Abstract :

I have a problem to learn chinese. I found it difficult but I asked myself : Chinese

people find learning Arabic, English, French, Deutsch etc. difficult too.

So I decided to find a solution for beginners to learn languages.

The new way :

The new method is based on learning by Keyboard and text to Speech.

The teacher shows a letter to his pupils and read it twice loudly and clearly and then asks his students to find the letter on the virtual keyboard and they should press the corrspondent key and hit the baffle.

Then they compare the sound response of text to Speech with what the teacher

taught them.

Step by Step, letter by letter, words by words and then small sentences the students will learn the basics of the languages essentially how to read. A course of writing must be taken in parallel with what they read.

In the link below a web app under MIT License. My way of teaching languages by key

board prototype can be used for Windows, Linux and Mac

https://github.com/didipostman/LearnLanguagesByKeyBoards

Conclusion

The prototype is simple to understand, download it and click index.html and just choose a language, hit the key, then the baffle and mimic what the app returns to you. You will learn the basis. But no grammar.

NB: Only English is available due to the newly ResponsiveVoice restriction in its free version

Minds, like parachutes, function best when open. ,,,
