBARI

Cold-water corals (CWC)

Octocorals

©Okeanos Explorer, NOAA

Antipatharia

©Okeanos Explorer, NOAA

## Fresh SPOM is not a food source for the analyzed CWC species

### Potential food sources for Octocorals and Antipatharia

- Resuspended Organic Matter (OM) from sediment and degraded OM – this has been seen in Antarctic CWC species
- Zooplankton might be an important food source – as seen in other studies and in aquaria experiments

Octocorals

Antipatharia

## What could explain the high Trophic Position occupied by sponges?

- High  $\delta^{15}\text{N}$  values for deep-sea sponges have been reported in literature
- **Bacterial symbionts**
  - in OMZs increase of remineralization of bacteria might increase N ratios
- **DOM and bacterioplankton as food source**
  - hexactinellid species assimilate bacteria more efficiently

Bart et al., 2021

Deep-sea sponges in Angolan CWC mounds

Group with the most enriched values of  $\delta^{13}\text{C}$   
-15.38 to -13.65 ‰

### Ophiuroids

©MARUM ROV SQUID

### Asterozoa

# iAtlantic CONCLUSIONS

INTEGRATED ASSESSMENT OF ATLANTIC  
MARINE ECOSYSTEMS IN SPACE AND TIME

- **Resuspended Organic matter and Zooplankton** as a potential food source for CWC
- **Sponges** occupy the **highest trophic position**
- **Similar** Trophic structure compared with **other CWC habitats**
- **Further steps:** Incorporation of *L. pertusa* and *M. oculata* to validate fresh SPOM as a food source
