What is artificial insemination of a dog?

Artificial insemination to the process of fertilizing a dog with the help of sperm from another male. The tension links is given when a natural attempt to breed between dogs has failed or when potential parents disagree. Relationships for which artificial insemination may be necessary, including:

-When one or both dogs are neutered / castrated, a their reproductive organs have been removed;

- When there is no other person in such a case for the dog, for example a purebred case or an alternative dog;

-When one or both dogs are injured a cannot join naturally form pairs;

-When genetic tests that can cause problems with blood line collection, if mate naturally.

Benefits of Artificial Insemination for Dogs

There are many advantages to using artificial insemination in dogs. One of the most important, new, newer is it that can come to improve the breed improvement. By creating more puppies from a specific breed, we can support these breeds. In addition, artificial intelligence also help us better understand our own animal configurations and gain the possibility of gaining access to our dog's kennels in the future. people artificial telecommunications to also good way on new new races, people, we be interested.

What hardware is the equipment?

Artificial insemination is the process of giving birth to another male to help a female conceive. To do this, you are going to need the hardware keyword. The latest introduction of the tool tool is [device|tool] for insemination. It is a inconspicuous device that helps semen enter the female's reproductive system. You'll also need a syringe and a condom. The condom acts as a barrier between the man's sperm and the woman's body. The syringe is used to inject the semen into the woman's reproductive system.

Steps of Artificial Insemination for Dogs

Artificial insemination (AI) for a process in which the sperm are placed in the bitch's reproductive tract using a syringe and which is behind the tolu for insemination. Artificial intelligence can be used to prevent pregnancy from pregnancies in dogs that are not able to to pregnant, in any natural way, or to improve fertility in dogs, according to there are troubles with the pregnancy, such as the rapid growth of a healthy baby.

Artificial intelligence consists of several stages:

1. Collecting dog and bitch semen training.

2. Personally mixing the seeds together so that they fit together as closely as possible.

3. Injection of the human factor into the settlement system by means of or system gel.

4. Monitoring of the female under marking the occurrence of ovulation.

Preparing the dog for AI

Puppies can be artificially inseminated in a number of different ways. In general, evaluation of three types of material: intracytoplasmic semen injection, intrauterine insemination and direct semen injection.

Intracytoplasmic sperm injection (ICSI) is the most common type of artificial insemination. ICSI relies on a needle into the female reproductive system and draws a few rich resources to ejaculate from the male's vas deferens. These cells are then reintroduced into the female's reproductive system and fertilized by male sperm.

Intrauterine insemination (IUI) is a less invasive method than ICSI. Instead of testing, IUI is about putting semen directly into the vagina.

Technique of honoring animals

Artificial insemination is a technique that can be used to conceive a litter of puppies. This technology is commonly used by operators who are unable to naturally have a litter box. In end. The veterinarian will then determine if fertilization is necessary. After the decision is made, the vet will prescribe all medications and supplies. Execution completion step-by-step Cakes resulting sperm injection into the spinal cord. This treatment a very close medical contact with the dog, therefore it is important that this manner is performed by a qualified personnel instructor.

Imitation results for the workshop
