Abstract: In this article Development of software products using the Java programming language as an example of the Android system opinions are discussed.

Keywords: Java programming technologies, Android studio, mobile application, programming languages, JDK, ADT, Eclipse.

Nowadays, the Android market is developing a lot. Doubling the number of apps coming to the Android market each month, and the development of many Android mobile devices and tablets, indicates that this development is not going to stop anytime soon, but rather an increase. Among these developments, every user who is interested in computer technology or in the field close to it should be interested in writing a program for his mobile communication tool. Android applications are written using the Java programming language, which is a relatively easy language for those just entering the world of programming. Android apps are written, compiled, and downloaded to a mobile device (whether it's your phone or tablet) for testing, just like any other mobile app. Android applications are built on the Java software system. It is possible to create a program for Android on Windows, MacOS, Linux operating systems. It is recommended to use Eclipse as a programming environment. We present the necessary tools for creating a program for the Android operating system.

These are:

1. JRE (Java Runtime Environment);
2. JDK (Java Development Kit);
3. Eclipse programming environment;
4. Android SDK (Android Software Development Kit);
5. ADT (Android Development Tools).

JRE. Java in the language to be written programs turn on and to use For this, it is necessary to install JRE (Java Runtime Environment) on computers.

JDK. JDK (Java Development Kit) for creating programs in Java

The Java programming language must be installed. The JDK contains the Java compiler, Java libraries, various utilities, examples, and documentation. But the JDK does not include the Java programming environment.

Eclipse. We use Eclipse to create a program in Java. Reasons why the Eclipse programming environment is recommended for Android:

First, Eclipse is free and it's very easy to learn how to use Eclipse.

Second, Google has developed an ADT plugin specifically for Eclipse.

ADT. ADT can be used to build and compile Android projects in Eclipse and use Android device emulators. As soon as we install the ADT plugin on the computer, it is automatically configured for Android projects.

Android SDK. To build on Android, you need the Android SDK. The Android SDK also includes an Android device emulator. Therefore, if we want to build an application on Android, we do not need to have a real switch, the application can be tested on a virtual device easily[11].

To write an application on Google Android is given above programs need to be downloaded and compatible with each other. Below are instructions for downloading and installing the necessary programs:

Phase 1: Eclipse

To write the program, you first need Integrated Development Environment (IDE) is required. Eclipse IDE is widely used nowadays, but if you can't use Eclipse, you can try using NetBeans. Eclipse IDE from your system properties from the link below come came out in case choose get

can:<http://www.eclipse.org/downloads/>

Step 2: Java JDK

If the Java JDK is not installed on your computer, the Java JDK will be downloaded:

(<http://www.oracle.com/technetwork/java/javase/downloads/jdk6-jsp-136632.html>)

And set: Next-> Next-> Finish

Step 3: Android SDK Tool

Now you will need the Android SDK Tool. Get it straight

You can get it from Google:

(<http://developer.android.com/sdk/index.html>)

Step 4: Adapt Eclipse for Android

Start Eclipse and select Help-> Install New Software. After we click on —Add...|| button

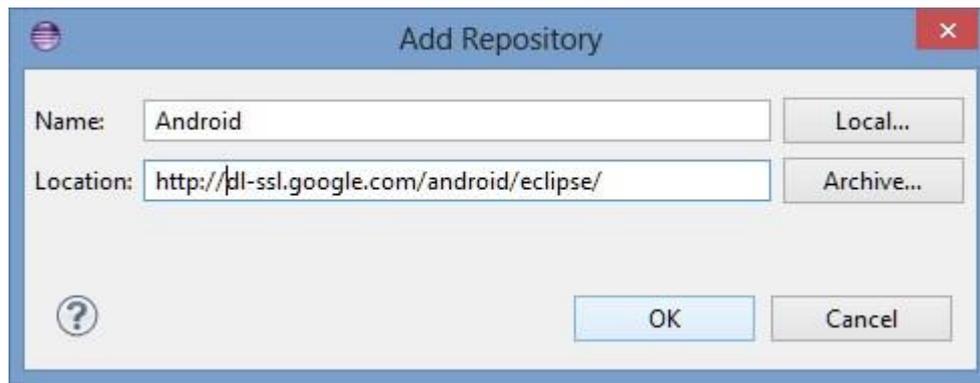

Figure 1. "Add Repository" window when installing a new software tool

As shown in Figure 9 above, the name of the software tool is –Android||, and the link is –Android|| "<https://dl-ssl.google.com/android/eclipse/>" (if the link is not working, you can write "http" instead of "https").
