ROSE WOOD

4.0 Sustainable Wood for Europe

Best practices and digital innovations for sustainable wood mobilisation

Full collection of 100 factsheets

rosewood-network.eu

Project No: 862681
Project acronym: ROSEWOOD4.0

Project title
EU Network of Regions On Sustainable WOOD mobilisation ready for digitalisation

Programme: H2020-RUR-2018-2020 (Rural Renaissance)
Topic: RUR-15-2018-2019-2020 Thematic networks compiling knowledge ready for practice
Start and end date of project: 01.01.2020 – 30.06.2022
Duration: 30 months

Deliverable D1.5

Best practices and digital innovations for sustainable wood mobilisation – full collection of 100 factsheets (second batch)

Lead author: Uwe Kies, InnovaWood

Due date of deliverable: 31.12.2021   **Actual submission date:** 14.01.2022

Work Package	WP1
Associated Tasks	T1.1, T1.2, T1.3
Covered Period	M12-M24
Deliverable Lead Partner	InnovaWood (IW)
Version	1.0

Dissemination Level		
PU	Public	X
PP	Restricted to other programme participants (including the Commission Services)	
RE	Restricted to a group specified by the consortium (including the Commission Services)	
CO	Confidential, only for members of the consortium (including the Commission Services)

Abstract

ROSEWOOD4.0 harnesses digital solutions and knowledge transfer along the forest value chain to reinforce the sustainability of forest resilience and wood mobilisation in Europe. This report documents a selection of 100 Factsheets of *Best practices and Innovations* (BP&I) in forest management, wood supply and forest-based industries exploiting relevant digital technologies and industry 4.0 solutions. It comprises the first batch of 50 initially selected BP&I (deliverable D1.3) plus the second batch of 50 additionally selected BP&I, presenting an overview of the full selection of 100 BP&I. All BP&I were jointly identified and validated by the project partners.

The consortium represents a living community of 21 organisations from 17 countries, organised in five European Regional Hubs which reach out to an even larger group of local stakeholders. The different categories and types of solutions that have been jointly identified by the Hubs are described and their relevance for wood mobilisation in Europe is pointed out.

The BP&I factsheets are published in a *Knowledge Platform for Regional Forest Innovation*, which is an open, multilingual repository created by the consortium to enable the widest possible dissemination of results. The complete BP&I selection with links to all online factsheets are included in the report. Spreading this knowledge in Europe will help practitioners and professionals to gain a better understanding of how the digital transformation in forestry can improve sustainable forest management and ecosystem resilience and thus benefit a more competitive forest-based sector in rural regions.

The platform is accessible at: forestinnovationhubs.rosewood-network.eu

1 Concept and objectives

1.1 Purpose and joint approach

1.1.1 A Knowledge Platform for Regional Forest Innovation

The digital transformation is also leading to disruptive changes in land management and rural areas. Forest ownership, forest management and forest-based industries which rely on wood as main resource will encounter tremendous changes in their business practices and production processes in an increasingly more connected world. Furthermore, digital technologies enable to reach a deeper understanding of ecosystem processes, climate change and related risks and have the potential to overcome barriers and bottlenecks of fragmented supply chains and small enterprises that are typical for the forest-based sector. There is a common need to gain a better understanding of the new trends and potentials of the digital transformation for all concerned actors and stakeholders in the sector.

The ROSEWOOD4.0 project has therefore developed the *Knowledge Platform for Regional Forest Innovation*, a new open portal with a large collection of best practices and digital innovations in the European forestry sector. This initiative aims to harness digital solutions and boosts knowledge transfer connecting multiple actors along the forest value chain to reinforce the sustainability of forest resilience and wood mobilisation in Europe.

- The platform is a 'one-stop shop' that simplifies sharing knowledge about sustainable, efficient, and data-driven management of Europe's forests. It is free to use for any forestry practitioner or other interested user, from the public and private actors to policymakers and researchers, to any individual interested in forestry.

- It contains a collection of over *100 Factsheets* highlighting outstanding Best practices and innovations (BP&I) in forestry from more than 15 European countries. The factsheets contain short abstracts, visuals, videos, additional materials, website links, and the contact details of the organisations who developed these solutions.

- With a user-friendly interface and a multi-lingual search option, the open access repository helps direct sharing and transfer of these practices and innovations to practitioners in forestry and wood industries all over Europe.

The open knowledge platform is online at:
forestinnovationhubs.rosewood-network.eu

Figure 1   Preview of the R4.0 Knowledge platform

1.1.2 A European-wide collaborative collection of knowledge and solutions

The *Knowledge Platform for Regional Forest Innovation* has been developed by the ROSEWOOD4.0 consortium funded under Horizon 2020. The platform connects and facilitates exchange between the different regions for wider replication and uptake of practices across Europe: a best practice in forest management from one country can be useful and applicable in another country, and vice versa.
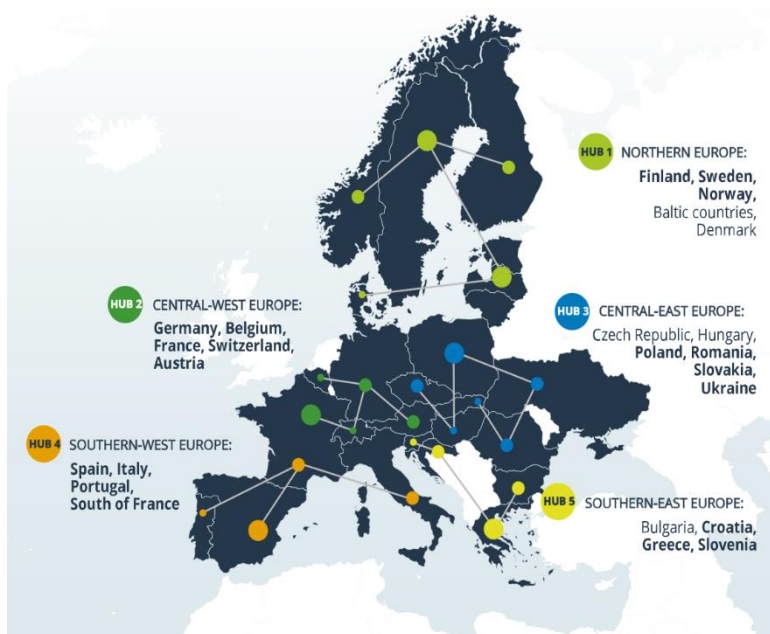

To facilitate this exchange, the consortium has established a network of *Regional Hubs* connecting multiple organizations along the forest value chain in Europe, which are grouped per geographical location and common conditions. Through a series of surveys, validation workshops and the elaboration of regional roadmaps, these regional teams identified the most relevant best practices within their region and among the other Hubs.

The BP&I collection is thus relevant for professionals, landowners, researchers and any other stakeholders in forestry and related sectors who can benefit from learning new ways of managing forests towards resilience, sustainability, and socio-economic impacts.

Figure 2   European map of Rosewood 4.0 Regional Hubs

The knowledge platform has been developed by the following partners: Steinbeis Innovation gGmbH (project coordinator, Germany), InnovaWood asbl (WP1 Leader, Belgium), EFI European Forest Institute (Finland), and the CESEFOR Foundation (Spain) with contributions from the whole consortium:

- Northern Europe Hub: Lapland University of Applied Sciences (Finland); Tretorget Ltd (Norway); Paper Province (Sweden); LUKE Natural Resources Institute Finland (Finland)

- Central-Western Europe: HCS Wood Cluster Styria (Austria); BFH Bern University of Applied Sciences (Switzerland); State Enterprise for Forestry and Timber North Rhine-Westphalia (Germany)

- South-Western Europe: CESEFOR Foundation (Spain); Forest Research Centre, School of Agriculture, University of Lisbon (Portugal); CNPF Centre National de la Propriété Forestière (France); AIEL Italian Agroforestry Energy Association (Italy)

- Central-Eastern Europe Hub: Łukasiewicz Research Network - Wood Technology Institute (Poland); National Forest Centre (Slovakia); FORZA Agency for Sustainable Development of the Carpathian Region (Ukraine); PRO WOOD Regional Wood Cluster (Romania)

- South-Eastern Europe Hub: Slovenian Forestry institute (Slovenia); CEKOM Competence Centre Ltd. for Research and Development (Croatia); CluBE Cluster of Bioeconomy and Environment of Western Macedonia (Greece)

1.1.3   Joint survey and validation

The factsheet selection is based on a larger survey and assessment carried out by the consortium under WP1. The main notable steps included the following:

1. A broad screening in the Regional Hubs allowed to build up a long list of potential BP&I with over 450 entries covering the whole range of topics in digital-supported solutions in forestry.
2. With the help and feedback of regional experts and stakeholders in validation workshops, each Regional Hub team assessed the long list and identified their own selection list of BP&I of main interest. These include BP&I that are of interest only to the national partner (Hub internal priority) as well as BP&I of mutual interest from different Hubs (transnational priority).
3. This assessment of the full survey collection (report D1.2) was then used to build regional roadmaps which also addressed opportunities to transfer BP&I between regions (report D2.1).
4. A subset of the 50 most relevant BP&I was concluded and selected as first batch of factsheets for the knowledge platform (report D1.3).
5. To complete the full selection, another round of reviews followed, from which the second batch of 50 BP&I was selected, paying attention to a balanced distribution of topics and types of solutions.

This whole set of 100 factsheets has now been prepared by the partners and published online in the knowledge platform. Further editing and translations of factsheets is ongoing and will soon be completed.

1.2   Definitions and classifications

1.2.1   Best practices and innovations

A '*best practice*' (BP) is defined as an effective, superior technological or social solution to a typical common problem or barrier. A BP can consist of a specific improved product, tool, or process (e.g. a machine or a technique), but it can also represent a more complex system solution (e.g. a sophisticated information system, a management system, or a legal or governance process or multi-actor initiative). A BP is a state-of-the-art implementation of a solution with latest (digital) technology, that has a representative character.

A specific implementation of a BP in a local context can be called a 'best practice case'. For example, a lot of quite similar digital management platforms for private owners exist in different countries, which can be all considered as different cases of the same BP. These will also be selected, and the best ones presented to the other Hubs. Main aim is here to improve collaboration and knowledge exchanges between the different tools.

In contrast, an '*innovation*' is defined as a very novel solution that has been developed and tested so far only in an experiment, pilot or a demonstration project, but which is usually not yet implemented on a larger scale or under real market conditions. The level of maturity of an innovation is usually assessed by the Technology Readiness Level (TRL). Innovations are also relevant in knowledge transfer projects such as ROSEWOOD4.0, because they go beyond the current state-of-the-art and provide new impulses for local solutions.

Note that innovation does not only refer to the advancement of a technology or system, but also to the wider adoption of an existing, proven technology or system in another context, e.g. another sector or country (this can also be described as 'social innovation').

1.2.2   Categorization approach for BP&I

Digitalisation applies a variety of modern information technologies to the specific problems and bottlenecks of the forestry sector. A classification scheme of four main categories (Table 1) was developed to organize the of BP&I factsheet collection. The categories highlight typical groups of BP&Is and provide an effective structure for the repository, allowing the user a practical way to query and navigate the knowledge platform.

Table 1   Classification concept of Rosewood 4.0 Best practices and innovations

Domains	Challenges
1. Inventory, assessment, monitoring 2. Ownership, cooperation 3. Forest management, ecosystem services 4. Forest disturbances, risks 5. Harvesting, infrastructure, logistics 6. Products, markets, trade 7. Forest-based bio/circular economy 8. Innovation management, hubs, clusters 9. Education, training, transfer 10. Financing, funding schemes	1. Improve forest resilience and adaption to climate change 2. Improve infrastructures and capacity of public actors 3. Activate private owners and cooperative forest management 4. Ensure a well-trained workforce through attractive skills development and education 5. Enhance economic and environmental performance of forest supply chains 6. Grow the forest-based bioeconomy through circular use and value-added products 7. Raise public awareness, social acceptance and political support for forestry

Hubs | Countries		Types of Solutions
1-NE Northern Europe	NO – Norway FI – Finland SE – Sweden	1. Sensors, measurement equipment 2. Data platforms, data hubs 3. Advice and services for forest owners 4. Joint forest management 5. Marketing platforms 6. Collaboration platforms, logistical hubs 7. Smart machinery, equipment 8. Traceability tools 9. Modelling, simulation, optimization 10. R&D platforms, testbeds, cocreation 11. Training, educational actions 12. Funding schemes, grants, contests 13. Awareness, infoportals, campaigns 14. Circular bio-based products
2-CWE Central Western Europe	AT – Austria CH – Switzerland DE – Germany	
3-SWE South Western Europe	FR – France ES – Spain PT – Portugal IT – Italy	
4-CEE Central Eastern Europe	PL – Poland SK – Slovakia RO - Romania UA - Ukraine	
5-SEE South Eastern Europe	SI – Slovenia CR – Croatia GR – Greece	
6-EU	multiple countries	

The classifications address the following aspects:

Domains correspond to main parts or activities along the forest-wood value chain from management of the forest ecosystem to final products and markets. The focus of ROSEWOOD4.0 lies on the forestry and raw material supply side, but final products and end uses are also considered in the sense that they can create higher demand for mobilization of wood. Note that BP&I can relate to several domains.

Challenges address typical needs and barriers to wood mobilisation encountered by stakeholders in their regional contexts. These groups are helpful to guide users to potential solutions starting from a common problem or area of interest for improvement. Each BP&I has been attributed to one main challenge as potential solutions to this challenge. A colour code has been applied in the platform to group BP&I of a same challenge also in a visual manner.

Types of solutions group together similar technological concepts with a focus on digital systems. It is important to differentiate typical digital approaches and/or business models that are widely applied to operationalize these solutions. The different types are explained in more detail with examples in chapter 2.

Hub and Country refer to the region and national context of a BP&I according to the geographical location of the solution. The collection contains mainly BP&I identified within the countries of the consortium, but the knowledge platform is designed to include any country, including the multilingual function for all EU official languages. A special class '6-EU' is defined to categorize EU consortia.

Additional categories that are also implemented as filters in the knowledge platform are '*Language'* and '*Scale of application*' (local, regional/sub-national, national, cross-border/multi-lateral, continental).

2 Overview of solutions

The following chapters give an introduction to the variety of identified types of progressive solutions which adopt digital technologies to the specific challenges in forestry and wood-based products. Each different type of solution is illustrated with three selected examples of a best practice. These factsheets can be viewed in the Rosewood 4.0 Knowledge Platform (weblinks in blue).

2.1 Technologies and measures for better forest management

2.1.1 Sensors, measurement equipment

A large group of digitalisation solutions comprises tools that enable easier, more precise and efficient ways of collecting data and measuring information in forests. They include a wide range of measuring devices, specialised sensors and apps that have been developed for their specific use in forest assessments. A lot of companies and start-ups have been emerging in recent years that offer tailored information services for surveying, analytical assessment and regular monitoring of forests.
Festmeter Wöls, Austria
Bark beetle detection via multi-spectral airborne sensing

Trestima, Finland
Forest inventory system using mobile applications for measurements

AJA by foldAI, Germany
Environmental sensors for real-time forest ecosystem monitoring

Figure 3   Best practice examples of sensors and measurement equipment

2.1.2   Data platforms, data hubs

Public forestry actors such as state forest administrations, ministries or research centres are elaborating advanced data collections which are made accessible through special data portals, warehouses, and web-based portals. Typical portals combine available baseline data from national land registers, forest inventories, environmental surveys and other monitoring schemes. These data hubs evolve to integrate more and more different thematic datasets, layers and analytical options, to make the data better usable and to allow addressing more complex questions. Interesting developments are that open data approaches are gaining in importance and that also novel approaches such as citizen science can be found.
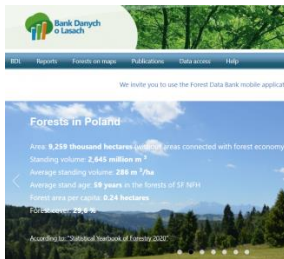

Forest Data Bank, *Poland*
Data warehouse for forest information
National Forest Inventory,
Slovenia: Regular forest resource monitoring

Biomass-Atlas, *Finland*
Web-based forest resource map service

Figure 4   Best practice examples of data platforms and data hubs

2.1.3   Advice and services for forest owners

Supporting private forest landowners through dedicated advice and useful practical information is the main purpose of a wide variety of online platforms, advisory services and programmes. Across European countries, many public and private actors have undertaken major efforts to set up such information services and support programmes, which can engage with a larger number of smallholder forest owners and thus bring more forest land into proper active management. A main common goal of all these solutions is to make it very easy for private persons who lack practical experience to get quick access to useful knowhow and guide them to professional advisors and service providers. User-friendly online platforms at your fingertips enable lay persons to take decisions how to manage your property. Successful advisory services take into account the large diversity of landowners regarding their knowledge, attitudes and values about forest management.

Metsään.fi, *Finland*
eServices for Forest Owners and Service providers
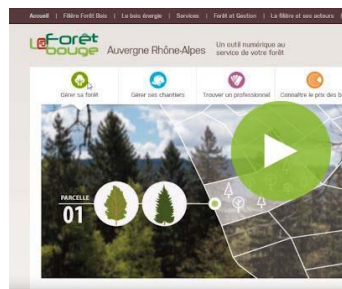

La forêt bouge *(forest is moving),*
France: Online portal to activate private forest owners

Melhor eucalipto *(Better eucalypt), Portugal*: Demonstrate proper plantation management

Figure 5   Best practice examples of advice and services for forest owners

2.1.4   Joint forest management

To overcome disadvantages and barriers of smallholder forest ownership and gain scale in forest management, a large variety of approaches have been developed and tested across Europe how to improve ownership structures. These aim at different solutions to bundle forest owners and/or forest land parcels into larger units that enable more effective management. The approaches differ according to their degree of grouping, association, aggregation and/or even merging of land units or owners, including both more voluntary, temporary concepts as well as more long-term, permanent reorganisations of structures. A critical element to make these approaches successful is a sound, transparent information baseline to enable proper decision-making. Specific measures such as land mensuration or forest stock assessment are quite data-intensive and thus benefit a lot from enhanced digitalized technologies.

Forest Area Aggregation,
Portugal: Grouping landowners to facilitate forest management

PROMINIFUN, Spain
Small-holder forests operational group to solve land abandonment

Jointly Owned Forests and Forest Land Consolidation in Finland

Figure 6   Best practice examples of joint forest management

2.2   Solutions to facilitate business and cooperation in the wood supply chain

2.2.1   Marketing platforms

e-business solutions have also seen wide deployment in forestry in recent years. Many examples of online marketplaces for timber and forestry services can be found in European countries, which facilitate business partnering and transactions especially also in rural areas.

Kuutio, Finland
Online timber marketplace
Forstify, Germany
App for easy timber purchase and trade
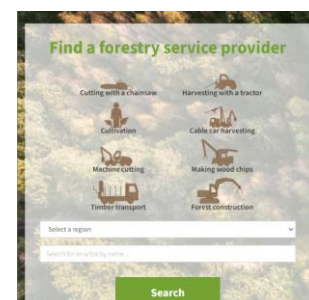

MojGozdar (My Forester)
Slovenia - Quality assessment of forestry contractors

Figure 7   Best practice examples of marketing platforms

2.2.2   Collaboration platforms, logistical hubs

Another important group of digital business solutions are specialised IT platforms that enable collaboration of different actors in the forestry supply chain, e.g. forest managers, harvesting contractors, transport companies, timber traders and forest-based industries. These systems facilitate direct communication and data transactions for a more efficient coordination of processes and workflows among the various actors. Some of these systems offer quite advanced solutions with an entire portfolio for all forestry-related activities, and interoperability with various commonly used other IT systems.

WoodForce, Finland
Software for harvesting
and forestry services

Forest HQ, Ireland
Forest land management and
operations system
WASP Logistik, Germany,
Wood logistics platform

Figure 8   Best practice examples of collaboration and logistical platforms

2.2.3   Smart machinery, equipment

Forestry work processes rely increasingly on high tech equipment. A lot of R&D is being carried out to deploy industry4.0 technologies in the sector for the common goals to optimize workflows, increase performance and ensure safety and health conditions for workers in the forest and industries.

Forwarder2020, EU/Germany
Smart Forwarder for sustainable
and efficient forest operation and
management

HiVision, Finland
Virtual reality support for
crane operators

AVATAR, EU/Germany
Smart real time feedback and
training system for forest
machine operators

Figure 9   Best practice examples of smart machinery and equipment

2.2.4   Traceability tools

A specific challenge for the forest-based sector is to establish ways to provide traceable data about the origin of wood. There is a need for transparent, credible and verifiable data which can ensure that the wood has been sourced from sustainably managed forests. Secondly, traceability of wood is also key for better control of performance and quality in industrial wood processing chains. A range of digital tracing solutions are currently being developed, tested and deployed together with companies. The main challenge for these advanced tools is to find effective, applicable setups that can work for all involved actors the various contexts (from local to cross-border or even global wood supply chains).
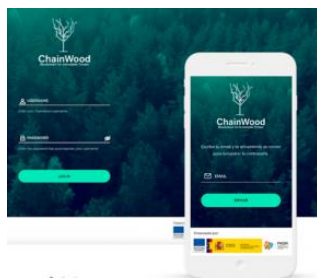

ChainWood, Spain
Blockchain for Inmutable Timber
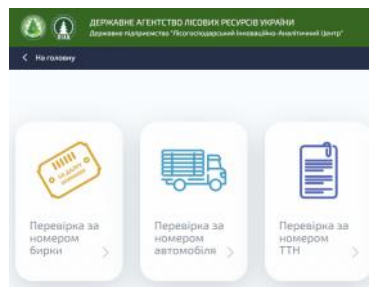

Electronic timber tracking
in Ukraine
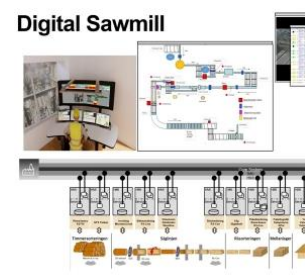

DigiWood, Sweden
Digital sawmill traceability tools

Figure 10   Best practice examples of traceability tools

2.3   Enhancing research and innovation in digital solutions

2.3.1   Modelling, simulation, optimization

Digitalisation and big data allow to model forest ecosystems at a new level of complexity. This enables to study the impacts of forestry management interventions and related impacts in much more detail. Such knowledge is becoming more and more widely accessible in various information systems and decision support tools for professionals, experts as well as lay persons. Gaining better insight into complex relationships of ecological factors, climate change and adaptation options will be key to enhance forest management for better long-term resilience and sustainability.
Virtuaalimetsä 2.0, Finland
Virtual Forest application to visualize forest properties
FORSITE, Austria
Dynamic ecological forest site classification
C.A.F.E., Spain
Carbon, Aqua, Fire & Eco-resilience DSS

Figure 11   Best practice examples of modelling, simulation and optimization tools

2.3.2   R&D platforms, testbeds, cocreation

R&D in digitalisation of forests is progressing fast. To integrate various R&D directions and better exploit synergies of sharing knowledge and results, special R&D platforms dedicated to digitalisation in forestry and forest-based industries have emerged in various countries. They establish basic research, testbeds, and demonstration projects for ground-breaking digital transformation of the sector. R&D activities are guided by needs of industry and aim to stimulate co-creative innovation. Companies can engage more easily with research centres and support a faster market entry or rollout.

SmartForest, *Norway*
Bringing Industry 4.0 to the Norwegian forest sector

Cutting-edge research on digitalisation in forestry

KWH4.0, *Germany*
Center of Excellence Forest and Timber 4.0

Figure 12   Best practice examples of R&D platforms and testbeds

2.4   Supporting measures for a competitive forest-based sector

2.4.1   Training, educational actions

Ensuring that people who own and work with forests have access to a good education and training is a key challenge for the entire sector. Especially the wider adoption of new digital solutions will require a lot of additional training and qualification both of managerial staff technicians and workers. A variety of training programmes that have been specifically designed for landowners and professionals in forestry can be identified in European countries. They also show good examples to include modern communication tools, multimedia, eLearning solutions and social media. This is especially important to make the sector also attractive for the future generations of students and apprentices.

Skogkurs, *Norway*
Forestry Extension Institute for practitioners and landowners

I'm training for my woods, *France*
Training portal for private forest owners

Marteloscopes, *EU/Switzerland*
Demo plots for silvicultural training of forestry practitioners

Figure 13   Best practice examples of training and education

2.4.2   Funding schemes, grants, contests

Access to funding is essential to support the wider adoption of solutions by practitioners, including good management practices and novel technological concepts. This category includes typical funding schemes for forestry and rural development, but also more unconventional schemes such as cascade funding or hackathons, which are especially interesting to stimulate novel approaches and involve more companies in innovation and demonstration.

KEMERA Funding, *Finland*
Governmental subsidy for sustainable forestry

Evergreen Innovation Camp,
Austria: Hackathon for university students and start-ups

SecureChain, *EU/Netherlands*
Innovation voucher scheme for forest bioenergy pilot projects

Figure 14   Best practice examples of funding schemes, grants and contests

2.4.3   Awareness, info portals, campaigns

Raising the awareness of the public about the major role of forests for the environment, the economy and the social contexts is of major importance. Many national and regional communication platforms have been established for this purpose, which also make extensive use of new digital formats and social media. Their aim is to contribute to a better understanding and image of the sector, highlighting the innovative trends and benefits of active forest management and sustainable wood products for the wider society.

3   Selection results

This chapter describes the full set of 100 BP&I selected and prepared by the Regional Hub partners to be of main interest for further dissemination and exchange.

- ➢ The full BP&I selection combines the *first Batch A* (D1.3) and the *second Batch B* (this deliverable) as of 29 December 2021.
- ➢ The distributions of the BP&I according to the classifications per domain, type of solution and geographical reference are analysed.
- ➢ Tables 1, 2 and 3 provide the complete list of the 100 BP&I sorted according to different categories.
- ➢ The full factsheets are accessible in the *Knowledge Platform* via the online *weblinks*. Right mouse-click on a link will open the factsheet in the default browser. A factsheet contains a short abstract, visual items (pictures, logos, videos), and additional information (categories, contacts, additional resources, references), providing quick access to the original information source via further weblinks.

BP&I project origin: The selection contains 22 BB&I identified during the first Rosewood project (2018-2020) and 78 BP&I identified during the Rosewood 4.0 project (2020-2022).
Figure 16   Number of selected BP&I per EU project origin and Hub (n total = 100)

Figures 17-22 and Tables 1-3 use the following abbreviations:

Regional Hubs: NE Northern Europe / CWE Central-Western Europe / SWE South-Western Europe / CEE Central-Eastern Europe / SEE South-Eastern Europe / EU whole EU / INT international

Origin: R1 Rosewood (2018-2020), R4.0 Rosewood 4.0 (2020-2022).

Batches: First Batch A, Second Batch B [see Table 3 on p.30 ff].

3.1 Domains and Types of Solution

3.1.1 Distribution according to Domains

The majority of selected BP&I relate to solutions for improved '5. Harvesting, infrastructure, and logistics' (Figure 17). Lots of industry 4.0 technologies in forestry are already well established here, as performance gains can lead to significant reductions of unit costs. These tools are tailored specifically to work processes in forestry companies, and can be rather easily adopted. This group clearly raised a high interest among Hub members. Other main areas are '1. Inventory, monitoring', '9. Education, training' and '2. Ownership, cooperation'. The last third of BP&I are diverse and fall under the remaining six other domains. Overall, the different domains are well distributed across the five Hubs.
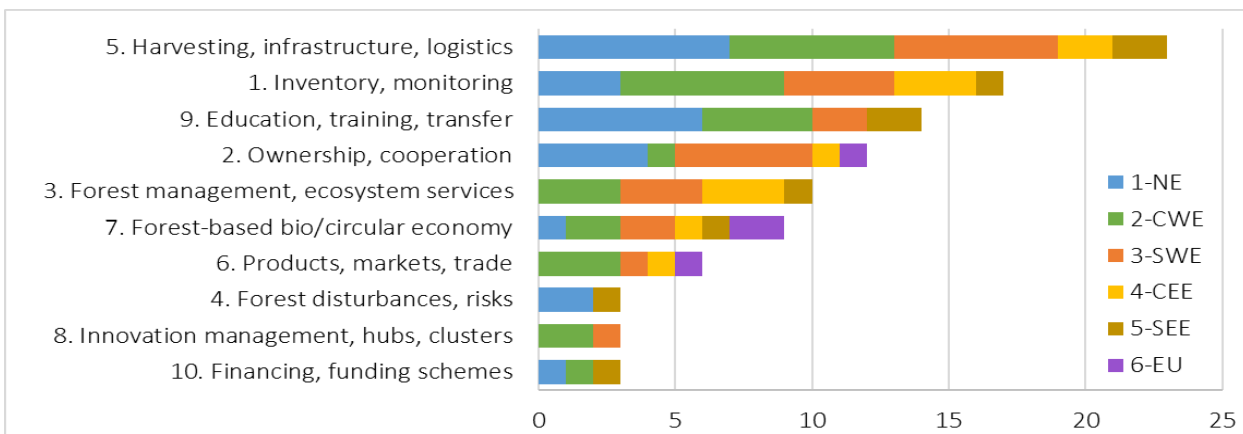

Figure 17   Number of selected BP&I per Domain and Hub (n = 100)

3.1.2 Distribution according to Types of Solution

Figure 18 shows that the most relevant types in the selection are '3. Advice and services for forest owners', '6. Collaboration platforms…', '1. Sensors…', '2. Data platforms…' and '9. Modelling…': each include 10 or more selected examples. The other types are more specific solutions and have a lesser number per group.
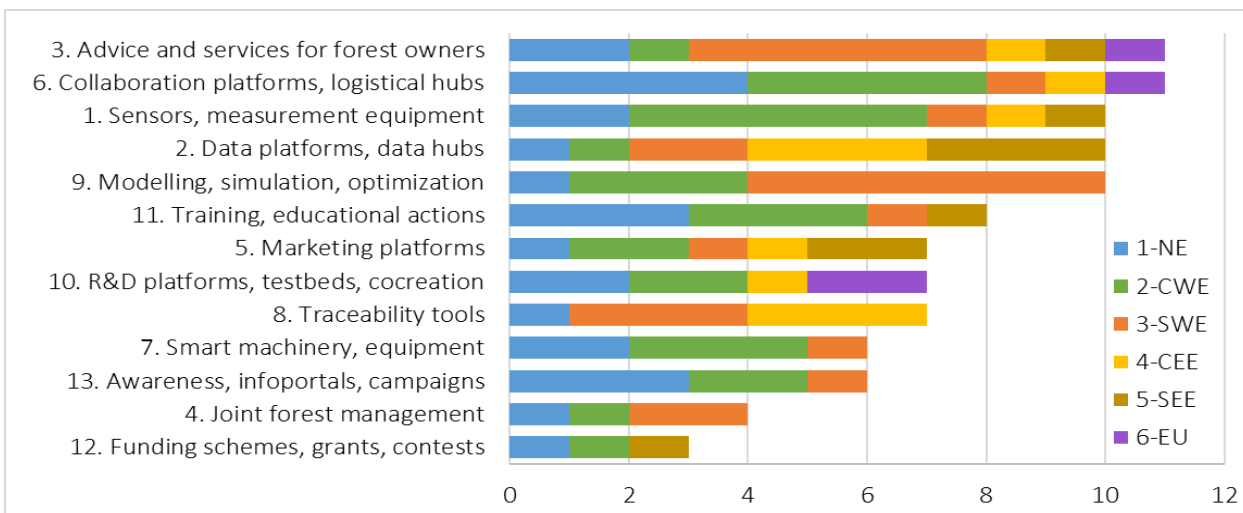

Figure 18   Number of selected BP&I per Type of Solution and Hub (n = 100)

3.2 Challenges for Wood Mobilisation

3.2.1 Distribution according to Challenges

The challenge of highest interest addressed in the factsheet selection is '5. Enhance economic and environmental performance', which is clearly a core topic of digitalisation (Figure 19). It is notable that certain types of solutions are more dominant or are found exclusively under certain challenges (Figure 20).
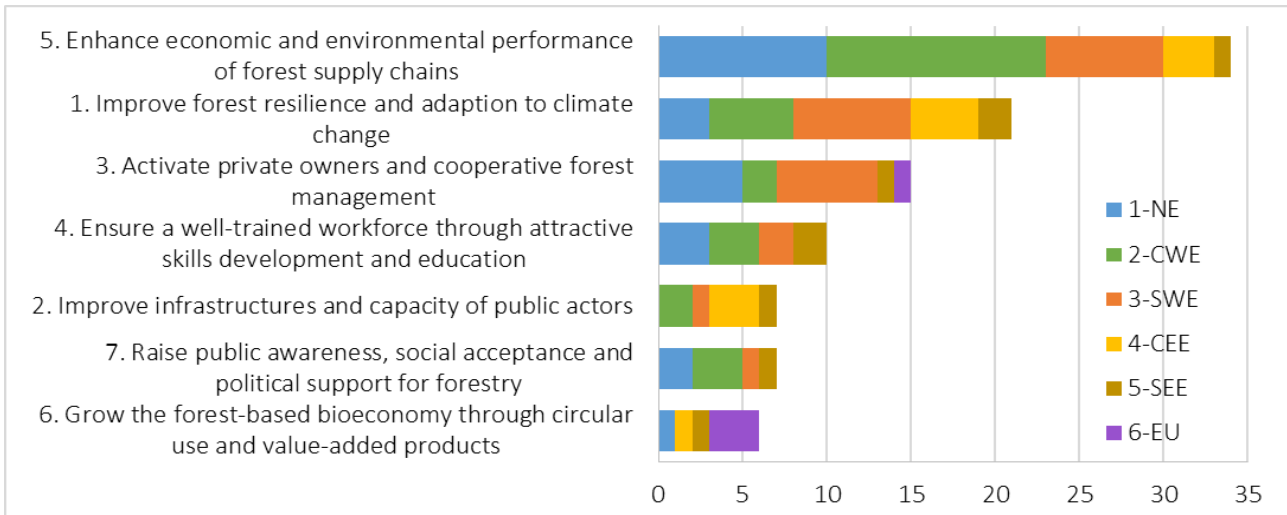

Figure 19   Number of selected BP&I per Challenge and Hub (n = 100)
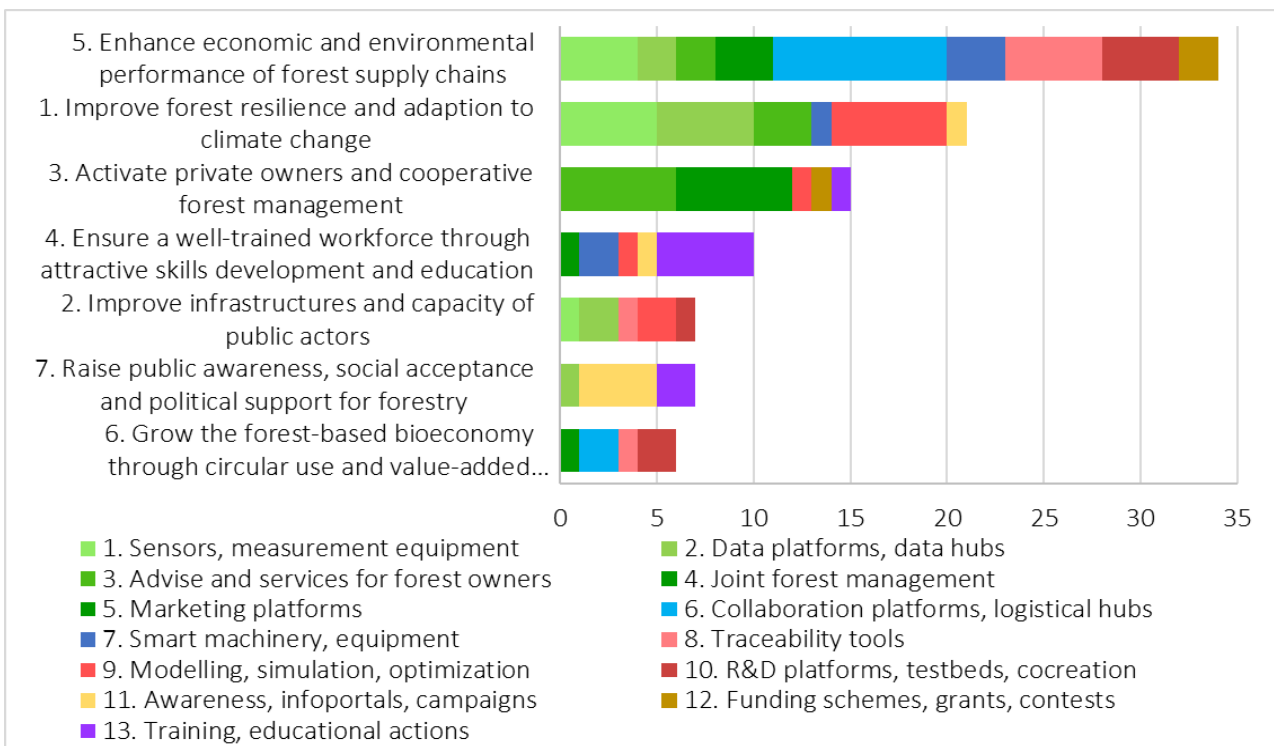

Figure 20   Number of selected BP&I per Challenge versus Type of Solution (n = 100)

3.2.2 Selection according to Challenges

3.3   Regional Hubs and Countries

3.3.1   Distribution across Hubs

The BP&I selection is distributed unevenly across the Hubs (Figure 21). The majority of BP&I were identified in the Central-Western Europe (CWE), the Northern Europe (NE), and the South-Western Europe (SWE) Hubs. The reason is that these represent the largest Hubs in terms of number and size of countries, plus these are the technologically most advanced countries in digitalisation. Nevertheless, to achieve a good European coverage, it was ensured that also at sufficient number of cases from the other Hubs was included.
Figure 21   Number of selected BP&I per Regional Hub (n = 100)

3.3.2   Distribution across Countries

The BP&I selection includes cases from 18 countries in Europe (Figure 22). The largest sets of cases are identified in Germany (DE) and Finland (FI), followed by Spain (ES), Norway (NO), Austria (AT), and France (FR). These BP&I cases raised the highest interest among the consortium partners. In addition, four European projects were selected as interested BP&I cases for collaborative approaches.
Figure 22   Number of selected BP&I per Hub and Country (n = 100)

3.3.3 Selection per Country

Table 4   List of BP&I selection sorted per Hub and Country

Note: First batch „A" refers to D1.3. Second batch „B" has been added in this deliverable D1.5.
