

**Figure S1. Number of detected proteins related to different protein classes and effect of an additional normalization.**

A – Number of proteins related to different protein classes was examined using the Panther Protein Class database.

B – The median ratio of protein expression (after to before Dry Immersion) without (above) and with normalization (below) was shown for each volunteer. GAPDH, RPLP0, ACTA1 depict in red. The additional normalization slightly decreased the interindividual variability.
