## What is Xanax?

Xanax is a brand name for the drug alprazolam, which belongs to a group of drugs called [benzodiazepines](#).

Xanax is a prescription medication used to treat anxiety, panic disorder, and anxiety related to depression. Xanax can be taken alone or in combination with other drugs.

## How to take Xanax

The dosage of alprazolam for adults varies based on its intended

[Privacy](#) - [Terms](#)

purpose. For extreme anxiety, a starting dose of 0.25 mg given twice or three times a day is recommended. This is raised gradually until anxiety is under control and side effects are minimal. Patients over the age of 65 may be started on a lower dose of 0.125 mg twice or three times per day. The usual daily maximum dose is 3 mg. [Buy Adderall online cheap without prescription](#)

For panic attacks, a beginning dose of 0.5 mg to 1 mg at bedtime or 0.5 mg three times daily is recommended. The dosage is then steadily increased until no panic attacks occur.

Your doctor would normally start you on a low dose and gradually raise it as needed. To avoid excessive sedation or motor impairment, it is critical that the dose be tailored to your unique needs.

NOTE: Bodyweight, other medical issues, and other drugs can all influence the dosage of medication that a person requires. If your doctor has prescribed a dose that differs from the ones stated here, don't adjust your medication's dosage without first consulting your doctor.

## Xanax side effects

If you develop hives, difficulty breathing, or swelling of your face, lips, tongue, or throat, seek emergency medical treatment right away.

Alprazolam can cause your breathing to slow or stop, especially if you've recently taken an [opioid medicine](#), drank alcohol, or taken other drugs that affect your breathing.

If you have weak or shallow breathing, are difficult to wake up, or stop breathing, someone caring for you should seek immediate medical treatment.

If you have any of the following symptoms, call your doctor right once.

- a seizure;
- hallucinations, risk-taking behavior;
- increased energy, decreased need for sleep;
- racing thoughts, being agitated;
- weak or shallow breathing;
- a light-headed feeling as if you might pass out;

Alprazolam's sedative effects may remain longer in older persons. Elderly people on benzodiazepines are at a higher risk of falling. To avoid falling or sustaining an injury, exercise caution.

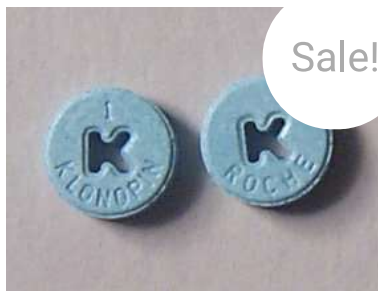

The following are some of the most common Xanax adverse effects:

- Drowsiness
- Feeling light-headed.

This is not an exhaustive list of potential side effects; more may arise. For medical advice on side effects, contact your doctor. You have the option of reporting side effects to the FDA.
