# Best fit

# Best fit – strong asymmetries

Forecast: tornados + hail

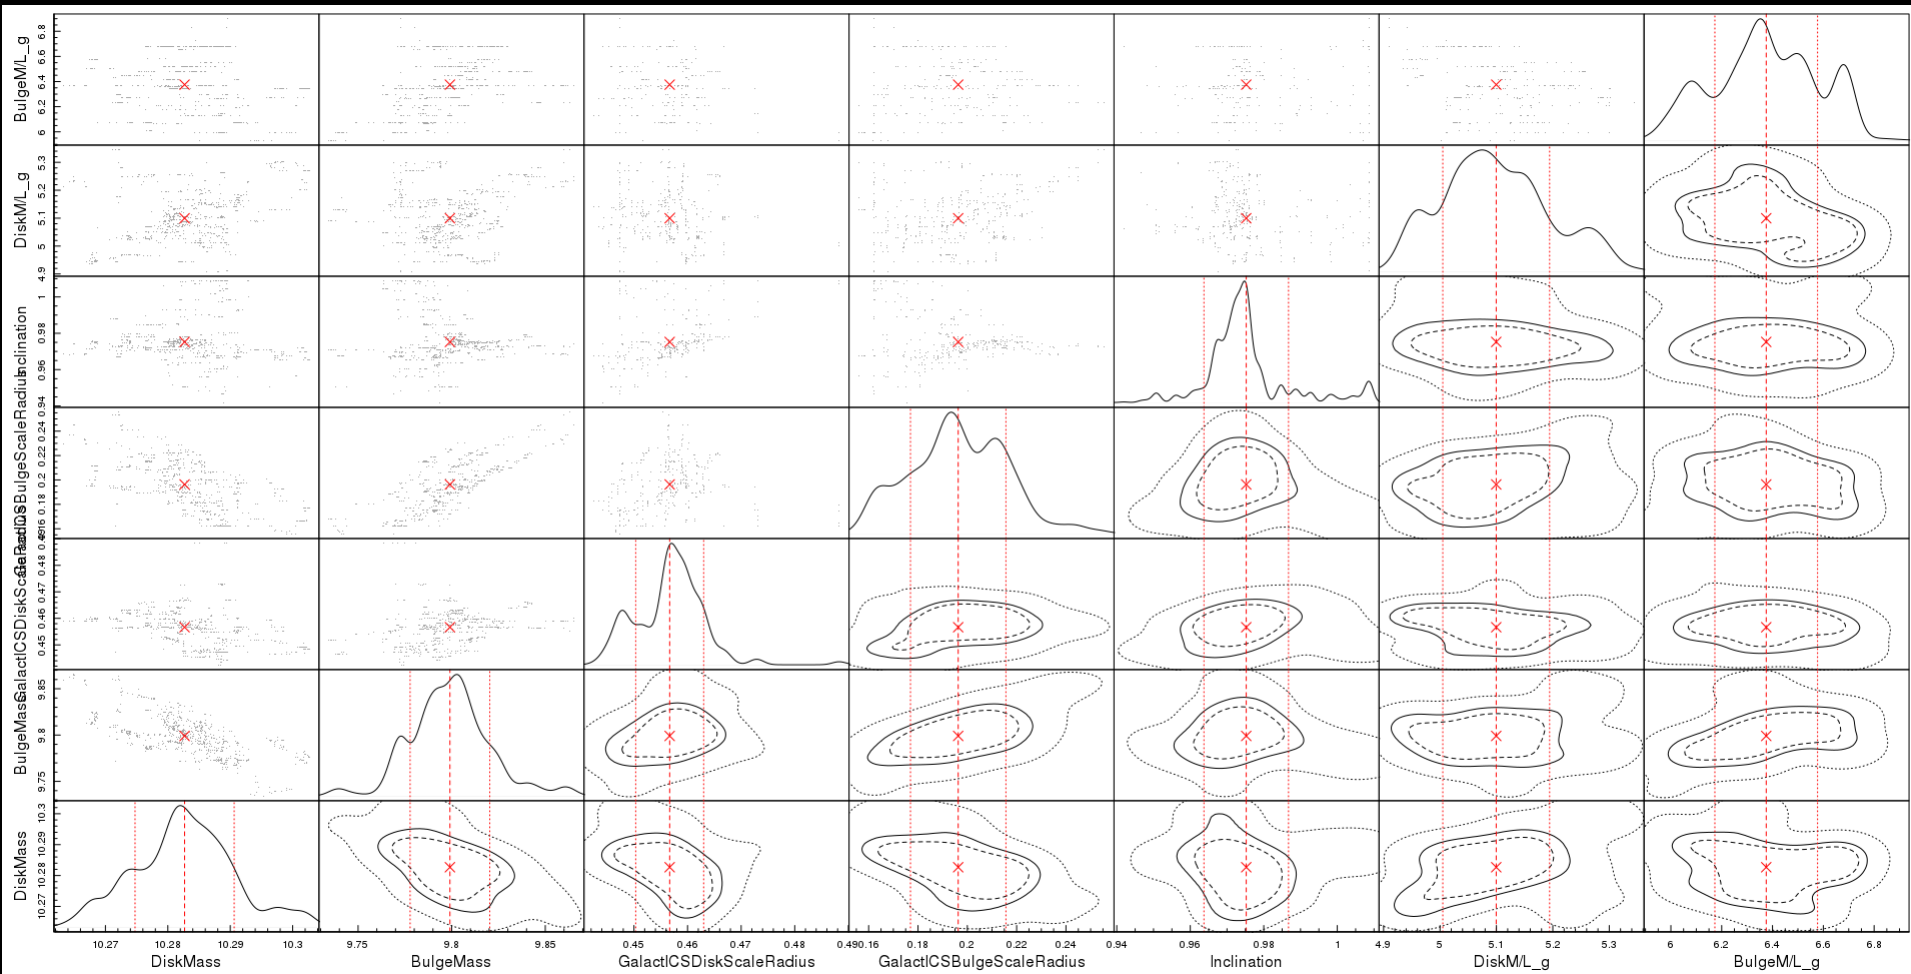

# Best fit – weak asymmetries

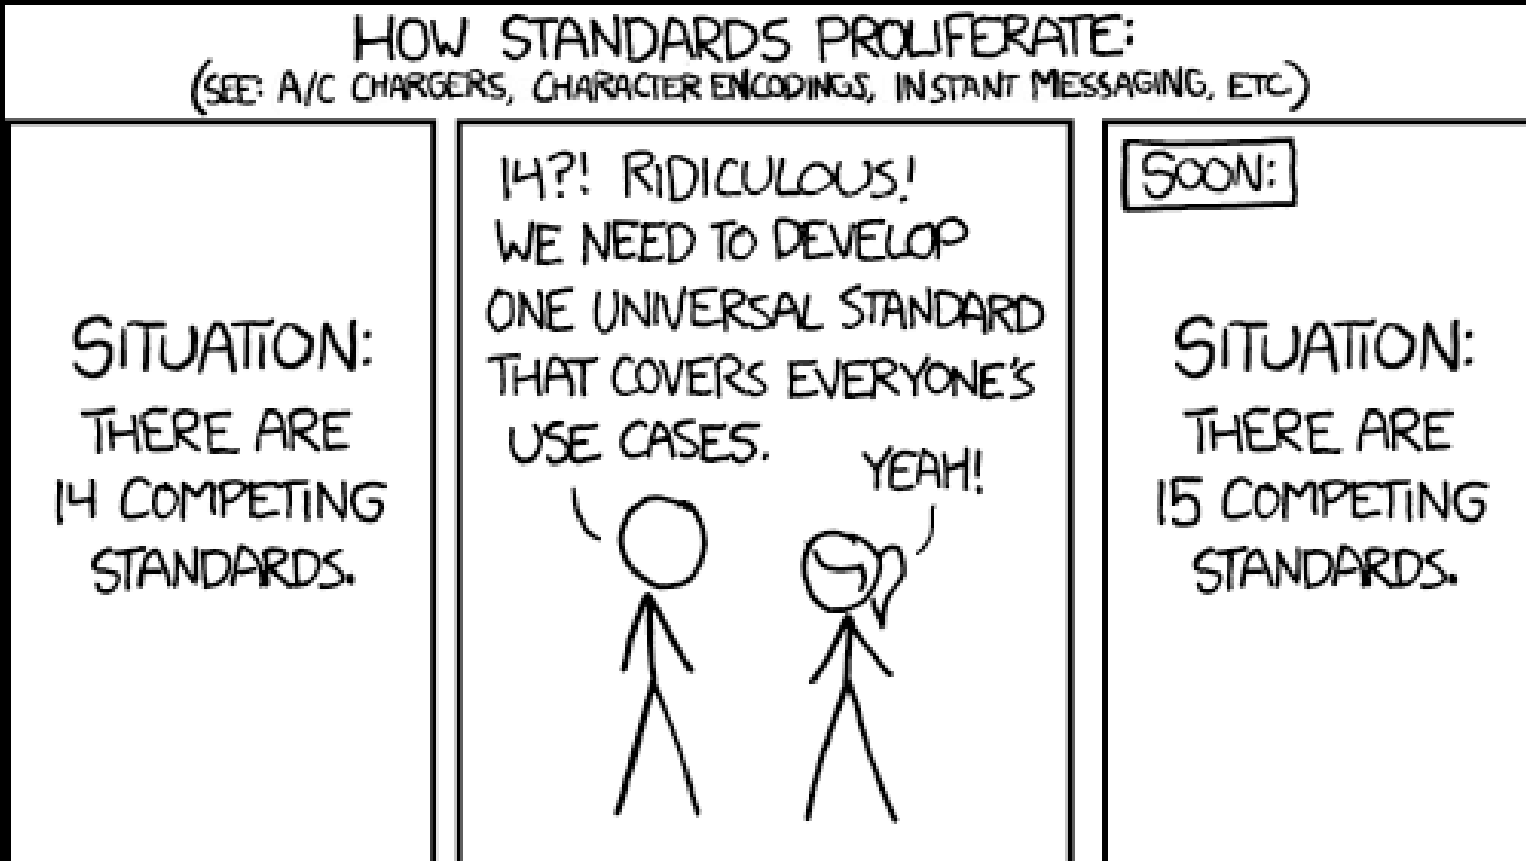

Forecast: sunny :)

# MCMC PDF\*

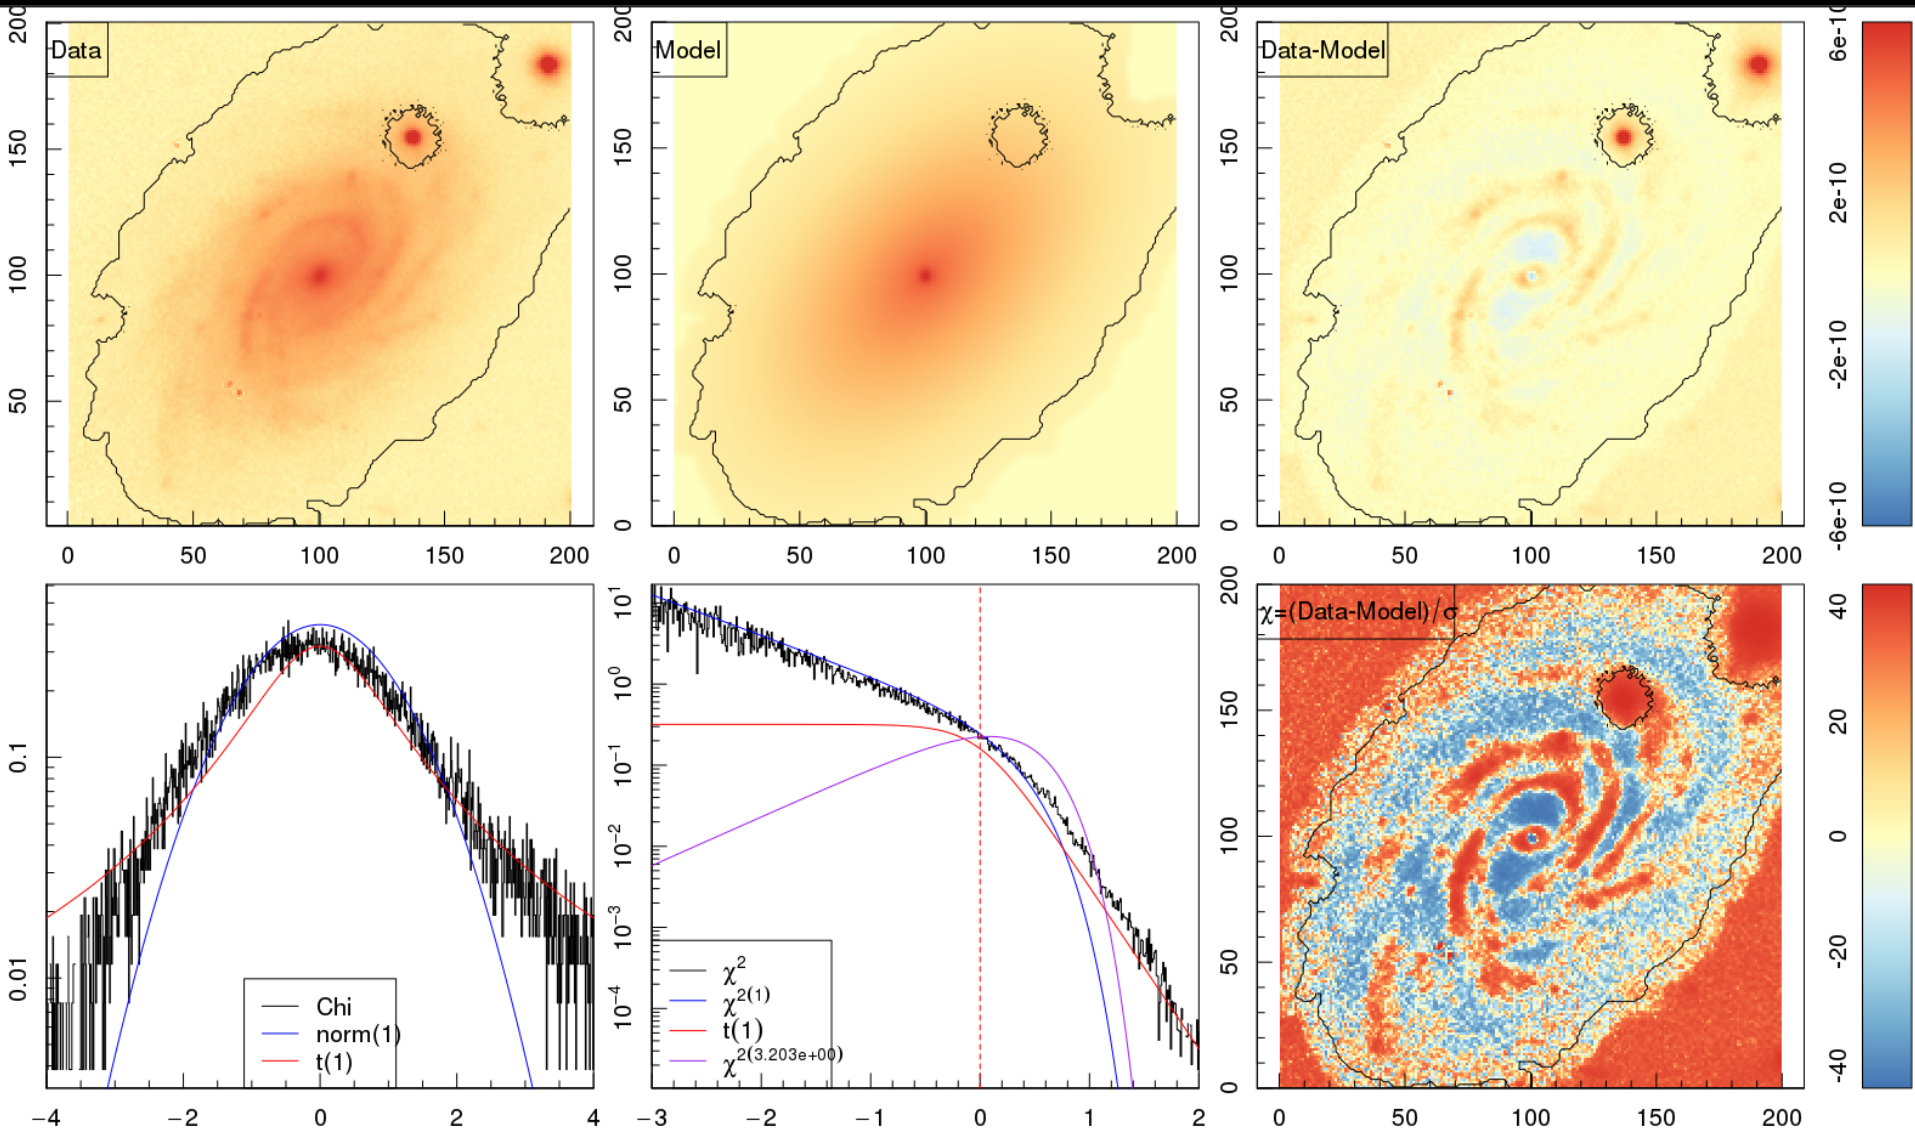

# Why another 2D code?

# Why another 2D code?

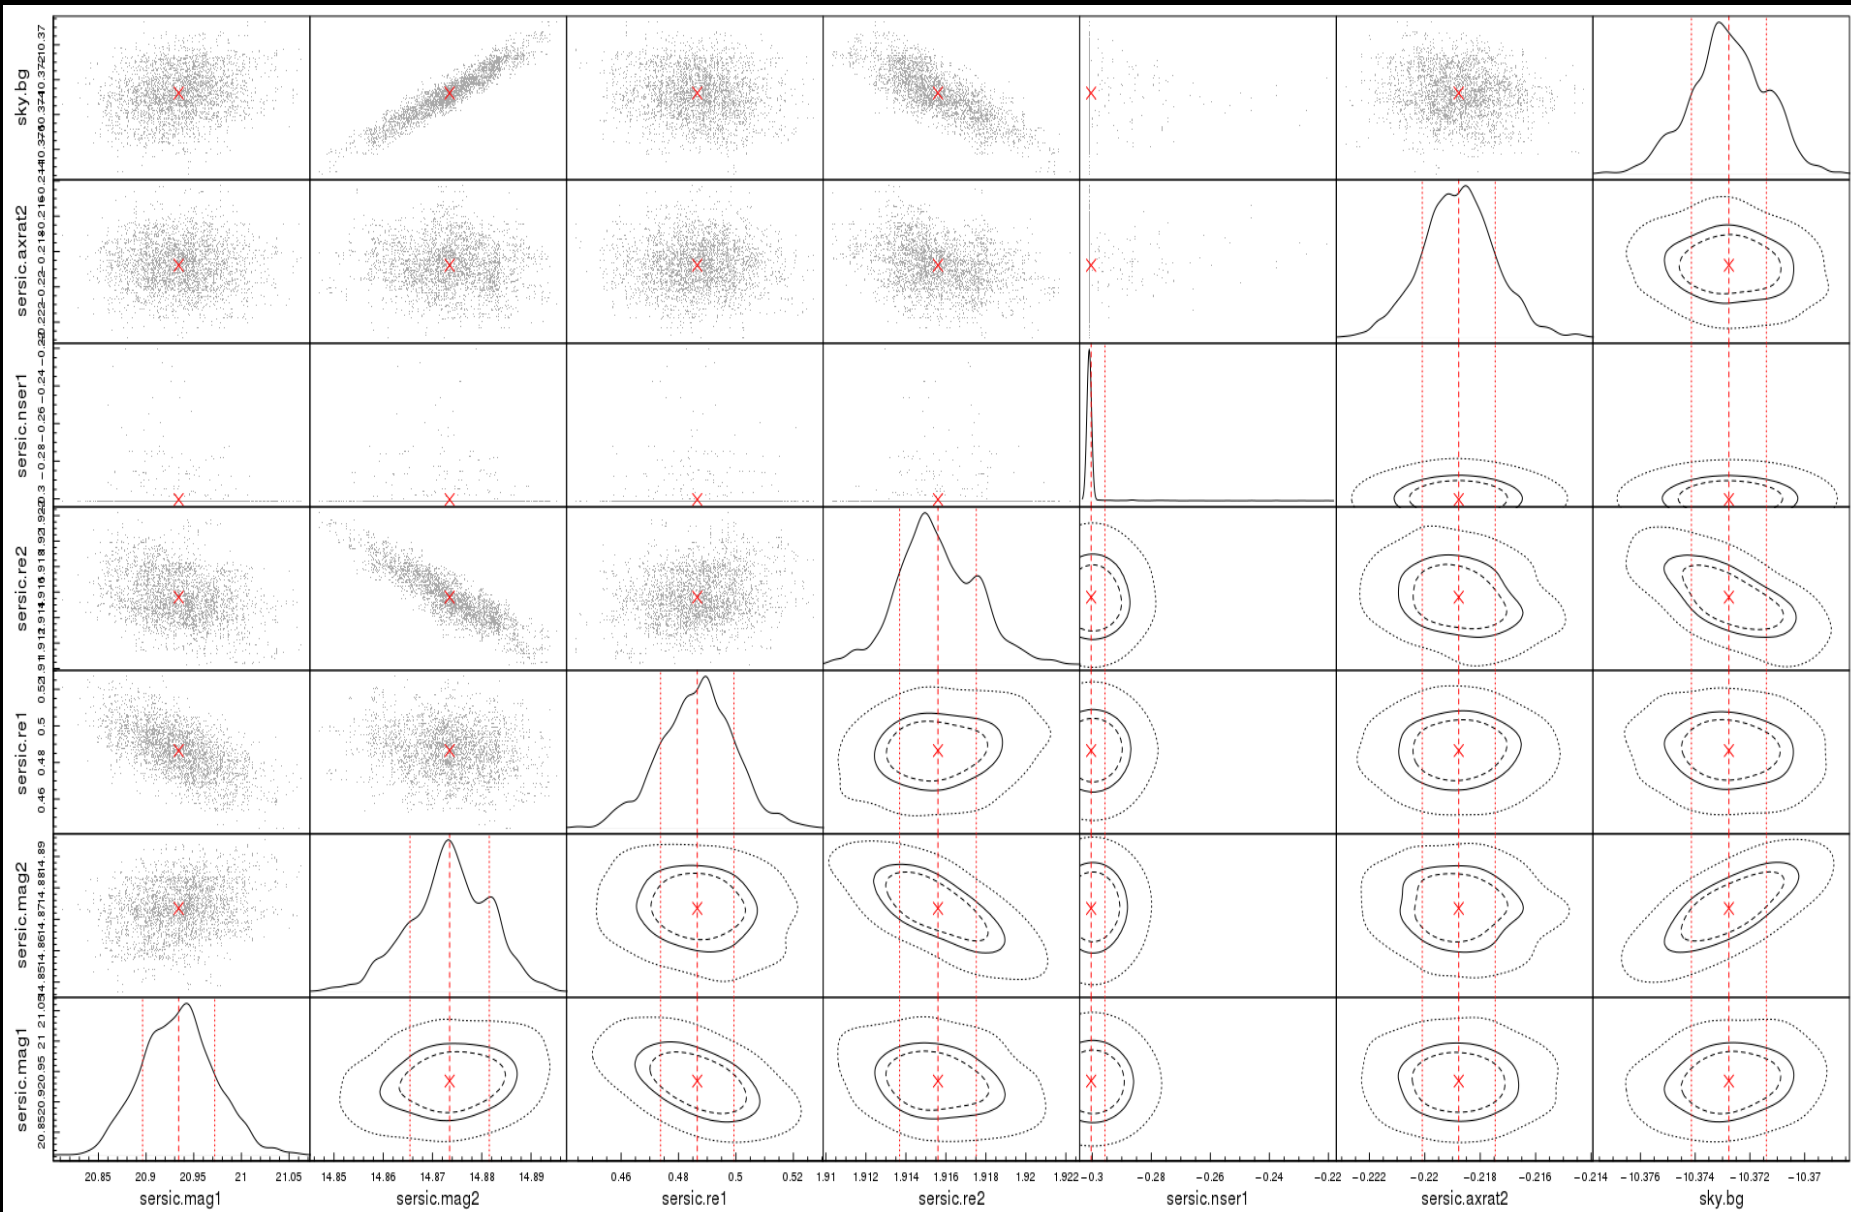

- Popular codes GALFIT, GIM2D closed-source
- Many use poor optimizers (Levenberg-Marquardt)
- Integration inaccurate/slow
- Few use Bayesian (MCMC) methods → errors not robust
- 
- I wanted a fast code to:
  - Compare 2D/3D modelling results
  - Test new features quickly
  - Understand origin of tiny uncertainties

# Taranu+16, Romulus@z=0.75, prelim.

# Summary

- Better 3D physical models are coming
  - Robust parameter constraints
- SAMI will have ~5000 galaxy IFU sample
  - Potentially ~100k w/KiDS + central spectra
    - HI with SKA/DINGO
- In 3-5 years, spiral galaxy scaling relations nailed down
  - Possibly constraints on IMF/DM halos
  - Cosmologists might be happy too
- Robust predictions from simulations: cosmological boxes (Romulus), zooms (NIHAO, MUGS2), controlled (TBD)
- 6D bulge/disk decomposition coming?
