Abstract

This research study was a mixed method design which was initiated to study the analysis of the role of School Heads in building educational leadership capacity of teachers at school levels in District Mardan. This study was based on primary data, the data which was collected through questionnaires and interviews from Teachers and Principals of the schools in district Mardan. The sample of data was consisted of 15 High and Higher Secondary Schools. The data was collected from 15 Secondary and Higher Secondary Schools where 60 Teachers and 15 Principals/Head-masters were respondents of this research study. Convenient and snowball sampling techniques were used for the selection of study respondents. Using REACH model, the results indicated that risk-taking, effectiveness, autonomy, collegiality and honor were considered as indicators of leadership at school teachers, and all the qualities were found in school teachers of District Mardan. This study also found that motivation and support of headmasters play a significant role in building teachers' capacity and enhancing leadership qualities in them.

Keywords (

Leadership Qualities, School Teachers, Capacity Building, Motivation.

Introduction

Education is always the cry of the day. The rapid changes in the global village are taking places because of education. Quality education is always the product of academically strong, technically sound and morally unmatched heads and teachers. In the Educational system of Pakistan, there is a need to improve leadership and management systems for better organizational structure and to assure targeted results. There are different levels of schooling in Pakistan which has different heads at different levels. At school level, Head-Masters are on the high position in the schools. They are responsible for provision of quality education through the motivation of teachers and making available all the needed resources. These Head-Masters are playing a vital role of managing the school activities and also inject the capacity of team work and motivation to other teachers. Monitoring and evaluation is done by these Headmasters in many schools for higher authorities and officers. These Head-masters most of the time chose their assistants among teachers, who are further assisted by some assigned co-operators to stream line all the activities and assure democratic process of assessment and evaluation. Schools where there are secondary and higher secondary classes are led by principals. The monitor and supervise all academic and human resources in systematic manner. The relationship of a head-master/principals and teacher is vital in the process of teaching learning. It can affect the solidity and obligation levels of head-masters as well as teachers (Price, 2012, p. 40).

It indicates that the role of a Head-masters/Principal's leadership is crucial as it has grooming impact on the output of a teachers' work (Hackman and Johnson, 2004, p. 2). The role of leadership can provide important benefits, but it has been observed that most of these heads are highly problematic. They practice controlling and dictator type of leadership in which they perform one man

show. It is extremely difficult to institutionalize leadership roles for teachers for several reasons. First, many teachers were reluctant to think of themselves as leaders (Fullan, 1993; Katzenmeyer & Moller, 2001). They viewed with some discomforts about the idea of assuming quasi-administrative or expanded teaching functions. Teachers are most of the time found unwilling to accept extra responsibilities than teaching. Second, there is an expectation of top-down mandates with little input from practitioners. Third, when teacher leaders emerge and begin to affect policy for larger domains of the school, they may encounter resistance not just from the principal, but also from other teachers as they start thinking in negative direction. They start focusing on the issue of senior and junior and seniors take it as their insult to perform in subordination of juniors. Lastly, it is unlikely that teacher leaders will emerge from the ranks in places where teachers are powerless to affect school-wide policy (Lord & Miller, 2000; Troen & Boles, 1993).

Well trained heads of education institutions know the art of mobilization and incitement of co-teachers towards the attainment of academic and administrative goals. Highly effective leadership can make the successful future of co-workers, if the leadership fails, it may replicate its effects on co-workers. Likewise, the performance and potentials of the members are also greatly influenced by the activities of the institutions. For instance, if the decisions within institutions are based on merit than it enhances members' commitment towards the institution and its desired aims. This enhancement of trust requires mutual exchange of cordial relationship between the heads and staff members (Settoon, Bennett, & Liden 1996, p. 219-220). In such circumstances, the school head-masters/principals' role acquires great importance in such challenging and arduous circumstances (Fullan, 2003, p. 22). Resultantly, it is an extremely tough task, for almost anyone, to not only produce but also maintain a school system of public domain without having dedicated and zealous teachers. Teachers are the human resources who utilize material resources for the qualitative academic results based on the overall grooming of learners to mould their souls and bodies for targeted goals.

Kuozes and Posner (2007) have rightly pointed out that in order to achieve the goals of an organization, a leader needs not only to build, but also needs to sustain relationships with subordinates that stimulate subordinates for the achievements of the desired goals. In building the capacity of teachers, Walsh (2005) stresses upon the fact that a cordial and balanced relationship among the staff members and with the school principal will have positive results on the learning and behavior of the students. Further, the role of leadership is encapsulated in a single individual. And, it refers to those who are entrusted with power in any setup (Friedrich, Vessey, Schuelke, Ruark, & Mumford, 2009, p. 933; Hackman & Johnson, 2009, p. 19). Studies around the world highlighted the importance of leadership in schools' system in cooperation of principals, but specifically there is lack of focus in past literature that, how school headmasters can develop the seed of leadership in teacher and coworkers, and how headmasters can build the capacity of teacher to sustain the existing leadership. What exactly is the mechanism that they follow during the struggle process? This study focuses to answer this kind of question and to make the policy relevant documentation for better monitoring evaluation.

Methods and Procedure

Data Collection

This study is based on primary data collected by the researcher. The nature of study is quantitative and qualitative which is also known as mix method research. The variables in this study were dichotomous choice variables. The data was collected from government middle and high school teachers in district Mardan, Khyber Pakhtunkhwa. This study has included the respondents from district Mardan of Khyber Pakhtunkhwa and within the district fifteen locations were selected for the data collection in which seven were rural villages and eight were urban areas locations in Mardan District. Researchers selected fifteen schools and interviewed sixty teachers and fifteen Head Masters/Principals of these schools. The researcher also collected data through well-structured questionnaires. The data was collected after school working hours, So that it did not affect the routine academic schedule of the school teachers.

Sampling Technique and Sample Size

The study has used simple random sampling technique through which sixty teachers and fifteen Head teachers. The sample size is taken into account on the basis of expected teacher population in the study area. Study has included around 75 respondents from 15 different schools, where 60 respondents are teachers and 15 are school's Headmasters.

Data Analysis

In this study the Quantitative Data was analysed using Statistical Package for Social Science (SPSS) whereas the Qualitative Data was analysed through thematic analysis procedure which is called convergent method of mixed method research (Creswell & Pablo-Clark, 2011). The REACH model was used by Merideath in (2000) which is composed of 5 components, which is risk, effectiveness, autonomy, collegiality and Honour.

Results and Discussions

This study has included 60 teachers and 15 headmasters from different schools for collection of data. The minimum age of the teachers is 25 years and maximum age is 58 years in selected respondents.

However, on average the age group of the teacher and headmaster is 38 to 40 years, which also indicates that on average at school level, there are sufficient numbers of young people, which are quite energetic and willing to lead if the opportunities are provided to them.

The respondents of this study were all educated, where minimum education were Bachelor of Arts (BA) and Bachelor of Science (BSC) level and Higher education was Master of Arts (MA) and Master of Science (MSC) level. On the average most of the teachers have qualification of MSC level education in high schools of Mardan. Minimum experience of teaching is 3 years, maximum experience is 25 years and on average every teacher has the experience of 8 years. The results of the study suggested that the teachers attend the schools with having good level of attendance as their minimum attendance record was 70% and maximum attendance record for teachers at school level was 98.55%. An average teacher has the attendance of 83%. This high level of punctuality has a great significance for this job at government school level. Total at Maximum of 7 workshops were attended by our respondents/teachers. Few teachers didn't even get the chance of attending any workshop. Further every teacher has attended at least one training session and maximum of 11 training sessions were also attended by the teachers. Further, there were a very limited number of teachers who had this opportunity to explore more about education and other training (Table-1).

The job experience of headmasters is always higher than teachers. More the experience of the teacher is more the educational leadership capacity. Headmasters have higher salaries than teachers. The reasonable salaries make the teachers and heads capable to cope up with the increasing expenditures on the required training activities which increase the educational leadership qualities of these teachers. Lack of interest of teachers in leadership trainings are the major factors of low level of leadership in teachers. Teachers have less amount of salary and most of the salary consumed during months and saving was near to nil because of this they do not go to participate in training which has affected their leadership quality (Table-2).

Head-masters we selected were from the age bracket of 31-55 years, minimum age of the head-master was 31 years and maximum age was 55 years. The demographic characteristics like family size results reflect the minimum family size of three members in a single family and a maximum of 25 members in a single family. However, on average the family size of head-masters is 8 members in a single family. The results of the study showed that Head-masters education was between the ranges of 14-years to 18-years, which mean that head-masters had the education level from BA to Master of Philosophy (MPhil) level. There were few head-masters, with good quality education level. On average every Head-master had the education of almost 16-years (Table-3).

The results in table-4 revealed that risk taking behavior is highly appreciated in school teachers as leadership quality. As a leader, it is important to take risk, as higher the risk is the higher premium is expected. 38 teachers out of 60 affirmed that risk taking is a good quality of leaders and it is the indicator for leadership. This study results also suggested that effectiveness is an indicator of leadership at school level teachers. 54 out 60 teachers mentioned that the effectiveness of the teacher can lead to make him a good leader and it is considered as the indicator for leadership. All the teachers were of the opinion that autonomy is in indicator of leadership. Collegiality is the delivery power of the teacher when he communicates with his/her students and it is considered as an attribute of leadership and honour is considered as a quality of leadership in teachers as mentioned by all the respondents.

Capacity Building and HD Support

Cross section data is the data which is collected through primary surveys via interviews or questionnaire. This type data is collected once from the selected respondents. So, the effect of relationship is across respondents from teacher to teacher and it did not vary across time. The results of the study showed the significance of the relationship between selected set of variables. The results show that factors such as age, income and education are positively associated with capacity building of the teachers at school level. Increase in age increases the capacity building of the person over the time due to extensive experience and increase in education will lead higher understanding about the issues, which can increase the problem solving capacity of the person. Income increase also helps us to invest more on self-capacity building activities.

The variable of workshop participation is a positive and scientifically related with capacity building. Participation in workshops increases the ability to explore much more about different problems and their solutions. Workshops are helpful to gain higher experience and learn more

techniques, which increase the capacity to manage a lot more on both school level and society level activities. Principal support is positively and statistically. Significant with the capacity building score of school teachers and it motivates these teachers to explore more and learn more. The teachers with higher participation rate in conferences have higher capacity building scores on average as compared to the others with zero participation. Conference participation has a positive effect on capacity building on school level. It is however, the biggest unfortunate and lack opportunities on school level teaching that very few chances were provided to government teachers to participate in conferences and workshops.

Leadership

Man is blessed with the intellectual faculties. They have been bestowed with the power of making decisions for the development of societies keeping in mind the required needs. All the decisions which are taken with practical mind and futuristic results ensure the achievement of targeted aims. These empirical minds know the fact that all these specified goals are achieved slowly and diligently for durable results. Leadership success always depends on the effective use of motivational strategies for teachers working inside the academic institutions (Cross et al., 2003). Barnes (1978) argues that leadership is a systematic method of motivating people for attainment of desired goals. Yokel (1998) explained that the leader as always an expert who thinks of a style of operation that ensures the achievement of goals. He led the process of directing strategies and processes to achieve goals. He is always concerned with all the relevant aspects which assure the aims for desired results.

Leadership Quality and Its Influencing Factors

There is a relationship between Head-masters motivation and leadership qualities of the school teachers in Mardan. Increase of Headmaster support will lead to increased leadership qualities in school teachers. The result of this study show that time allocation from Headmaster for teachers encourages the leadership qualities due building their confidence.

Headmaster's openness to criticism is positively associated with leadership qualities score of schools' teacher at primary and high schools level at Mardan; it indicates that if high schools Principals are open to criticism about any issue, will lead to increase the leadership quality score of school teachers. This allows teachers to argue or discuss around important things and certain facilities about training and workshops to be a part of it. However, the headmaster's openness to criticism is linked with teacher confidence in our case, which indicates that there is a relationship between leadership qualities of school teachers and openness to criticism of Headmasters.

Age of the teacher as well as education of the teacher is positively associated with leadership qualities of these teachers. The results indicate that increase in age and education will lead to the growth of leadership qualities because increasing responsibilities and since of understanding over the time.

Family size is negatively and adversely associated with leadership qualities on school level teachers of government schools in District Mardan, Khyber Pakhtunkhwa. This means that increase in family size across respondents will lead to decrease the leadership qualities. This also implies that the larger family size doesn't allow teachers to carry extra-curricular activities, which are important factors of growing leadership and leaders.

Family income and intrinsic rewards like personal income are positively associated with leadership qualities of teachers at schools' level. Increase in income across respondents has positive implications for leadership qualities. This is possible because of increasing expenditure on the required activities and the person with high income and personal income is always expected to take part in training and workshops, it increases the leadership qualities score of the school teachers.

Extrinsic rewards like motivation from school principals with awards and certificates or motivation associated with leadership qualities at school level. Intrinsic rewards are highly significant for leadership qualities score and motivation from headmaster is also important for increase in leadership qualities of government school's teachers at District Mardan.

Conclusions

This study concluded in light of the analysis of collected data, that support from Head-masters at school level gives moral support and positive energy to teachers so that they can perform better in school curricular, co-curricular and extra co-curricular activities with full zeal and spirit. It also enhances the leadership qualities of teachers which enable them to face different academic and non-academic situations in the school. Motivation through intrinsic and extrinsic rewards can increase the

capacity of teachers in terms of more working hours on duty and can also polishes the leadership qualities of the teachers. Teachers with high leadership potentials are taken as models by students which in response transform the faculties of leadership of learners also for future.

Recommendations

The following recommendations are suggested in light of the findings of the study:

- 1. School Heads should facilitate the teachers for leadership role in school.
- 2. Teamwork should be developed among heads and teachers.
- 3. Schools' Heads should be motivators to encourage leadership among teachers.
- 4. Schools heads should ensure to control the biased attitudes of seniors towards juniors.
- 5. Schools heads should apply the principles of extrinsic motivation for motivating the teachers.
