Abstract

Objective: In this article, we aimed to perform bibliometric analysis of articles on cytokine and cytokine storm published in the academic literature during 1980 to 2018-2020.

Methods: The bibliometric analysis was performed using the Thomson Reuters Web of Science database.

Results: A total of 232,606 articles were retrieved, 82.52% of which were original articles. The United States of America (USA) was the leading country by total publication number (n=84,426, 36.29%), followed by Japan (n=21,983, 9.45%) produced the most literature on cytokine. Among the institutions identified, Harvard University (USA) contributed the most articles on cytokine. All authors and institutions in the top 10 contributor's lists were from the developed countries.

Conclusion: Researchers from the developing and underdeveloped countries should be encouraged to perform novel studies on cytokine. Cytokine studies are associated with the pathology and physiological variability of many diseases and may have beneficial results in the medical field. Cytokine and cytokine storm studies may be useful particularly in identifying the pathogenesis of global viral infections such as SARS-CoV-2, evaluating and developing new treatment strategies.

Keywords: Cytokine, cytokine storm, COVID-19, bibliometric, publication trend.

INTRODUCTION

Polypeptide cytokines are produced and secreted by many cell types regulate immune and inflammatory events, including inflammation, cell growth, healing, and systemic response to injury (1). Cytokines were initially called lymphokines because only lymphocytes were thought to be the source of cytokines (2). It was later understood that monocytes also produced these factors, and the name of “*monocrine*” was coined (3). Today, it is known that these mediators are not only secreted by lymphoid cells, and the name of “*cytokine*” is commonly used. The classification of cytokines originates from many cells, resulting in a wide range. These include interleukins, interferons, tumor necrosis factor (TNF), chemokines, transforming growth factor (TGF) and colony stimulating factors (CSF) (4). Scientometrics or bibliometrics is the assessment of various qualitative and quantitative aspects of scientific literature in a certain field. Scientific studies evaluate characteristics and features of the authors, organizations and countries of the articles in the literature (5). Bibliometric analyses evaluate academic studies in any subject in detail, allowing us to see the situation where scientific developments have come over the years in terms of panoramics and statistics. It also clearly demonstrates the influence and power of countries in the world in any scientific issue. In this way, it sheds light on the development of scientific policies (5-7). In recent years, *cytokine* has been a popular topic that scientific researchers have measured and investigated quite frequently to explain immunological physiological and biochemical mechanisms in diseases. Although cytokine is a popular issue for explaining the pathogenesis of many diseases, the literature lacks a bibliometric article investigating scientific documents published in the field of cytokine. In the SARS-CoV-2 pandemic, which began in Wuhan, China in December 2019, cytokine storm was observed in some patients, and researchers have done quite a lot of work on cytokine storm. Cytokine storm was also seen in most patients with other global viral infections, such as MERS and SARS CoV-2 infections (8-10). We can explain the cytokine storm a little over COVID-19 infection because it is related to the subject. Cellular entry of SARS-CoV-2 depends on the binding of S proteins covering the surface of the virion to the cellular ACE2 receptor, and on S protein priming by TMPRSS2, a host membrane serine protease. After entering respiratory epithelial cells, SARS-CoV-2 provokes an immune response with inflammatory cytokine production accompanied by a weak interferon (IFN) response. The proinflammatory immune responses of pathogenic Th1 cells and intermediate CD14+CD16+ monocytes are mediated by membrane-bound immune receptors and downstream signaling pathways. This is followed by the infiltration of macrophages and neutrophils into the lung tissue, which results in a cytokine storm (11-13).

In this study we aimed to evaluate bibliometric features of cytokine and cytokine storm literature covering a period during 1980 to 2018-2020 and, to the best of our knowledge, our study was the first to investigate bibliometric networks of cytokine literature. We believe that this study will serve as a guide to future cytokine researches, save time to focus on more important points, and make a scientific contribution by directing cytokine research.

MATERIALS AND METHODS

Web of Science databases (*Web of Science Core Collection, SciELO Citation Index, Russian Science Citation Index and Korean Journal Database*) were the main sources for our study. We included all documents including the key word of “*cytokine*” published between 1980 and 2018. Bibliometric analysis of cytokine storm literature from 1993-2020 was added to the article when it began to appear frequently in patients in the COVID-19 pandemic that occurred during our study. We produced infomaps by using GunnMap free web source (14). Scientometric network graphics were created in a freeware named VOSviewer (15). Clinical Research Ethics by the presidency of the board due to the design of the study board approval was not required.

RESULTS

General Features of Cytokine Literature

A total of 232,606 documents were indexed in cytokine literature between 1980 and 2018. The first document of cytokine literature published in 1980 was an original article titled “*Cytokine production invitro by lymphoid and nonlymphoid cells and partial-purification of a bone-resorbing factor*” written by Khan YA *et al.* (16) Annual productivity increased by year gradually and reached up to 12,631 items in 2018. With 12,654 documents, 2017 was top year in production (Figure 1). Most documents indexed in WoS databases were found to be original articles (82.523%) followed by reviews, meeting abstracts and proceeding papers (8.029, 6.975 and 4.169%, respectively; Table1). The most studied areas in this area were immunology, molecular biology, cell biology and medicine (Table 2).

Authors, institutions and sources

All top ten authors were from China and the most prolific authors in this field were Zhang Y, Wang Y and Li Y (n=832,831 and 729 items, respectively; Table 3). All top producer institutions were from the USA except only one from Japan, University of Tokyo. Harvard University was the top institution with 4741 documents (2.038%) followed by University of Pittsburgh, University of Michigan and National Cancer Institute (1.015,0.942 and 0.931%, respectively; Table 4). *Journal of Immunology* covering 4.141% of all literature was the most contributor source title with 9633 documents (Table 5). The most cited manuscript in cytokine literature was an original article written by Oltvai ZN, Milliman CL and Korsmeyer SJ published in 1993 in the journal of Cell titled “*Bcl-2 heterodimerizes in vivo with a conserved homolog, Bax, that accelerates programmed cell death*” (17) (Table 6).

Table 6. The 20 most cited manuscripts in the cytokine literature between 1980 and 2018

Article	Author	Journal Name	Total Citation	Year
Bcl-2 Heterodimerizes In-Vivo with A Conserved Homolog, Bax, That Accelerates Programmed Cell-Death	Oltvai, ZN <i>et al.</i>	Cell	4945	1993

Productivity of countries

The USA covered 38.01 % of all cytokine literature with 88,426 articles followed by Japan, Germany, China and the United Kingdom (UK) (n=21,983, 20,744, 20,375 and 15,627 items, respectively). China was the only developing country among top ten countries producing articles in cytokine literature (Figure 2). Documents were published all around the world except certain regions of Africa, Mongolia and Papua New Guinea (Figure 3).

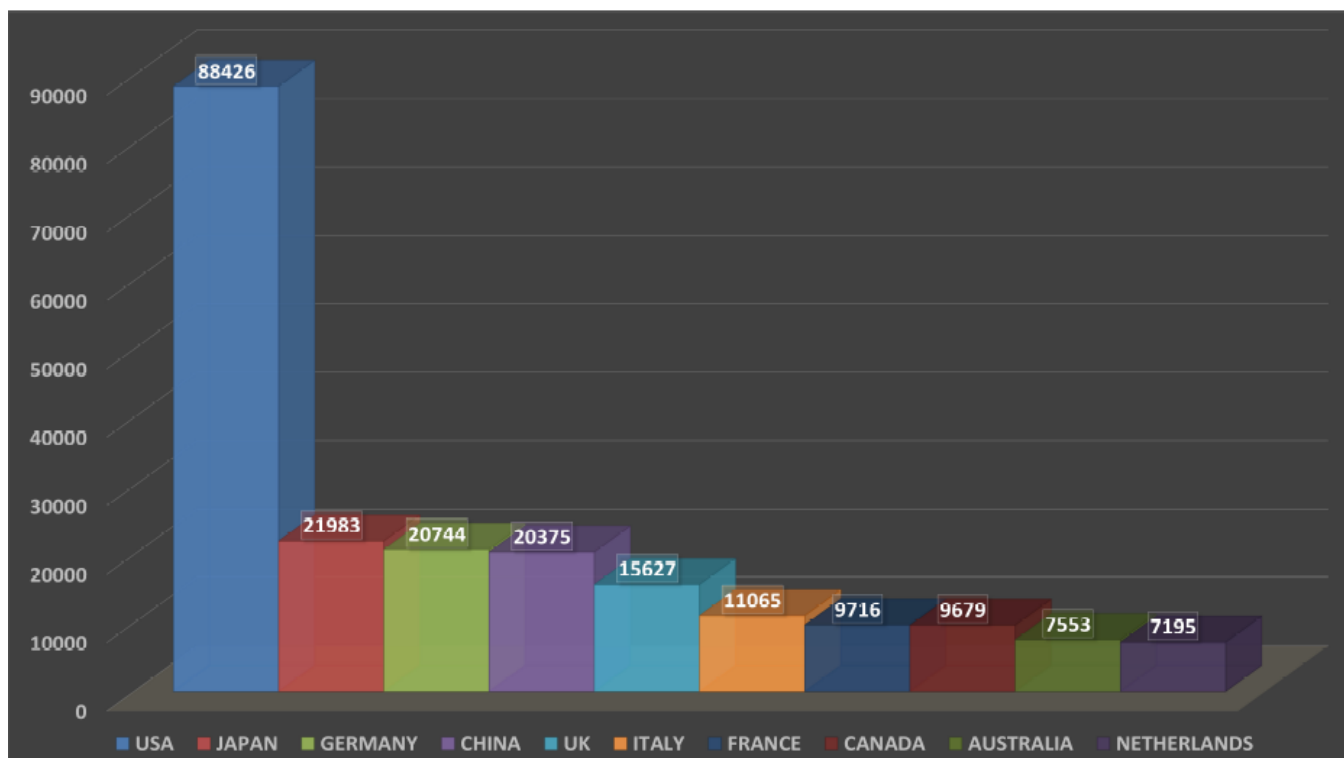

Figure 2: Top 10 countries producing cytokine literature

Scientometric Networks

We performed scientometric network analyses by downloading indexed data of all indexed documents in WoS Core Collection between 1980 and 2018. The most indexed keywords in the literature of cytokine were found to be “*cytokine*”, “*inflammation*”, “*apoptosis*”, “*macrophage*” and “*IL-6*” (Table 7). Scientometric network analysis revealed a “starburst” pattern in which the keyword of “*cytokine*” centered (Figure 4). The USA was detected to be the most collaborative country in cytokine studies followed by China, Japan, South Korea, Germany, the UK and Italy (Figure 6). The top collaborative institutions were Harvard University (USA), Shanghai Jiaotong University (China), University of São Paulo (Brazil) and University of Melbourne (Australia) (Table 4).

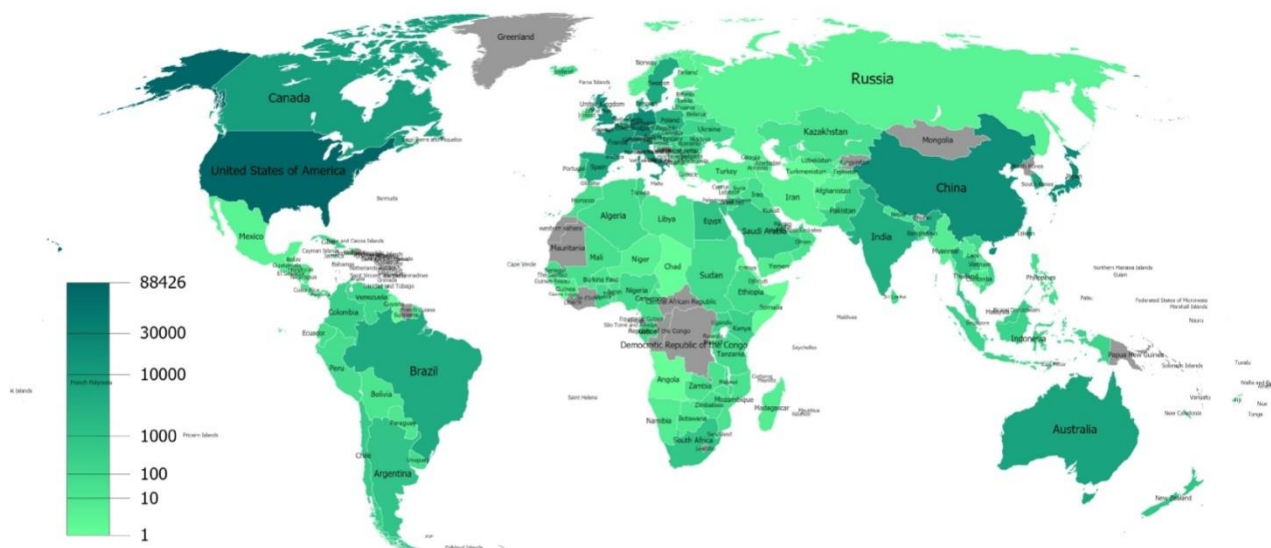

Figure 3: Global cytokine publication density according to the country

Table 7. The 20 most used keywords in cytokine literature between 1980 and 2018

Rank	Keyword	Total link strength	Occurrences (per 100,000 items)
1	Cytokine(s)	8861	3860
2	Inflammation	6053	2534
3	Apoptosis	2013	904
4	Macrophage(s)	1833	715
5	IL-6	1706	615
6	TNF- α	1665	653
7	NF- κ B	1624	656
8	Asthma	1596	677
9	Microglia	1528	551
10	Oxidative stress	1506	639
11	Dendritic cell(s)	1332	611
12	Neuroinflammation	1288	511
13	Cancer	1203	444
14	IL-10	1199	448
15	T cell(s)	1194	445

20	IL-1 β	983	339

and Technology (China) and Emory University (USA) (1.554, 1.315, 1.315, 1.255 and 1.195%, respectively). Zhang L from Huazhong University of Science and Technology, Wuhan, China was found as the most prolific author with 18 articles. The leading contributor source titles were *Frontiers in Immunology*, *Journal of Immunology*, *PLOS One*, *Blood* and *Journal of Medical Virology* (2.929, 2.57, 1.793, 1.614 and 1.494%, respectively). H-index of the literature was measured as 81 and total number of citations was 33,644 (30,059 without self-citations). An original article titled “Cytokine storm in a phase 1 trial of the anti-CD28 monoclonal antibody TGN1412” by Suntharalingam G et al. published in 2006 was the most cited document with 1230 citations (18). The most used keywords in “cytokine storm” literature were “COVID-19”, “cytokine storm”, “SARS-CoV-2”, “coronavirus”, “cytokine(s)”, “inflammation”, “tocilizumab”, “sepsis”, “IL-6” and “pneumonia” (Figure 7). The most collaborative countries were the USA, the UK, Germany, China and France (total link strength=373, 170, 142, 142 and 132, respectively). The most cooperative institutions were Harvard Medical School (USA), University of Pennsylvania (USA), University of Minnesota (USA), University of Pittsburgh (USA) and Emory University (USA) (Total link strength=57, 40, 35, 34 and 30, respectively).

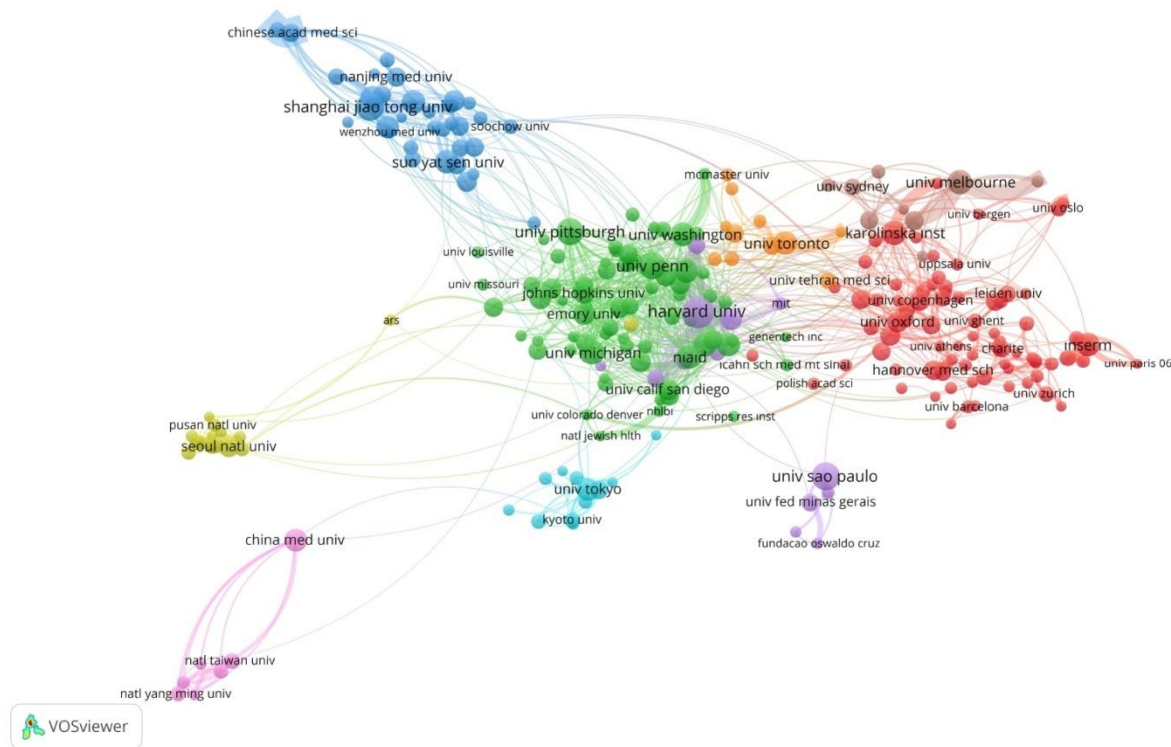

Figure 6: International cooperation network among institution

DISCUSSION

Cytokine and cytokine storm studies have been of interest for many years by researchers to identify biochemical mechanisms, intercellular communication and interaction, inflammation, cellular immunity in the body (19). Cytokine studies are particularly important for the evaluation of infectious diseases, and the phenomenon of cytokine storm causes a prognosis that makes treatment difficult in viral infections and fights the immune system against the body. The pandemic, which began in December 2019, was caused by a cytokine storm, the biggest challenge in Coronavirus treatment. Mortality rate in patients with cytokine storm was higher in the COVID-19 pandemic, and these patients were more likely to undergo intubation and intensive care processes (20-24). From this point of view, cytokine studies have become quite important, especially in the evaluation of global viral infections. Accurate evaluation of cytokine studies may offer benefit to develop new strategies for the treatment of this type of global viral infections, and bibliometric analysis of cytokines may be time-saving and guiding researchers on this path. The role of cytokines in the pathogenesis of many diseases contributes to the development of diagnostic and treatment strategies. A bibliographic assessment of cytokine research can offer a panoramic view of the academic adventure on the subject. Particularly, with the identification, detection and measurement of different cytokine molecules in biological materials, researchers have increased their interest in this subject. The development of methods and kits used in the measurement of cytokine molecules is an economic and important factor determining the interest of scientists in research. From this perspective, the level of development of countries and national income per capita is an important factor in determining the interest of researchers. This bibliometric analysis may play a guiding role for researchers in future cytokine studies. The present analysis

we see that the most common type of the documents are original articles. The journal names were found to be informative on cytokine-related research areas such as immunology, biological chemistry, allergy, leukocyte biology. Particularly, Chinese authors were seen to dominate the top ten list in cytokine-related studies. However, the top ten institutions by number of publications in cytokine literature was dominated by USA universities. The most cited article on cytokines was published in 1993 by Oltvai et al. published by the name 'Bcl-2 heterodimerizes in vivo with a conserved homolog, Bax, that accelerates programmed cell death' (17).

Limitations: The present research has a limitation. We did not utilize databases such as PubMed, Scopus, or Google Scholar, which contain more publications than WoS. We preferred only WoS index for literature review because it is the most reliable database indexing the journals with high-impact factors and covering the oldest publications.

CONCLUSION

Although there has been a growing interest in cytokine studies in recent years, the fact that our study was the first in the bibliometrics of cytokine-cytokine storm and that there was no other study to compare was indicative of the inadequacy of the statistical literature in this area. We found a moderate correlation with the number of publications and level of development of countries. Researchers in low-income countries should be supported and encouraged to carry out cytokine studies. Cytokine-cytokine storm studies may be particularly useful in identifying the pathogenesis of global viral infections such as MERS, SARS-CoV and SARS-CoV-2 infections, evaluating and developing new treatment strategies.

Conflict of interest: The author declares that there is no conflict of interest.

Financial disclosure: No funding was received in support of this study.

Peer-review: Externally peer-reviewed.
