

Tables of the Cohomology of the Mod 2 Steenrod Algebra

Weinan Lin

Abstract

This document contains tables of the indecomposables, basis and relations of the cohomology of the Steenrod algebra at the prime 2 up to total degree of $t = 261$. It is long but intended to be a handy tool to explore the E_2 page of the Adams spectral sequence. You can find the manual at the beginning of the this document. The author will release a separate paper about the algorithms that generate these tables.

1 Introduction

1.1 About the Tables

There are four big tables, one for the indecomposables, one for the basis and two for the relations. The first table of relations lists relations that contain at least two summands, such as $h_1^3 = h_0^2 h_2$, while the second table of relations lists monomials that equal to zero, such as $h_0 h_1 = 0$.

The author is supported by China Postdoctoral Science Foundation 2021TQ0015 and the Fundamental Research Funds for the Central Universities, Peking University

In the range of $t \leq 261$, there are 2914 indecomposables, 23560 basis elements (in positive stems) and 231848 relations (Gröbner basis). The size of a minimal generating set of the relations in this range is 227498.

Some of the names for the indecomposables are adapted from the symbols used by Dan Isaksen, Guozhen Wang and Zhouli Xu. When there is a pair of square brackets $[\cdot]$, it means that the indecomposable could differ to theirs by some other summands. Sometimes parentheses are added when the names of the indecomposables look like decomposables.

1.2 Basis and Relations

The basis consists of monomials that are not divisible by any monomials in the LM (leading monomial) column of the two tables of relations. The relations form a Gröbner basis and if you keep rewriting monomials that are divisible by the leading monomials using these relations, you can reduce any polynomial into a linear combination of the basis.

The basis has the property that all monomials in the basis that contain h_0, \dots, h_i form a basis of the ideal generated by h_0, \dots, h_i for $i = 0, 1, 2, 3$. This is due to the choice of a monomial ordering that orders generators by total degrees and orders monomials (in the same degree) reverse lexicographically. This ordering is performant in the sense that the Gröbner basis is very close to being a minimal generating set of all relations in the range.

1.3 Abbreviations of Some Relations and Navigation

Some times you might see relations in abbreviation form such as

$$x_{91,8}x_{151,11} = m_4 + m_7 + m_8$$

in degree (stem, s) = (242, 19). Here the right-hand side of the equation stands for the sum of the fourth, seventh and eighth monomials in the basis in the same degree. You can click the blue link in the region of relations in degree (stem, s) = (242, 19) (in this case a blue 19) to navigate to the position of the table of basis in this degree. You can also do the same thing to come back to the relations. By using the **i** column of the table of basis you will find that $m_4 + m_7 + m_8$ corresponds to

$$h_0x_{242,18,2} + h_0h_3x_{235,17,2} + h_0h_3x_{235,17}.$$

Here are more navigation tips. In the search bar you can type 242 19 to find elements in degree (stem, s) = (242, 19) across the whole document. You can also type **x242,19** to search for all occurrences of the indecomposable $x_{242,19}$.

1.4 Other Formats of the Tables

The reader can find a graphical interface of $\text{Ext}_A(\mathbb{F}_2, \mathbb{F}_2)$ from the website [link](#). You can also download the sqlite3 database file or csv files for the tables from the same webpage. The computer program is hosted on this [Github repo](#).

1.5 About the Computer Program

The computer program is based on a form of generalized Gröbner basis by the author. The resolution program builds the resolution step by step in total degrees. Coordinates with the same total degree

t are calculated in parallel. For the resolution the peak CPU usage of the program is about 30 cores and on average it uses about 10 cores. The memory usage is about the same as the size of the output resolution file which is currently at 106GB. It takes 88 days to get the resolution up to total degree of 261. However, a recent version of the program can run twice as fast.

The program that computes the multiplications in $\text{Ext}_A^{*,t \leq 261}(\mathbb{F}_2, \mathbb{F}_2)$ takes 63 days to finish. It can utilize more CPU cores at the same time but it demands much less memory (25GB).

1.6 What Will be Added in Future Revisions

- More data up to 261 stem ($t - s \leq 261$).
- Power operations on $\text{Ext}_A(\mathbb{F}_2, \mathbb{F}_2)$ such as $Sq^0 h_i = h_{i+1}$.
- Other Ext groups $\text{Ext}_A(M, \mathbb{F}_2)$ (in separate documents) and maps between them (which deduce some Massey products).

2 Table of Indecomposables

2.1 Indecomposables

name	stem	s	name	stem	s	name	stem	s	name	stem	s
