

Module 1

Introduction to Research Data Management (RDM)

Stefano Della Chiesa iD

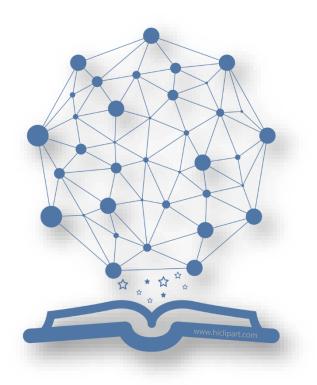

Before starting

RDM as multidisciplinary knowledge management

- You'll be introduced on several concepts linked with another (be patient, feel free to ask)
- The training material contains several hyperlinks to other sources

Knowledge network

Introduction

This first module introduces RDM, giving its context in the Research Data Governance

- Research Data Management (RDM)
- RDM Top Down & Bottom Up
- Linked Research Outputs
- Research Assessment

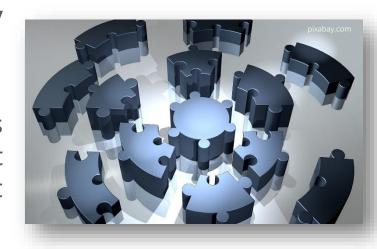

Research Data Management - What?

A Puzzle of knowledge bricks

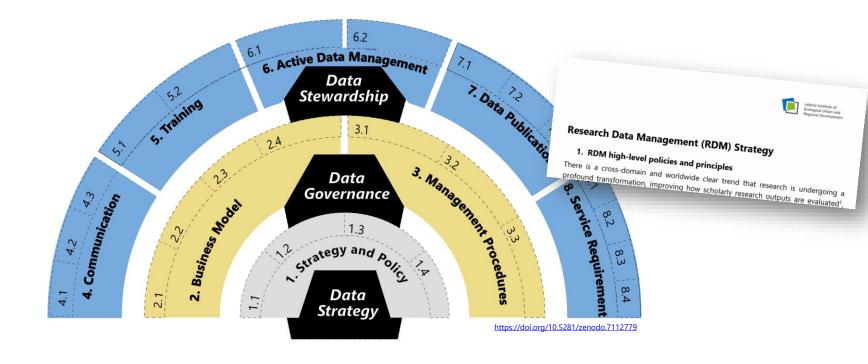

RDM is a mosaic of **multidisciplinary knowledge** and competencies.

RDM know-how is a **toolkit** to address policy compliance and data management best practices throughout the project lifecycle.

RDM & Institutional Research Data Strategy

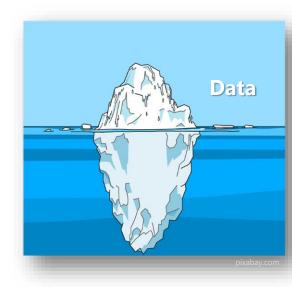

What is Research Data?

No standard definition available

- Research data is the fundament of any scientific work documenting its results.
- <u>DFG specifies</u>: "Research data includes measurements, audio-visual information, texts, documentation, samples, questionnaires, algorithms, software, simulations, etc..
- Research data is highly heterogeneous, with subject area having a wide variety of data type and formats.
- Hence: Research Data → Research Input/Output

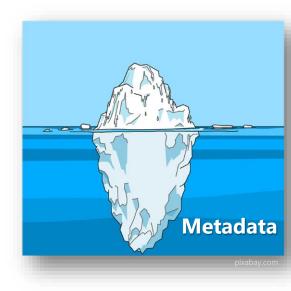

What is Metadata (MD)?

Metadata (MD) is data about data.

In research, Metadata represents the **information that describe data** in a <u>structured</u> way the research data.

Structured? It means there are several MD elements that can describe the data: Title, Creator, Abstract, Keywords, Format, Subject, PID, License, Provenance/Lineage, etc.

Research Data Management

The research and data lifecycle

Research idea and design planning

Data retrieval (existing or new)

Data processing and analysis

Publishing and re-use

Research Data Management - Why?

- Assure return of investment
- Efficient spending
- Increases publicly available knowledge
- Community network and beyond
- Provides new unexplored benefits

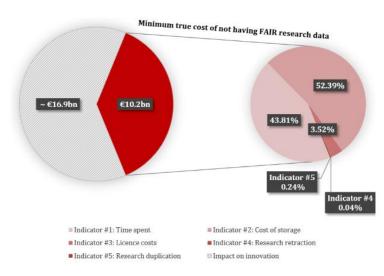

Lack of RDM best practices has a price!

~1x 10¹⁰ arguments

- Huge cost for not having "open/FAIR" data
- Minimum cost ~ €10bn^{-y} (likely cost → almost three-fold)
- A perspective (Horizon Europe ~ €13.6bn^{-y})

EU Cost-benefit analysis for FAIR research data - https://data.europa.eu/doi/10.2777/02999

Research Data Management - How?

Enforcement & real needs

Top Down Requirements

Bottom up needs!

Top Down

Stakeholder Requirements & High level policies

- DMP Funder requirements
 (e.g. <u>DFG</u>, <u>Horizon Europe</u>)
- Open Science
- Good Scientific Practice
- Guidelines Handling Research Data
- Open Access
- FAIR Principles

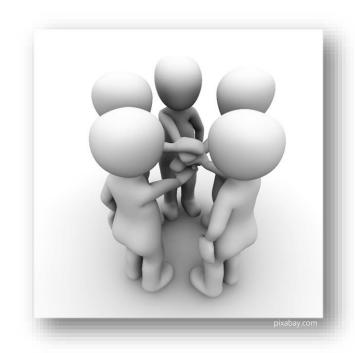

Bottom Up

Researcher and community needs!

- RDM Solutions
- Find again your data
- Good practices & Data Culture
- Partnership & Collaboration
- Share, re-use and **get credits**
- Data/Method/Software Paper
- No longer grey literature

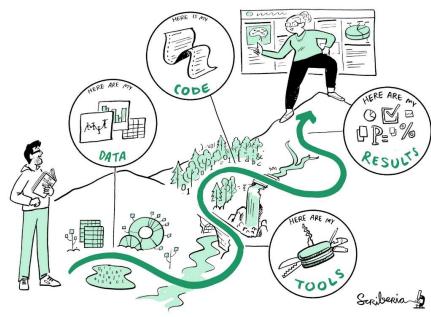

Linked Research Outputs

Several research outputs associated with the formal Journal publication are stored & shared online. (e.g. datasets, code/algorithms, protocols, preprints, posters, documentation, etc.)

Changing the Research Assessment

<u>Declaration on Research Assessment (DORA)</u> to Improve the ways in which researchers and the outputs of scholarly research are evaluated!

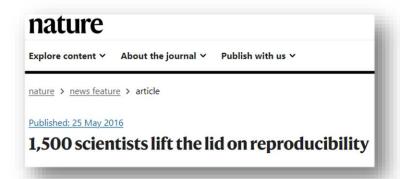

<u>Coalition for Advancing Research Assessment</u>: a shared direction for changes in research assessment practices

"Research assessment criteria should reward **ethics**, **reputation**, **teamwork and diversity of outputs**"

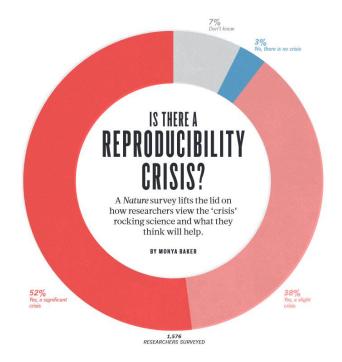

Why RDM does it matter?

The reproducibility challenge

"More than 70% of researchers have tried and **failed to reproduce** another scientist's experiments, and more than 50% have failed to reproduce their own experiments"

Baker, M. 1,500 scientists lift the lid on reproducibility. Nature 533, 452-454 (2016)

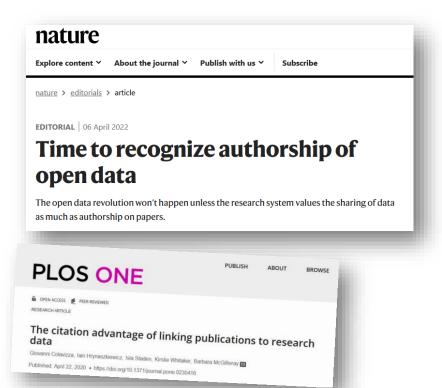

RDM Growing momentum

RDM it matters!
