

Tilløbsprognoser til renseanlæg - *driftsfordel med Machine Learning?*

Sten Lindberg, DHI
Barbara Greenhill og Dines Thornberg, BIOFOS

Agenda

- Hvorfor?
- Metode og resultater
- Virker det?
- Afrunding, QA

BIOFOS catchment area

15 municipal owners

- 9 shareholders
- 7 utility companies (clients)
- 1.2 million inhabitants
- 3 wastewater treatment plants
- 60 km sewer system, 5 basins and 2 pumping stations
- Mostly combined sewer system
- Dry and wet weather operations at the WWTP

28.000 m³/t

Tilløb Damhusåen rensel anlæg juni 2021 – oktober 2022

Tør/regnvejrs grænse 6400 m³/time

300 skift – eksisterende varsel system -> 600 skift

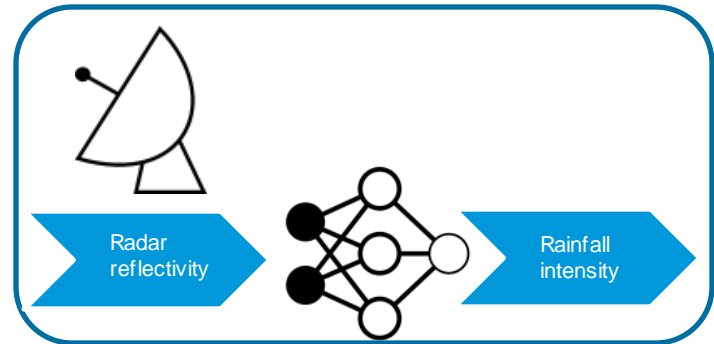

Metode og resultater

Inflow prediction – Machine Learning

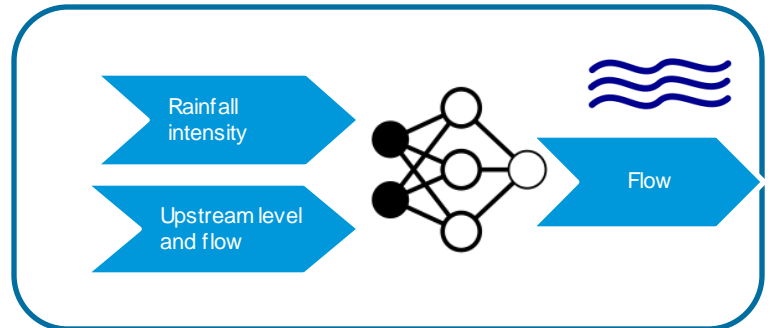

Training

- Training data, 4 different data sources (BIOFOS, Novafos, HOFOR, DMI)
- Training period min. 12 months
- Different ML variants, End-points

Real time

- DMI radar data, 25 level, flow and rain sensors
- 14% of time all data available
- 35% of time Novafos data

Inflow prediction – MIKE+ and STAR

MIKE+ Hydrodynamic model

MIKE+

1 h hindcast, 3 h forecast, 10 min resolution

STAR – linear reservoir model

STAR

2 h forecast, 30 min resolution

KPI reports

Styring	Average of ME	Average of ME _{neg}	Average of ME _{pos}	Average of RMSE	Count of ME _{neg}	Count of ME _{pos}	Count of RMSE
ML 030	325	-676	807	775	2145	5450	9192
ML 060	325	-697	799	781	2124	5596	9192
ML 090	321	-742	808	801	2123	5597	9192
ML 120	333	-784	816	812	2025	5695	9192
STAR 030	142	-1052	839	1025	3757	6735	12000
STAR 060	80	-1375	882	1110	3688	6837	11997
STAR 090	51	-1516	904	1163	3679	6847	11998
STAR 120	33	-1598	910	1193	3661	6862	11995

3 Main KPI

MACHINE LEARNING		
MEpos	Average of RMSE	Count of f
30 m	807	775
60 m	799	781
90 m	808	801
120 m	816	812

STAR CONTROL		
30 m	839	1025
60 m	882	1110
90 m	904	1163
120 m	910	1193

The inflow predictions of the ML forecasts, expressed as RMSE, is around 30% better than the existing STAR and the hydrodynamic model results

The ML routine provides a significant improvement in the number of wrong switches, in the order of a 90% reduction

The prediction of the dry weather for 12-24-36 h ahead, has an accuracy score of around 75-80%

Virker det?

Values and next

- ML reduces the number of false dry- to wet weather shifts
- ML is fast and robust

- Stabilize the data flow
- Continue to evaluate performance until June 2023

ML reduces the number of false start by 90%

ML predicts correct high flows for 60% of all occurrences, existing STAR predicts 30%

From December 2022 to June 2023

Continued evaluation and updated performance numbers
