

# ***IN SITU DIFFRACTION EXPERIMENTS AT THE NAGOYA UNIVERSITY BL2SI BEAMLIN***

**Chavas Leo, Umena Yasufumi, Onoda Hiroki, Ghosh Swagatha**

**Nagoya University, Japan**

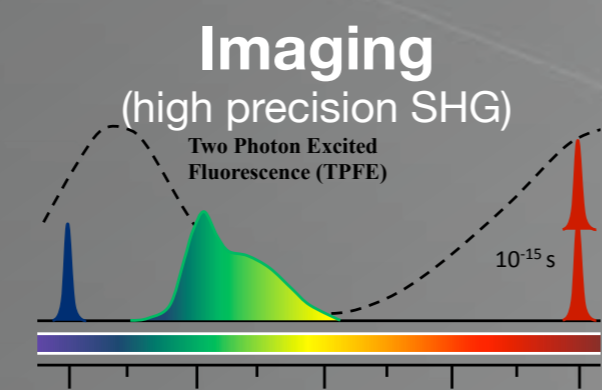

# Motivations: easier sample handling

Cloning      Expression      Purification      Crystal screening      Crystal mounting      Crystal freezing      X-ray diffraction      Structure

**Cloning**  
(ivMX plasmid library)

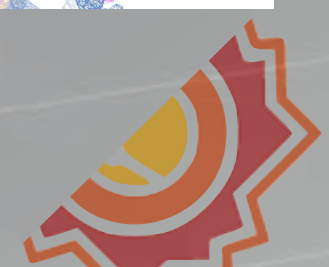

**Cell biology**  
(expression facility)

**Serial trapping**

(Structure solution)  
**MX**

# Why microfluidics?

**Microfluidics = handling of small-scale fluids (typically sub-millimeter)**

**There are two distinct processes practically applied:**

**passive fluid control  
uses capillary forces**

**active fluid control  
uses active components such as pumps**

# Passive fluid control

## Quick experiment:

- choose a capillary with the proper inner diameter ( $\sim$  beam size)
- setup crystallization conditions

100  $\mu$ m ID

small volume batch crystallization

20  $\mu$ L tip

capillary

protein crystals

# Passive fluid control

## Quick experiment:

- choose a capillary with the proper inner diameter (~ beam size)
- setup crystallization conditions
- pick up and mount the capillary
- perform diffraction experiments

SUBSET OF INTENSITY DATA WITH SIGNAL/NOISE  $\geq -3.0$  AS FUNCTION OF RESOLUTION

| RESOLUTION LIMIT | I/SIGMA | R-meas | CC (1/2) | Anomal Corr | SigAno | Nano |

Chavas et al. (submitted)

# Active fluid control

## Crystallization via tubing:

- using syringes, micropumps, pressure controllers ...
- much more sophisticated setup to permit matrix screening
- systematic and repeatable drop size, easily scalable
- room for improvement (addition of inlets for ligand screening)

Gerard et al. (2017)

# Active fluid control

## Crystallization via tubing:

- . using syringes, micropumps, pressure controllers ...
- . much more sophisticated setup to permit matrix screening
- . systematic and repeatable drop size, easily scalable
- . room for improvement (addition of inlets for ligand screening)
- . the capillaries can be used mounted for in-flow Serial SX

Chaussavoine et al. (2020)

# Active fluid control

## Crystallization via tubing:

- using syringes, micropumps, pressure controllers ...
- much more sophisticated setup to permit matrix screening
- systematic and repeated
- room for improvement
- the capillaries can be
- the same capillaries can be used for harvesting the crystals for more classical cryo MX

Crystallization via tubing microfluidics permits both in situ and ex situ X-ray diffraction

**A total of 21 data sets of 20 degrees each were merged to improve the statistics at higher resolution and limit possible damages from X-ray radiation**

**The electron density is neat and does not show strong signs of radiation damages.**

# Chip devices - crystal trapping

One can also take advantage of the fluidic properties to play with the samples.

There is a similitude between fluidics and resistance:

- the fluid will go through the less resistive path
- if the path is blocked, the fluid will look for another path of smaller resistance

These properties can be applied to serial trapping of samples.

Lyubimov et al. (2015)

# Chip devices - crystal trapping

One can also take advantage of the fluidic properties to play with the samples.

While increasing the number of traps, it is possible to multiply the number of samples that can be trapped

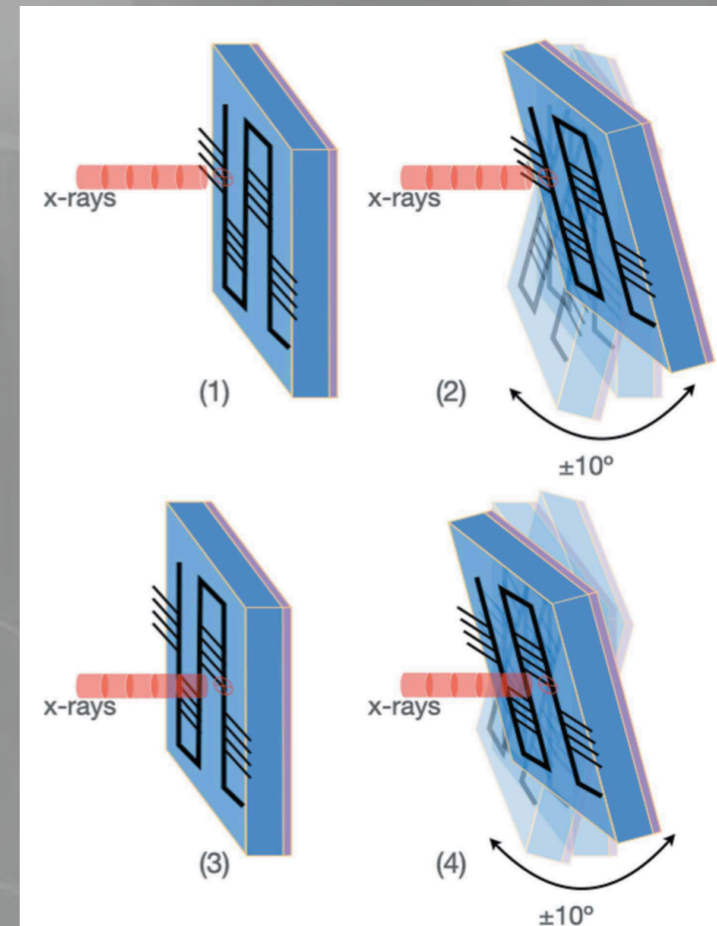

# Chip devices - crystal trapping

**The main advantage of the trapping chips lies in their adequacy toward the full automation of data collection**

**The known location of the traps permits an automated data collection procedure of small wedges without prior manual sample centering**

**The frame around the chip is adequate for handling using a robot with adapted tongs**

Chaussavoine et al. (2022)

# Handling at the beamline

**To optimize data quality, we aim at minimizing the background while preserving the capacity to rotate the sample**

**This is a major challenge at MX beamlines where the sample environment is fixed.**

**What are the possible causes of noise?**

Every aperture is a new source of scattering and noise.

A long path through air results in a scattering background.

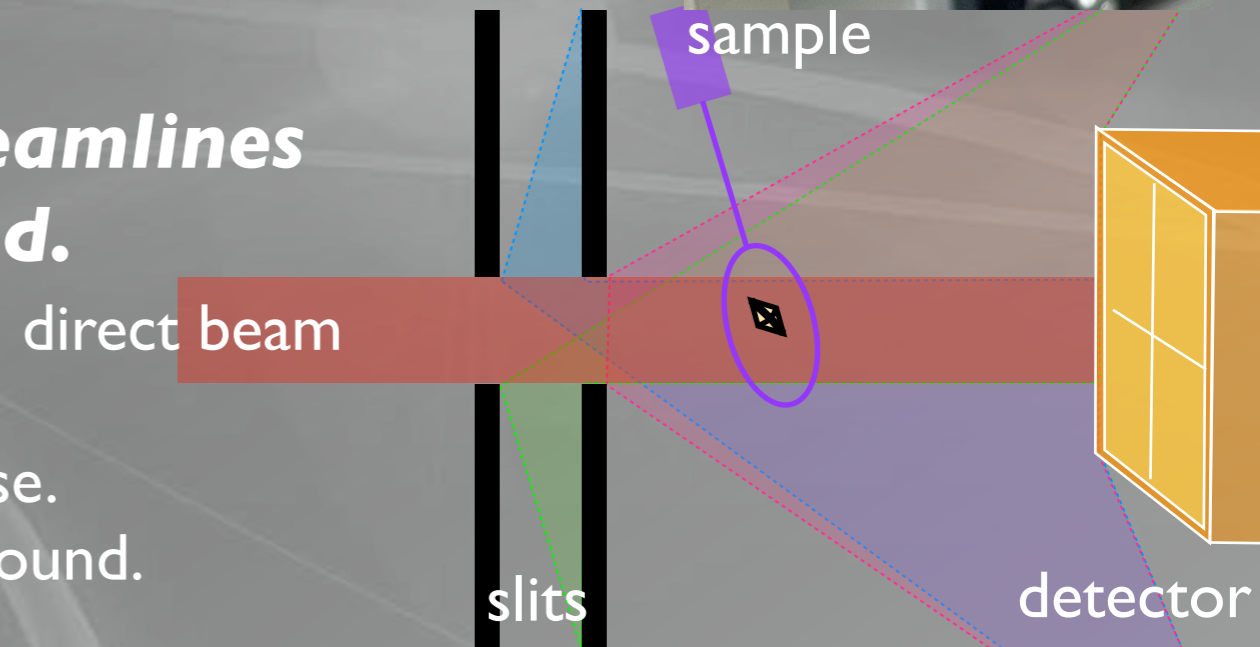

An X-ray beam larger than the crystal will increase the noise.

A crystal loss in a large quantity of buffer will show a large background.

The latest slits met by the X-ray beam should be brought as close as possible to the sample.

The direct-beam stopper should be brought as close as possible to the sample.

The detector distance should be kept short to avoid air scattering and allow reaching the highest resolution.
