Introduction

Introducing MOBIS, the ultimate tool for citizen science app creators. The MOBIS software development kit includes a robust and open sourced back end, front end software, and an example app using popular development tools.

The service is designed to bring together a wide range of citizen observatories, from biodiversity to environmental, and provide common functions such as single sign on and interoperability standards.

With Mobis, you'll have everything you need to create a successful citizen science app. Our service is targeted towards developers looking to create innovative and impactful citizen science apps. Whether you're a seasoned developer or new to the field, Mobis is the perfect tool to help you achieve your goals.

Executive Summary

D4.5 (MOBIS) is a software framework that allows developers and CO owners to create integrative citizen science applications. Citizen science involves the participation of members of the general public in scientific research, often through the use of technology.

The Mobis Framework enables developers to build applications that allow citizens to contribute data, observations, and other information to scientific research projects in a seamless and intuitive manner.

One of the key benefits of the Mobis Framework is that it is built on top of the well known Ionic Framework along with the PARSE back end server, which is a popular and widely-used framework for building mobile applications. This means that developers can leverage the power and flexibility of the Ionic Framework to create robust and feature-rich citizen science applications that can be used on a variety of devices, including smartphones and tablets.

In addition to its built-in support for the Ionic Framework, the Mobis Framework also includes a number of other features and tools that make it easy for developers to create integrative citizen science applications. We integrated Cos4Cloud observatories for

example, Canair.io CO2 and PM25, iSPEX and PlantNet are in. All the code is open source and documented.

More information and full source code for example apps are available in the following repository: https://github.com/DDQ-NL/MOBIS_PUBLIC

The MOBIS service is available through the EOSC marketplace and our landing page:

<https://marketplace.eosc-portal.eu/services/mobis-mobile-observation-integration-service>

MOBIS

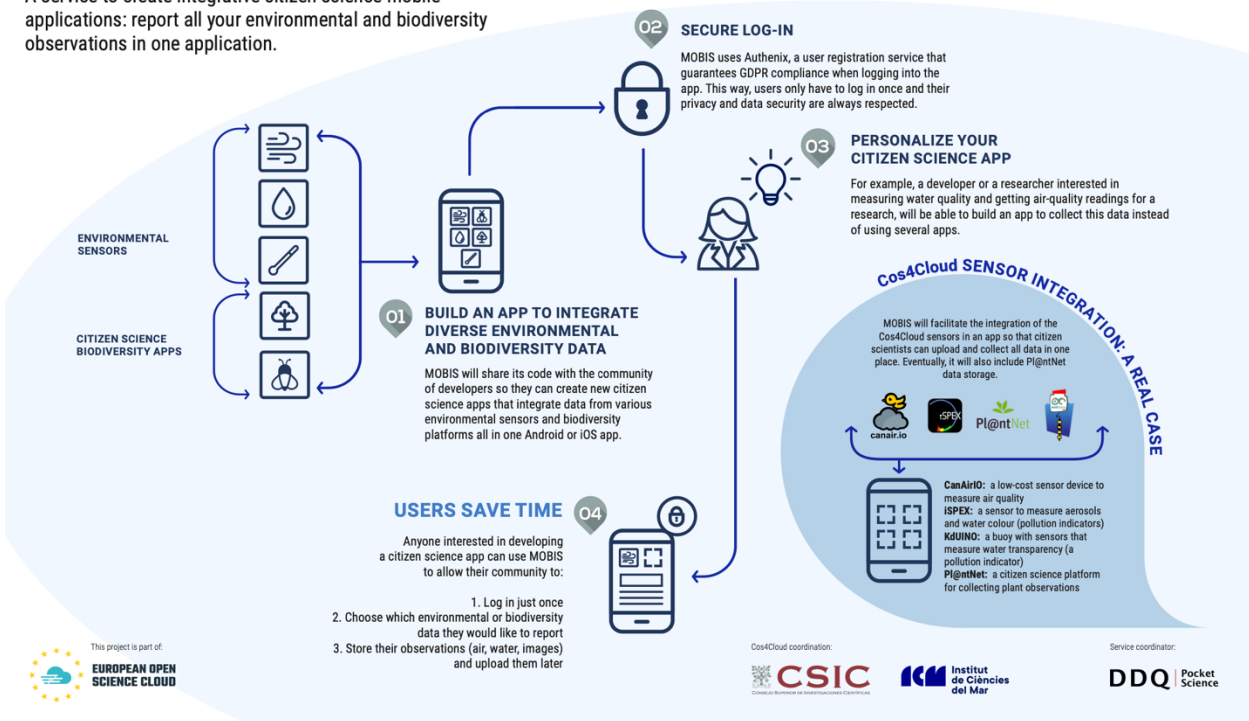

MOBILE OBSERVATION INTEGRATION SERVICE

Why should you use MOBIS?

A service to create integrative citizen science mobile applications: report all your environmental and biodiversity observations in one application.

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 833463

01 BUILD AN APP TO INTEGRATE DIVERSE ENVIRONMENTAL AND BIODIVERSITY DATA

MOBIS will share its code with the community of developers so they can create new citizen science apps that integrate data from various environmental sensors and biodiversity platforms all in one Android or iOS app.

02 SECURE LOG-IN

MOBIS uses Authenix, a user registration service that guarantees GDPR compliance when logging into the app. This way, users only have to log in once and their privacy and data security are always respected.

03 PERSONALIZE YOUR CITIZEN SCIENCE APP

For example, a developer or a researcher interested in measuring water quality and getting air-quality readings for a research, will be able to build an app to collect this data instead of using several apps.

04 USERS SAVE TIME

Anyone interested in developing a citizen science app can use MOBIS to allow their community to:

1. Log in just once
2. Choose which environmental or biodiversity data they would like to report
3. Store their observations (air, water, images) and upload them later

Cos4Cloud SENSOR INTEGRATION- A REAL CASE

MOBIS will facilitate the integration of the Cos4Cloud sensors in an app so that citizen scientists can upload and collect all data in one place. Eventually, it will also include Pl@ntNet data storage.

CanAirIO: a low-cost sensor device to measure air quality
iSPEX: a sensor to measure aerosols and water colour (pollution indicators)
KdUINO: a buoy with sensors that measure water transparency (a pollution indicator)
Pl@ntNet: a citizen science platform for collecting plant observations

This project is part of:

Cos4Cloud coordination:

Service coordinator:

MOBIS DEVELOPMENT

Mobis can be separated in two parts: MOBIS back end and MOBIS framework.

- Server side Mobis server: the mobile Back end As a Service (BAAS)
- Client side (front end) framework: a set of scripts and plugins for generating citizen science apps with one codebase

-

MOBIS REQUIREMENTS

Back end

Hardware and software

For the demonstration back end we use an Ubuntu server with NodeJS, Parse server, Express and Docker CE for the Sensor Things API

A running instance of Parse server (www.parseplatform.org). Back4App provides a possibility to create servers on the fly, but you can always setup your own using the guides on <https://www.parseplatform.org>

Front end

Ionic is a free, open-source framework for building mobile applications with web technologies such as HTML, CSS, and JavaScript. It allows developers to build cross-platform mobile apps for iOS, Android, and the web with a single codebase. MOBIS uses the Ionic framework to develop the front-end of the mobile application, which is then integrated with sample MOBIS plugins such as iSPEX, Mini Secchi, Canair.io, and PlantNet. The code for the MOBIS is available on GitHub and can be used to generate apps for iOS, Android, and the web (limited to Google Chrome).

The code is available and maintained on https://github.com/DDQ-NL/MOBIS_PUBLIC

MOBIS TESTING ENVIRONMENT

The MOBIS testing server resides on the EGI (IFCA) and consists of an Ubuntu Virtual Machine with Parse Server as the mobile back end and MongoDB for data storage. It also hosts a Fraunhofer Sensor Things API instance.

Parse mobile backend

All data are stored in the MOBIS parse back end. Parse is an open source framework. It can be accessed through REST/JSON calls on this endpoint:

<https://mobis.pocket.science/parse/>

For user convenience we have a sample dashboard to look up data:

objectID	PM25	altitude	record_UID	CO2	output_json	PAX	datetime_unix	device_UID	ses

Interoperability: OGC SensorThings API

The OGC SensorThings API provides an open, geospatial-enabled and unified way to interconnect the Internet of Things (IoT) devices, data, and applications over the Web. It is less used in the biodiversity domain so far, but it has the advantage of making biodiversity data more interoperable with other types of geo-spatial data (e.g. air quality measurements, sound environment measurements and weather sensors).

The API is accessible through the following end-point:

<https://mobis.pocket.science/sta/>

We are still experimenting with sta plus, because of performance issues we keep offering V1.1

Example sta record (Pm2.5) coming from a canair.io device

```
{
  "value": [
    {
      "@iot.id": 20968,
      "phenomenonTime": "2021-10-10T10:07:25.000Z",
      "result": 44,
      "resultTime": null,
      "@iot.selflink": "https://prod3.ddg.nl/sta/v1.1/Observations(20968)",
      "FeatureOfInterest@iot.navigationLink": "https://prod3.ddg.nl/sta/v1.1/Observations(20968)/FeatureOfInterest",
      "Datastream@iot.navigationLink": "https://prod3.ddg.nl/sta/v1.1/Observations(20968)/Datastream",
      "MultiDatastream@iot.navigationLink": "https://prod3.ddg.nl/sta/v1.1/Observations(20968)/MultiDatastream"
    }
  ]
}
```

*(Note that the server mentioned here is our own development server, not the mobis one)

Interoperability: Authenix integration

We have implemented generic OAUTH2/PKCE support for our mobile back end (Google/Apple tokens). We decided to integrate with Authenix on the server-side to facilitate secure login and ensure interoperability with this COS4CLOUD service.

Design

We provided an app icon, styling and theming are not taken into consideration, but it is relatively easy to implement using the ionic framework css and resourcing.

Implementation

User authentication (Oauth2/Email/Google/Apple sign on)

- Push notifications
- Back end connectivity
- Offline support/sync
- Geolocation
- Multilingual

Supported COS4CLOUD CO'S

From left to right: Pl@ntNet, Mini Sechi, Canair.io

iSPEX

water

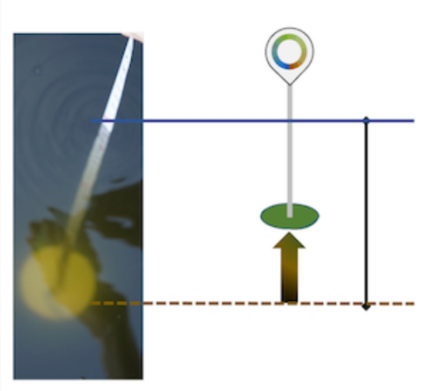

d + Write	90.07	Fri Sep 23 2022 04...	(undefined)
d + Write	89.01	Wed Sep 07 2022 12...	50.8581154960645

Mini Secchi (Note: this is a CO outside COS4CLOUD, but a nice addition for environmental monitoring)

← Colour at half depth

The Secchi depth is: 0 cm
Raise the disk to half the Secchi disk depth: 0 cm Record the Forel-Ule colour of the disk at this depth (use the colour scale on the handheld device). In addition, if it is safe to do so, take a photo of the disk in the water at this depth using the button at the bottom of this screen.

The colour of the disk in the water is most similar to Forel Ule colour:

Enter colour number (1-21)

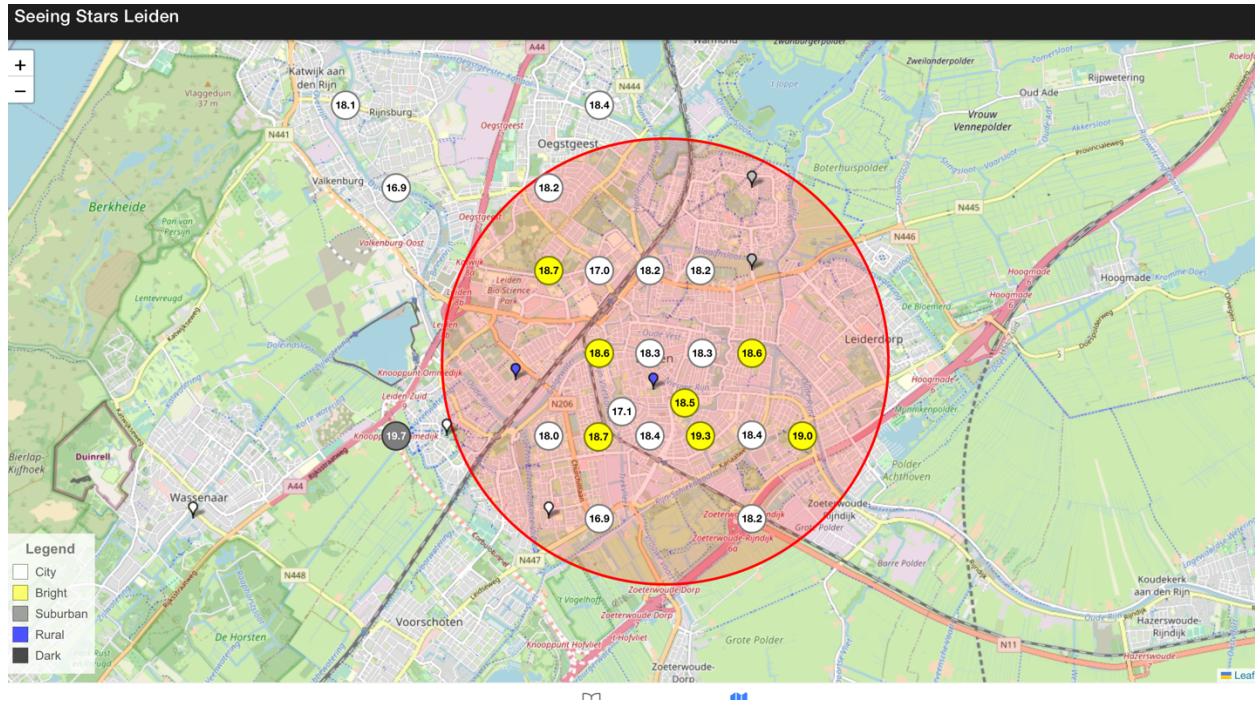

To add a photo click here: 

GO TO STEP 4

MOBIS use cases

Seeing stars leiden

We combined data from two apps recording light pollution at the time all the city lights went out (on purpose) and collected it through the MOBIS back end.

Run4Science

To demonstrate MOBIS we took a few of the supported sensors (Mini Secchi, Plant@Net, Canair.io) and shot a video showing our colleague Joep running and measuring. Results are available through the Sensor Things API.

LATEST NEWS

New RDA Open Call Announced: RDA Communities of Practice

The Research Data Alliance (RDA) has recently announced new open calls for proposals in the context of the EOSC Future...

Mobis demonstration app

Although not a deliverable the mobis app integrates all these plugins. At the time of writing, we are integrating two environmental and one biodiversity CO's.

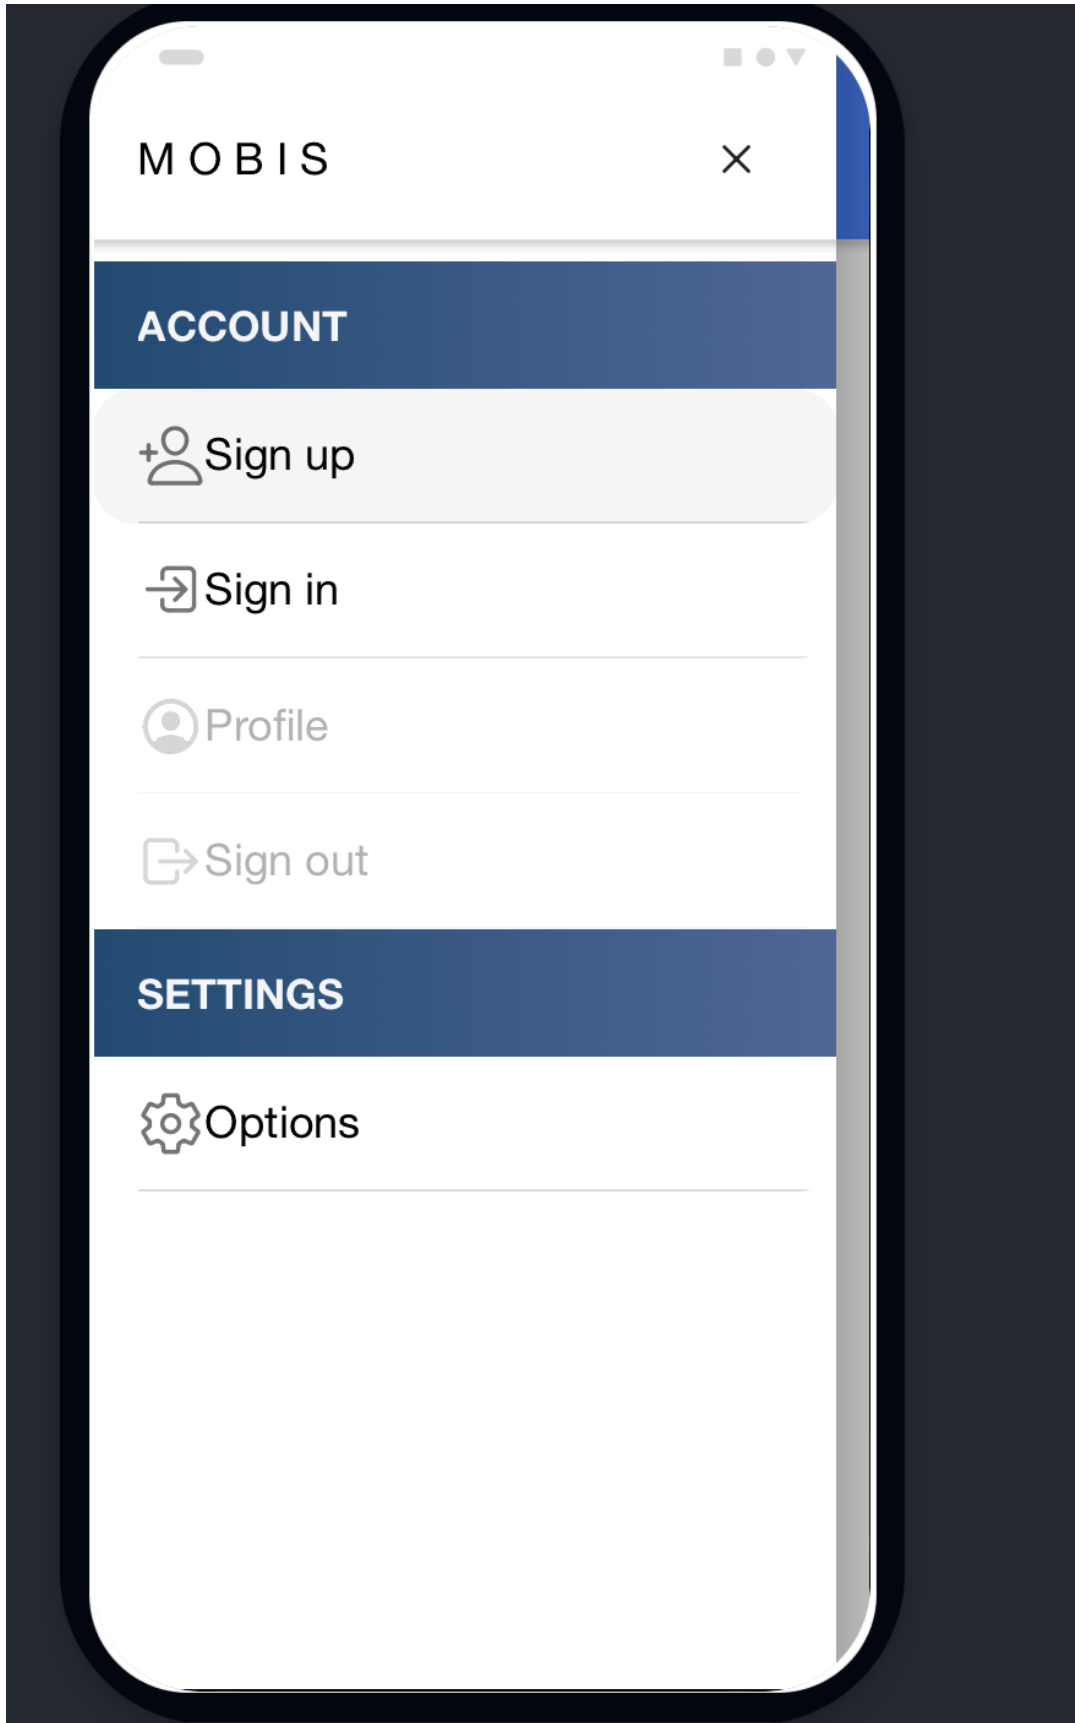

Mobis App screenshots.

The (basic) mobis app combines the Mobis plugins and will provide a single sign on in later versions as well as a nice map interface for user feedback. Note that the screenshots here show the iOS app, but we have an Android version available too.

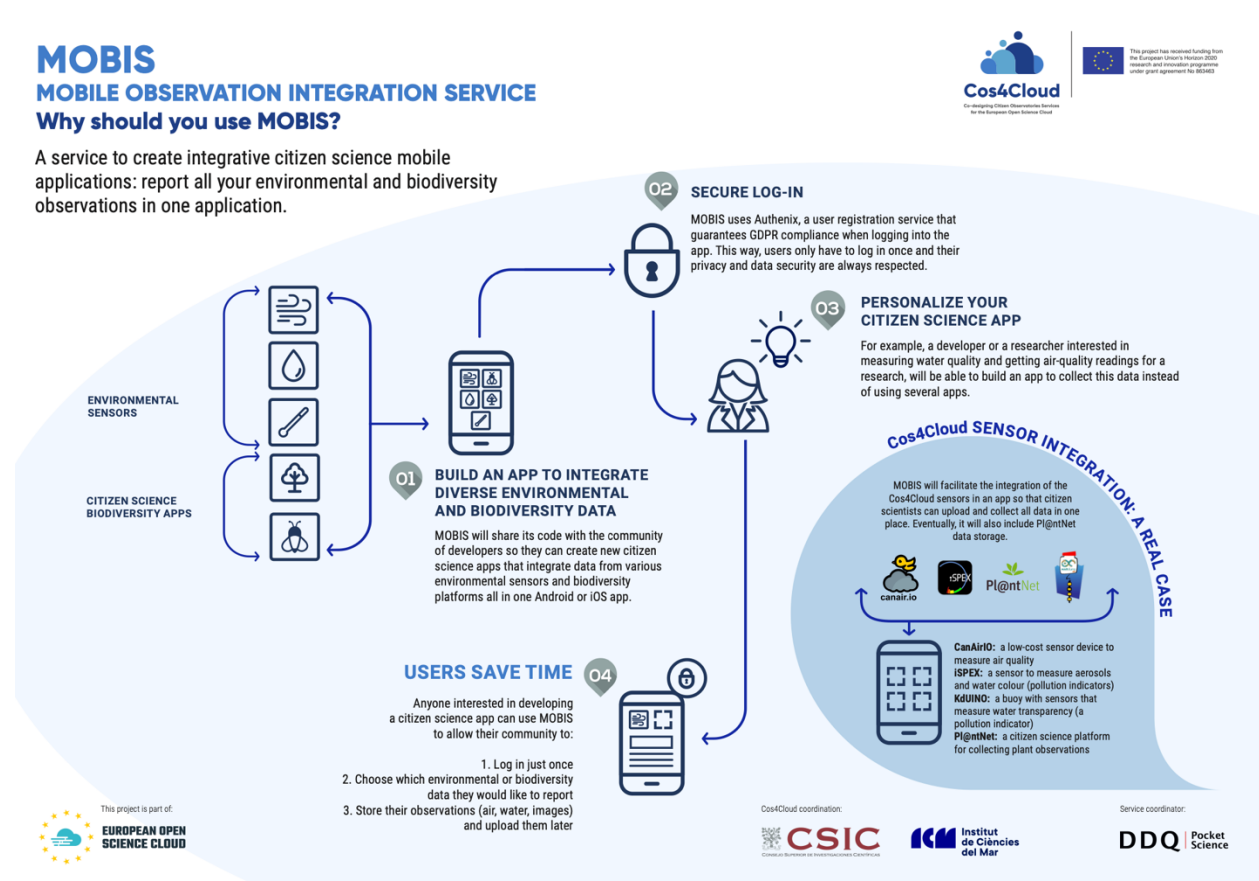

The image shows a mobile application interface for MOBIS. At the top, there is a blue header bar with a white hamburger menu icon on the left and the text 'MOBIS' in white. Below the header, the main content area has a white background. At the top of this area, it says 'WELCOME TO MOBIS' in bold black text. Underneath, the word 'Observe' is written in a smaller font. The interface is organized into three main categories, each with a dark blue header bar and a light blue button below it:

- WATER QUALITY**: This category includes two buttons: 'New Mini Secchi Observation' and 'New iSPEX Water Observation'.
- AIR QUALITY**: This category includes two buttons: 'New CanAir.io PM2.5 Observation' and 'New CanAir.io CO2 Observation'.
- BIODIVERSITY**: This category includes one button: 'New PI@ntNet Observation'.

Output					
User's input	Description	Relevance (low, medium, high, very high)	Decision	Status	Comment

<p>Systematic sampling protocol</p>	<p>Be able to define measurements protocols (visual guidelines)</p>	<p>Medium</p>	<p>Measurement protocols are defined in collaboration for each data set / sensor with the scientists</p>	<p>On demand (in use for ongoing projects)</p>	<p>Users make correct measurements</p>
<p>Customization</p>	<p>Define the parameters I want to measure (by the volunteers) Make custom and/or new projects, select sensors from existing pool.</p>	<p>Very high</p>	<p>Scientists decide which data sources are selected (not the end users), however in the future a custom/free app where users select from a list of sensor options could exist</p>	<p>Available MOBIS offers far going customization, from light pollution to black hole detection . It can accommodate completely new Citizen Science requests</p>	<p>MOBIS offers a base set of functionalities (data storage, login, data visualization) on top of that adding customization for project specific requests is easy.</p>

<p>Single source of truth</p>	<p>Have one location which contains the correct and most recent data</p>	<p>High/Low Depending on the needs of customization</p>	<p>At this point data is still largely stored in multiple locations . Needs agreement for use</p>	<p>Available Can be used in MOBIS</p>	<p>From a data management view this is very complex. At this point the data is still stored in the databases for each individual measurement/sensor project. However, for MOBIS we have created a new fast database which can combine all types so MOBIS CAN be used for this purpose (if the various data source owners agree to use MOBIS as SSoT).</p>
<p>Data quality module</p>	<p>Possibility for users to review their data</p>	<p>Low</p>	<p>Desired functionality</p>	<p>Available We offer a data review and simple filtering table</p>	<p>Data is also grouped by location on a map, where outliers can be easily identified. Data offered</p>

			rules to account for the lack of a standard	currently lacking	
Open source	Code is available for review and inspection so it's not a black box	High	Desired functionality	Planned Delivered in December 2022 on Github	From the EU funding point of view MOBIS should be open source to make it easy for other people to benefit from what was developed
Opportunities: community contribution, making the project a reference		Very high		Planned Every new campaign is planned to include MOBIS	We expect that as data sources are combined into MOBIS it might become a reference method or service in the future
Multilanguage	Offer multiple language support so the application can be used across the world.	Very high	Desired functionality	Done	Some CS projects have suffered from not having multiple language support. Now

					possible to translate to any language
Privacy	Allow users to contribute while respecting their privacy and offer privacy related options	High	Desired functionality	<p>Available</p> <p>User has the option how they will login and IF they share private information with us.</p> <p>Log in and out can be done anonymously</p>	<p>By using existing authentication providers and offering an anonymous login we feel the privacy requirement has been fulfilled.</p> <p>When Authenix is ready for mobile, it will be integrated into MOBIS</p>
Acknowledgment / reward	Stimulate end users to contribute more/better by giving them potential rewards	Low	<p>Optional functionality</p> <p>Facilitated by project leaders.</p>	<p>In Progress</p> <p>We are still developing a user ranking system but struggle with the requirements from the Science</p>	<p>Based on the project, users can be acknowledged, become co-author or get rewards (travel).</p> <p>To be done in the future</p>

				leaders, as they usually don't know themselves when the citizen	
Save observations without internet connection	Allow users to contribute anywhere they are on the globe. Store the measurements on the mobile device first and upload later when internet connection is restored.	Very high	Desired functionality	Test complete Need to be built into service	Offline functionality is currently being tested on marine ships. It should work as expected, however the final version/functionality is not built into the service (yet)
Ability to provide feedback to users	Engage them, improve the way users collect data if we detect any error	Very high	Desired functionality	In Progress Sending push notification is in development right now	
Interactivity	Possibility to interact between citizen science experts, other citizen scientists, external people and society in general	Low	Not developed.	N/A Scientists can use MOBIS	Interaction is not that evident. What is made

					through deskboard
Potential for future extensibilit y	MOBIS started out with a selection of sensors/data sources, this should be possible to expand	High	Desired functiona lity	Available MOBIS can be (quite) easily adapted to include new data sources	Being able to make custom projects, or improve projects and CS measuremen ts as more Observatorie s or sensors improvement s become available to come to new conclusions
Many different types of observatio ns are supported (image, text, value, etc.)	Several measurements options in the same app (air quality, biodiversity).	Very high	Desired functiona lity	Available MOBIS offers support for images, plain text, XML, JSON	At this point MOBIS is not the limiting factor
Possibility to combine heterogen eous data in a single project	Multiple Citizen Science Observatories and source data can be stored in 1 single (big) project	High	At this point we still query each data source individua lly with custom	On hold due to depende ncy This data storage/f ield standard is	We have prepared the MOBIS backend to facilitate this single project nature. Once agreement is reached it is ready for use

			<p>We feel that existing platforms like forums, social media work better for this.</p>	<p>for outreach, for rewarding users, and involving users.</p>	<p>available in the app is usually only scratching the surface of the science. So while users might be engaged and feel that they are experts for the part they are contributing, what happens after that is much more nuanced, and complicated.</p>
<p>Metadata and related information</p>	<p>See the associated information to the data available in the mobile app like: methodological approach, context of the project</p>	<p>High</p>	<p>We don't feel that the app should be the location where this is presented. The science leader can elaborate on this at a given</p>	<p>Completed</p>	<p>Metadata of measurements is stored in the database, as localization information is essential for CS data of course</p>

			location of their choice (like a project website)		
Manual and guidelines	Nice tutorial to use the app, with short and useful information, ideally some examples	Low	Desired functionality	On Demand Based on science leader requirements	This is where an app really shines. There will be a demonstration app of MOBIS

Will DDQ use co-design methodologies? Yes, it gives a lot of useful information.

MOBIS (1-10) how co-designed the service was? The co-design sessions led to MOBIS, so 9.

Any future that co-designed helped to develop? Most of them, for example, we included the end-users point of views.

Seeing Stars Leiden: 50-60 people continue measuring. 150 people participated . Validation more than testing, no user inputs directly.

Plankton campaign: they're validating iSPEX, but they're using MOBIS backend. The event is taking place this year in ? They're taking measurements with spectrometer (iSPEX) - validation campaign - MOBIS will store these data (not now, once they have internet connexion)

Offline collection that will be uploaded to MOBIS backend.

In the future CanAirIO and schools will promote it...
