Metadata in the **DATA** communication...

- When you **provide** data to someone else, what types of information would you want to include with the data to make them useful?
- When you **receive** a dataset from an external project/researcher, what types of details do you want to know about the data?

A simple one...

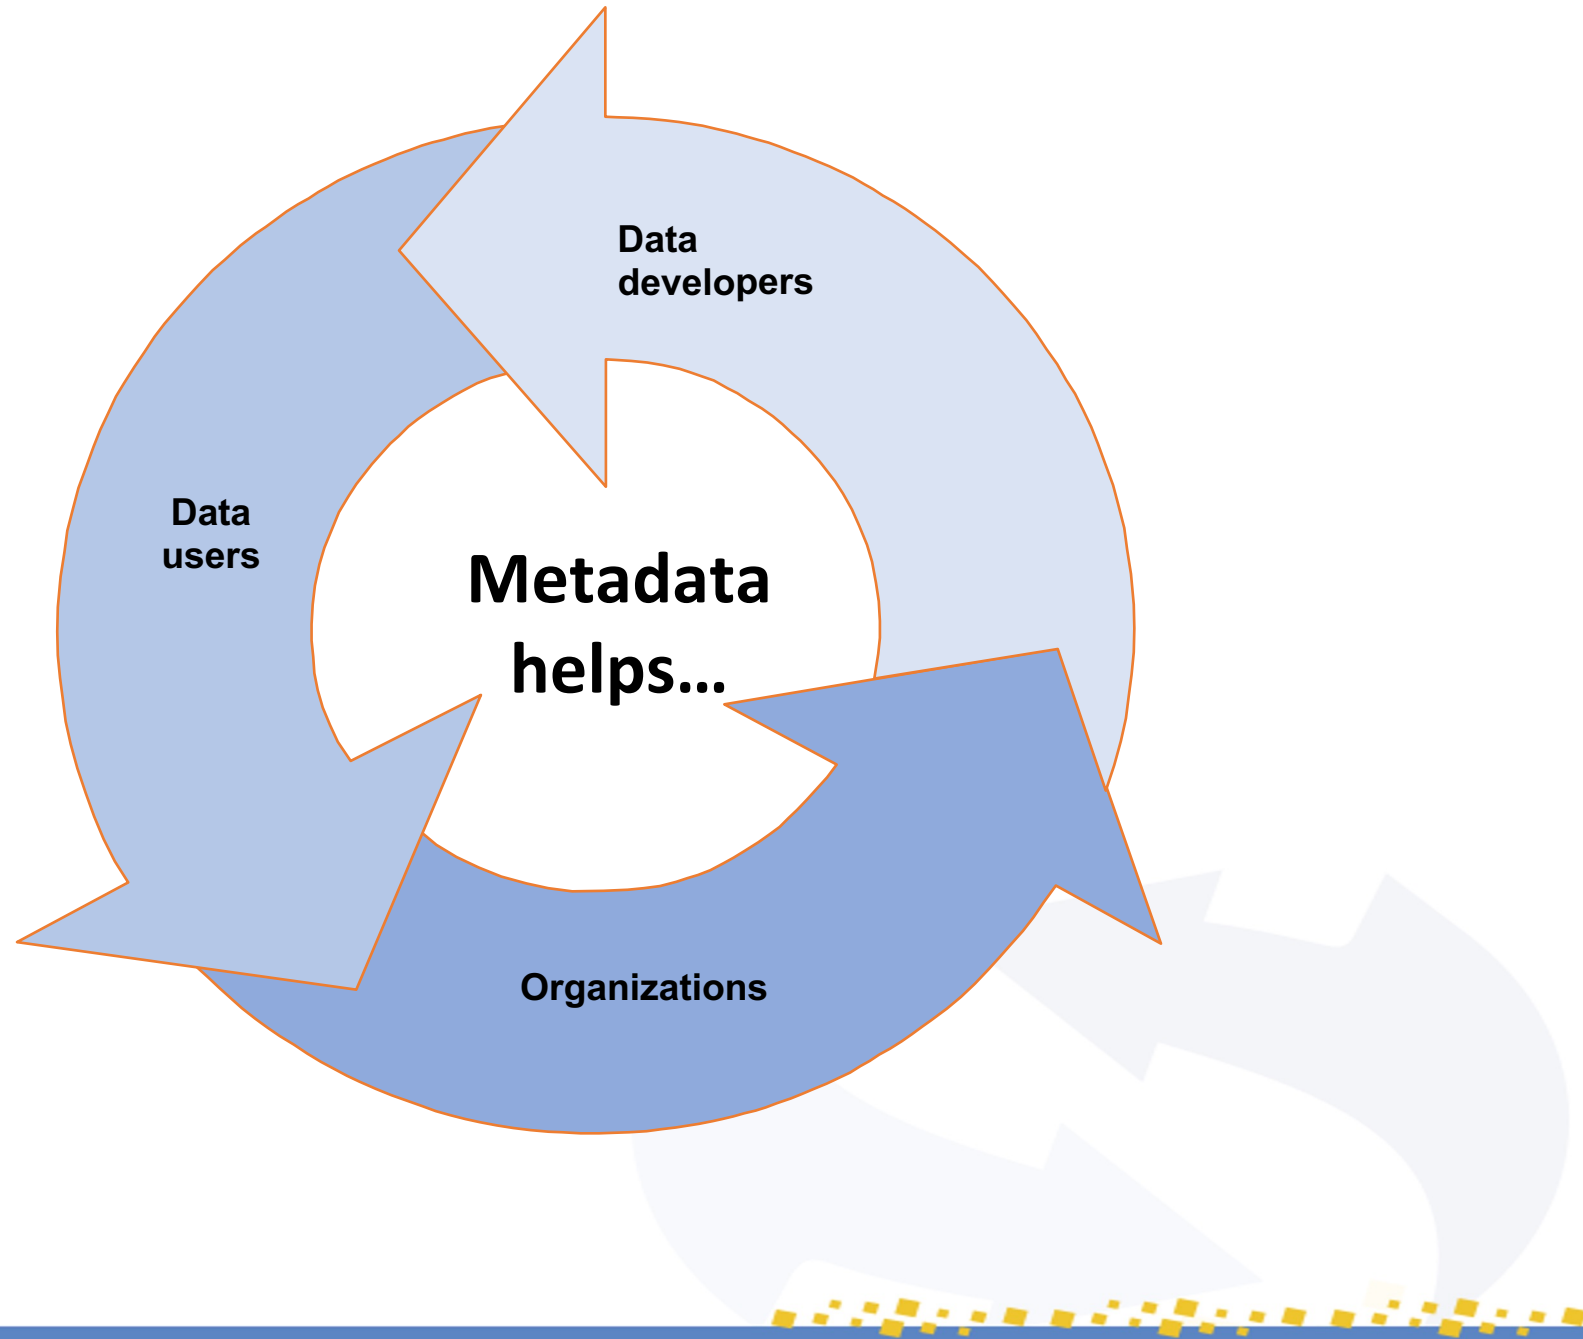

- **Metadata by definition:**
 - Data
 - Data about data
 - Data which provides information about a resource
- **Metadata by example:**
 - Title, author, subject, date, type, coordinates, (metadata elements - schemas) ...
 - “physics”, “2004-01-23” (metadata values-schemEs)
 - Digital format, terms and conditions, location & PID

(Rich, Structured)

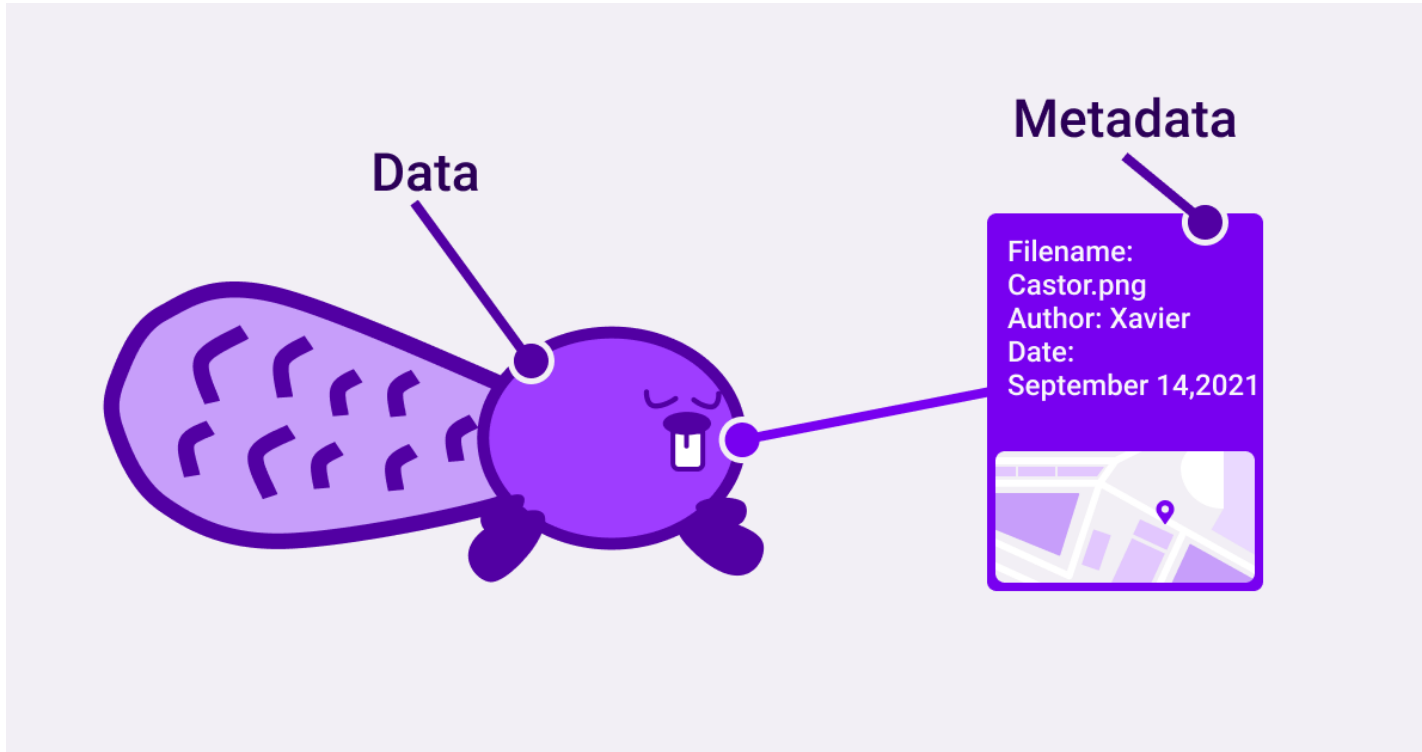

Nutrition Facts*

Amount Per Serving (serving size) = 1/2 cup (120mL) condensed soup

Calories 100	Dietary Fiber 2g
Fat Calories 50	Sugars 1g
Total Fat 6g	Protein 1g
Sat. Fat 1g	Potassium 60mg
Trans Fat 0g	
Polyunsat. Fat 4g	% Daily Values**
Monounsat. Fat 1g	Vitamin A 0%
Cholesterol 5mg	Vitamin C 0%
Sodium 870mg	Calcium 0%
Total Carb. 9g	Iron 0%

* The nutrition information contained in this list of Nutrition Facts is based on our current data. However, because the data may change from time to time, this information may not always be identical to the nutritional label information of products on shelf.

** % Daily Values (DV) are based on a 2,000 calorie diet.

Findable

- F1. (Meta)data are assigned a globally unique and persistent identifier
- F2. Data are described with rich metadata (defined by R1 below)
- F3. Metadata clearly and explicitly include the identifier of the data they describe
- F4. (Meta)data are registered or indexed in a searchable resource

Accessible

- A1. (Meta)data are retrievable by their identifier using a standardised communications protocol
 - A1.1 The protocol is open, free, and universally implementable
 - A1.2 The protocol allows for an authentication and authorisation procedure
- A2. Metadata are accessible, even when the data are no longer available

Interoperable

- I1. (Meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.
- I2. (Meta)data use vocabularies that follow FAIR principles
- I3. (Meta)data include qualified references to other (meta)data

Reusable

- R1. Meta(data) are richly described with a plurality of accurate and relevant attributes
 - R1.1. (Meta)data are released with a clear and accessible data usage license
 - R1.2. (Meta)data are associated with detailed provenance
 - R1.3. (Meta)data meet domain-relevant community standards

Metadata at the core of FAIR data

How FAIR are your data?

Findable

It should be possible for others to discover your data. Rich metadata should be available online in a searchable resource, and the data should be assigned a persistent identifier.

- A persistent identifier is assigned to your data
- There are rich metadata, describing your data
- The metadata are online in a searchable resource e.g. a catalogue or data repository
- The metadata record specifies the persistent identifier

Accessible

It should be possible for humans and machines to gain access to your data, under specific conditions or restrictions where appropriate. FAIR does not mean that data need to be open! There should be metadata, even if the data aren't accessible.

- Following the persistent ID will take you to the data or associated metadata
- The protocol by which data can be retrieved follows recognised standards e.g. http
- The access procedure includes authentication and authorisation steps, if necessary
- Metadata are accessible, wherever possible, even if the data aren't

Interoperable

Data and metadata should conform to recognised formats and standards to allow them to be combined and exchanged.

- Data is provided in commonly understood and preferably open formats
- The metadata provided follows relevant standards
- Controlled vocabularies, keywords, thesauri or ontologies are used where possible
- Qualified references and links are provided to other related data

Reusable

Lots of documentation is needed to support data interpretation and reuse. The data should conform to community norms and be clearly licensed so others know what kinds of reuse are permitted.

- The data are accurate and well described with many relevant attributes
- The data have a clear and accessible data usage license
- It is clear how, why and by whom the data have been created and processed
- The data and metadata meet relevant domain standards

- *Making data findable, including provisions for **metadata***
- *What **metadata** will be created? In case **metadata standards** do not exist in your discipline, please outline what type of metadata will be created and how.*
- *Where will the data and associated **metadata**, ... be deposited?*
- *Interoperability of your data... What data and **metadata vocabularies**, standards or methodologies will you follow to make your data interoperable?*
- The **Research Data Alliance** provides a **Metadata Standards Directory** that can be searched for discipline-specific standards and associated tools.

FAIR Guiding Principles: all about metadata

80% metadata
20% PIDs

@

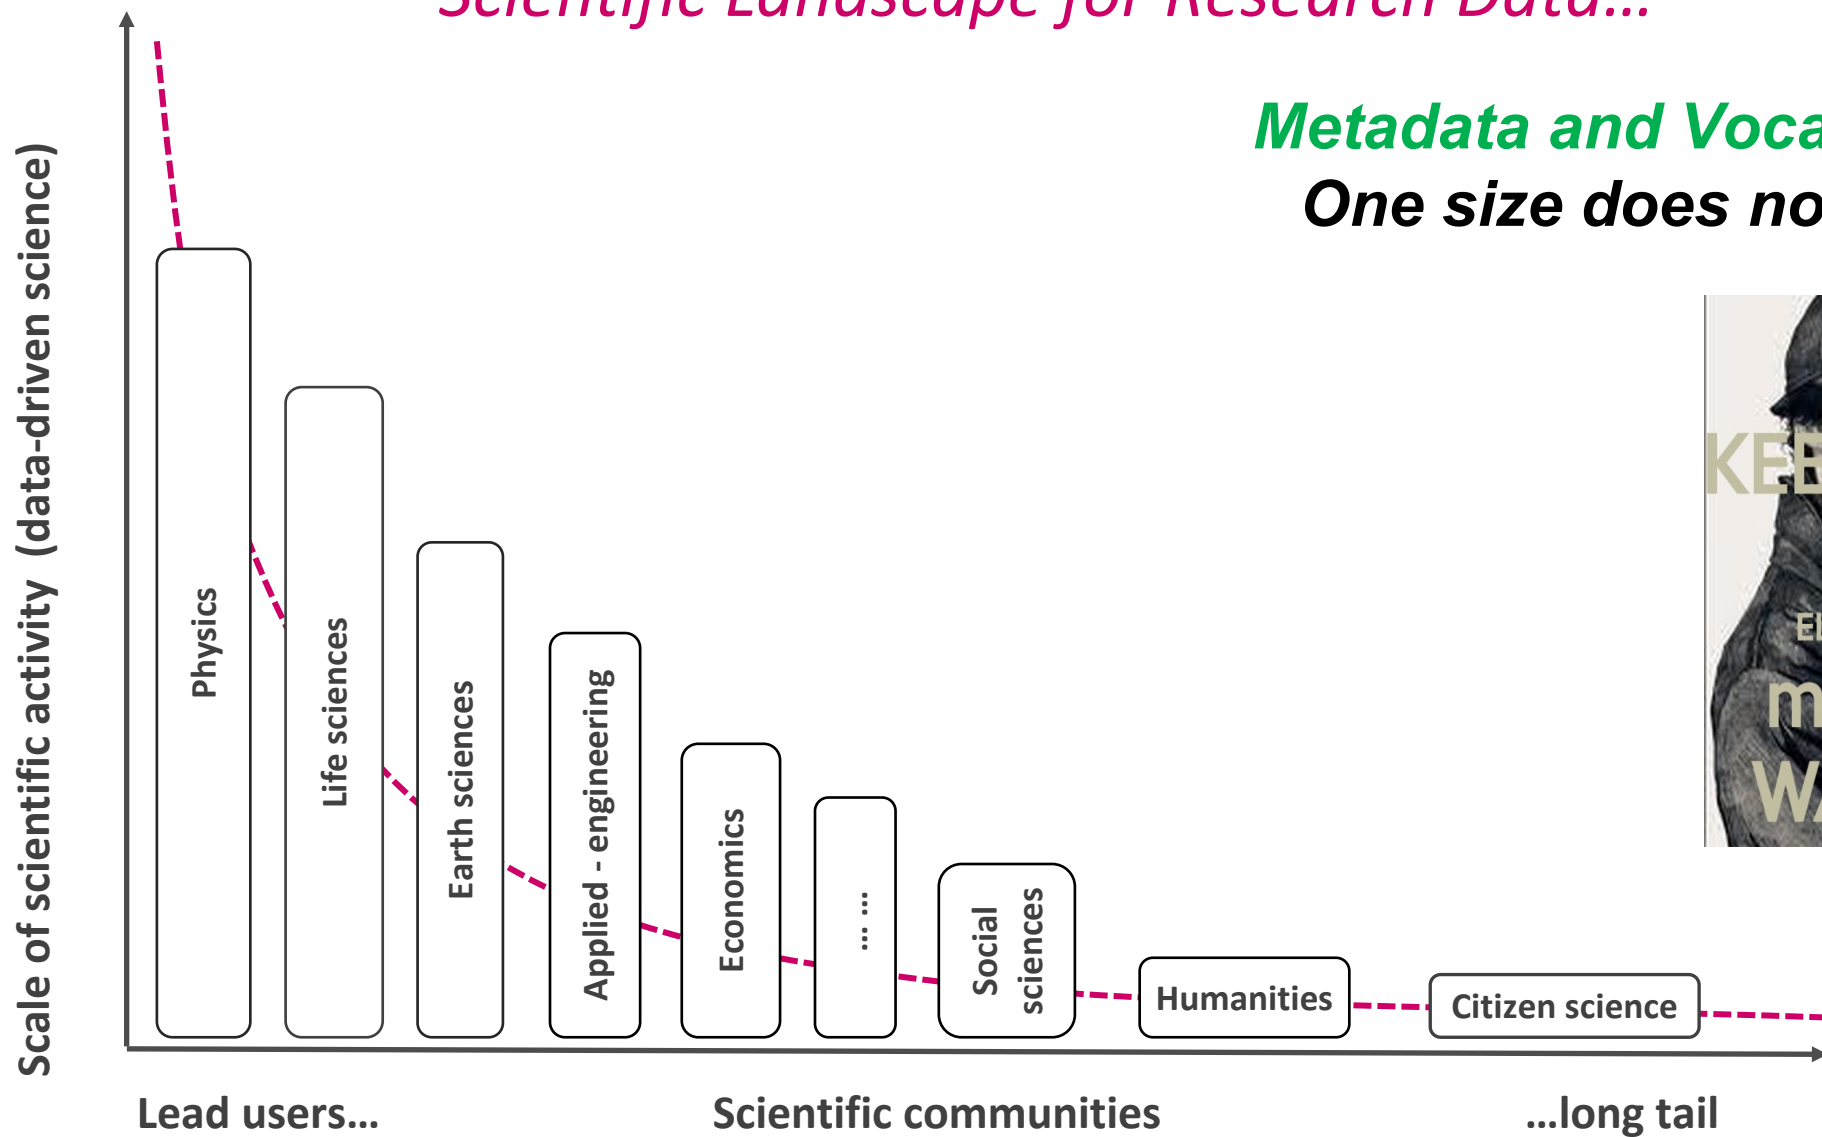

Metadata principles (CoolM4OS)

- The only difference between metadata & data is **mode of use**
- Metadata is **not just for** publications and data, **it is also** for users, software services, computing resources, **etc.**
- Metadata is not just for description and discovery; it is also for **contextualization**, (relevance, quality, provenance, restrictions (rights, costs) and for coupling users, software and computing resources to research outcomes
- Metadata must be **machine-understandable as well as human** understandable for autonomicity (formalism)
- **Management (meta) data** are also relevant (research proposal, funding, project information, research outputs, outcomes, impact, etc.)
- We must create: **“COOL” metadata**

EOSC & FAIR DATA

Scientific Landscape for Research Data...

Metadata and Vocabularies
One size does not fit all!!!

Back to the problem

Metadata are like toothbrushes...

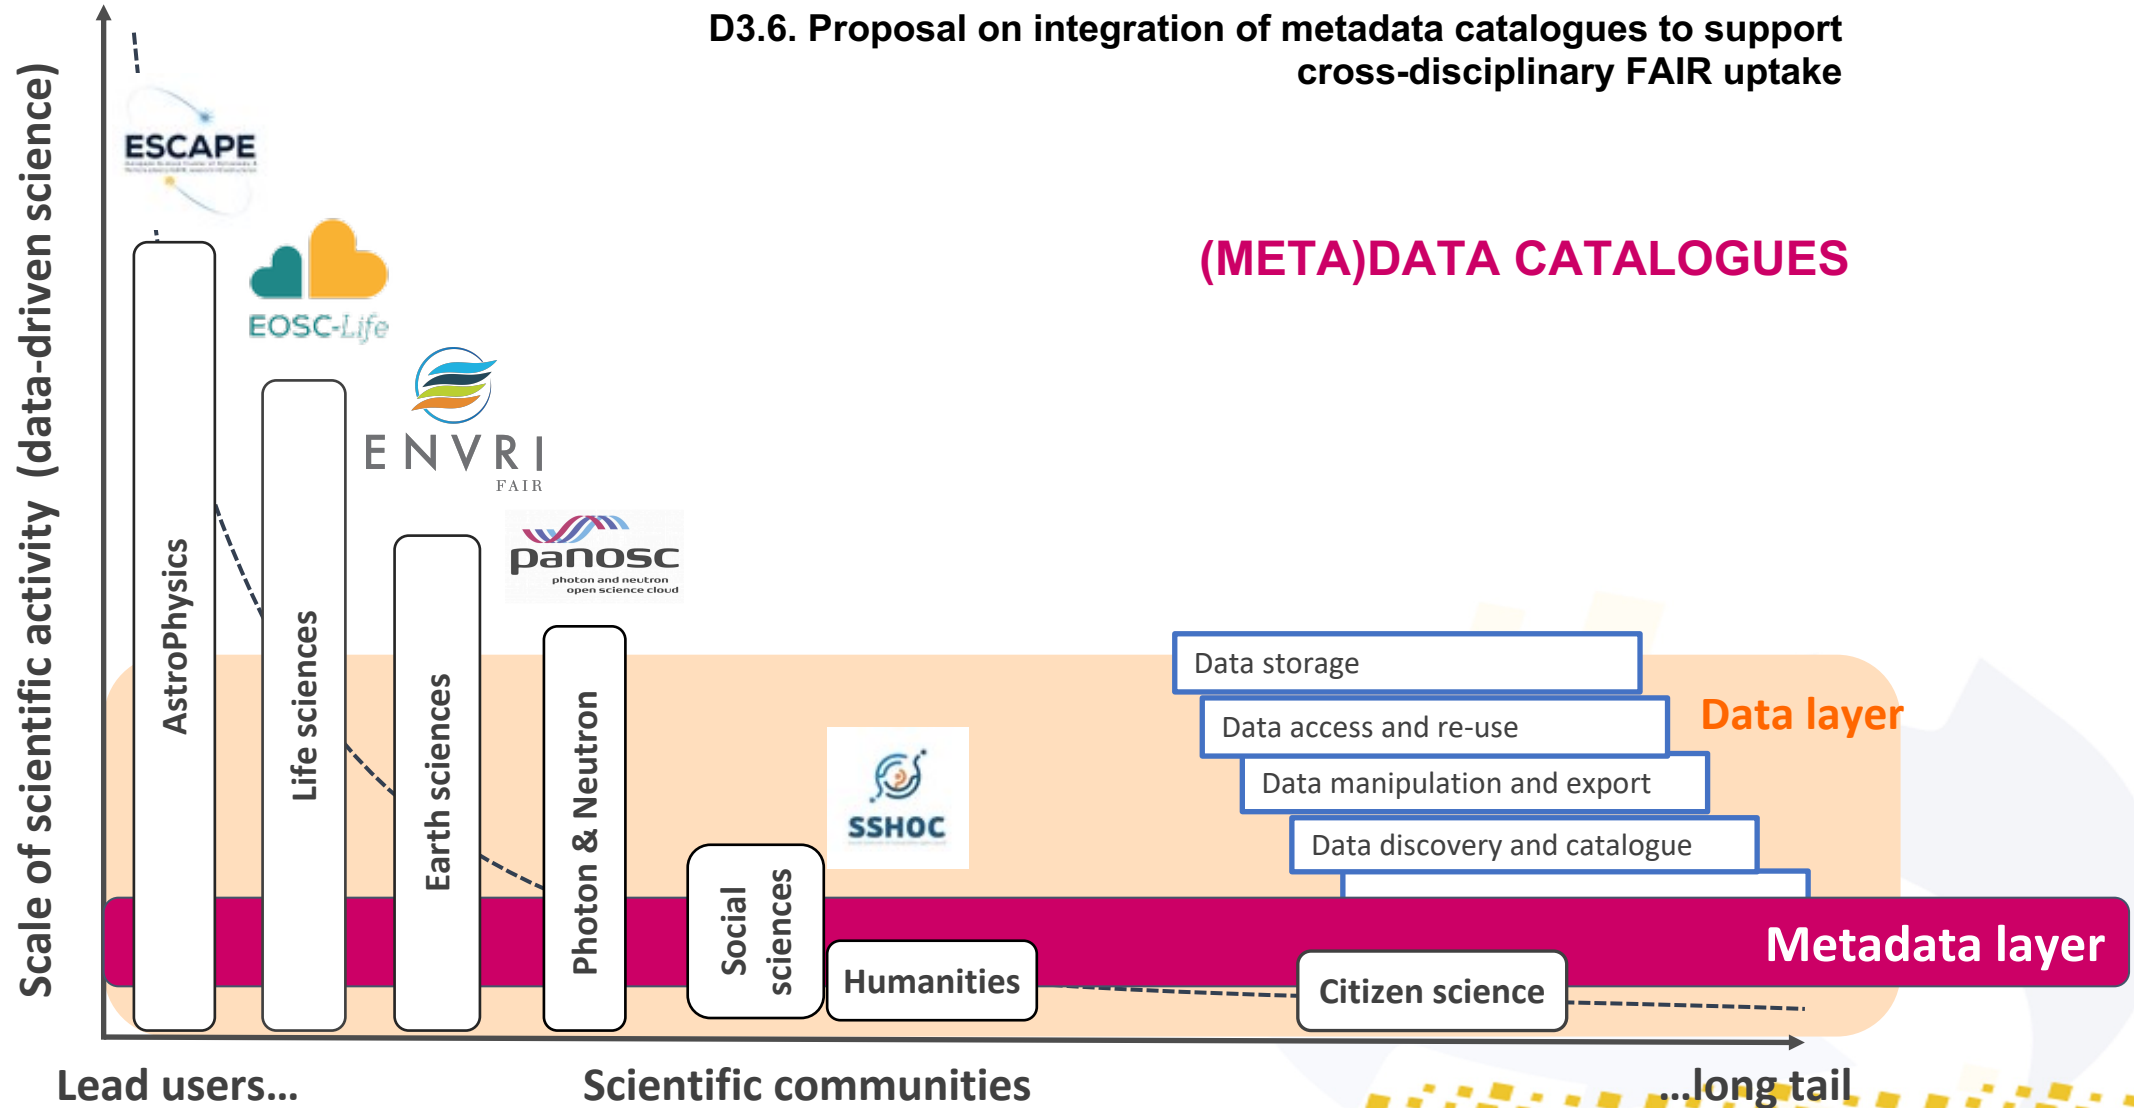

...Everyone thinks that it is a good idea,
but nobody wants to use someone else's.

<https://www.rd-alliance.org/rda-disciplines/rda-interdisciplinary-research>

Source: <https://imerg.info> By Dr Seuss (with obvious modifications by Ashley Barnett contextualization by Eva Méndez)

D3.6. Proposal on integration of metadata catalogues to support cross-disciplinary FAIR uptake

Challenges

Metadata

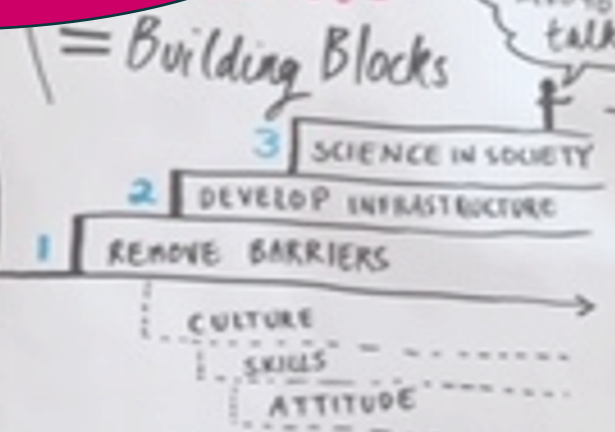

- **Inter-cross disciplinary** research
- Metadata **standards**: avoid the “*toothbrush effect*”
- (Meta)data **catalogue integration**
- **Metadata quality** is not only at schema level (metadata formats), but also at scheme (semantic artifacts) and content
- Good research outcomes (publications and data) include **good metadata**, but difficult to balance *rich/cool/good* metadata.

THANK YOU!!

PROF. DR. EVA MENDEZ
WE ARE RESEARCHING with TAXPAYERS' MONEY. WE NEED YOUR SUPPORT BACK.

THERE IS ALWAYS A TEMPTATION TO show us...
TENURED YOU MOST BE an excellent OPEN SCIENTIST

MANY HATS!
I AM PART of the SYSTEM AND I AM TRYING to CHANGE IT.
