

V1298 Tau

Extracting planetary signals buried in extreme stellar activity

A.; Chinchilla, P.; Esparza-Borges, E.; González-Álvarez, E.; Granzer, T.; Luque, R.; Martín, E. L.; Nowak, G.; Oshagh, M.; Pallé, E.; Parviainen, H.; Quirrenbach, A.; Reiners, A.; Ribas, I.; Strassmeier, K. G.; Weber, M. & Mallonn, M.

A young star with 4 transiting planets

20 ± 10 Myr

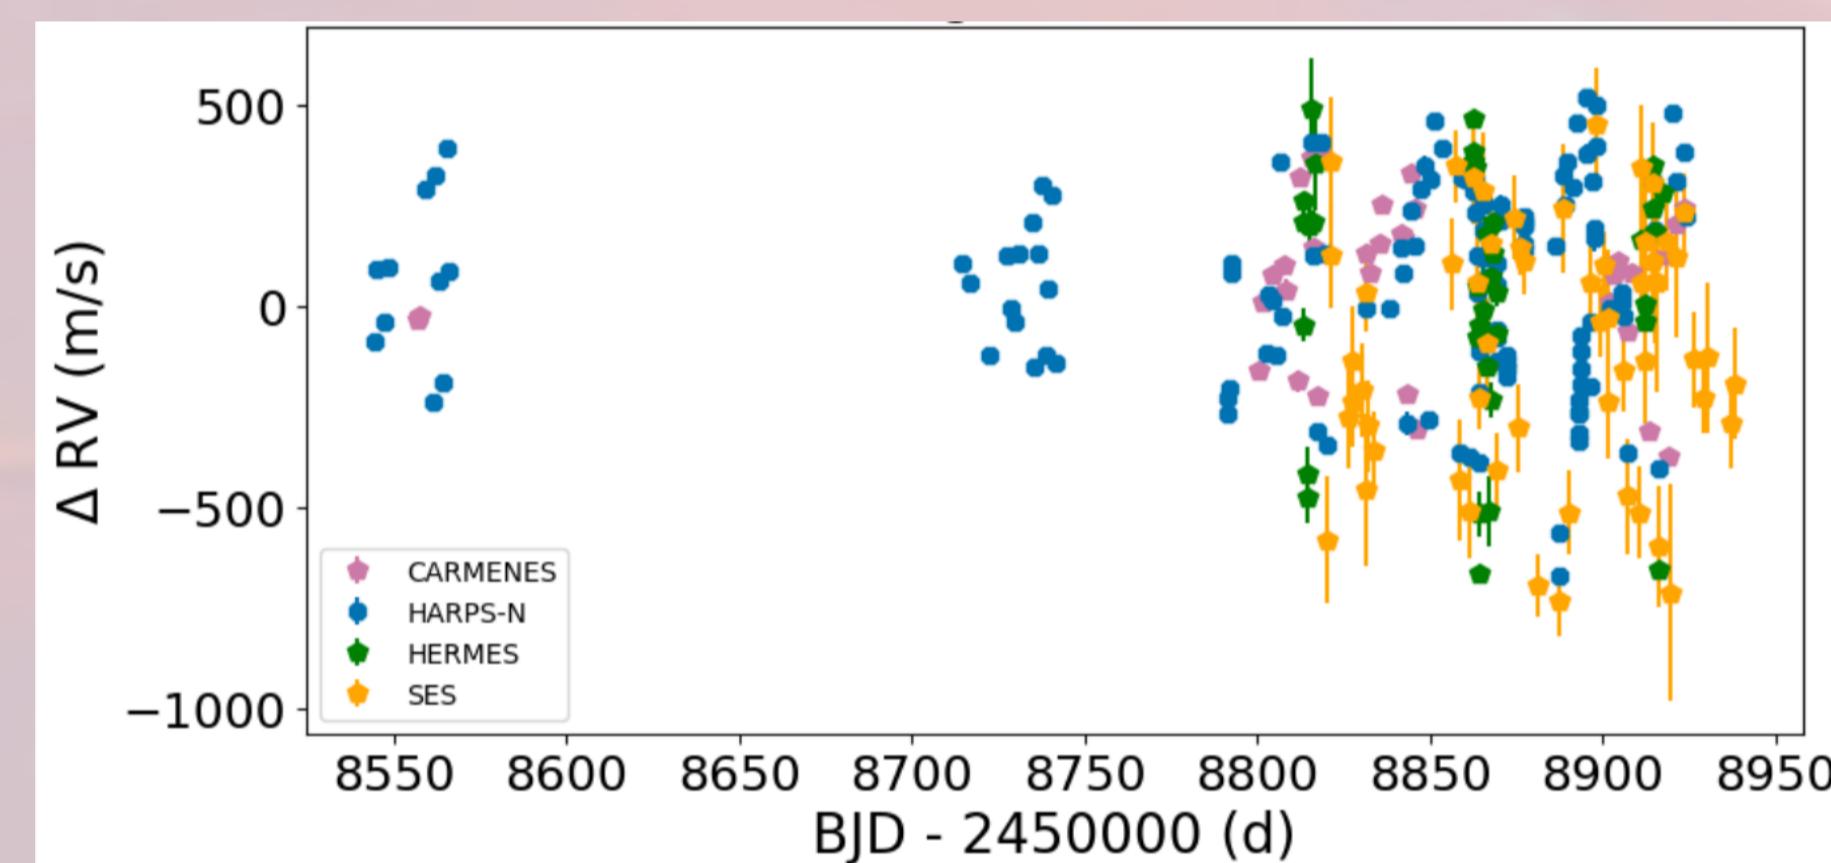

Why study young planets?

Laboratories to test models of early evolution of planets and planetary systems. Very young planets are expected to be very inflated.

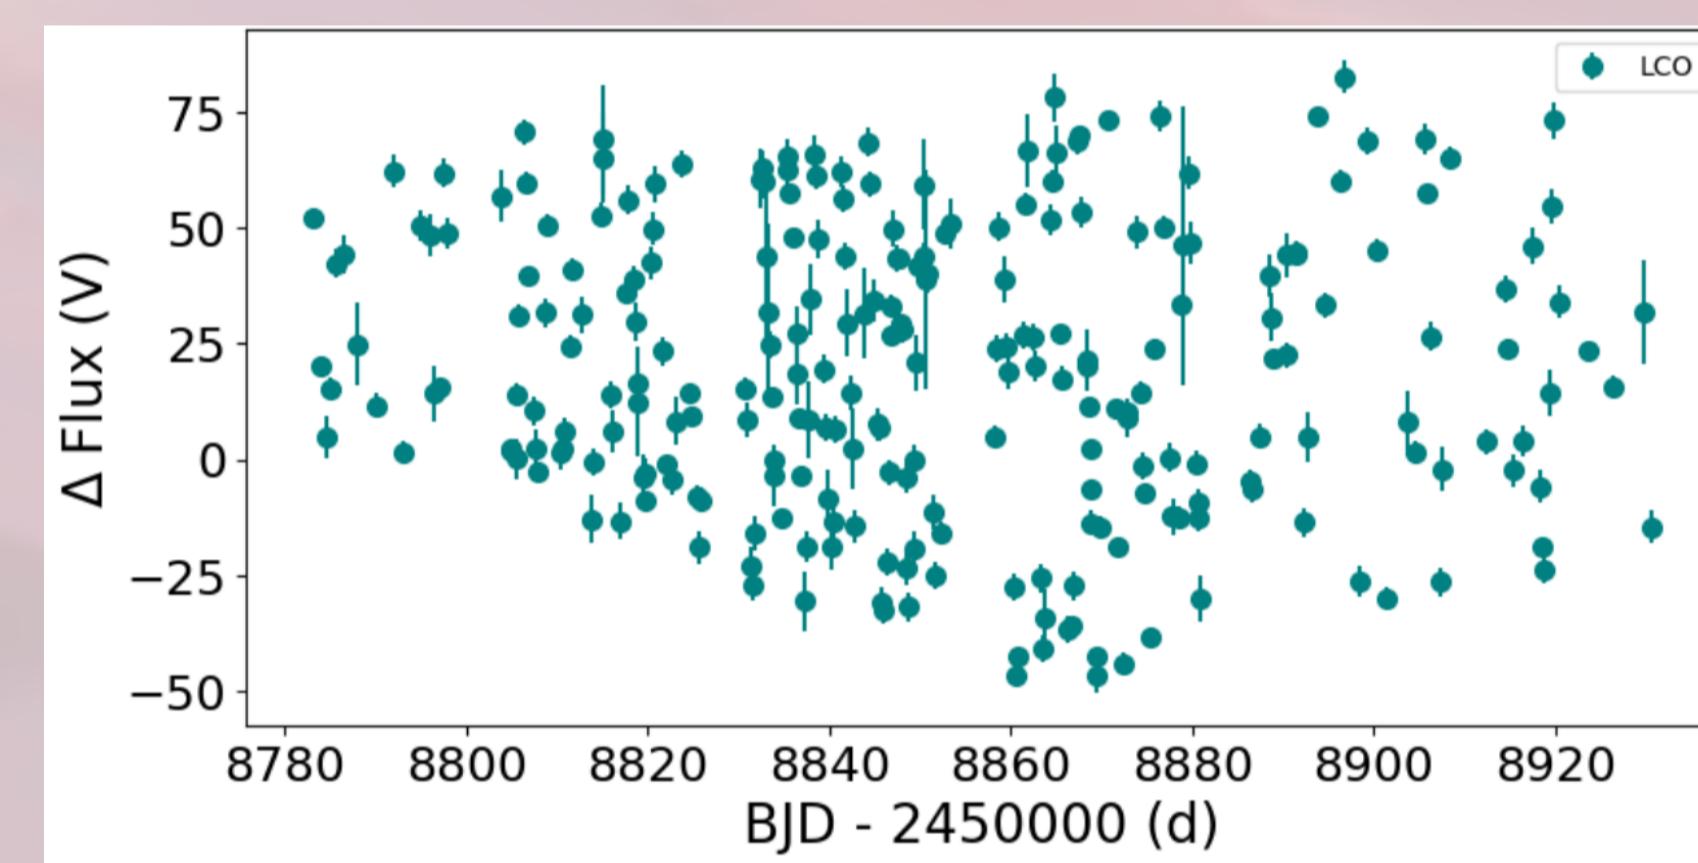

Intense observational campaign

250 RV measurements in 1 year (200 in 5 months)

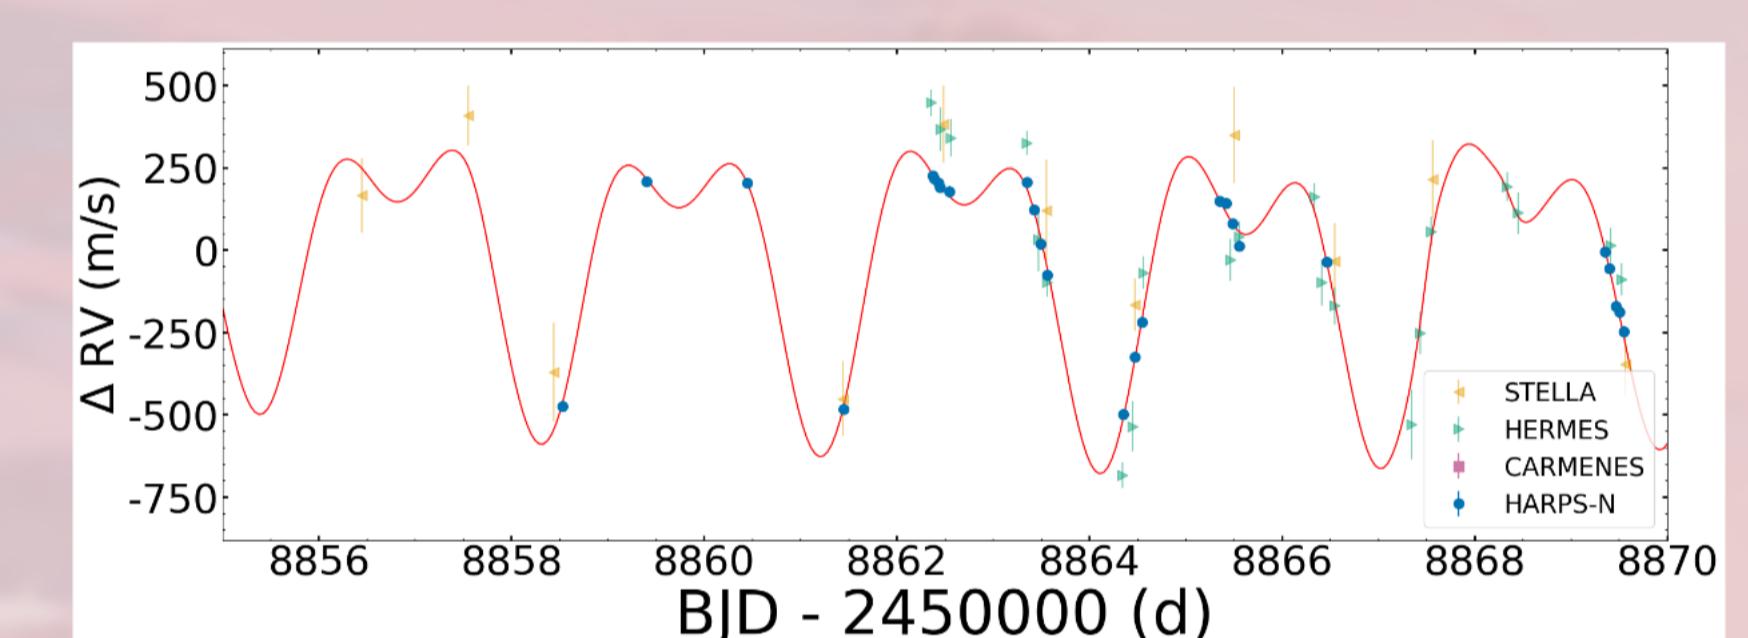

250 photometric measurements in 5 months

Joint model RV+K2+LCO

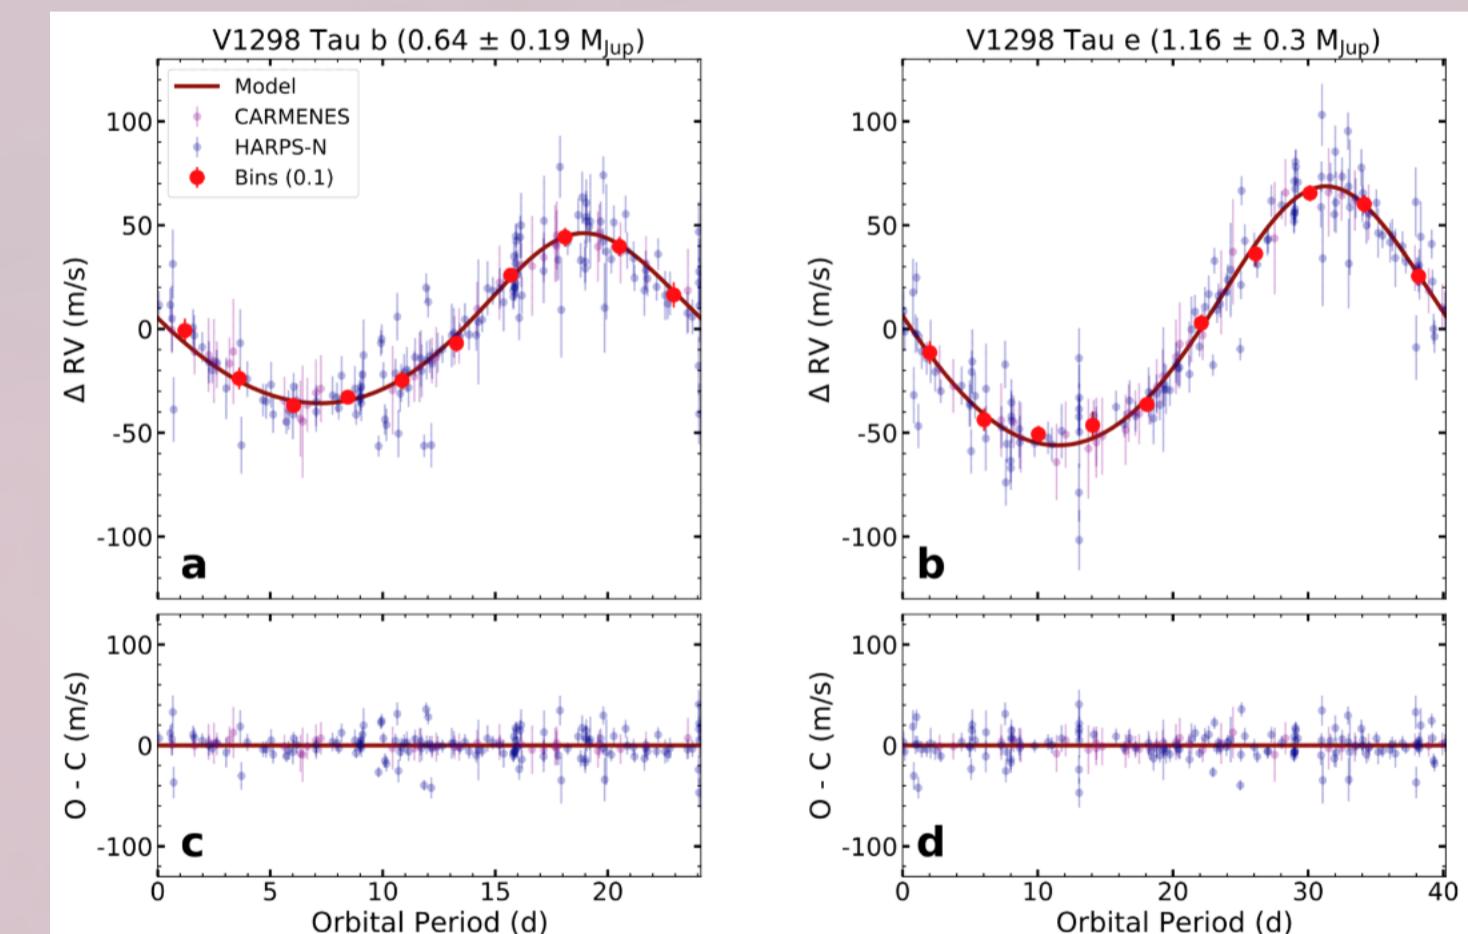

GP regression combining RV and photometry to constrain parameters of stellar activity

Planetary signals?

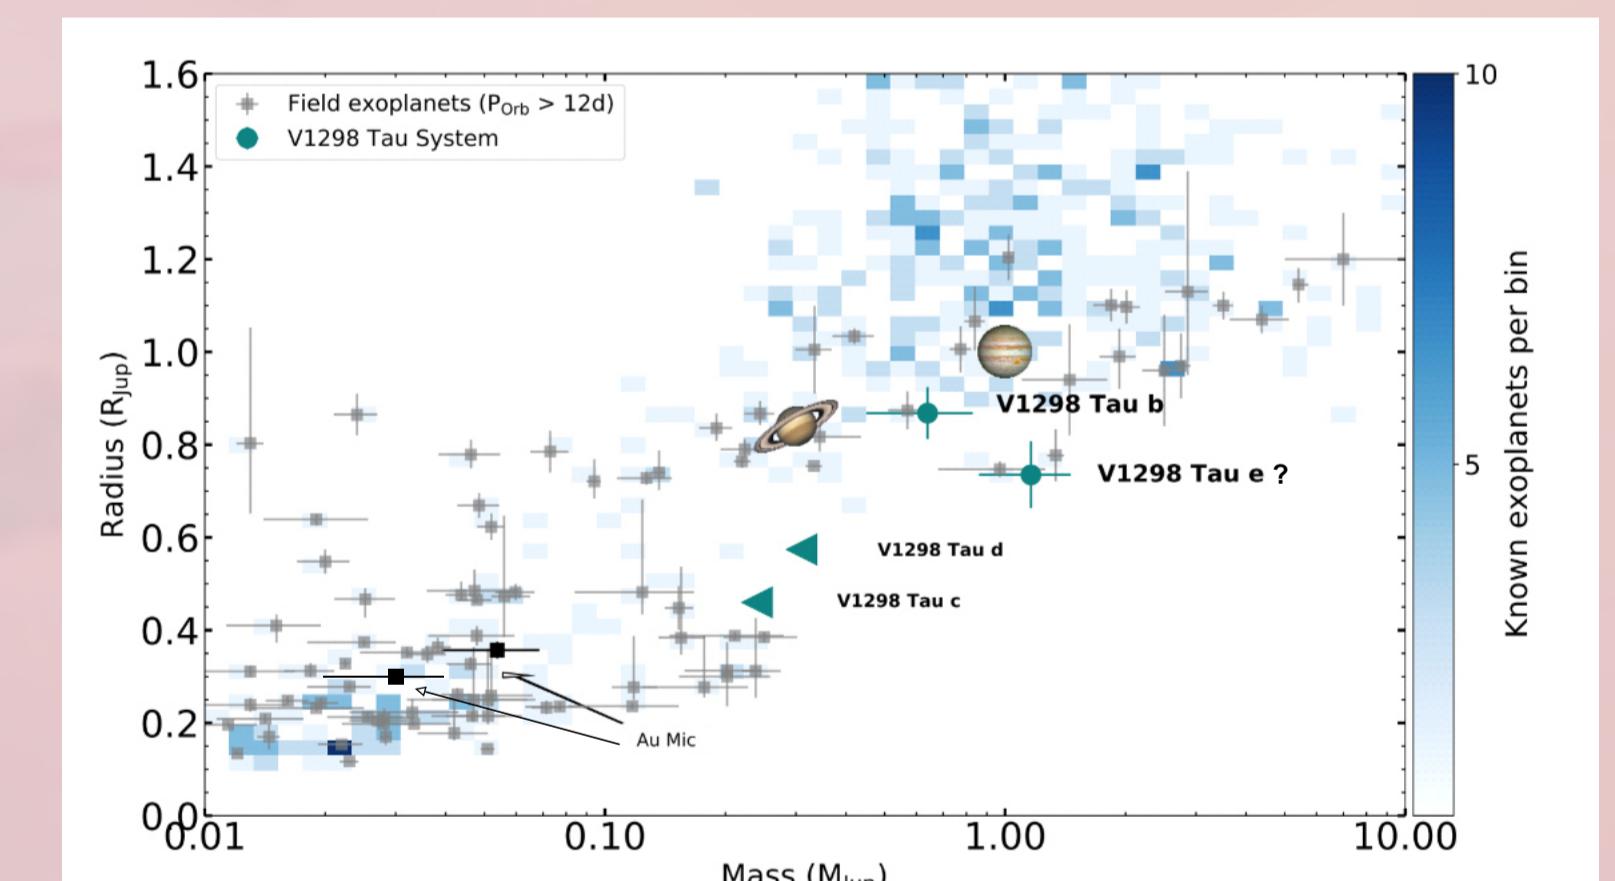

40 m/s at period of planet b

60 m/s signal at 40.2 days period (activity? see Feinstein et al. 2022)

Similar to old planets?

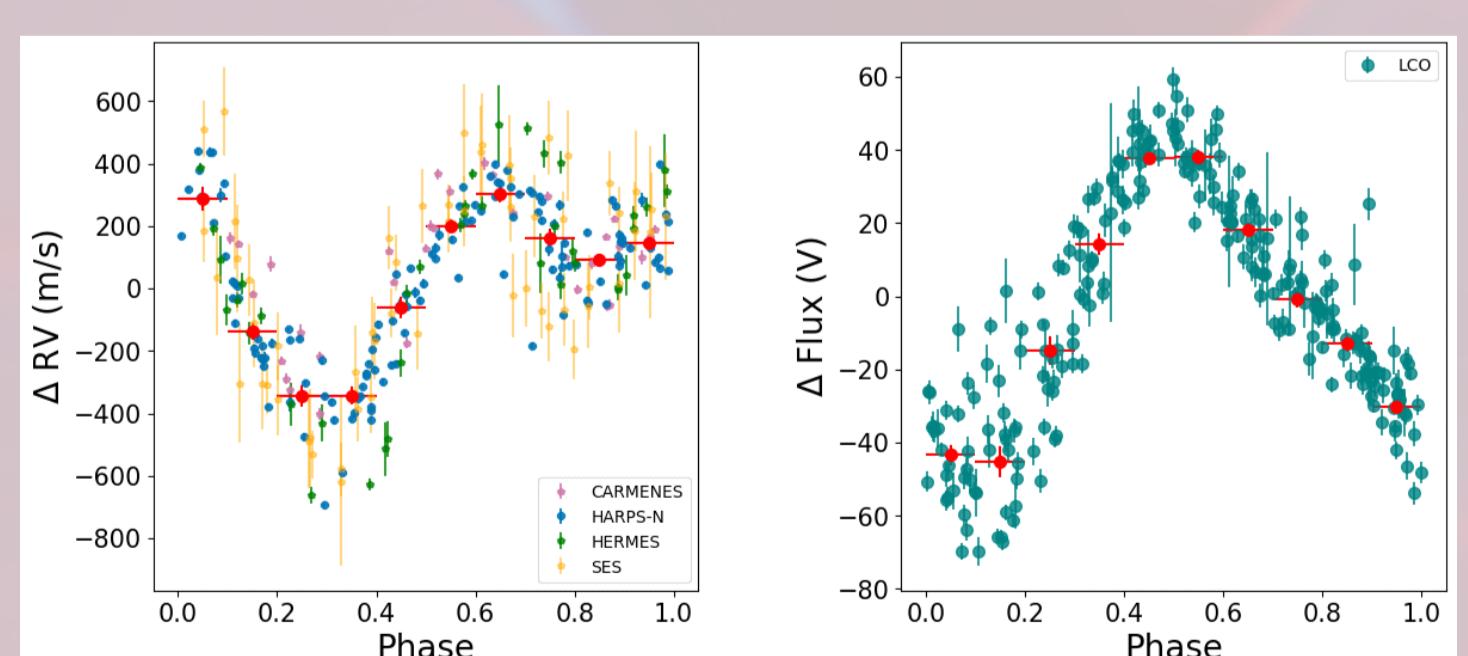

Mass-radius ratio of V1298 Tau b **consistent with solar-system planets**. Similar situation with AU Mic planets.

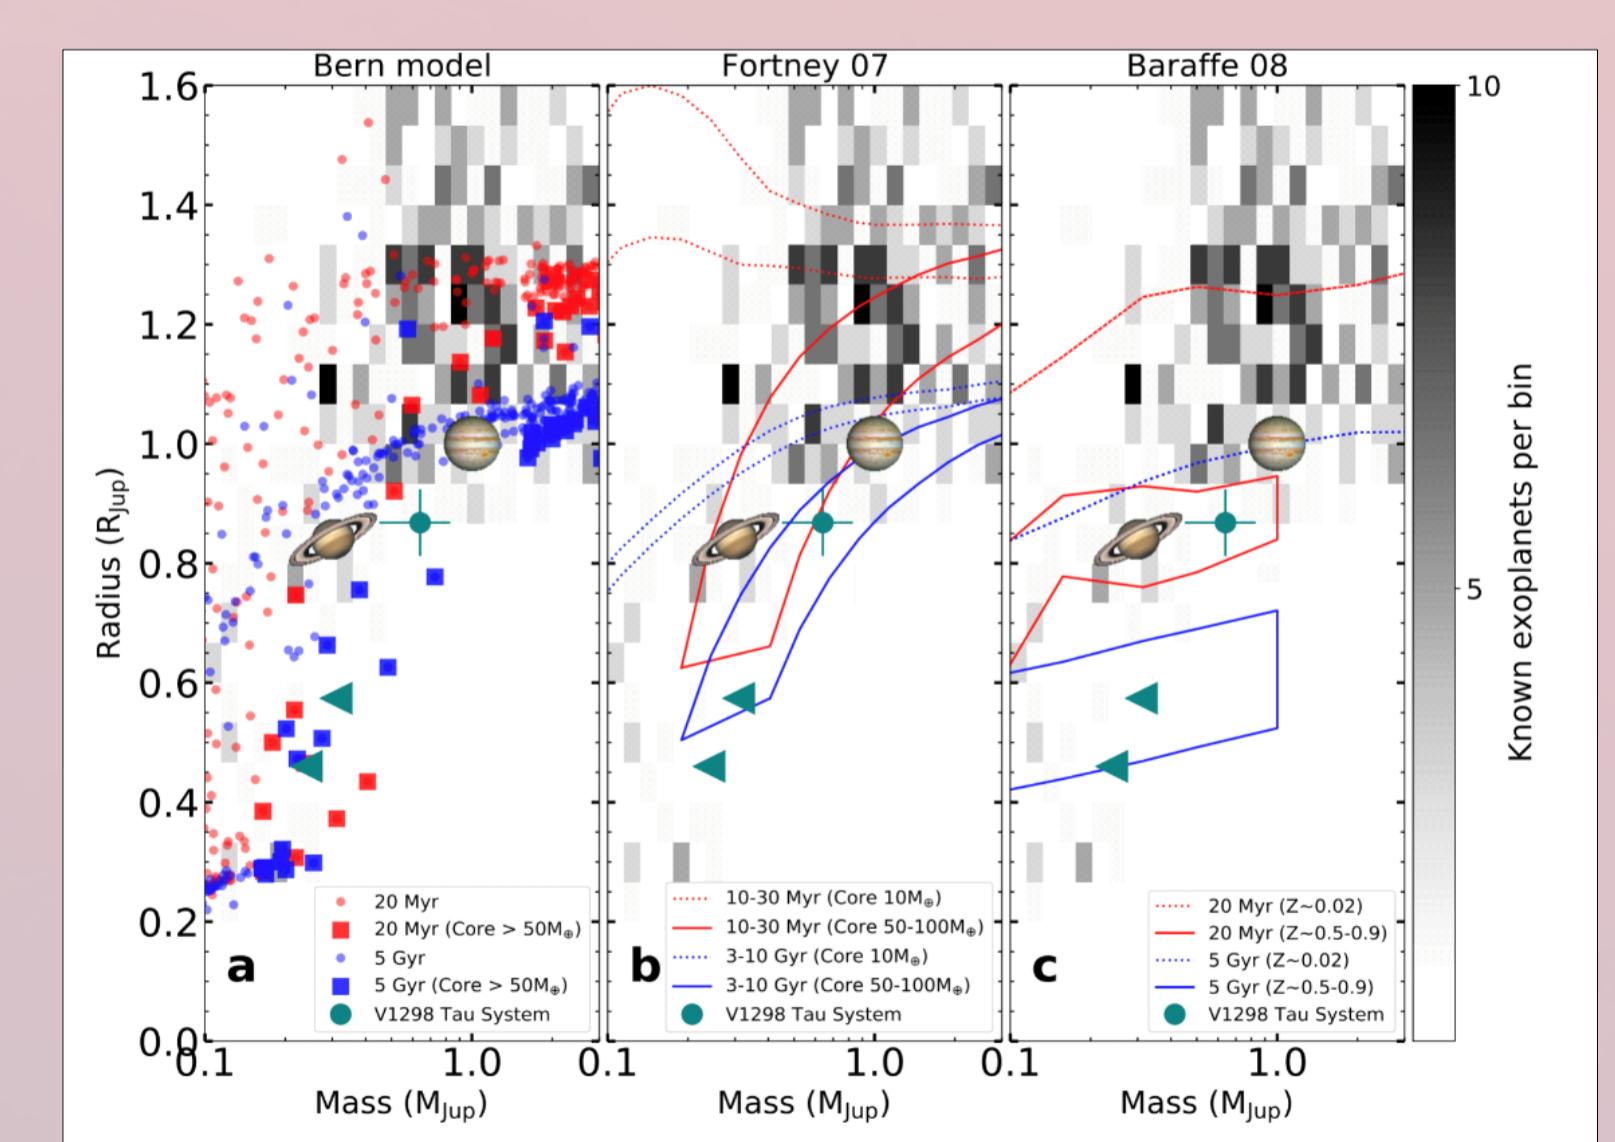

Rotation signal

Stable over ~5 months

More harmonic complexity in RV

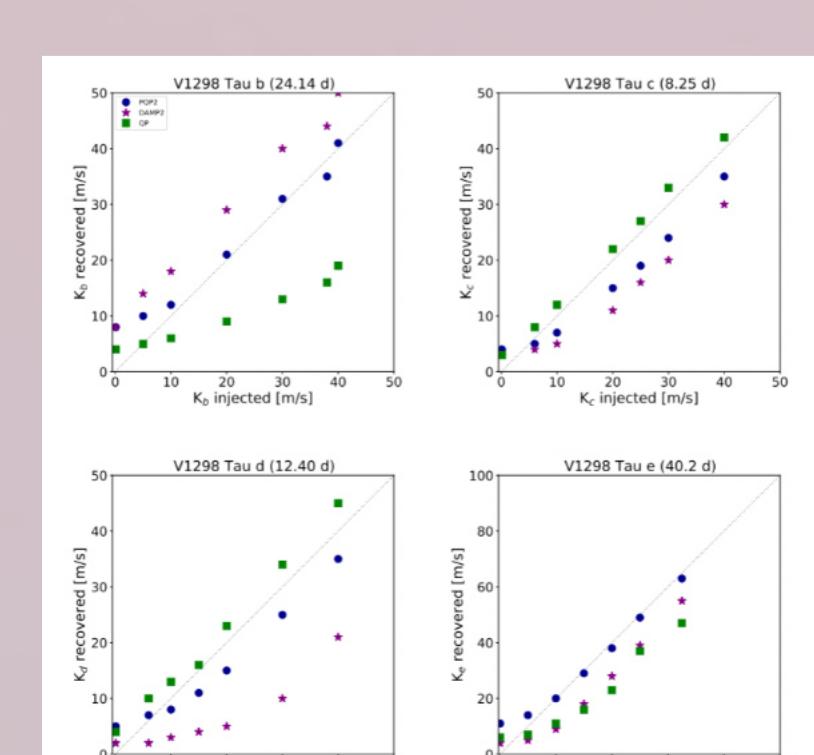

If the mass measurements of V1298 Tau b and Au Mic b and c are correct, **early evolution of young planets is not consistent with current models**.

A word of caution

Different activity models provide different mass measurements.

Injection-recovery tests favour the presented solution, **but... the potential biases introduced by the choice of GP model in low signal to noise scenarios haven't been fully explored within the community**. These biases can potentially affect our understanding of the physical properties of exoplanets.
