Introduction: Alchemy

Computational Alchemy

- Molecular dynamics based method
- Free energy calculation

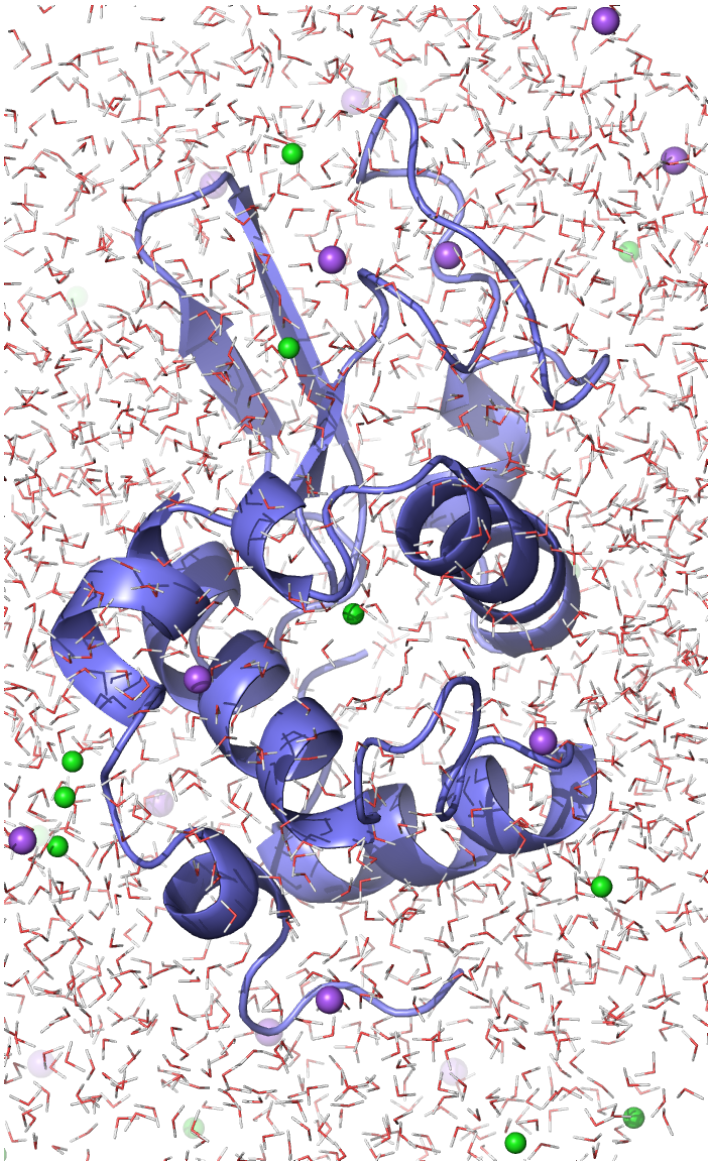
Introduction: Molecular Dynamics simulations

Molecular Dynamics simulations

- Thermostat: scale velocities
- Barostat: scale box dimensions
- Integrate equations of motion over time

System setup

- Fully atomistic representation
- Explicit solvation
- Ions



Introduction: Molecular Dynamics simulations

Introduction: Molecular Dynamics simulations

Molecular dynamics simulations

- Well defined statistical ensembles
- Atomistic resolution

Alchemical Methods

Aim

Calculate change in thermostability due to a mutation.

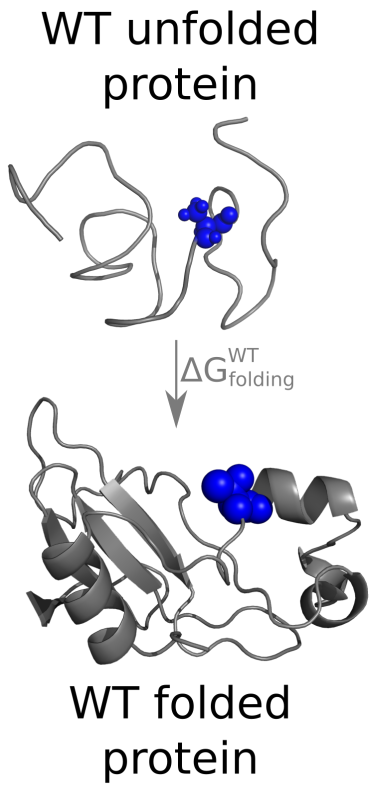
Alchemical Methods

Aim

Calculate change in thermostability due to a mutation.

Counting

- Simulate the process of folding the WT protein.
- Count folded/unfolded states.
- Extract $\Delta G^{WT}_{folding}$ from the frequencies.



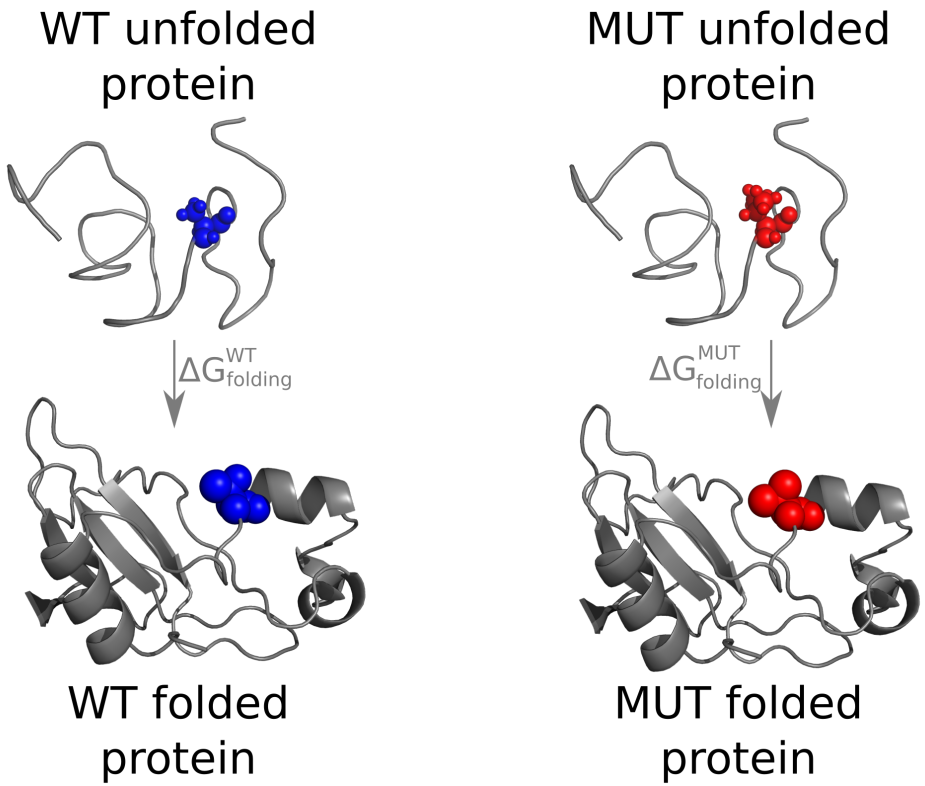
Alchemical Methods

Aim

Calculate change in thermostability due to a mutation.

Counting

- Do the same for the MUT protein:
  $\Delta\Delta G = \Delta G^{MUT}_{folding} - \Delta G^{WT}_{folding}$



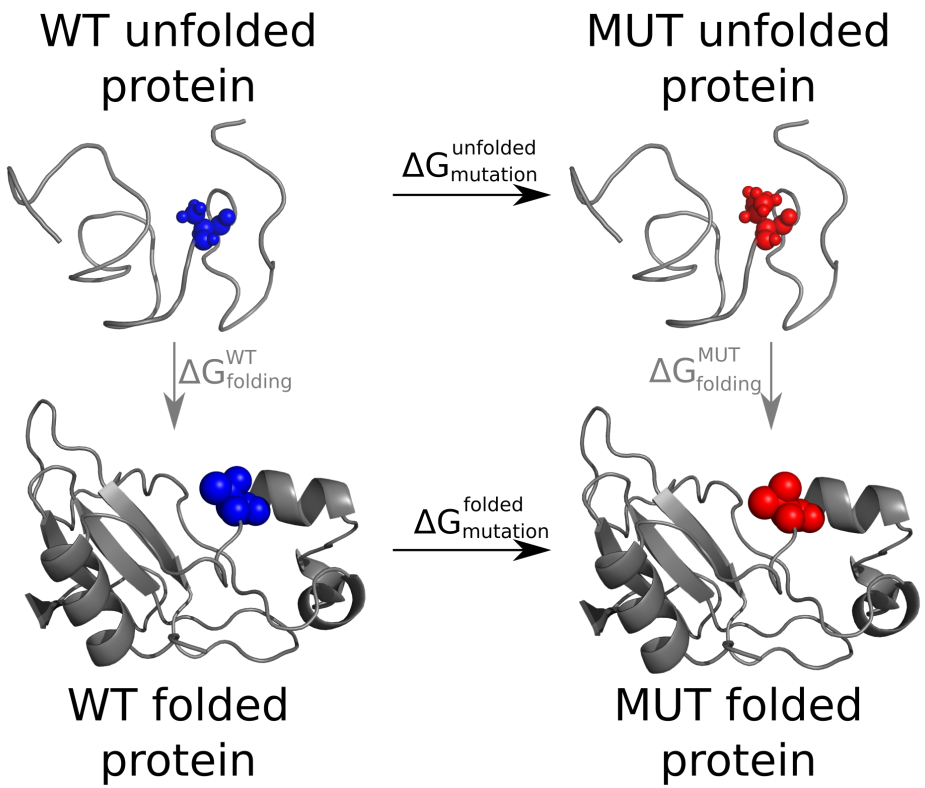
Alchemical Methods

Problem

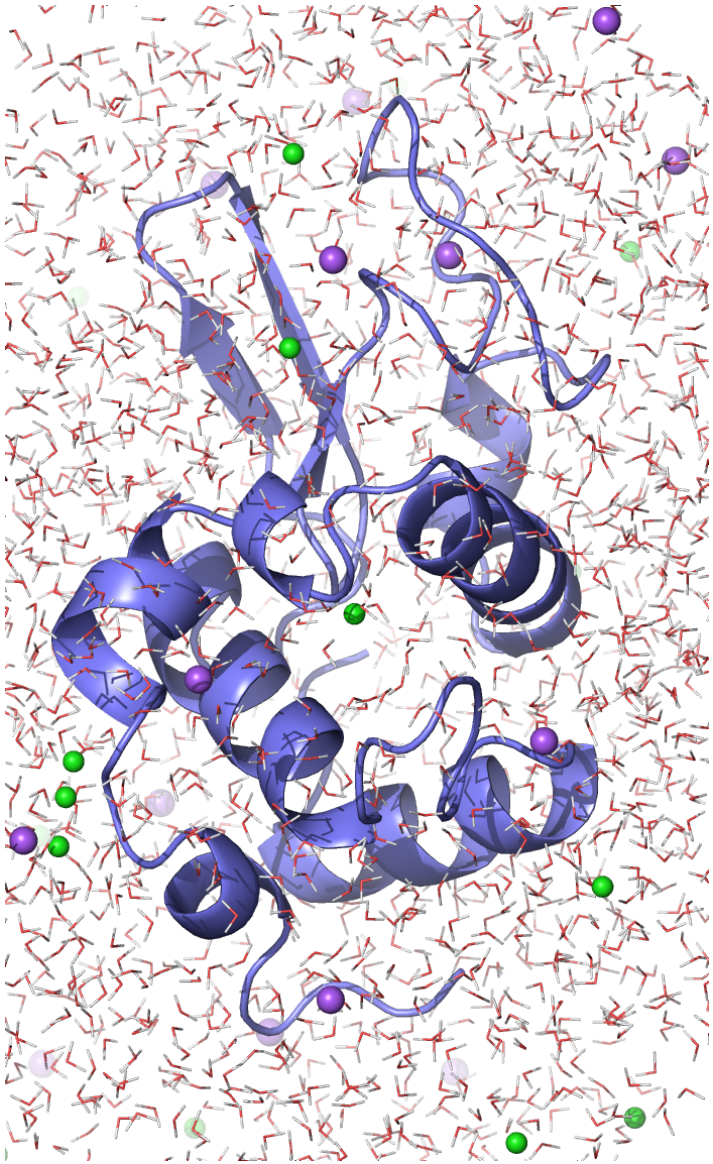
Folding simulations are computationally expensive.

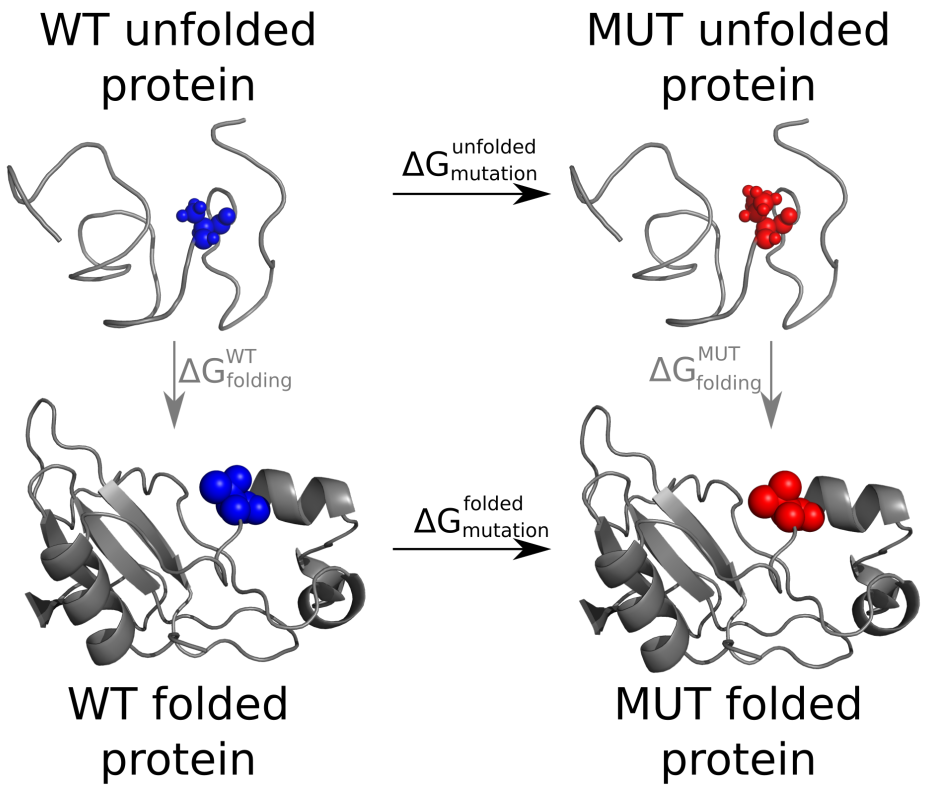
Alchemical solution

- Traverse the thermodynamic cycle in the horizontal directions.
- Use a modified hamiltonian: $H(\lambda) = (1 - \lambda)H_0 + \lambda H_1$.
- The same double free energy difference is recovered: $\Delta\Delta G = \Delta G^{folded}_{mutation} - \Delta G^{unfolded}_{mutation}$

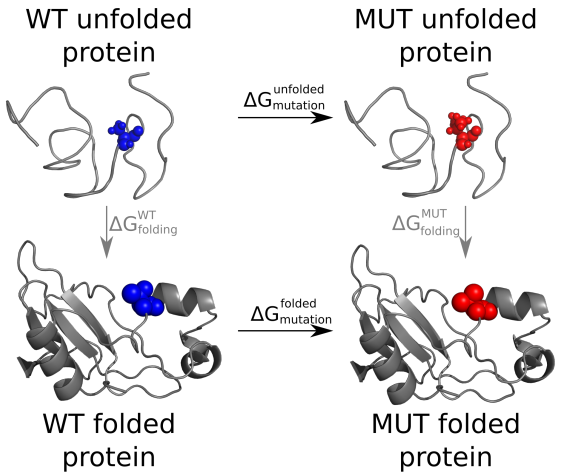


Alchemical Methods

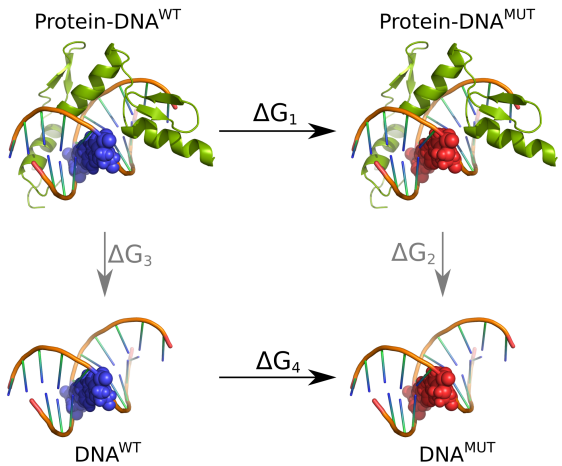




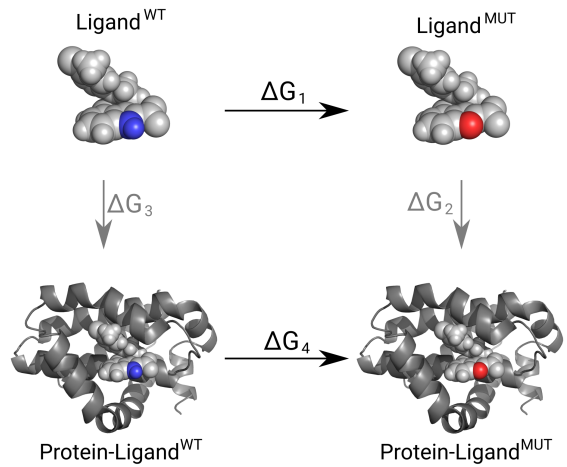
Gromacs/pmx based alchemistry



Amino acid mutations

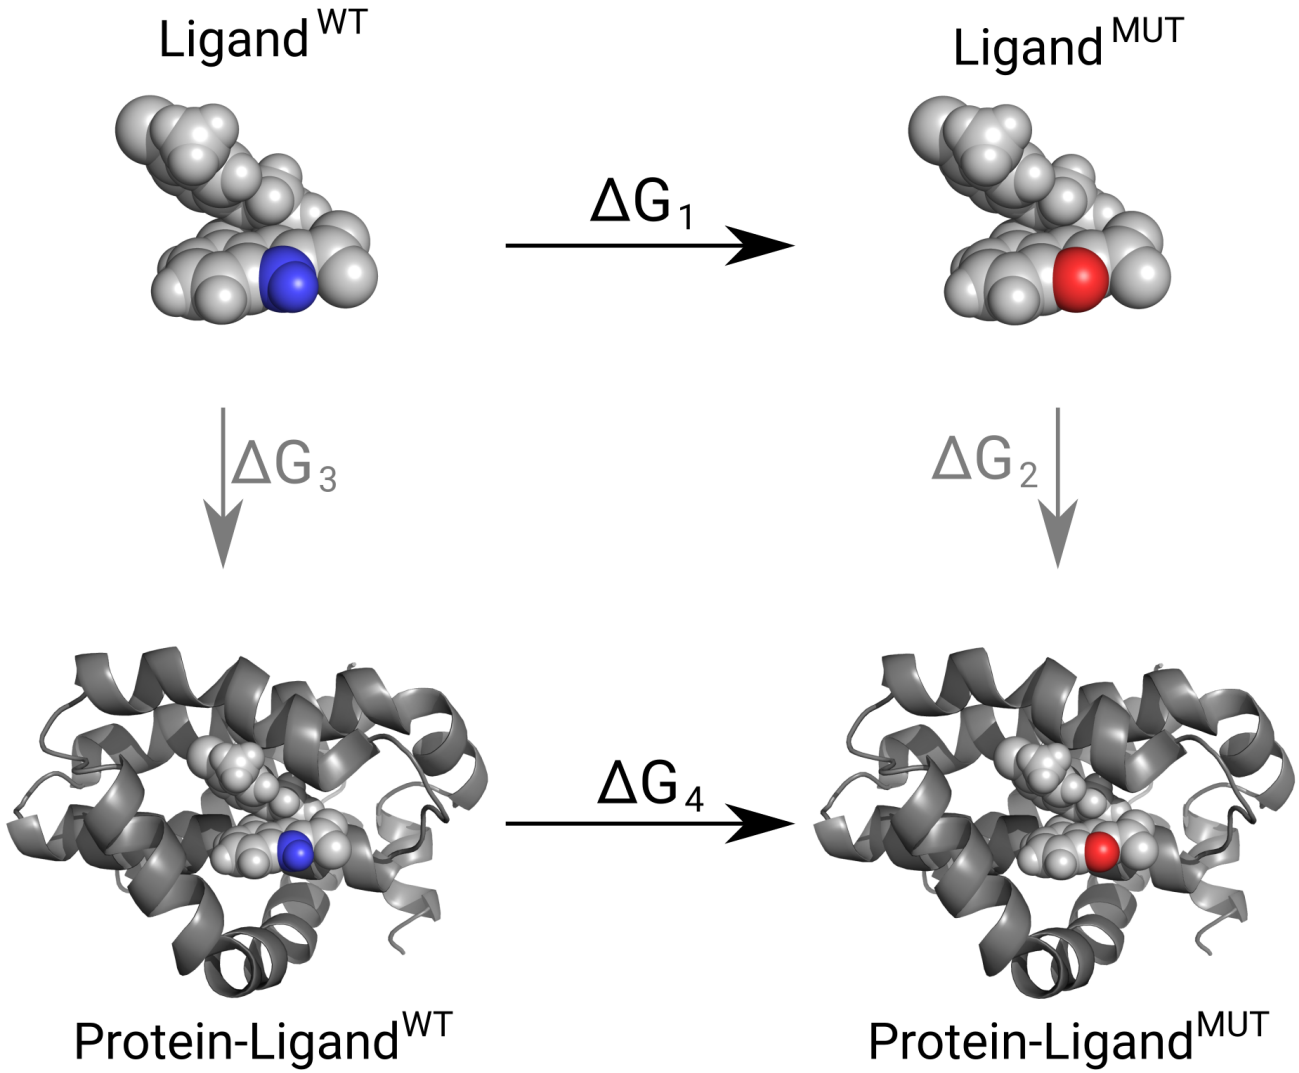


Nucleotide mutations

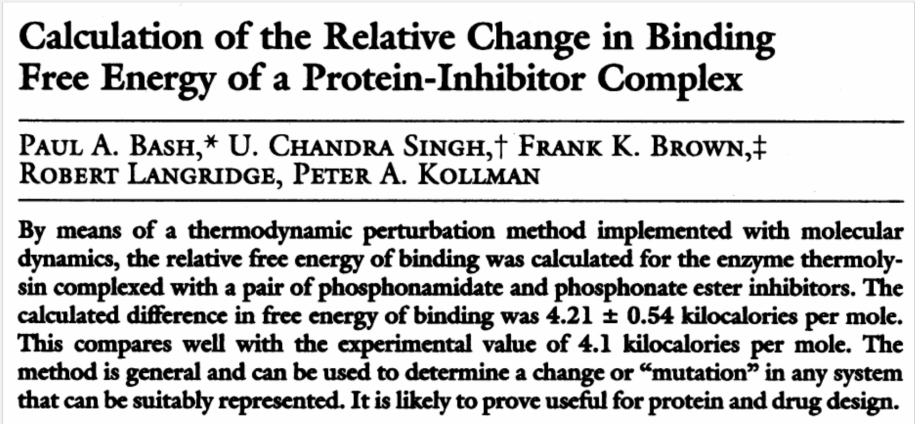


Ligand modifications

Relative Protein-Ligand binding free energy



Protein-Ligand binding



Calculation of the Relative Change in Binding Free Energy of a Protein-Inhibitor Complex

PAUL A. BASH,* U. CHANDRA SINGH,† FRANK K. BROWN,‡
ROBERT LANGRIDGE, PETER A. KOLLMAN

By means of a thermodynamic perturbation method implemented with molecular dynamics, the relative free energy of binding was calculated for the enzyme thermolysin complexed with a pair of phosphonamidate and phosphonate ester inhibitors. The calculated difference in free energy of binding was 4.21 ± 0.54 kilocalories per mole. This compares well with the experimental value of 4.1 kilocalories per mole. The method is general and can be used to determine a change or "mutation" in any system that can be suitably represented. It is likely to prove useful for protein and drug design.

TI for a single free energy value. Science, 1987

Summary: absolute ΔG Part 1

Non-equilibrium approach

- Can be used for absolute ΔG
- Converges faster than FEP, comparably to HREX-FEP
- Allows taking into account Apo and Holo conformations

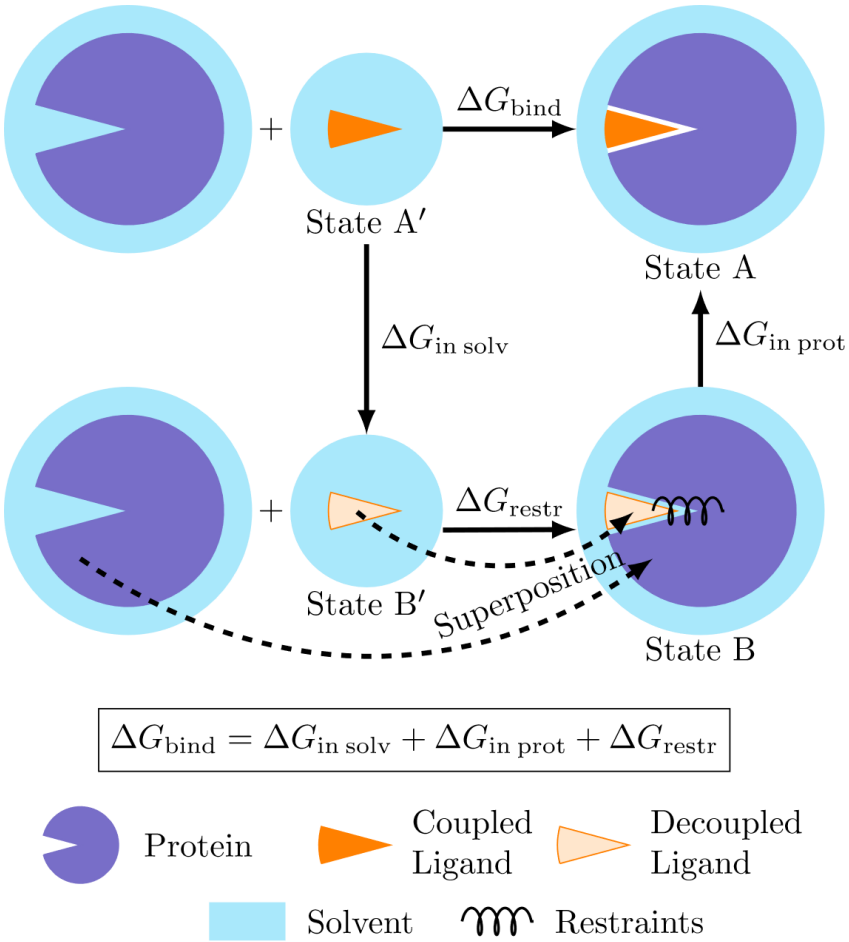
Absolute protein-ligand binding ΔG: Part 2

Large scale absolute protein-ligand binding free energies

Khalak, Tresadern, Aldeghi, Baumann, Mobley, de Groot, Gapsys, Chem. Sci., 2021

Method

- Do not simulate protein-ligand complex with the decoupled ligand
- Place a proper ligand ensemble into the apo protein ensemble



Protein-Ligand complexes

- 7 systems
- 128 ligands

A case study: p38

Summary: absolute ΔG Part 2

ABFE

- It is essential to capture ΔG between apo and holo protein conformers
- Absolute ΔG accuracy comparable to that of RBFE
- Comes at a higher computational cost
