SUPPLEMENTARY FIGURES

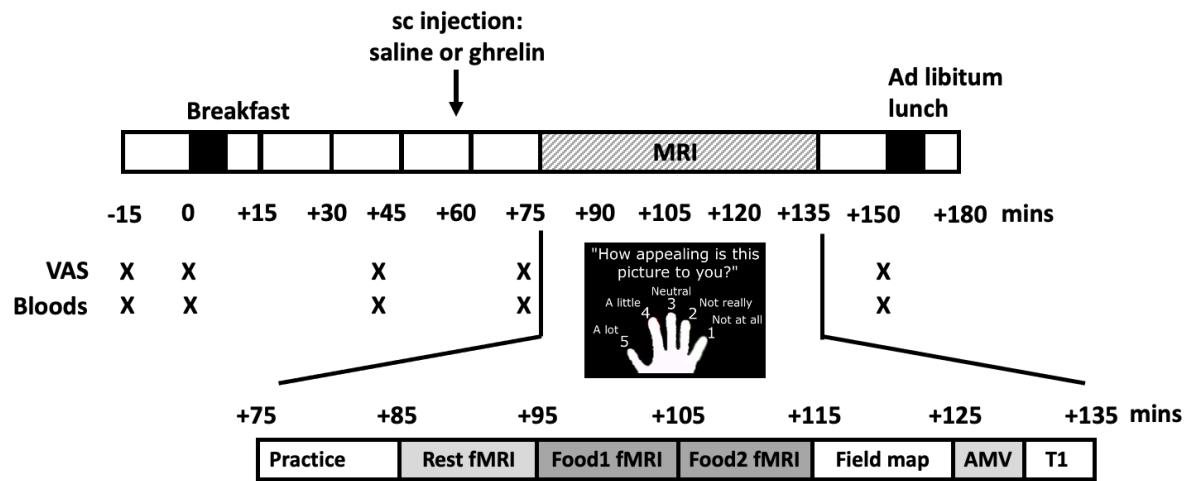

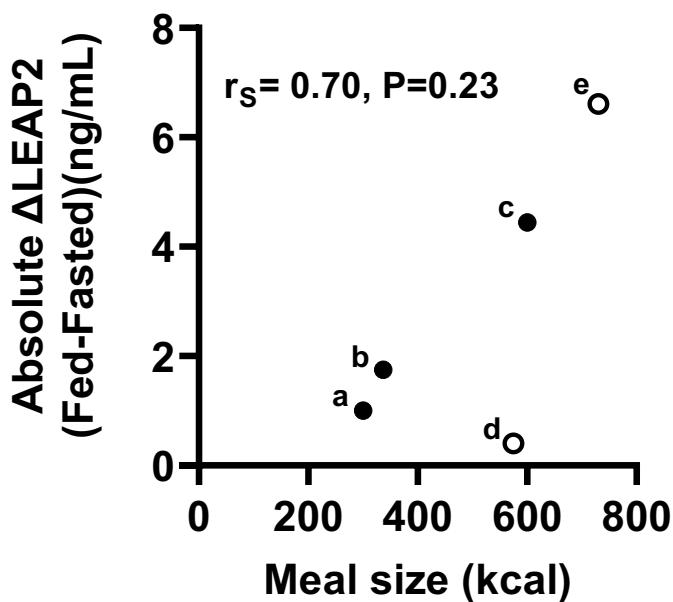

Figure S1. Study Protocol

Breakfast consumption at $t=+0\text{min}$ and saline or ghrelin injection at $t=+55\text{min}$. Blood and VAS measurements used for the analysis were at $t= -15, 0, 40, 70 and 150 min , food picture evaluation fMRI task between $t=+95$ and $+115\text{min}$. *Ad libitum* lunch given at $t=+150\text{min}$. Abbreviations: AMV, auditory-motor-visual fMRI task; fMRI, functional MRI; food, food evaluation fMRI task; MRI, magnetic resonance imaging; sc, subcutaneous; T1, structural T1 MRI scan; VAS, visual analogue scales,$

Study	Study	N	kcal	Macronutrient composition of meal	Post-prandial sampling (mins)
a	Hagemann et al. 2021	18	300	50% CHO, 35% fat, 15% protein	120
b	Mani et al. 2019	20	337	52% CHO, 30% fat, 18% protein	90
c	Mani et al. 2019	20	600	49% CHO, 35% fat, 16% protein	90
d	Hagemann et al. 2022	20	575	49% CHO, 35% fat, 16% protein	120
e	Current study	22	730	55% CHO, 31% fat, 14% protein	150

Figure S2. Correlation of post-prandial plasma LEAP2 with meal size consumed across different studies.

Correlation of post-prandial change in absolute plasma LEAP2 concentrations between fed and fasted time points (Δ fed-fasted) and meal size (kcal) consumed across different studies made using Spearman's (r_s) correlation coefficient. Black dots indicate participants with obesity ($BMI > 30\text{kg}/\text{m}^2$) and open dots participants without obesity ($BMI < 30\text{kg}/\text{m}^2$). Meals are liquid nutritional supplements with similar macronutrient composition: carbohydrates 49-55%, fat 30-35% and protein 14-18%. Table at bottom indicates details of meal and time of post-prandial blood sample for each study indicated by letters a-e: ^a Hagemann CA et al. J Clin Endocrinol Metab. 2021;106(2):e966-81; ^{b,c} Mani BK et al. J Clin Invest. 2019;129(9):3909-23; ^d Hagemann CA et al. Cell Rep Med. 2022;3(4):100582. Abbreviations: BMI, body mass index; CHO carbohydrate; kcal, kilocalorie.

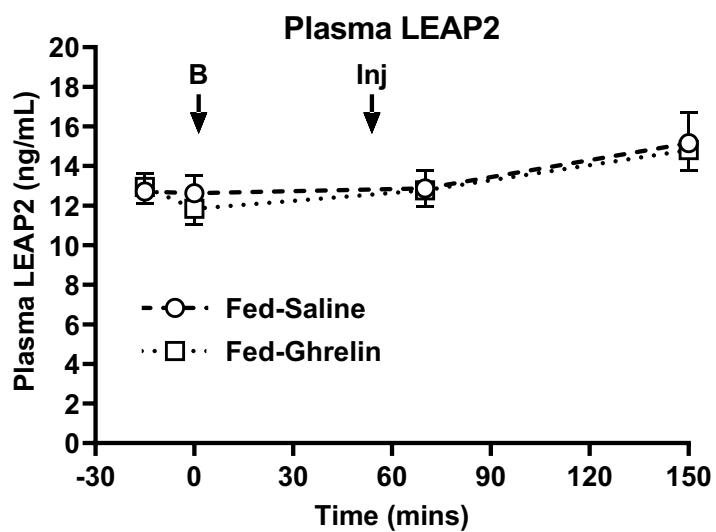

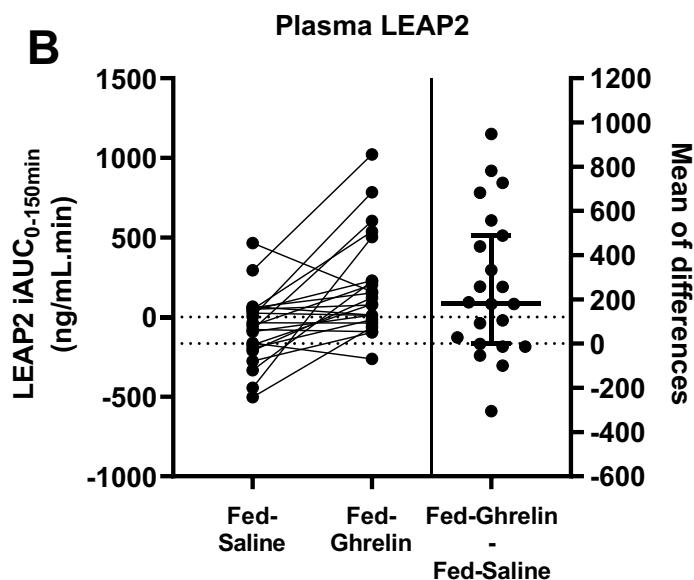

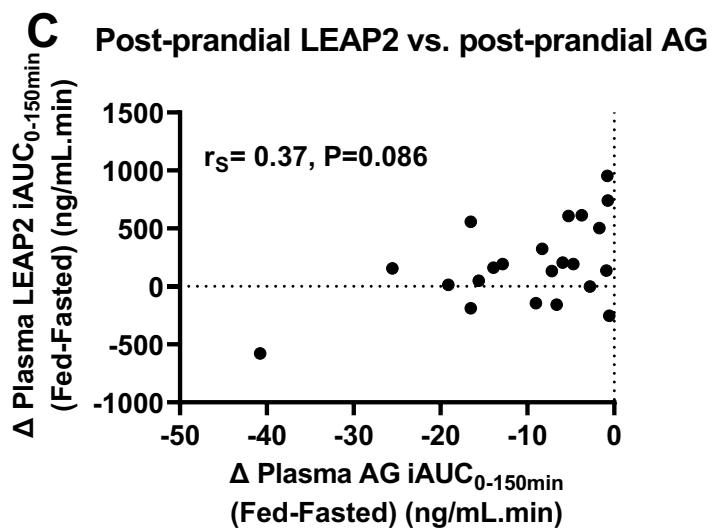

A**B****C**

Figure S3. Plasma LEAP2 at study visits

(A) Plasma LEAP2 concentration over study visits at Fed-ghrelin and Fed-saline visits. Arrows indicate (B) time of breakfast ($t=0\text{min}$) and (Inj) subcutaneous saline/AG injection ($t= +55\text{min}$). Comparisons made using 2-way repeated measures ANOVA with post-hoc Tukey's test: * $P<0.05$, ** $P<0.01$, *** $P<0.001$, **** $P<0.0001$ Fed-ghrelin vs. Fed-saline, $n=22$. (B) Comparison of incremental value of area under the curve (iAUC) from $t=0$ to $+150$ min for plasma LEAP2 between Fed-ghrelin and Fed-saline visits with right-hand part of graph showing mean differences between visits (Δ Fed-ghrelin minus Fed-saline). Comparisons made using Wilcoxon matched pairs signed rank test: $P>0.05$, $n=22$. (C) Correlation of change in incremental value of area under the curve (iAUC) from $t=0$ to $+150$ min between Fed-saline and Fasted-saline visits (Δ fed-fasted) for plasma LEAP2 with change in incremental value of area under the curve (iAUC) from $t=0$ to $+150$ min between Fed-saline and Fasted-saline visits (Δ fed-fasted) for plasma AG using Spearman's (r_s) correlation coefficient.

Abbreviations: AG, acyl ghrelin.

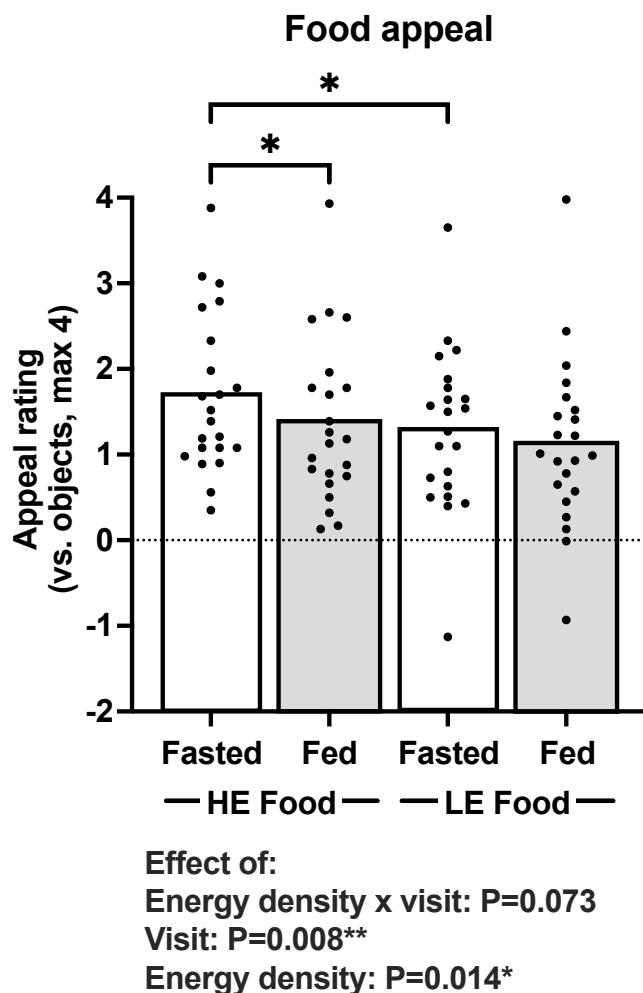

Figure S4. Food appeal ratings between visits for high-energy and low-energy foods

Ratings of food picture appeal (averaged at t=+70 and +150min) between Fed-saline (730 kcal breakfast, grey bars) and Fasted-saline (overnight fast, white bars) visits for high-energy and low-energy foods. Comparisons made using 2-way repeated measures ANOVA with post-hoc Tukey's test:
 $*P<0.05$, $**P<0.01$, n=22. Data given as mean (bar). Abbreviations: HE, high-energy; LE, low-energy.

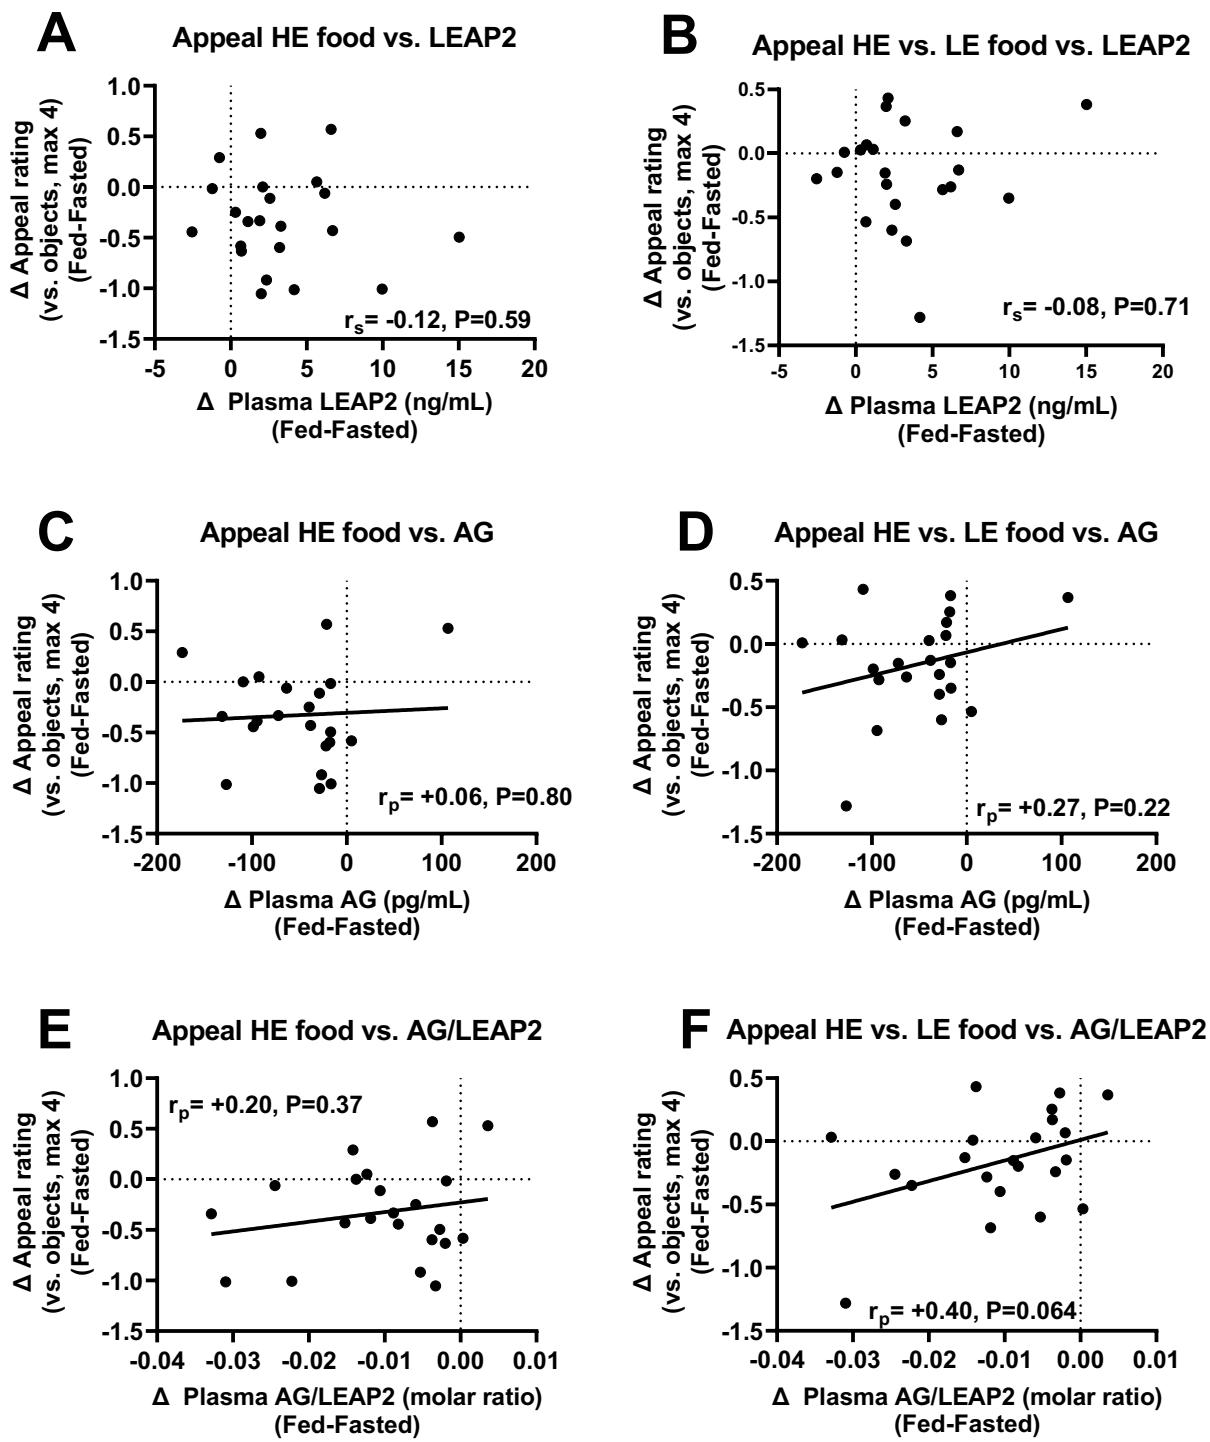

Figure S5. Correlations of post-prandial change in appeal ratings for high-energy food and high-energy vs. low-energy food with post-prandial plasma LEAP2, AG and AG/LEAP2 molar ratio

Correlations of post-prandial change in appeal ratings (average of $t=+70$ and $+150$ min time points) between Fed-saline and Fasted-saline visits (Δ fed-fasted) for (A,C,E) high-energy food picture appeal (vs. objects) and (B,D,F) high-energy vs. low-energy food picture appeal with change in incremental value of area under the curve (iAUC) from $t= 0, +40, +70$ and $+150$ min time points (except AG and

AG/LEAP2 molar ratio missing t=+40 min time point) between Fed-saline and Fasted-saline visits (Δ fed-fasted) or plasma (A,B) LEAP2, (C,D) AG and (E,F) AG/LEAP2 molar ratio, using Pearson's (r_p , linear regression line) or Spearman's (r_s) correlation coefficients, n=22. Abbreviations: AG, acyl ghrelin; HE, high-energy; LE, low-energy.

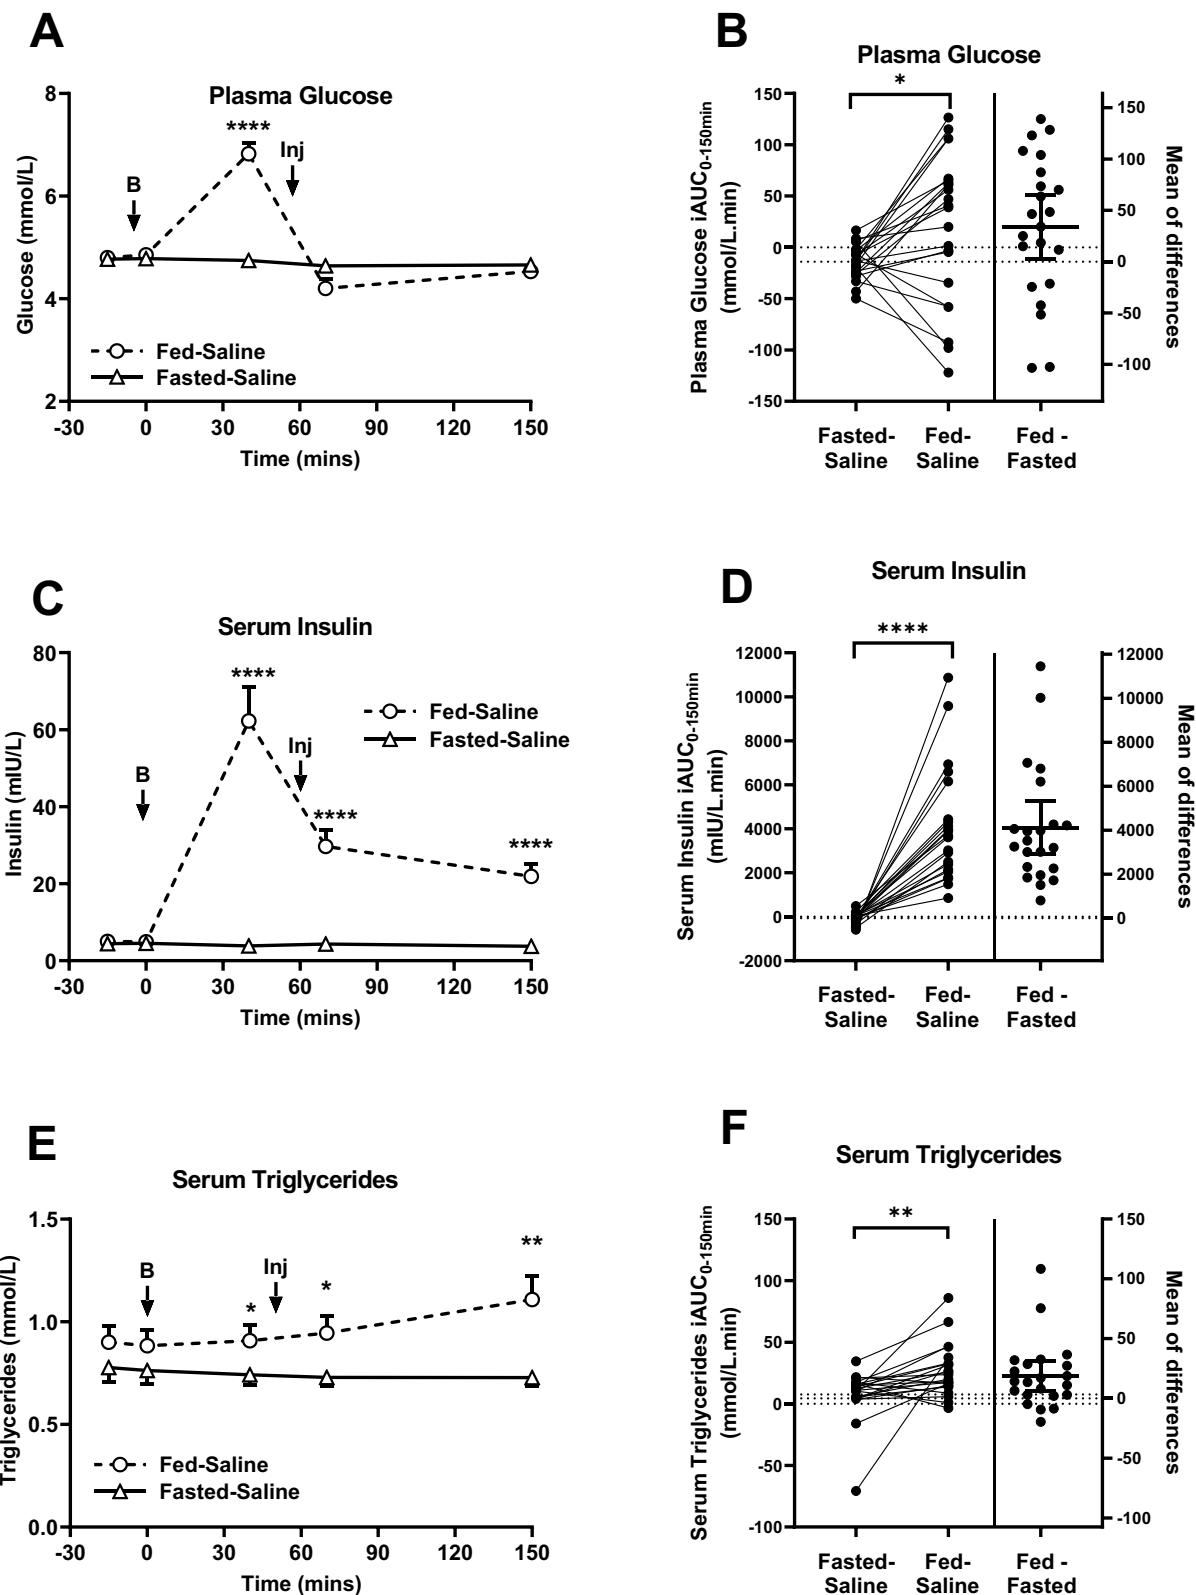

Figure S6. Plasma glucose, serum insulin and triglyceride concentrations at study visits

(A,C,E) Concentrations over study visits for (A) plasma glucose, and serum (C) insulin and (E) triglycerides at Fasted-saline and Fed-saline visits. Arrows indicate (B) time of breakfast ($t=0\text{min}$) and

(Inj) subcutaneous saline/acyl ghrelin injection (t= +55min). (B,D,F) Comparison of incremental value of area under the curve (iAUC) from t=0 to +150 min for (B) plasma glucose, and serum (D) insulin and (F) triglycerides between Fed-saline and Fasted-saline visits with right-hand part of graph showing mean differences between visits (Δ fed-fasted). Comparisons made using (A,C,E) 2-way repeated measures ANOVA with post-hoc Tukey's test, (B) paired Students t-test, and (D,F) Wilcoxon matched-pairs signed rank test: *P<0.05, **P<0.01, ***P<0.001, ****P<0.0001 Fed-saline vs. Fasted-saline, n=22. All data given as mean \pm SEM.

SUPPLEMENTARY TABLES

Table S1. Whole brain analysis for correlations of post-prandial changes in BOLD signal to high-energy foods with plasma hormones.

Hormone	Correlation	Cluster	Number of voxels	Z	x	y	z	Laterality	Brain region
LEAP2	Positive	None							
	Negative	1	1462	3.70	0	24	58	B	43% superior frontal gyrus
				3.49	2	20	46	R	65% paracingulate gyrus, 5% anterior division cingulate gyrus, 5% superior frontal gyrus
				3.35	-4	-12	34	L	22% anterior division cingulate gyrus, 10% posterior division cingulate gyrus
				3.22	10	-32	38	R	31% posterior division cingulate gyrus, 5% precuneus
				3.18	2	2	46	R	44% anterior division cingulate gyrus, 27% juxta positional lobule cortex
				3.17	-2	-42	32	L	98% posterior division cingulate gyrus
	2	1445	3.55	6	34	26		R	48% paracingulate gyrus, 42% anterior division cingulate gyrus
				3.45	50	24	10	R	35% inferior frontal gyrus pars triangularis, 19% inferior frontal gyrus pars opercularis
				3.43	42	38	26	R	41% frontal pole, 24% middle frontal gyrus
				3.32	12	38	24	R	49% paracingulate gyrus, 8% anterior division cingulate gyrus
				3.29	6	48	26	R	48% paracingulate gyrus, 28% superior frontal gyrus
				3.27	20	36	24	R	99% right cerebral white matter
	3	612	3.72	4	-82	54		R	8% precuneus
