Keywords

Information and communication technologies, preschool education system, electronic board, computer, laptop, television, youngsters, tools.

Pre-school education is the first stage of education and upbringing of our youth. The right preschool program helps our children grow and learn in ways that match their unique intelligences (1). That's why these primary educational institutions form the foundation for the subjects that play a key role in the development of humanity. Kindergarten sisters teach children of this type of educational institution to count numbers, to teach the mathematics of our country, and at the same time, they memorize various wonderful and interesting poems. As you can see, this basic knowledge permits them to quickly and easily understand the following steps. Looking at various poems, a number of poems aid students to broaden their horizon and enrich the world of imagination. Because the ability to imagine is the ability to draw conclusions from some acquired knowledge. Many unique knowledge holders emphasize that it is better to expand and develop people's imagination than to deepen their knowledge. Because, throughout imagination, mankind has made intelligent discoveries that are known to us now. Developing children's ability to imagine from the age of kindergarten motivates their further learning process to be fast and effective. In addition, by memorizing poems, they sharpen their memories. Copying various phrases and words from these poems into their own language, they become eloquent and able to express their opinion everywhere. A number of processes listed above, which help to develop children's science, undoubtedly help our country to produce individuals who can think independently. They will be able

to express their every ideas in advance. By this way , they can get self - confidence . Appearing self - confidence is a key factor to upcoming generation. In the last decades , in addition to counting and memorizing various poems, English language teaching has been included in the curriculum of preschool educational institutions. The importance of this language can be explained by the sentence that 90% of world literature is in English (2).

However , you can ask a question: why do we need to teach young children another language from a young age? , or is it necessary to give children morals by reading a language other than learning to write and even read in their own language? and features. However, according to Duya scholars, they have emphasized that learning foreign languages is easier for children over ten years old. During this period, the child learns the language not by understanding, but mechanically, so it becomes easier to use and pronounce the existing language (2) . This allows them to expand their vocabulary and create pronunciation as much as possible. In this way, they have a partial vocabulary, and when they enter the 1st grade, they do not meet the sea in a certain sense. Because, by memorizing and telling different English words in kindergarten, the process of adaptation to this language is formed, and when they go to school, this language will be familiar to them and will be learned. It is easy to learn something with background information. By this kind of information, they can urge the way of learning process.

We all know that in our country it is not possible to receive tuition for pre-school education. The students who study here come directly to English, but one can also wonder what happens to the children who do not receive education in such educational needs. There is no reason for this, because there are TV channels for children in our country. On these television channels, children are shown various cartoons in English. In this way, they will also have some knowledge in English. Television, and the words television may bring information and communication technologies to your mind. Today, information and communication technologies have their place in every aspect of our lives. It has already had a sufficient effect on the education system. This has resulted in effective quality of education. It is possible to establish communication through information communication in the preschool education system, rapid development of the information society in the preschool education organization, increase children's guidance on learning (3). For example, an electronic whiteboard or computer comes with pictures of new words, the file itself begins to speak freely, looking at this pace. And this process, even students with

difficulty in acquiring words quickly learn new words and can be repeated by showing these pictures in each lesson. Because repetition is the mother of knowledge. If first step begins with early age , they can repeat a lot when they began to attend a school. As a result, they can commit themselves to this language.

While we all look at something we haven't seen before, it grabs our attention and we can't pay attention to anything else. Children are not unfamiliar with such activities, because they are very interested in modern technologies, and they always come across such technologies in everyone's hands, at home, but because they are young, they are not given the opportunity to use them. That's why they pay attention to it when using various electronic boards, computers, laptops, and at the same time, they acquire more than 50% of knowledge by hearing and seeing, that is, new words. More than 50 % means that they are able to develop their knowledge in advance.

All in all , it can be said that in the process of teaching English to preschoolers with the help of information and communication technologies, they see the images of words and pay attention to the tools that seem interesting to them. they will have the opportunity to say things freely and enjoy this process. Giving their full attention to the learning process leads youngsters huge knowledge . Their attention takes by several tools to build up their knowledge.
