About this report

The archaeological potential of Svalbard in the circum-Arctic context continues to be overlooked and its zooarchaeology in particular is much undervalued. Svalbard is far away and expensive to travel to, so without a stepping-stone, no one is simply going to pick up a project on animal bones. We therefore went through the trouble of gathering the material presented here in order to provide such a stepping-stone and to inspire future research in Arctic zooarchaeology and historical ecology.

Lea Kohlhage visually inspected the faunal material in the archives of the Svalbard Museum for one and a half weeks in November/December 2021. Time was short. It always is. Kohlhage therefore ignored the boxes from Smeerenburg, Kokerineset, and Advent City, which are published projects. A quick look into several Russian-led excavations indicated that unworked faunal remains appear not to have been kept. She nevertheless photographed and described assemblages from 15 separate excavations.

Frigga Kruse compared the photographs and descriptions to information readily available online. She searched the collections of the Svalbard Museum¹ and the Digitalt Museum² for photographs and finds from the archaeological sites, but with limited success. Google Scholar³ served as a first indication of whether any excavations had been published. Kruse also owns copies of past excavation reports that are otherwise stored by the Governor of Svalbard⁴. As is often the case, some excavations have been reported well, others not. Barely any pay due attention to the bone assemblages.

It was not our goal to present extensive and exhaustive zooarchaeological research here. In fact, our preliminary identification may not always be correct. We neither studied the available excavation reports and finds lists in detail, nor did we consult *Askeladden*⁵, the official database for cultural heritage in Norway. We leave that up to you.

If we do inspire you, please remember to cite this report, including its DOI, and acknowledge all the effort we put into it. We would like to hear about your project.

L. Kohlhage & F. Kruse

Report: Faunal material at Svalbard Museum

Site name: Festningen

Site function: Not recorded

Excavated in: 1989

Excavated by: Hebba?

Photo archive: Not relevant

Digitalt Museum: Not relevant

Excavation report: Not known

Published: Not known

Location of Festningen in Isfjord. Source: TopoSvalbard.

Box label: TS 8957 a-q Festningen, Tuft 1, Svalbard

Bag number: TS 8957 a

Context: site 1, trial trench, layer 1

Specimen count: 25

Species: reindeer (at least 11x), bird (6x)

Data-rich material: yes

Measurements available: yes

Teeth present: no

Comments: reindeer pelvis fragments (one complete acetabulum), ds tibia, astragalus fragment, rib, vertebrae, px radius; carpals/tarsals (reindeer?); bird shaft fragments

Box label: TS 8957 a-q Festningen, Tuft 1, Svalbard

Bag number: TS 8957 g

Context: site 1, trial trench, layer 2

Specimen count: 29

Species: reindeer (at least 19x), bird (3x)

Data-rich material: yes

Measurements available: yes

Teeth present: yes (reindeer mandible with 2 teeth + loose premolar)

Comments: reindeer ds humeri, px humerus, shaft fragments, vertebrae fragments, astragalus, loose premolar, mandible with 2 molars; MMAM unident fragments; bird shaft fragments

Festningen, 1989. Additional notes:

In August 1991, another excavation took place at Festningodden. It may or may not have been the same site. The 1991 site was threatened by coastal erosion and appears to have vanished since then. Details can be found in the excavation report (Starkov, V. F. 1991. Rapport om den sovjetiske arkeologiske ekspedisjonerns arbeid på Spitsbergen øygruppen i 1991. Norwegian translation by A. Berteig. Unpublished. Available on request from the Governor of Svalbard.) The report lists 81 individual finds. Among these was one bone button.

Report: Faunal material at Svalbard Museum

Site name: Gåshamna (Gåshamna vest)

Site function: whaling station (as per excavation report)

Excavated in: 1991

Excavated by: Helberg, Jensen, Jørgensen (as per excavation report)

Photo archive: Not immediately relevant*

Digitalt Museum: Not known**

Excavation report: Yes***

Published: Not known

*There are seven photos of whale bones and the former whaling station taken around 1983.

**It seems that the online search of the Digitalt Museum does not accept search terms via copy/paste or search terms where Norwegian characters (å, ø, æ) are replaced by English ones (a, o, ae, respectively). This is true for all other sites spelt with Norwegian characters hereafter.

Box label: TS 9019 w, ab, aa, ac, af, ad, Gåshamna 1991

Bag number: TS 9019 w

Context: oven 5, (layer 3), find 22, 31.07.91

Specimen count: ca. 20

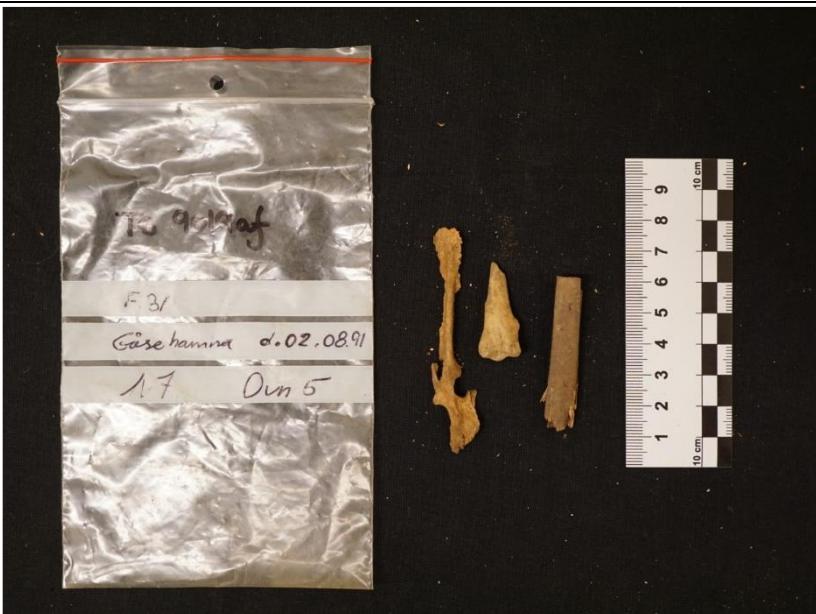

Species: walrus, unident LMAM (presumably walrus)

Data-rich material: yes

Measurements available: no

Teeth present: no

Comments: Description from the excavation report, p. 10: Finds from oven 3, Ts. 9019w div. bones of sea mammals, layer 3 [the oven number contradicts the label on the bag]; walrus mandible fragment with tooth sockets; several unident fragments LMAM

Box label: TS 9019 w, ab, aa, ac, af, ad, Gåshamna 1991

Bag number: TS 9019 af

Context: oven 5, find 31, 02.08.91

Specimen count: 3

Species: MMAM, bird (2x)

Data-rich material: yes

Measurements available: yes (bird bones)

Teeth present: no

Comments: Description from the excavation report, p. 11: Finds from oven 3, Ts. 9019af, outside oven, layer 2 [how can something be 'outside oven' and still have a layer number?]; bird ds humerus, sternum fragment; MMAM rib fragment

	<p>Box label: TS 9019 w, ab, aa, ac, af, ad, Gåshamna 1991 Bag number: TS 9019 ? Context: Specimen count: 4 Species: bird (4x) Data-rich material: yes Measurements available: yes Teeth present: no Comments: bird matching radius + ulna, sternum fragment, unident</p>
--	--

Gåshamna, 1991. Additional notes:

The excavation report provides useful information. Oven 3 was excavated, not oven 5. The finds list for oven 3 comprises bones on five occasions: Ts. 9019f beinfragmenter, Ts. 9019i pattedyrbein, Ts. 9019w div. bein av sjøpattedyr, Ts. 9019ae kvalbarde, and Ts. 9019 af bein. If bag TS 9019 ? is in fact Ts. 9019ae, the piece left in the bag in the photo could be whale baleen. However, bird bones were not originally mentioned in Ts. 9019ae.

Gåshamna, 1992. Additional notes:

In the excavation report's finds list, bones are noted on 70 occasions, namely Ts. 9677**a, c, d, i, j, l, m, o, p, q, r, s** (rørknokkel), **u, z** (frg. av dyrekranie), **ab, aj, ar, aw, ba, bf, bg, bh, bi, bj, bk, bt, bu, bv, bw, ca, cc, cd, ce, cf, ch, cj, ck, cm, co, cq, cs, cv, cw** (fiskevirvel), **cy, db** (kjeve av rev/hund?), **dc, de, df** (bearbeid beinstk.), **dg, dh, dk, dl, dr, ds, dt, dx, eo, ev, fi, fj** (bearb. kvalknokkel), **fq** (frgm. av lærsåle), **fr** (konsentr. av bein), **gf, gh, gi** (bein og del av eggeskall), **gj** (10 beinfrgm.), **go, gp, gr, gs, and gx** (bearbeid bein).

- The finds in bold correspond to the bags covered in the table above. It is unclear what happened to the other bags. It is also unclear if bags were, for instance, put together at some stage post-excavation.
- TS 9677 gg is not listed but contained two bones, one bird, one MMAM.
- TS 9677 gw is not listed but contained a bird pelvis.

Where the report's brief description went beyond the usual *bein*, it is mentioned in brackets. The preliminary description of Ts. 9677 z – fragment of animal skull – indicates that the excavator only had a very basic knowledge of animal bones, or at least bird bones, as the bone in question is a bird pelvis.

Nonetheless, the excavators seemingly collected every bone (and every nail!), so we can assume that the bone assemblage from this excavation was at one stage complete.

TS 9677 fq is not an animal bone but the fragment of a leather sole. Still, it may be the product of a local animal and thus of further research interest. The same can be said for the eggshell in TS9677 gi.

Gåshamna, 1994. Additional notes:

In the Governor's archives, there is an excavation report for Gåshamna from 1993, which mentions animal bones that were, however, not part of LK's visual inspection. We are not aware of an excavation report for Gåshamna from 1994. Judging from the richness of the material, it may have been a house excavation very similar to that of 1992 above. If possible, the report should be tracked down.

Site name: Gipsvika

Site function: “russetuft”, Russian hunting station (as per report)

Excavated in: 1984

Excavated by: Rossnes, Næverstad, Jørgensen (as per report)

**The artefact of interest here is a wooden cube, find location uncertain. The description reads “Denne gjenstanden er trolig en terning. Gjenstanden er trolig fra en av Roger Jørgensens (Tromsø Museum) utgravinger i Gipsvika ved Sassenfjorden. Gjenstanden har trolig vært merket med Ts-nummer: Ts8313BT. Gjenstanden har vært oppbevart på Tromsø Museum og har vært utstilt på Svalbard Museum siden 1995.”

***Jørgensen, Roger. 1984. Rapport fra utgravning i Gipsvika, Svalbard 1984. Tromsø: Tromsø Museum. Unpublished report. Available upon request from the Governor of Svalbard. The file at our disposal does not include a finds list.

Report: Faunal material at Svalbard Museum

Gipsvika, 1984. Additional notes:

The dirt in the finds bags suggests that the bones have not been taken out, let alone looked at since the excavation in 1984. This assemblage contains some exciting material. Future environmental or historical-ecological studies should definitely take the molluscs into consideration.

--	--

Gnåladden, 1989. Additional notes:

The year report of cultural heritage advisor Tonte Hegard for 1989 (available on request from the Governor of Svalbard) states that Hornsund was visited between 3. and 5. July, yet there does not seem to be a separate inspecting report on file.

Hegard also prepared the summary of a meeting (Hegard, T. 1989. Referat fra møte 13.09.89 mellom arkeologer som har arbeidet på Svalbard 1989 – oppsummering av årets feltsesong) that refers to the “polsk-norske prosjekt i Hornsund” (pp. 6). Regarding Gnåladden, it states that the site was discovered in 1988 and that a total of 59 m of trench were excavated in 1989. The statement “Dette var en ny type kulturminne for ekspedisjonen” is not explained further. Bones are not among the finds classes mentioned.

The dirt in the finds bags suggests that the bones have not been taken out, let alone looked at since 1989. As above, this assemblage contains some exciting material.

There are two finds bags labelled 123, but they come from different trenches. To differentiate between them, we added N (trench N) and E (for trench E).

Site name: Kapp Lee*

Site function: Russian hunting station (as per report)

Excavated in: 1995

Excavated by: Roger Jørgensen (as per report)

Photo archive: Not immediately relevant

Digitalt Museum: Yes**

Excavation report: Yes***

Published: Yes****

*There is no archaeological site at the actual Kapp Lee. This site should correctly be called Dolerittneset.

** Object SVB01030 is the lower jaw of a walrus found at Kapp Lee on 2 October 1969. The indexing term is “Naturhistorisk materiale / Natural history Fauna / Fauna” as opposed to archaeology. Maybe it was a surface find.

***Jørgensen, R. (1995) Rapport fra utgraving av russetuft på Kapp Lee, Edgeøya, Svalbard i 1995. Tromsø: Tromsø Museum and Universitetet i Tromsø. Unpublished report. Available upon request from the Governor of Svalbard.

**** Jørgensen, R. (2017). Slutten på en epoke. Pomorenene fangststasjon på Kapp Lee, Svalbard. Viking. 80:203-222. Does not include zooarchaeology.

Location of Dolerittneset on Edgeøya (as opposed to Kapp Lee further north). Source: TopoSvalbard.

Comments: fish vertebrae (5x) + other; bird shaft fragments + other; walrus cranium fragment with part of tusk socket; MMAM/LMAM sternum, rib, unident fragments

Kapp Lee, 1995. Additional notes:

The Russian hut was excavated twice, first by Arne Dalland (1968) and again by Roger Jørgensen (1995). Dalland's hand-written report (*Utgraving av gammal russisk fangsthytte ved Kapp Lee, Edgeøya*) was not checked for animal bones in detail. Jørgensen's (1995) report mentions that "det blei gjort 275 katalogiserte funn, i tillegg kommer en mengde dyrebein". Oddly, the animal bones were initially given consecutive find numbers but later removed from the submitted finds list – with the exception of three polar bear teeth (see below).

Included in the report's finds list are leather (65, 70, 176, 199, 218, 253, 254, 361, 342 [sic: 362 - FK], 395, 396) and hide or fur (369, 394). These could have been imported or, more interesting for further study, produced locally.

Also in the finds list – as opposed to being among the separated bone assemblage – are polar bear teeth (260, 319, 339).

Numbers that appear neither in the report's finds list nor in the bags of bones above are 4, 7, 27, 39, 41, 47, 49, 56, 60, 74, 82, 91, 118, 120, 121, 133, 135, 137, 138, 148, 150, 161, 162, 169, 182, 193, 200, 208, 212, 213, 220, 230, 233, 235, 241, 242, 249, 256, 257, 258, 264, 265, 268, 270, 272, 279, 284, 286, 290, 294, 296, 301, 305, 307, 308, 310, 311, 317, 327, 330, 349, 353, 368, 372, and 384.

Report: Faunal material at Svalbard Museum

Site name: Kapp Wijk

Site function: Russian hunting station (as per report)

Excavated in: 2001 & 2002

Excavated by: Richard Woolley and others (as per report)

Kapp Wijk, 2001 & 2002. Additional notes:

From the report (2003): "Gjenstander av bein og gevir. Det ble funnet kammer (Kw 1221 og 1311) og nåler (Kw 1309, 1312 og 1314) av bein og gevir. I tillegg ble det funnet et munnstykke (Kw 1222) laget av gevir. Det ble funnet flere andre gjenstander laget av gevir og bein, men mange av disse synes å være uferdige. Det ble funnet en gjenstand av bein som trolig er laget av hvalbein grunnet tyngden (Kw 1848). Det lå hvalbein spredt rundt omkring på feltet (Feltfoto 3.16), og under utgravnningen ble det funnet noen fragmenter av bearbeidet hvalbein. Under utgravnningen ble det også funnet beinrester. **Det er imidlertid kun kjever og tanner som er tatt med i funnfortegnelsen** [our highlight – FK]. I alt ble det funnet **svært få beinrester**; noen få rein- og revekjever og litt gevir. Det ble også funnet rester av fugleskaller."

From the report and the photos above, it is clear that bone/antler ("ecofacts") and worked bone/antler ("artefacts") were separated by the excavators and that a strong selection for fox mandibles and crania took place without mention of what happened to any deselected bone/antler, bird bone or fish bone.

In the report's finds list, other finds would be of interest to a thorough zooarchaeological study. These are

- gevir (antler): Kw 1082 (worked; initially transferred to NTNU for conservation), 1208 & 1221-1222 & 1282 (worked; initially transferred to Sysselmannen)
- lær og tekstil (esp. locally produced leather but not so much the textiles): Kw 1155-1204 (NTNU), 1270-1272 (NTNU), 1275-1276 (NTNU), 1315-1370 (NTNU), 1372-1400 (NTNU), 1412 (NTNU), 1480 (NTNU)
- bein og gevir (bone and antler): Kw 1309-1314 (worked; Sysselmannen), 1683-1687 (worked; Sysselmannen), 1841-1861 (1848, 1854, 1860, and 1861 may be whale bone; Sysselmannen)
- bein (bone): 1661-1662 (Sysselmannen), **1690-1701** (*not originally photographed; Sysselmannen*) [in table above], **1950-1958** (*not originally photographed; Sysselmannen*) [in table above].

Rekvika, 1989. Additional notes:

The cultural heritage advisor Tonte Hegard prepared the summary of a meeting (Hegard, T. 1989. Referat fra møte 13.09.89 mellom arkeologer som har arbeidet på Svalbard 1989 – oppsummering av årets feltsesong; available on request from the Governor of Svalbard) that states

“[Roger] Jørgensen redegjorde for de arkeologiske arbeidene utført i regi av Kulturvernet/Tromsø Museum. Det er i år gravet på tre lokaliteter på nordvest-Spitsbergen: Tuft i Rekvika, nødgravning av fire graver på Liknesset [sic] og trankokeri i Scheibukta:

“Rekvika: Her gravet de en tuft som ble registrert/oppmålt av Rossnes og Gisle Løkken i 1988. Lokaliteten består i dag av en nyere hytte som er bygget inntil en pomortuft.

„Det ble foretatt utgraving i ytre del mot nord. Liksom i Ekrollhamna finnes ulike ulike [sic] byggteknikker i samme hus. Totalt fant man ca. 190 løsfunn, overveiende tregjenstander. [...]”

Scheibukta, 1989. Additional notes:

Molaug, S. (1968, Hvalfangst på 1600-tallets Svalbard, NPI) include the section “Undersøkelser av minner fra hvalfangsttiden – Scheibukta” (p. 15 – 35), which states that fieldwork already took place there in 1966. It includes several photos and drawings. *Bein* or *ben* find practically no mention.

Foreløpig rapport fra Norsk Arkeologisk/Biologisk Undervannsekspedisjon (N.A.B.U.) Spitsbergen 1966, unpublished report, is available from the Governor of Svalbard.

Chochorowski (1991, Archaeology in the investigation of the history og human activity in the region of Svalbard, Polish Polar Research 12 (3), 391-406) mentions “S. Malaug’s [sic] partial uncovering of the remnants of the Scheibukta whaling station (Smeerenburgfhorden) in 1968 [sic?]” (p. 396).

Albrethsen (1989, cited above) mentions the partial re-excavation of a blubber oven in Scheibukta by himself.
