# Species get closer to extinction because of the small population size

## Species get closer to extinction because of the small population size

- Stochastic demographic and environmental events

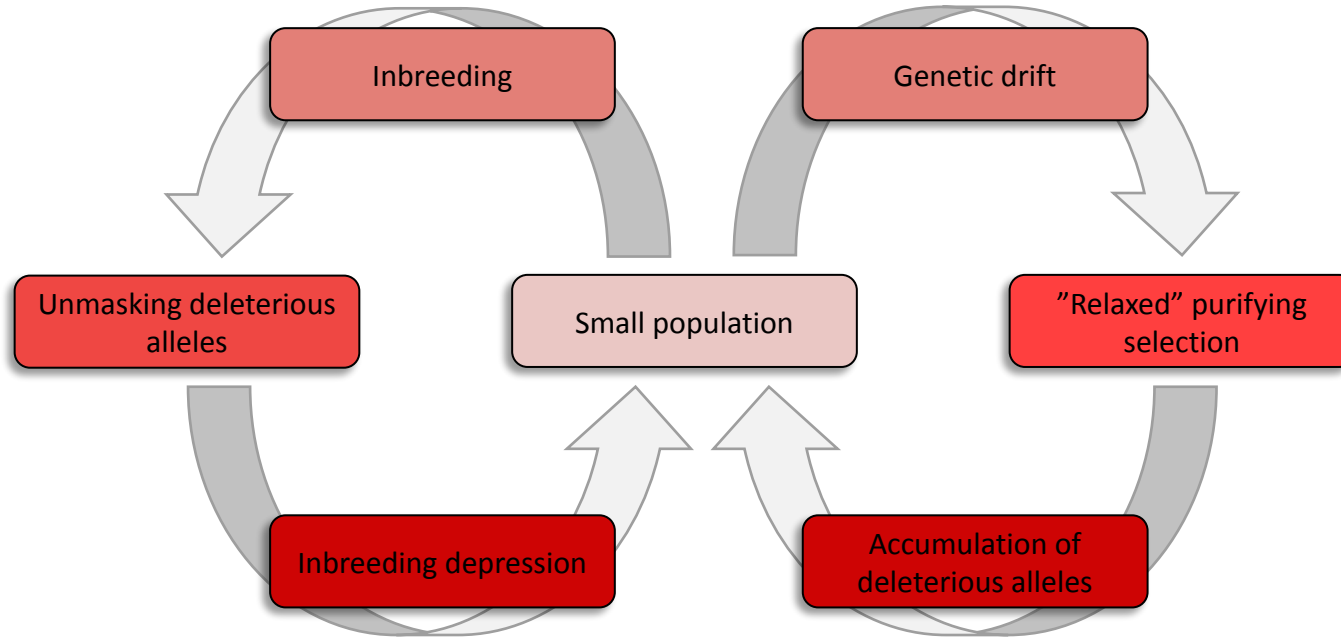

## Species get closer to extinction because of the small population size

- Stochastic demographic and environmental events
- Genetic processes

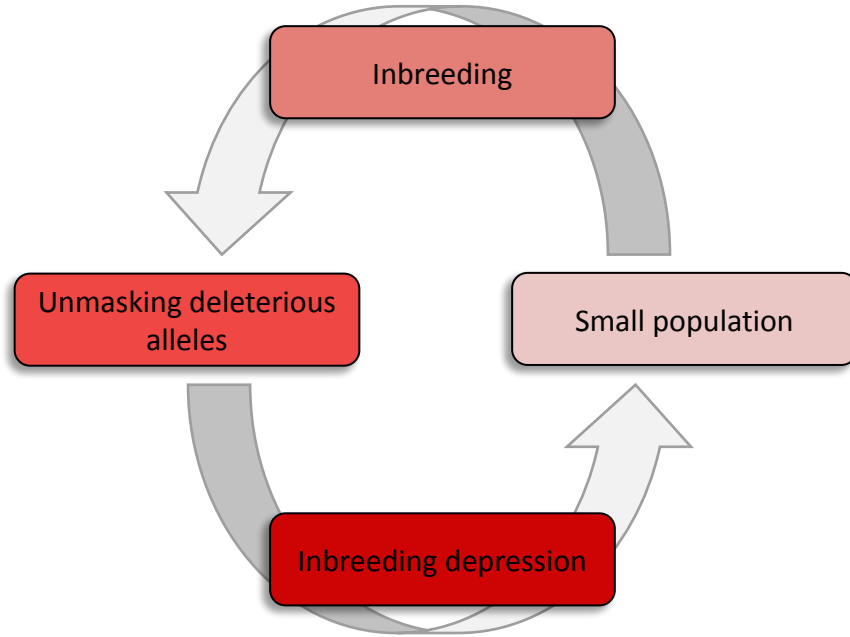

# Extinction vortex

## Inbreeding depression

Genomic evidences:

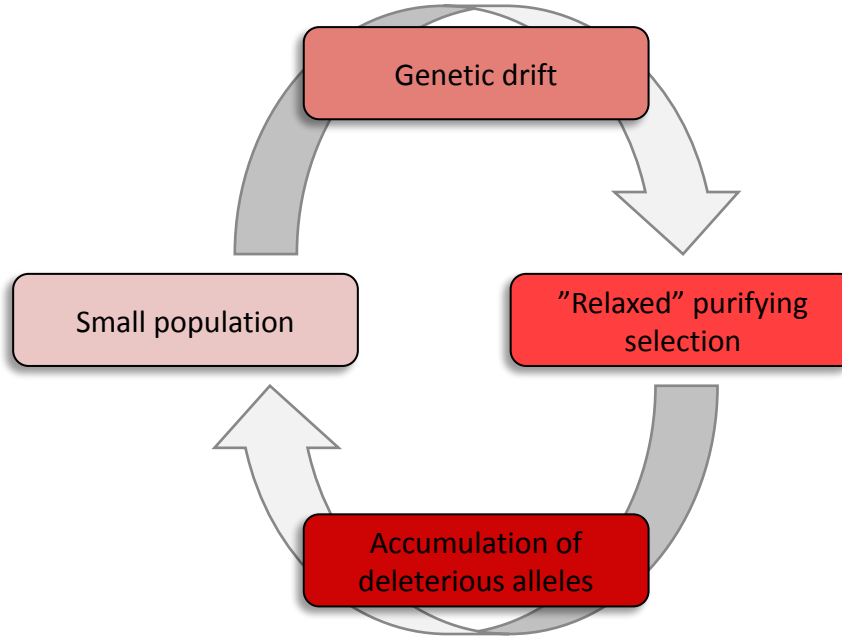

- Reduced heterozygosity
- Increased inbreeding

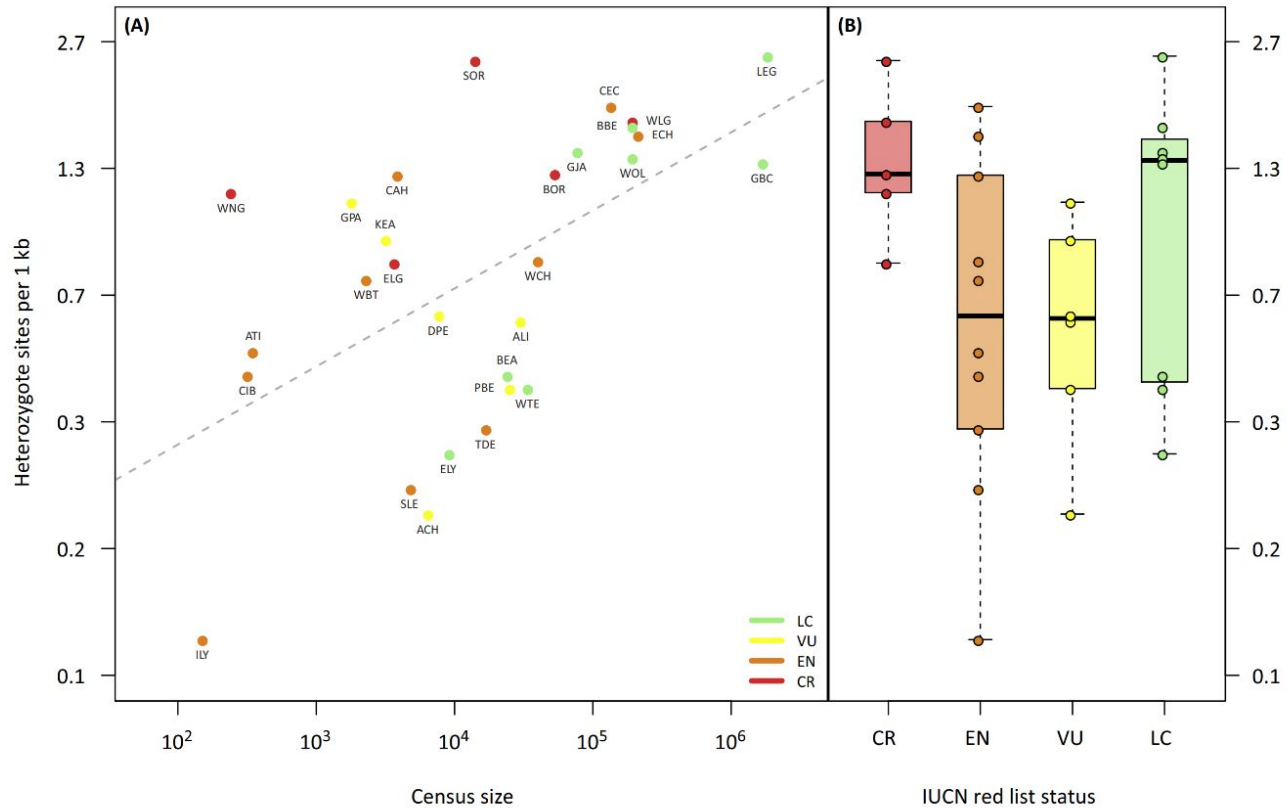

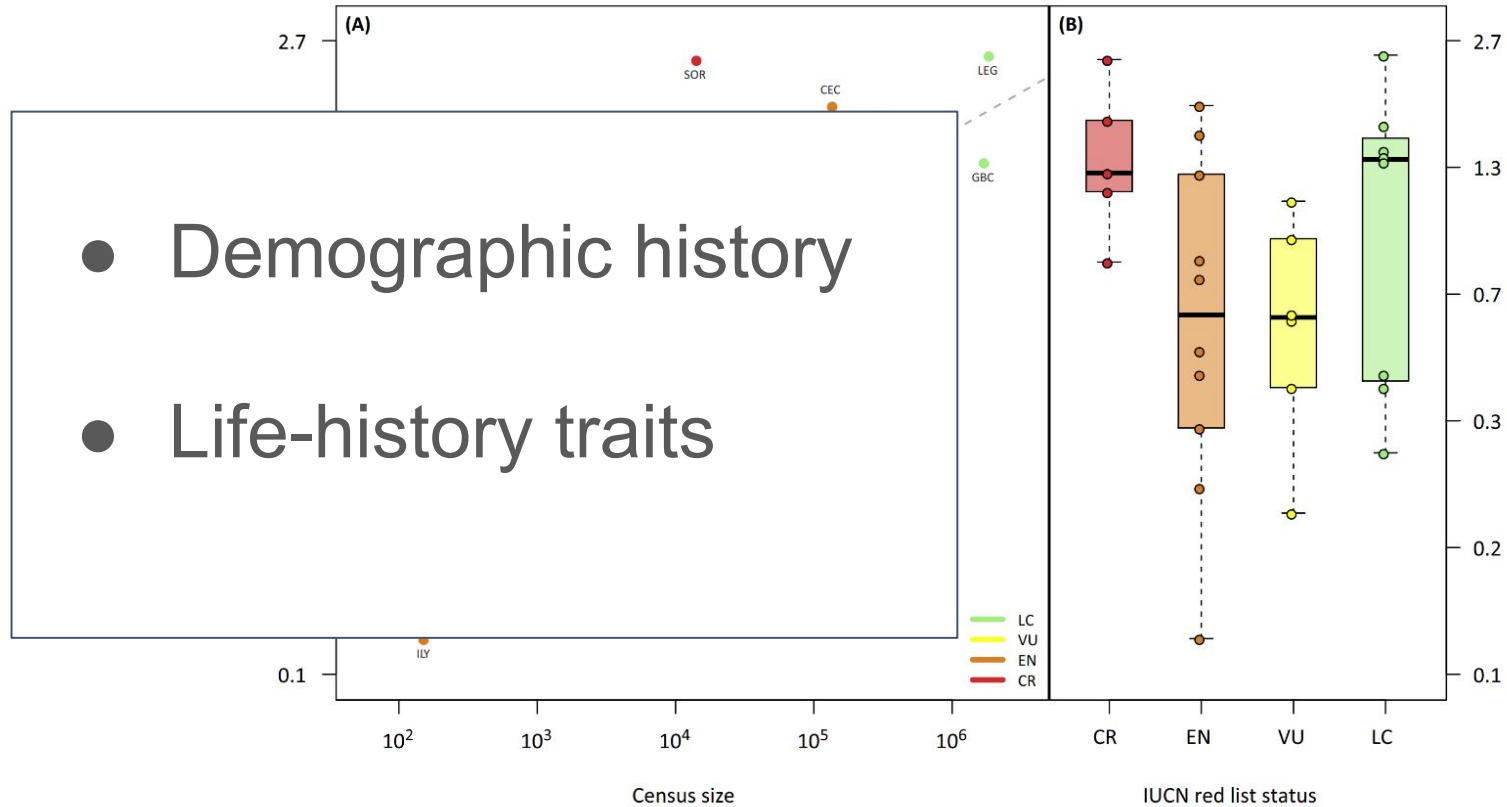

## Mutational meltdown

### Genomic evidences:

- Increased number of deleterious alleles

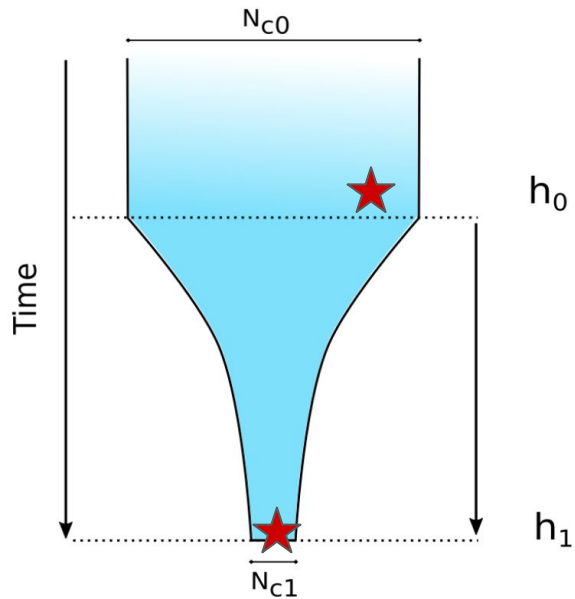

**Interspecific comparisons of contemporary  
genomic erosion indices are poor proxies  
for conservation status of wild organisms**

## Temporal data

*Dicerorhinus sumatrensis*

**CR** (30 individuals)

## Temporal data

# Temporal data

## Temporal data

Temporally sampled data useful for:

- Inform of the rate of change in genomic erosion indices.
- Provide comparable trends for modern-day endangered populations.

## Temporal data

Temporally sampled data useful for:

- Inform of the rate of change in genomic erosion indices.
- Provide comparable trends for modern-day endangered populations.

# Temporal data

# GenErode

A bioinformatics pipeline to simultaneously analyze genome re-sequencing data from **ancient/historical and modern samples**, with the aim to look for patterns of **genome erosion**.

# GenErode

- Snakemake
- No programming knowledge required
- Conda and Singularity containers
- Designed for HPC clusters
- Modular and highly flexible
- Well documented (github wiki + article)

# GenErode

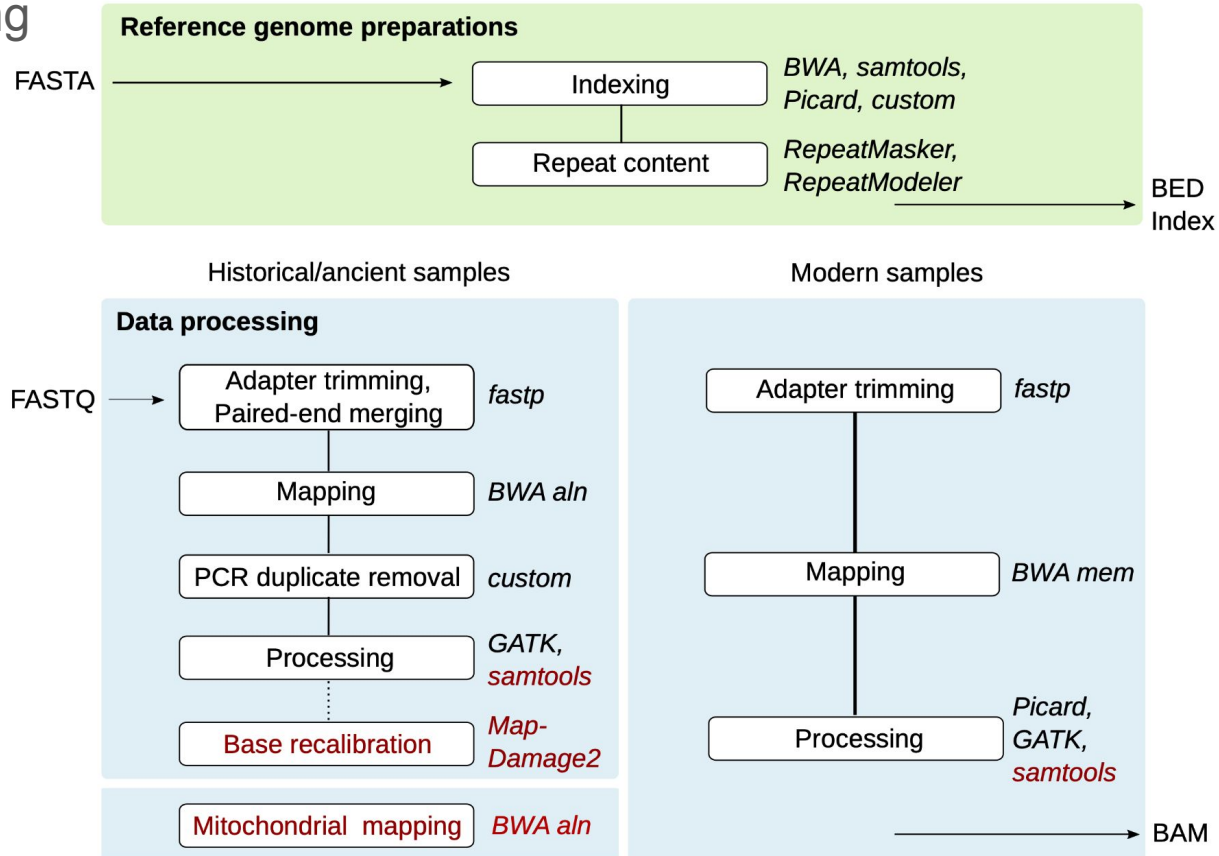

**GenErode  
pipeline  
objectives**

- Reproducible analyses
- Standardization of indices
- Comparable indices historical/modern samples
- Accessible to non-experts
