

RevBayes trace

Version 1.0.0, by Giorgio Bianchini

Description: Opens a tree trace file produced by RevBayes. Safe even when opening huge files.

Module type: FileType

Module ID: 89f05f57-dc57-4cc4-bace-84e52c201769

This module is used to read tree trace files produced by [RevBayes](#). These files consist of a single header line, containing tab-separated column headers, followed by multiple lines each containing a tree (in the last column) together with information about it (e.g., the iteration number, likelihood, prior and posterior). This information is preserved as attributes on the root node of each parsed tree.

To avoid memory overflow issues, the module does not read all the trees from the file into memory at once; instead, it only reads them one at a time when requested by the chosen Load file module.
