

# Migration to InvenioRDM: A Case Study

Guillaume Viger, Austin Sharp, Eric Newman, and Matt Carson  
Galter Library, Northwestern University

# Overview

- Motivation
- How did we do it?
- Lessons learned (so far)
- Current status and challenges

# Why Migrate?

- To enhance data management for sharing, reproducibility, and open access
- Years of customizations made upgrading problematic; chance to explore new options
- Grant funding acquired
- Conversations with [COAR](#) and [CERN](#) began

# Why InvenioRDM?

## Free Open Source Software

Invenio is Free Open Source Software supported by a committed community of multidisciplinary institutions.

[Code](#) | [Docs](#) | [Examples](#)

## Friendly and Responsive Community

Although Invenio was born at CERN, its community is growing bigger every day. Talk to the team now in our chatroom or forum.

[Chatroom](#) | [Forum](#) | [Get Involved](#) | [Events](#)

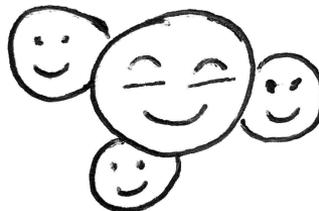

## The "Safe bet"

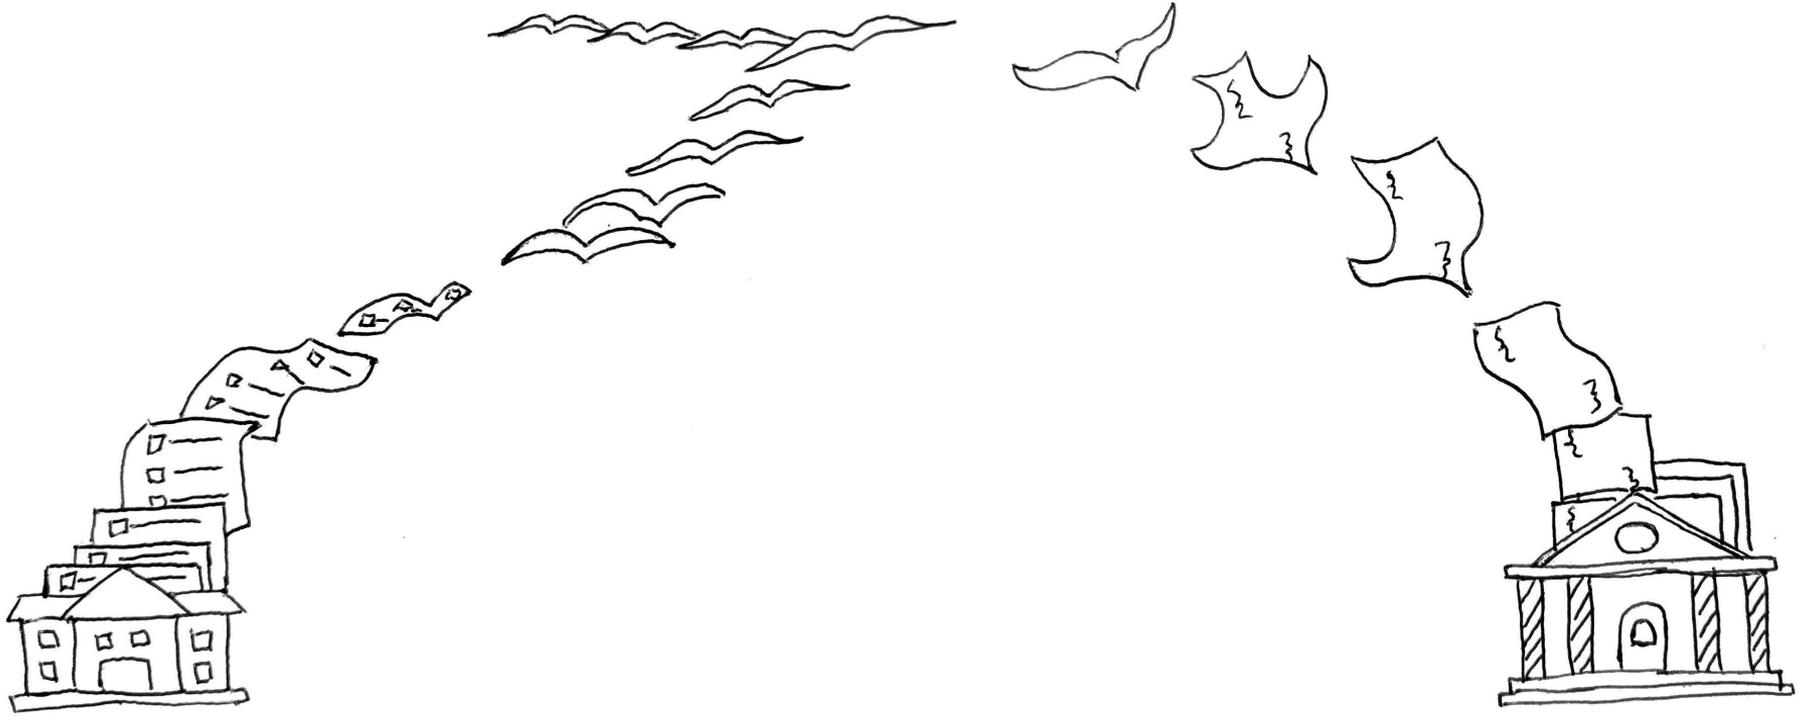

Invenio community has been around for 20 years. **Solid services** have been built on top of it to ensure long-term confidence.

# Who?

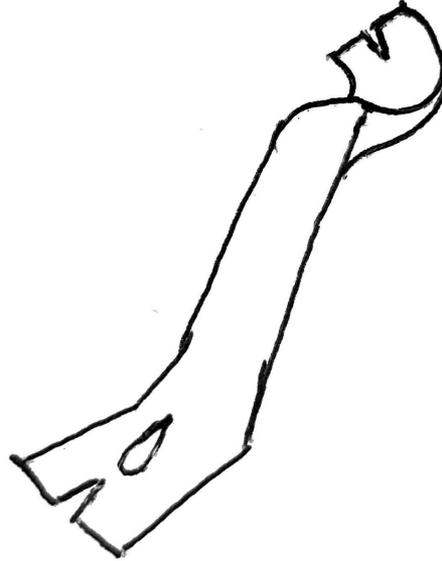

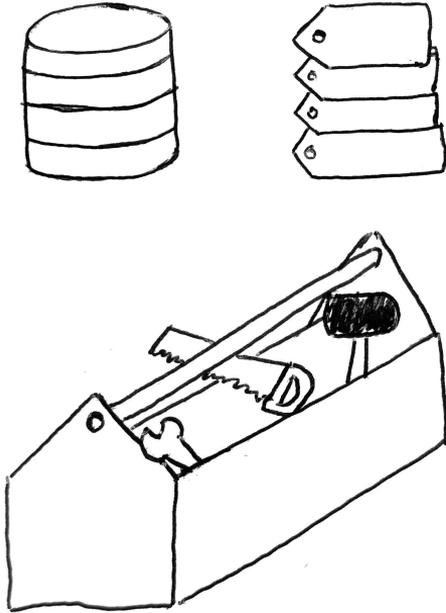

# Goal

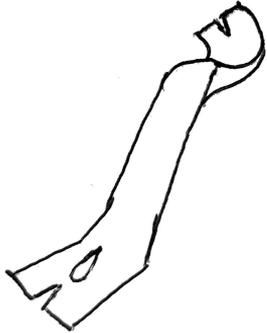

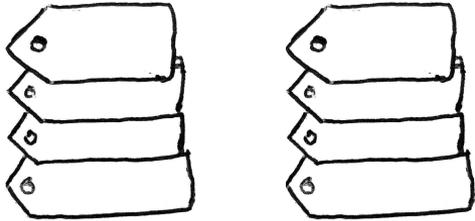

# Exporting the Data

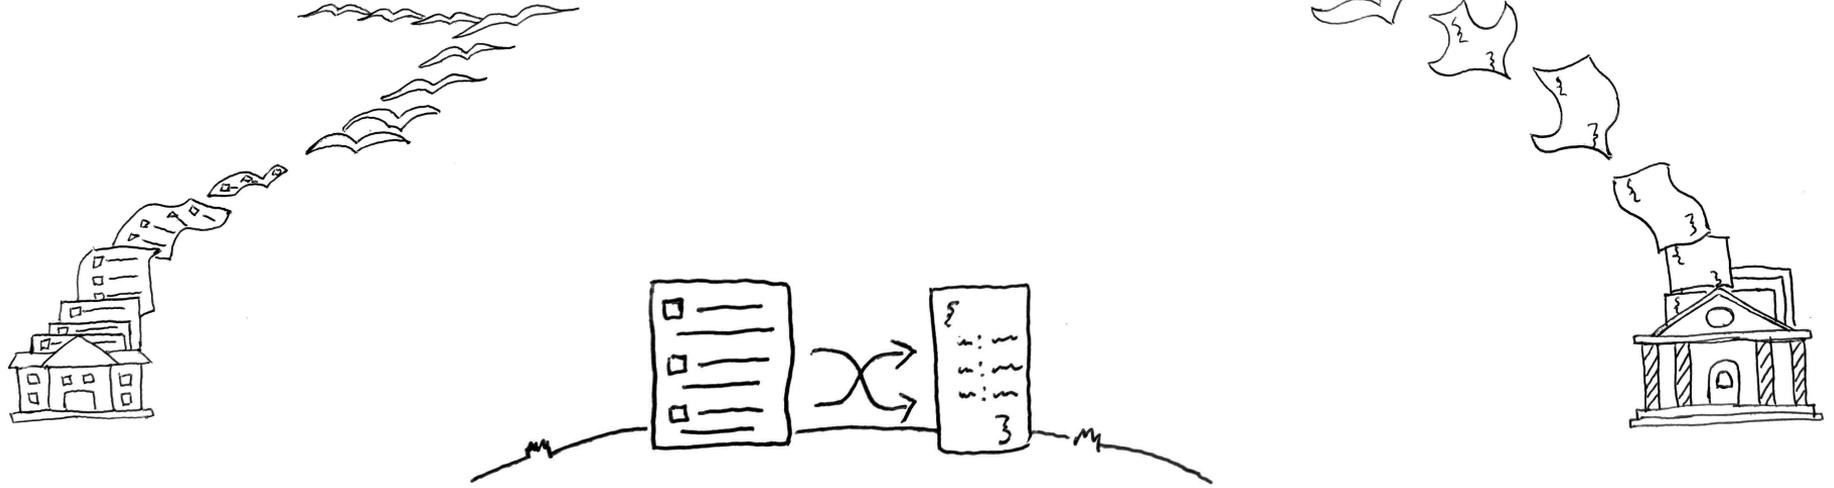

# Using the Tools

# Transforming the Data

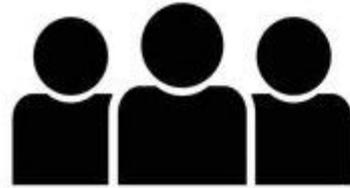

# Getting There

**How did we do it?**

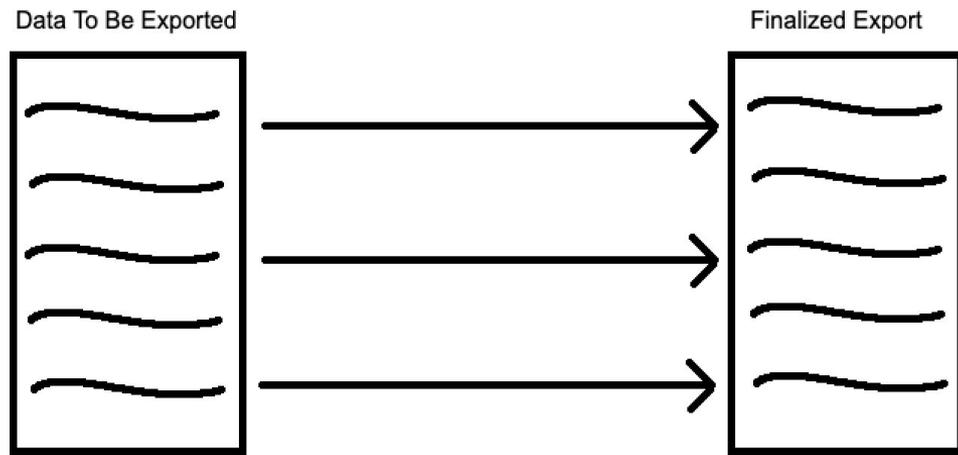

# Export: Metadata Mapping

- Organized an internal working group specifically for metadata
- Composition: metadata librarians, repository stakeholder representatives, and developers
- Came up with a table of correspondences

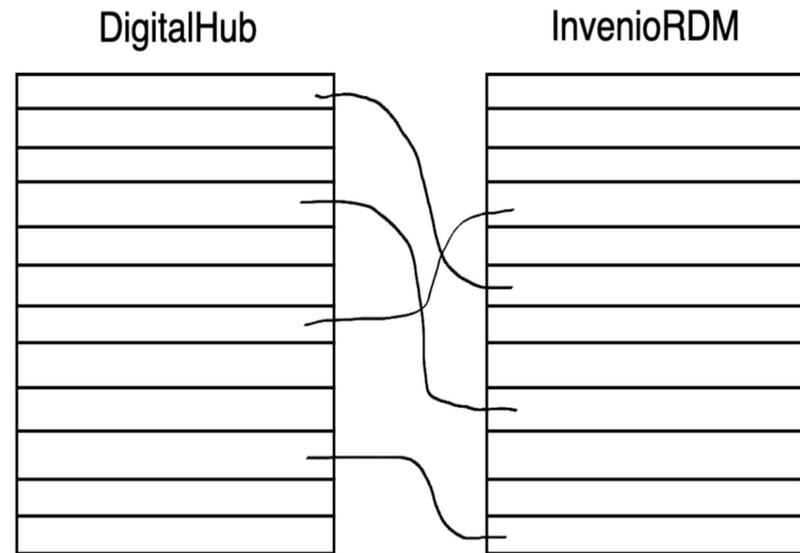

# Export: Metadata Mapping

- Mapping informed serialization rules from DigitalHub to Prism
- Used InvenioRDM metadata reference for details of structure
- Having export structure the data and do the correspondences, we could parallelize the development
- Feedback from import
- [InvenioRDM Documentation](#)

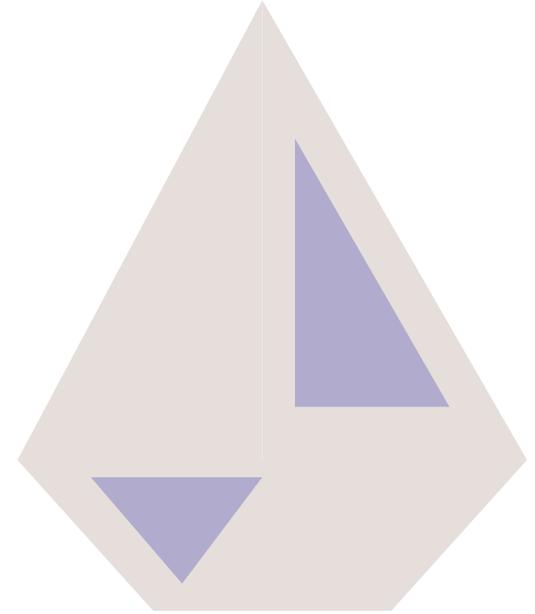

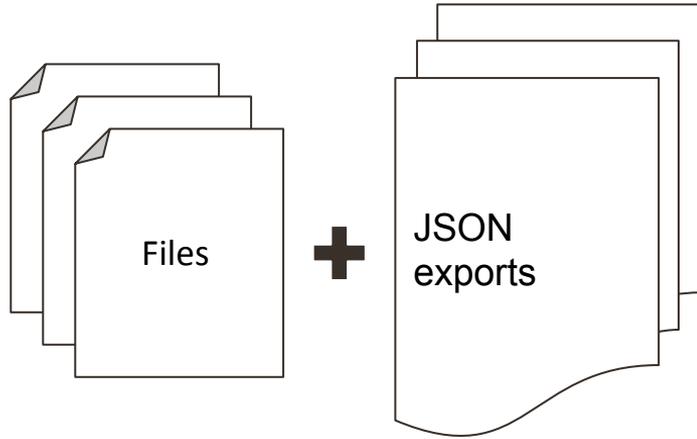

# Export: Metadata Mapping Tips

- Existing Code From Sufia could be used as a jump start
- Beware of quirks unique to ActiveFedora

# Import

**Prism**

# Import - Two Approaches Considered

## REST API

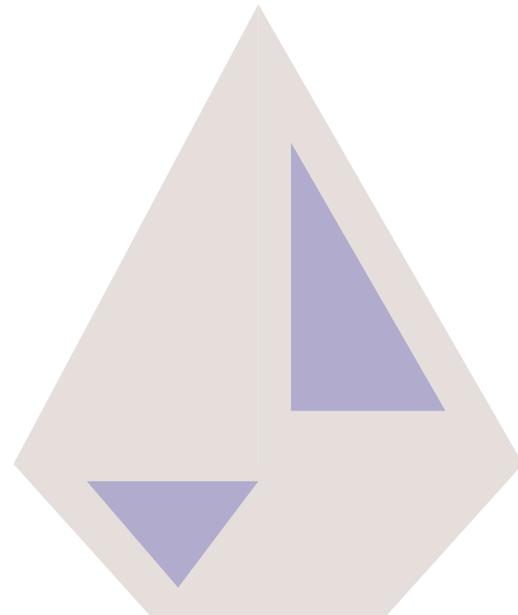

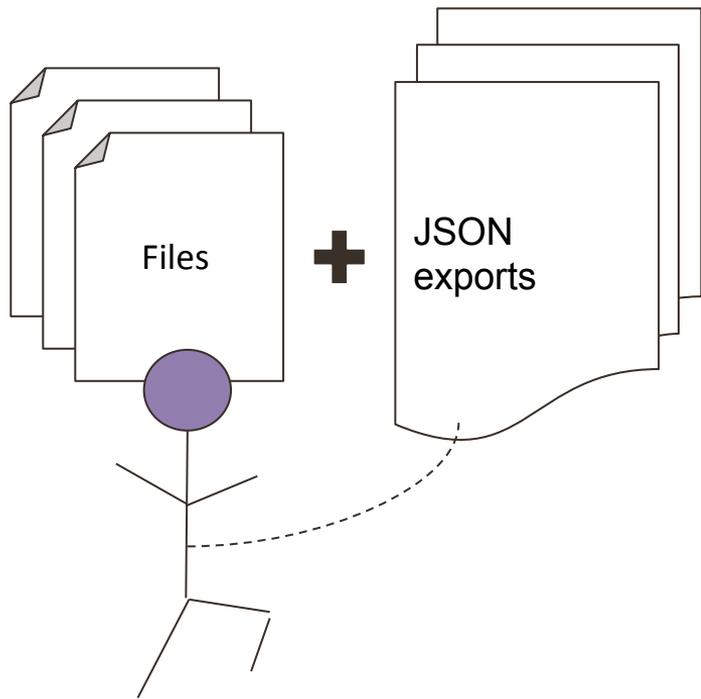

- + Stable
- + Less development effort
- Limited to released features
- Slow

## Programmatic API

- Less stable
- More development effort
- + Unconstrained by released features
- + Fast

# Import - Deciding factor

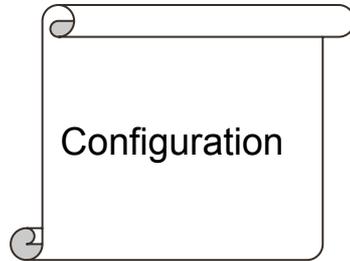

## Programmatic API

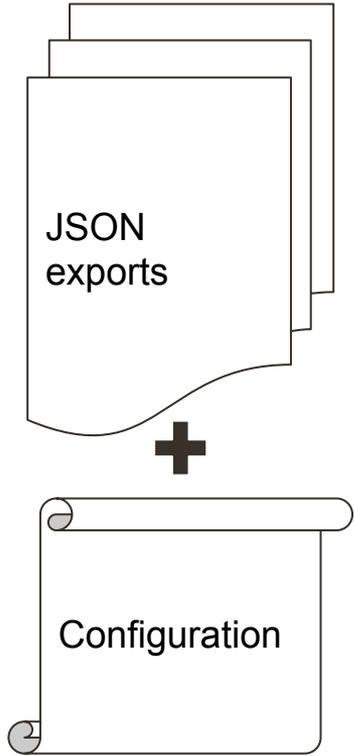

**Prism**

# Import extension

```
pipenv run invenio galter-import --config import-config.json
```

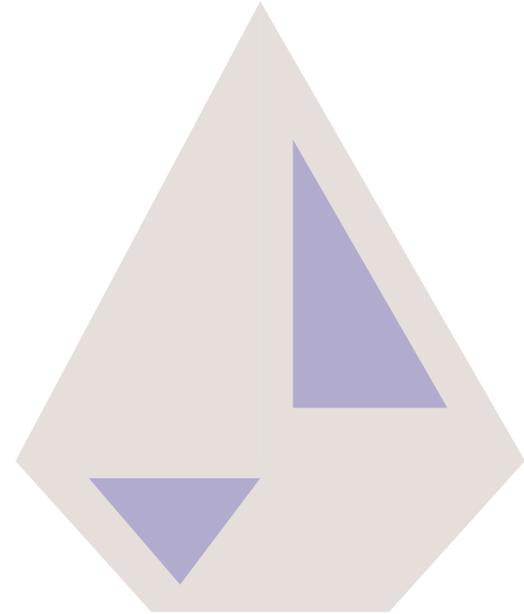

# Import Communities

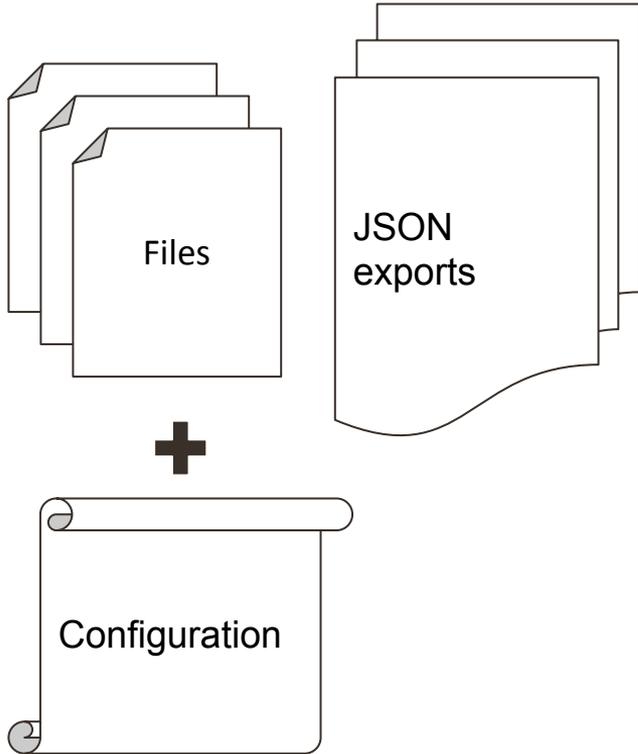

For each community

- Prepare it
- Import users
- Import metadata

**Prism**

# Import Records

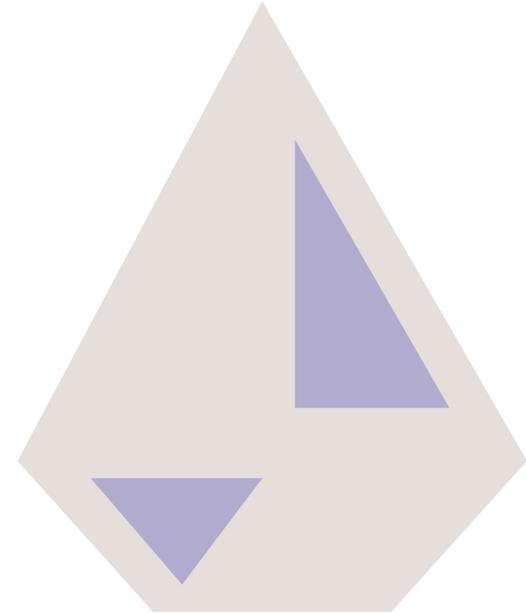

For each record

- Prepare it
- Import users
- Import metadata
- Assign to community
- Import file

Then

For each record

- Publish

**Prism**

# Review Records

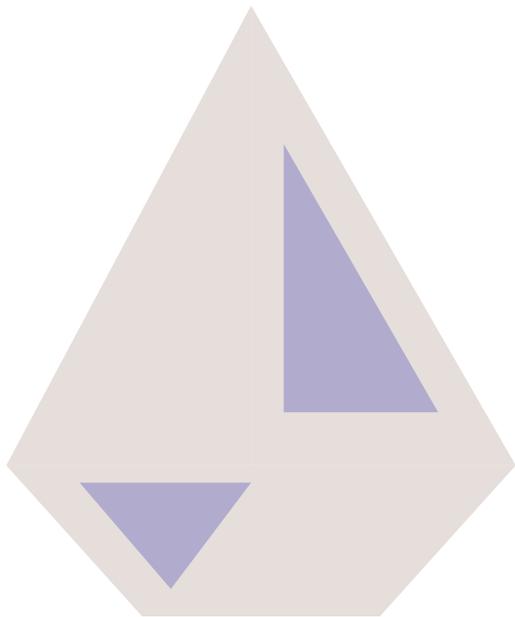

Librarians review representative samples

- All fields
- Edge cases
- User interface

# Migration Summary: An Iterative Process

# Lessons learned

# Challenges

- Communicating field characteristics:
  - cardinality, substructure, meaning
- Working on migration as field structures and programmatic APIs were changing
- Details matter: docs don't always reflect reality

# Dealing with Challenges

- Fields: show on the interface
  - use a different medium than just words
- Tests allowed us to detect upstream changes
  - churn still present, but changes automatically detected

# Lessons Learned... so far

- Tooling useful
- Programmatic API import did pay off
  - Same development effort
- Very iterative process
  - Don't make perfect enemy of the good
    - “ [...] very clean system and the data is visually organized in a really approachable way. I also appreciated how responsive it was compared to DigitalHub

# Current Status

# Current Status

- Nearly all record metadata ingested with no issues; a few outliers
- Librarians reviewing metadata of migrated records in detail
- Challenges on the horizon
  - Performing the file import will slow feedback cycle
  - Most challenging: DOI transfer
    - Not possible yet with InvenioRDM
    - Upstream development will be needed

# With thanks...
