MUSE view of 47 Tuc

47 Tuc

old, massive and nearby globular cluster

age 10 to 12 Gyr ⁽¹⁾

$\sim 10^6 M_{\odot}$ ⁽²⁾

distance 4.5 kpc ⁽³⁾

MUSE

IFS observing campaign of globular clusters

MUSE FoV
of 47 Tuc

Search for SB1 binaries

data $t, v_{\text{rad}}, \sigma_{v_{\text{rad}}}$

model $v_{\text{rad}} = v_z + K (\cos(\omega + f) + e \cos(\omega))$

Walker (2017)

A. identify binaries in a statistical approach (*Giesers et al. 2019*)

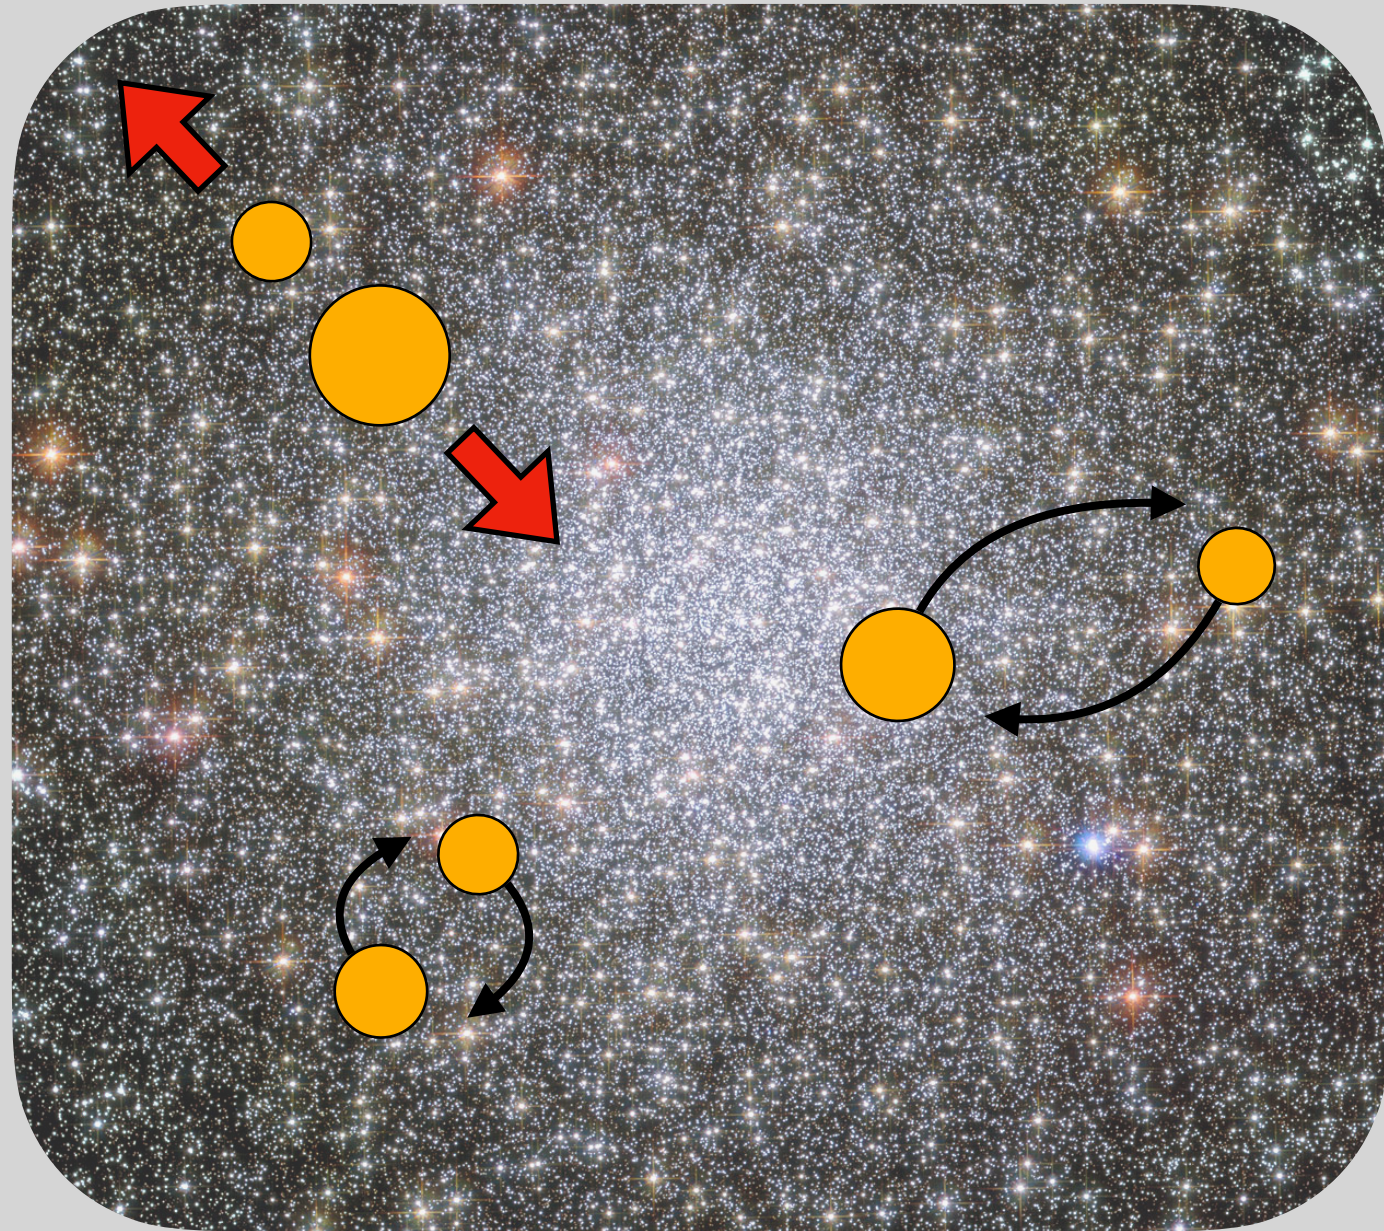

larger RV scatter \Leftrightarrow higher binary probability

B. determine orbital parameters using nested sampling (*Buchner 2021*)

nested sampling works well for multi-modal solutions

need spectroscopy!

- ➔ limited information on companion masses and period distribution
- ➔ low overall binary fraction

Binary demographics

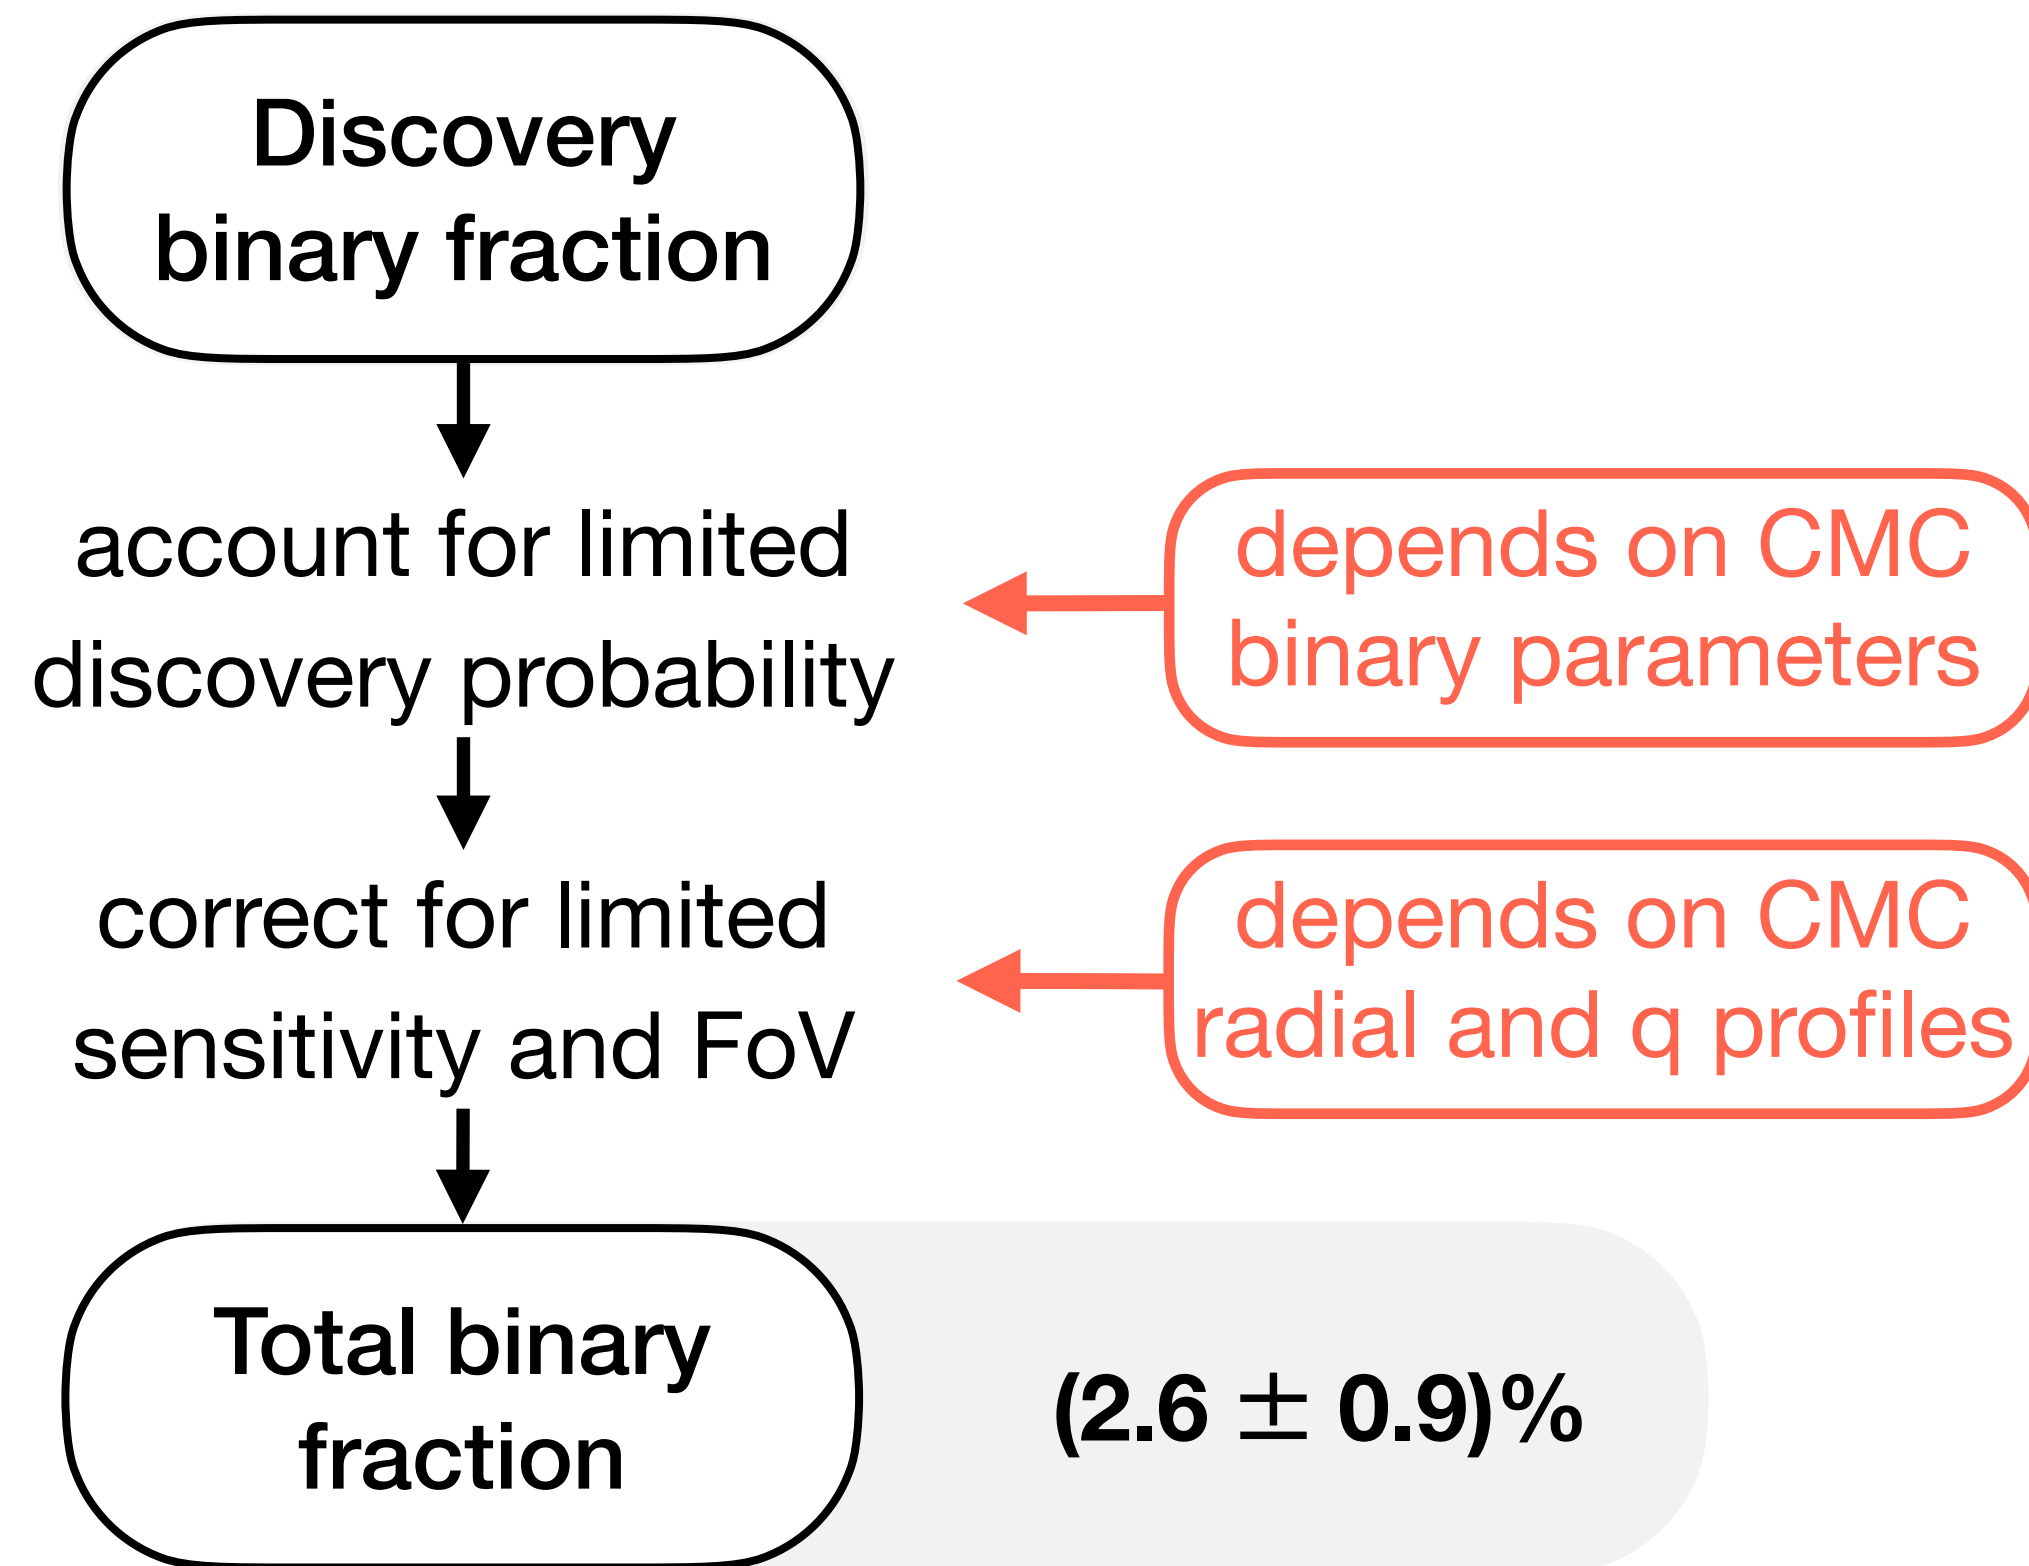

Binary fraction

Binary demographics

Binary fraction

low total binary fraction,
consistent with
photometric estimates ✓

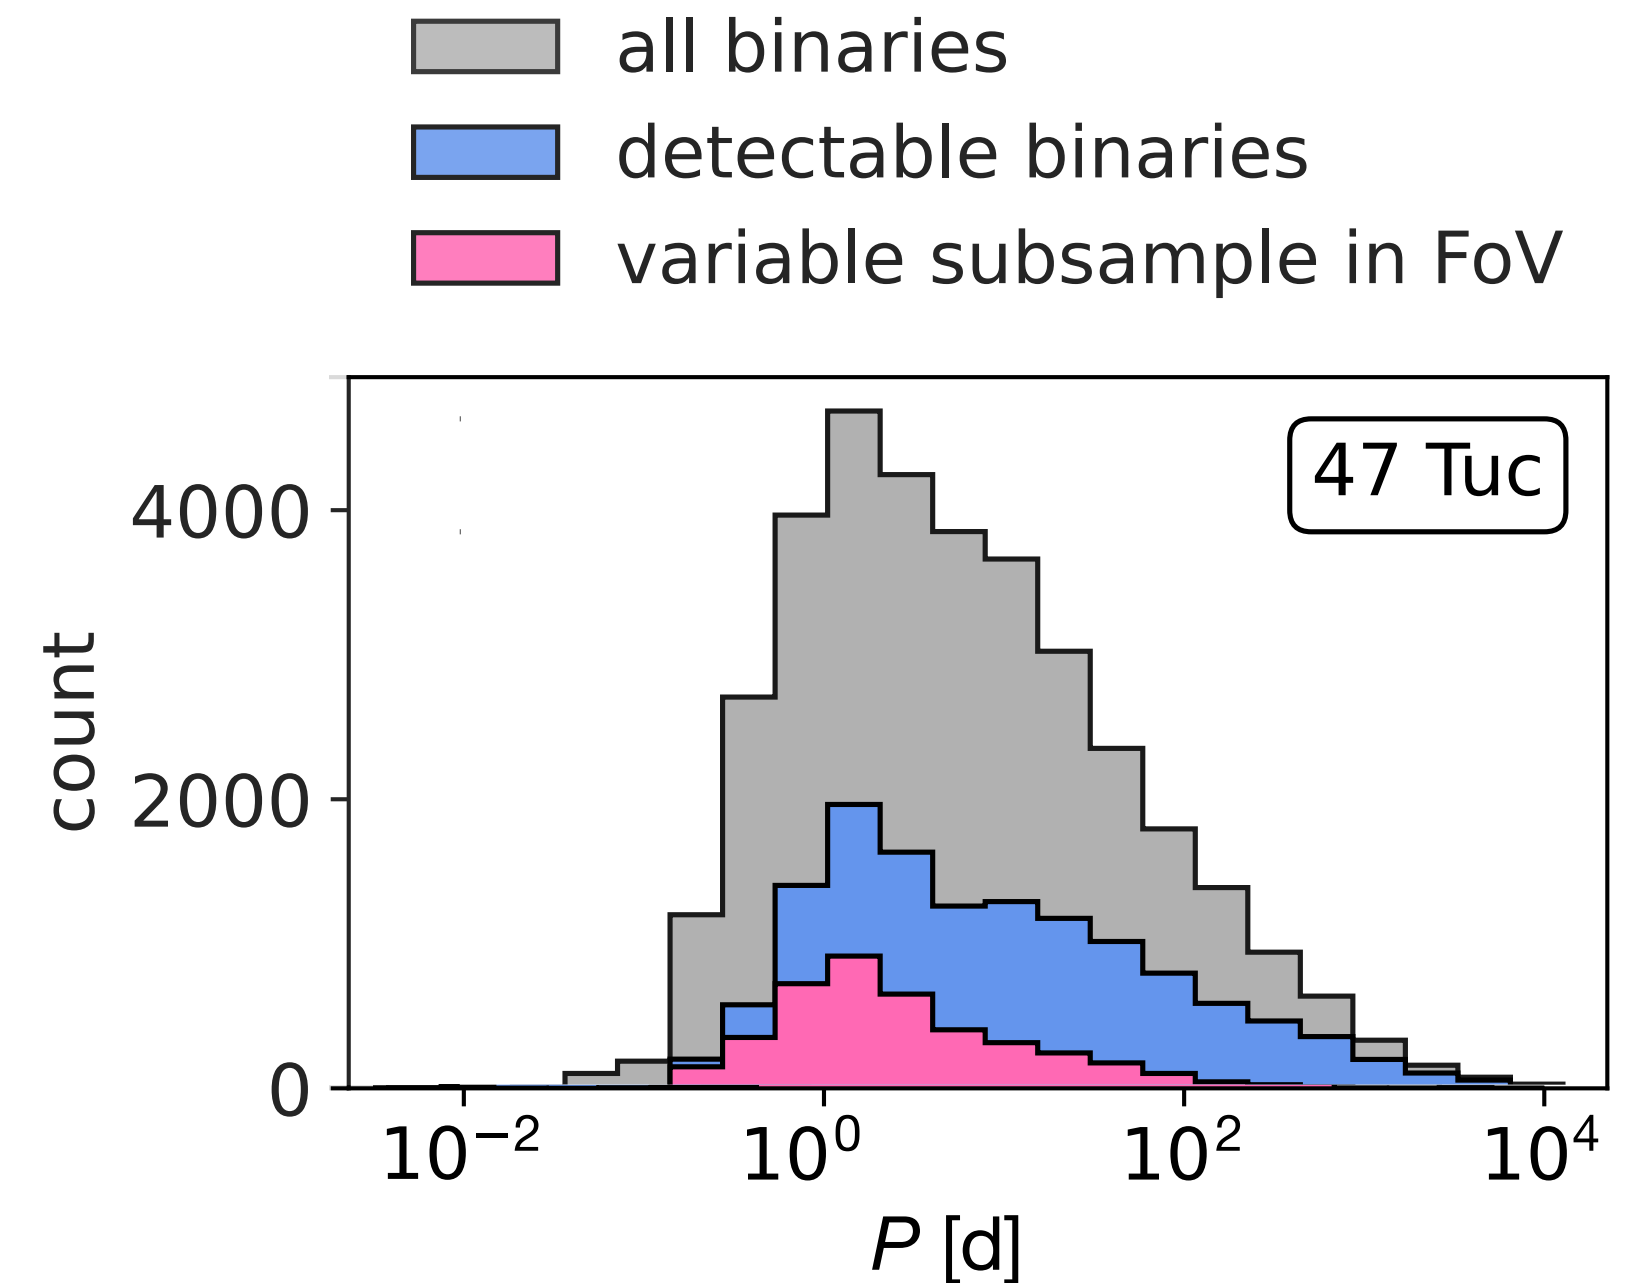

Binary demographics

Predictions from simulations

CMC simulations of
47 Tuc (*Ye et al. 2022*)

- ➔ account for observational biases using mock data
- ➔ make predictions of binary properties

binary detection
probability is
highest for short
periods

Binary demographics

Orbital parameters

We expect to find and are more sensitive to short-period binaries

but instead we find binaries with longer periods.

Binary demographics

Orbital parameters

We expect to find and are more sensitive to short-period binaries

but instead we find binaries with longer periods.

possible interpretation

- A. uncertainty in binary evolution models
- B. different fractions of RGB stars
- C. (excessive) dynamic hardening in CMC

Black holes in 47 Tuc

Dark remnant companions

no evidence for BH/NS companions; all min. $m_2 \ll 1.4 M_{\odot}$

⚡ ~7 MS-BH binaries expected from CMC simulation

- ▲ WD candidate
- MUSE binaries, unimodal
- MUSE binaries, bimodal

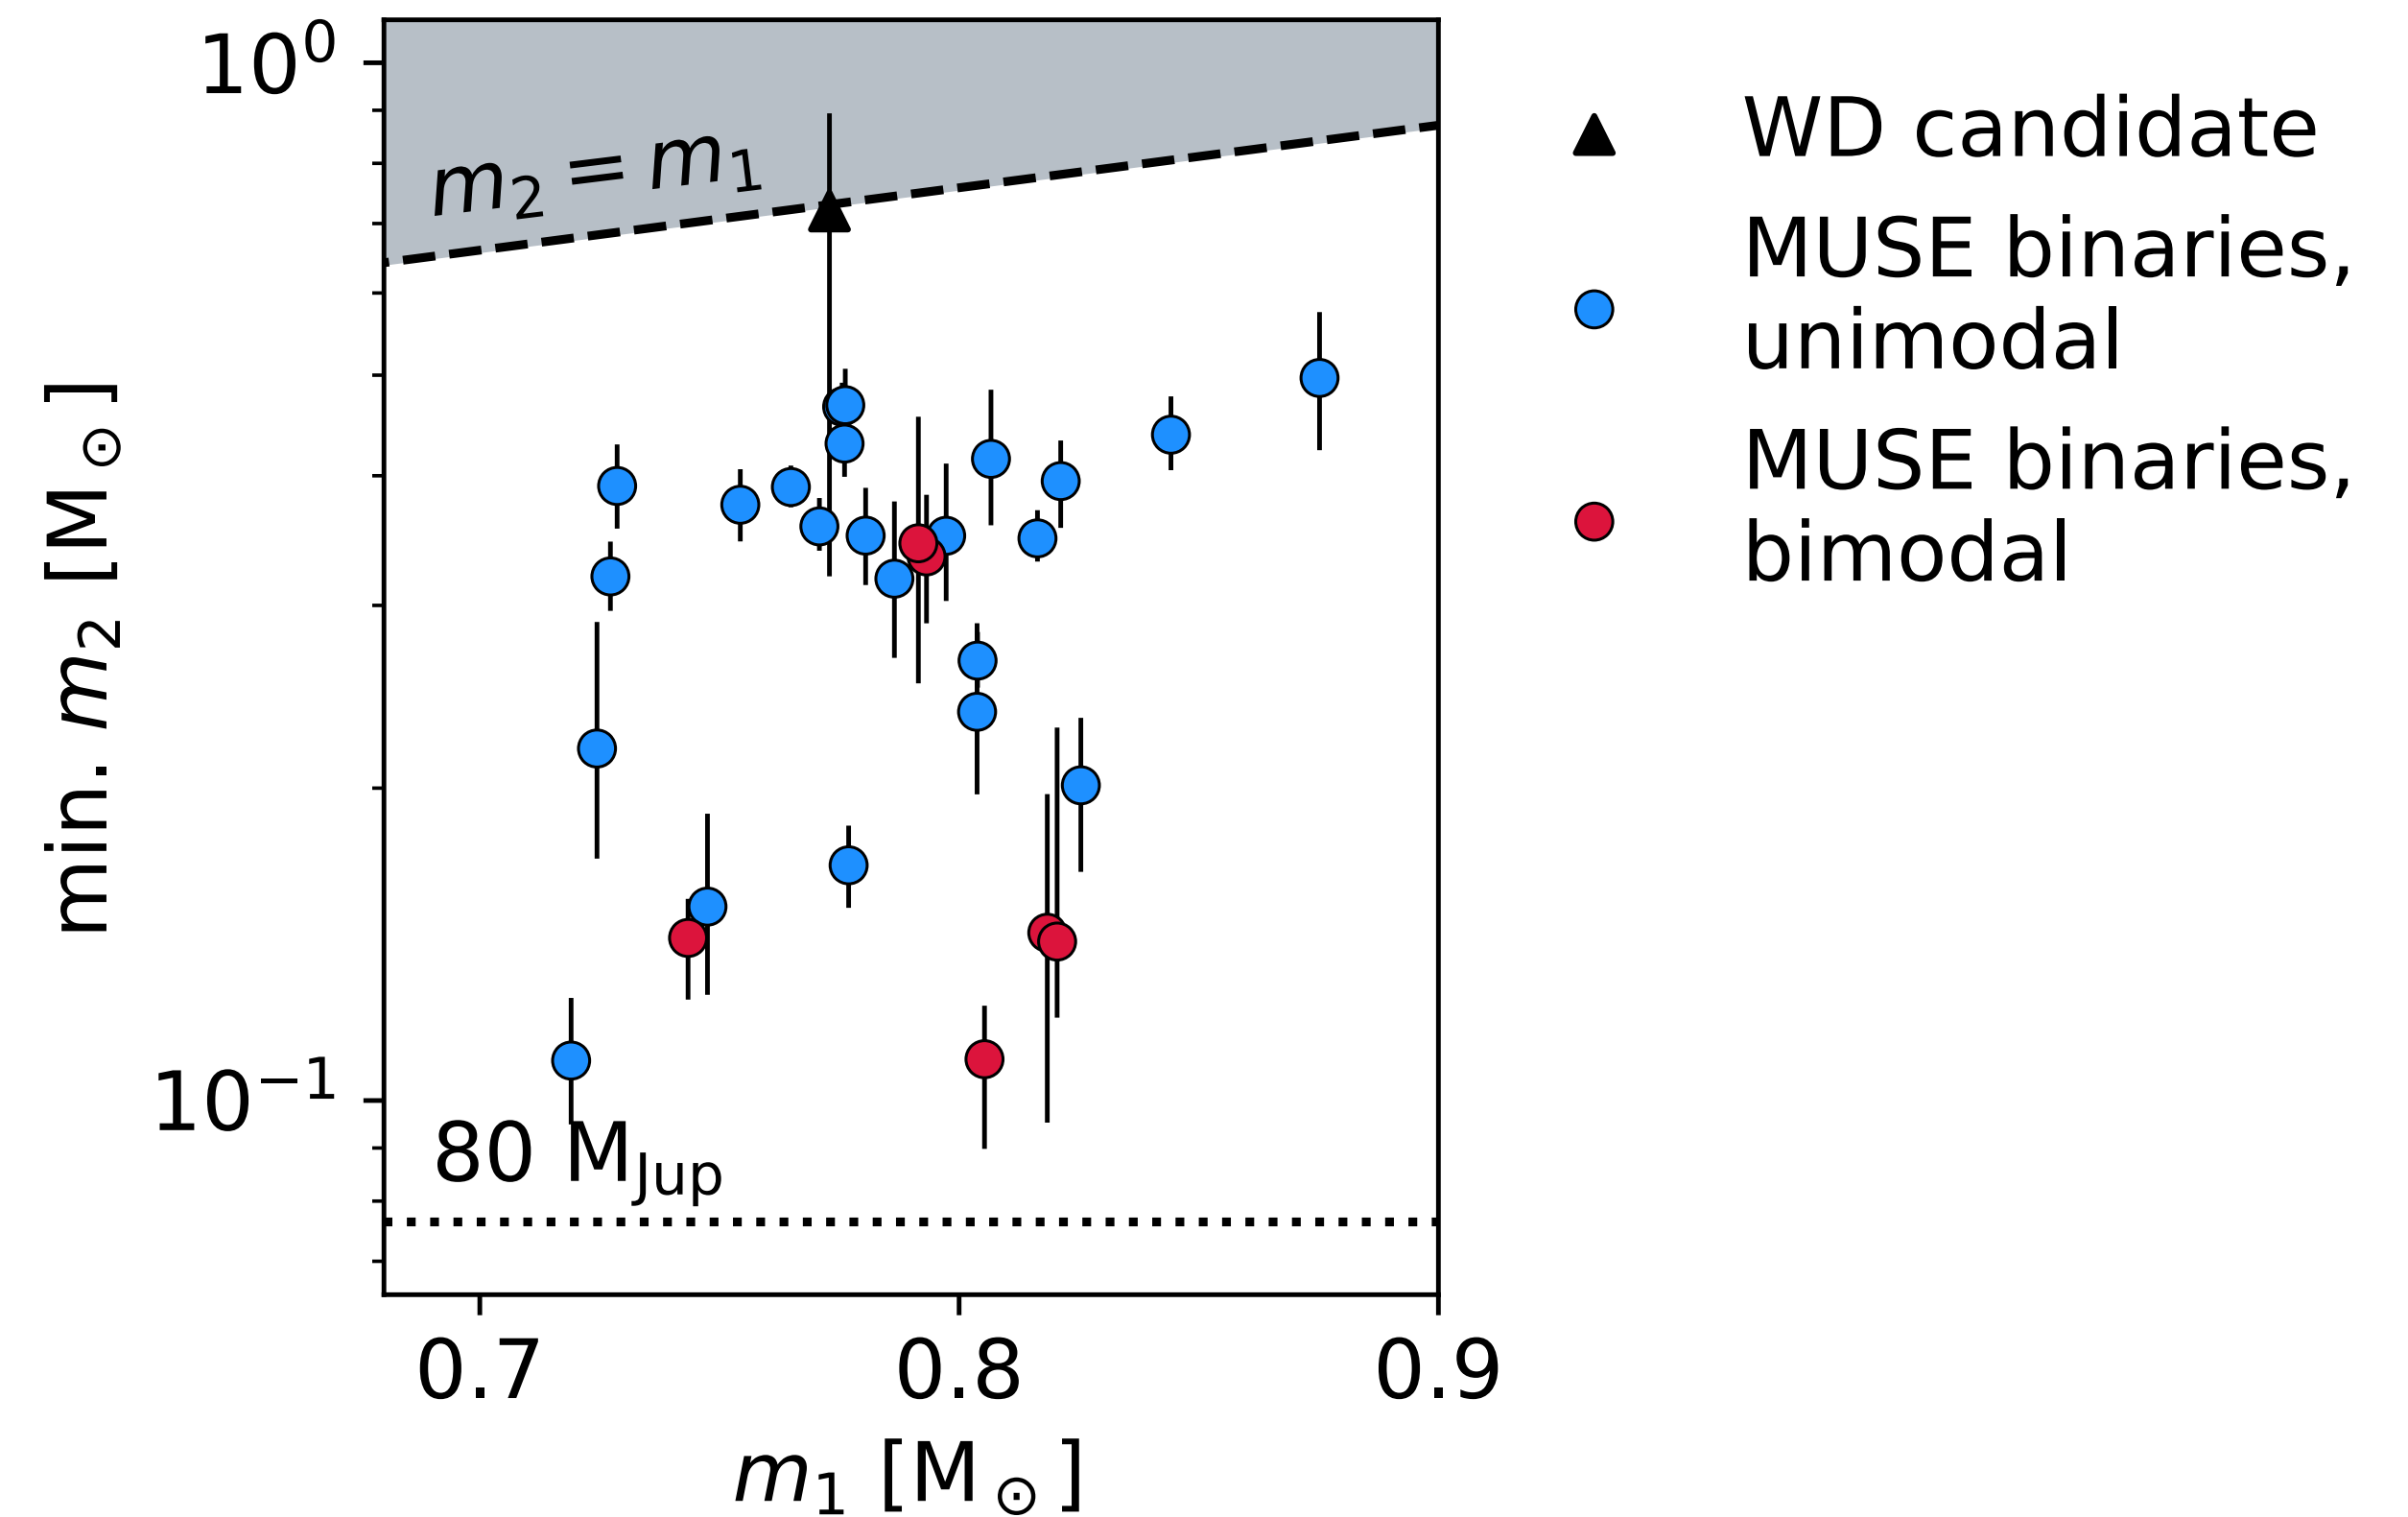

Black holes in 47 Tuc

Dark remnant companions

possible interpretation

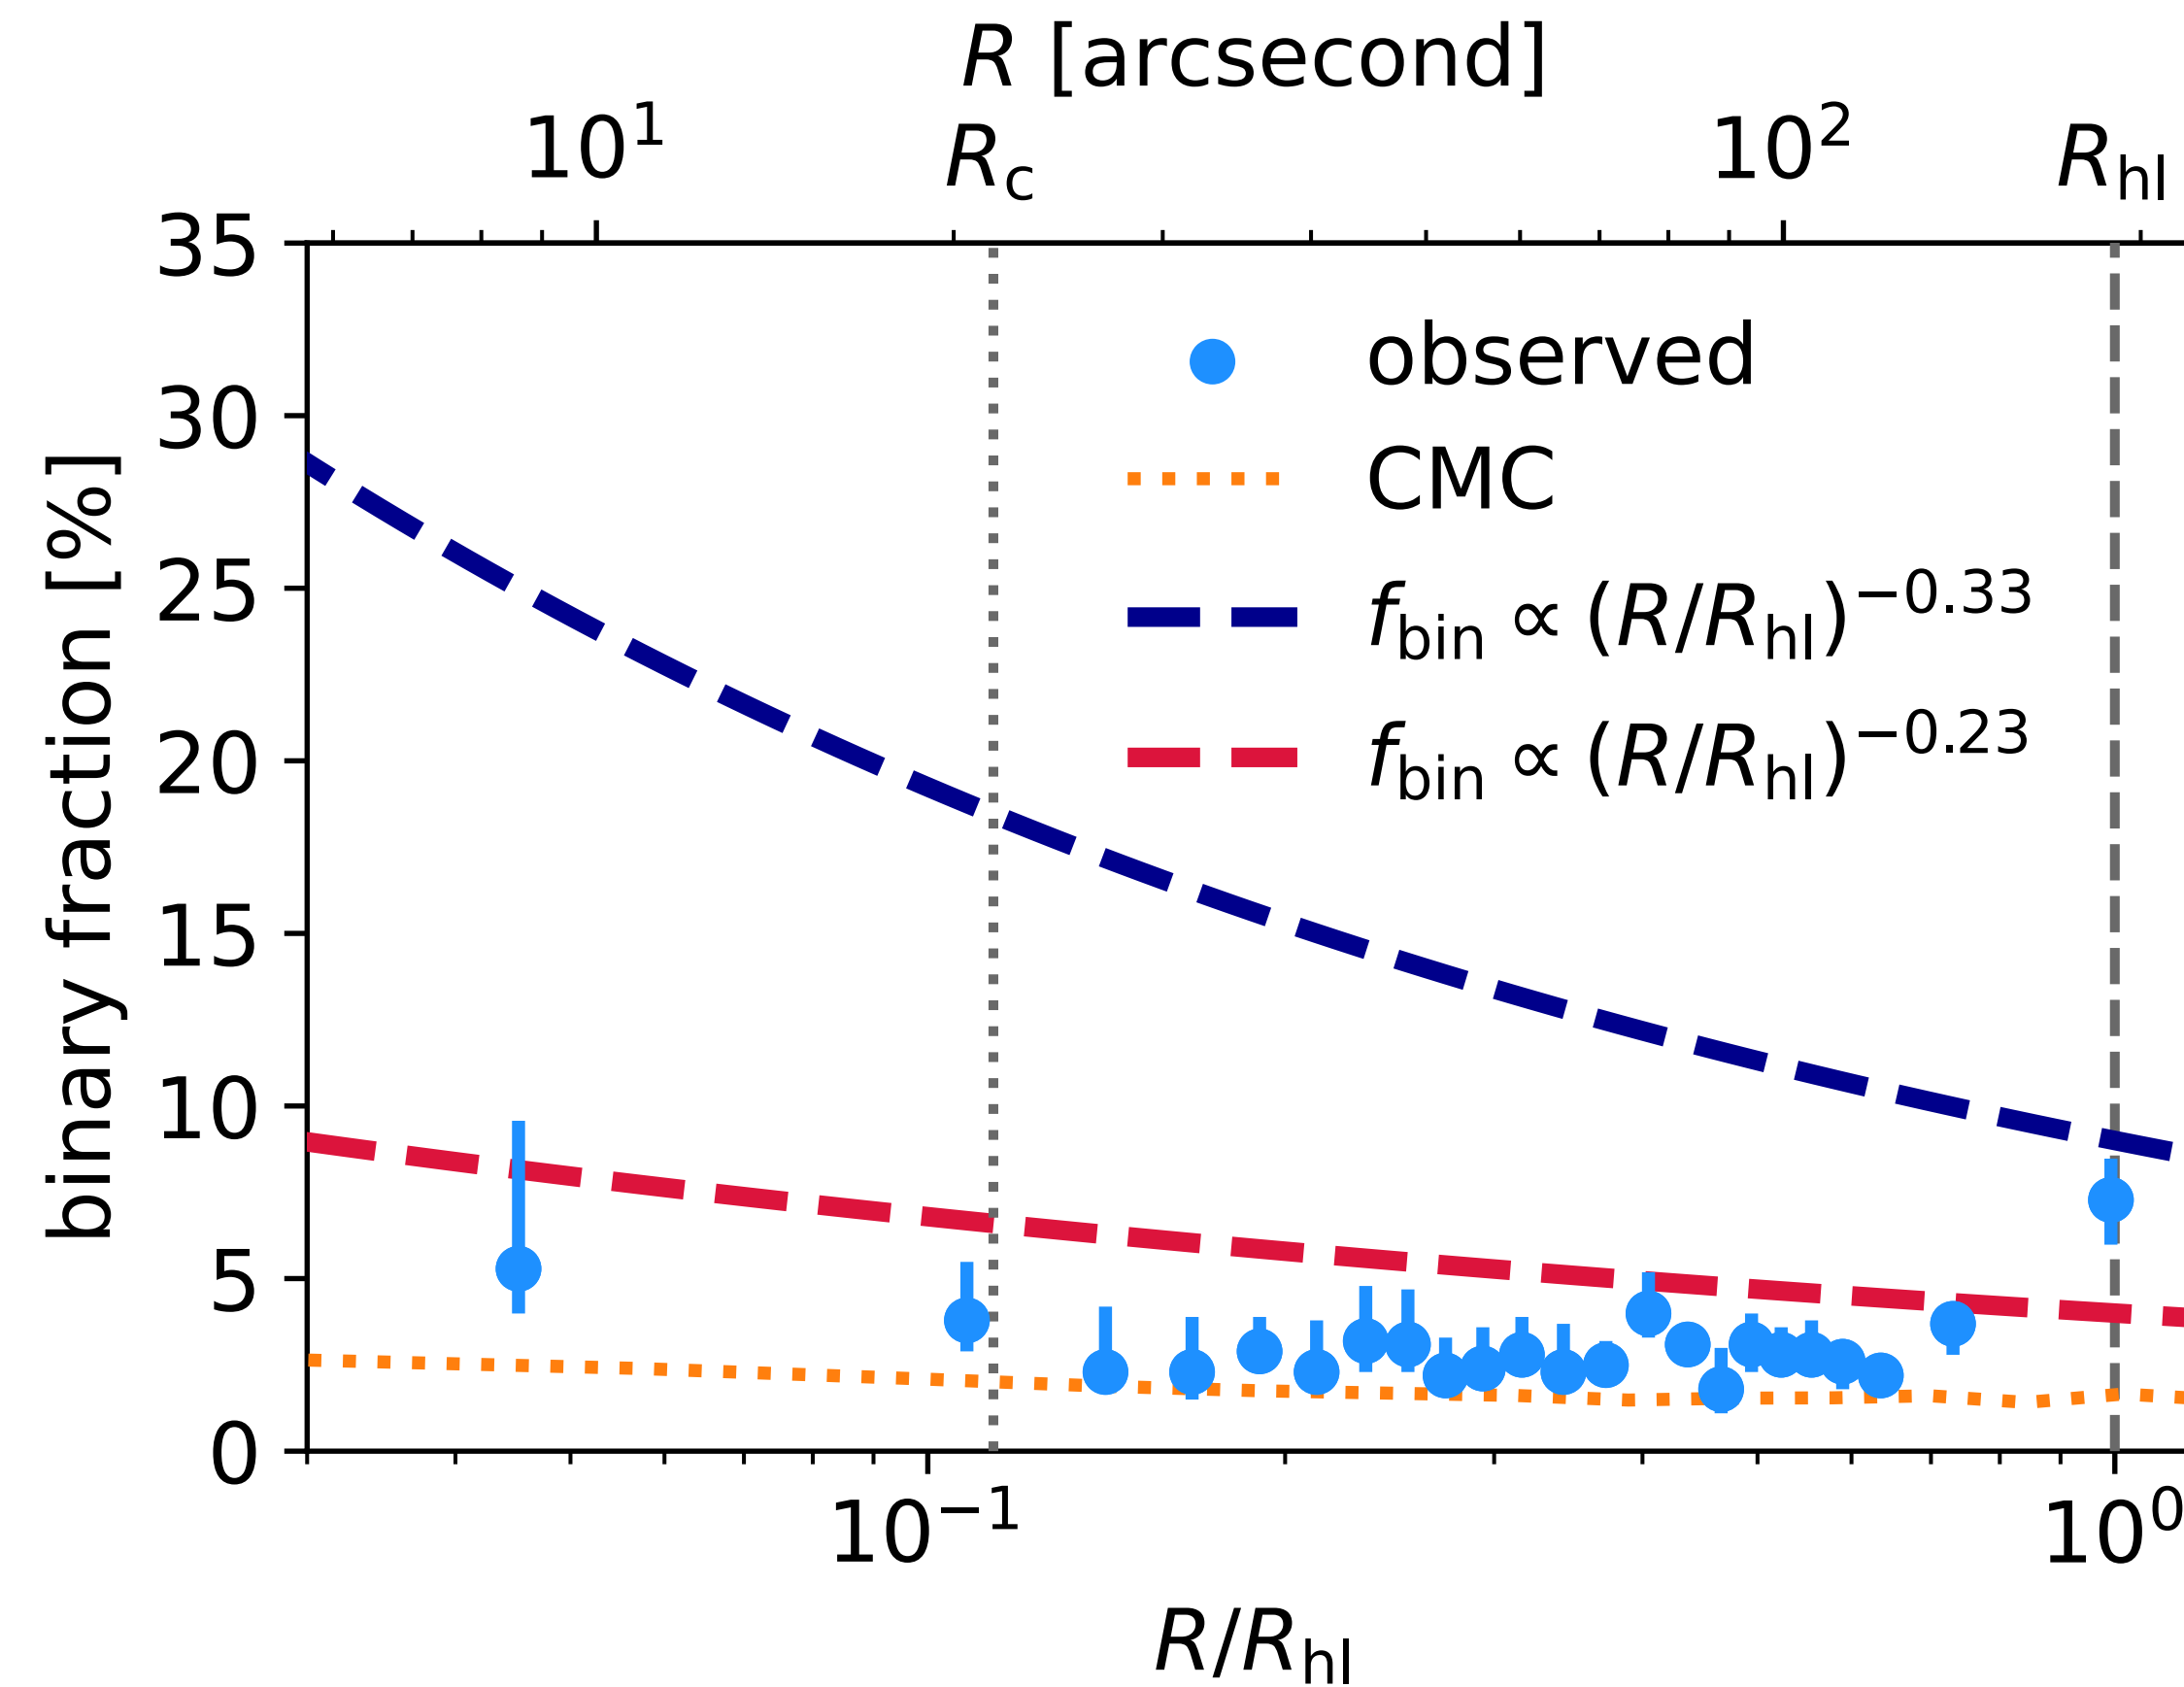

- low inclinations, unfortunate time sampling
- magnitude limit, restricted FoV
- low number of binary BHs / unobservable configurations

Black holes in 47 Tuc

Central IMBH

Black holes in 47 Tuc

Central IMBH

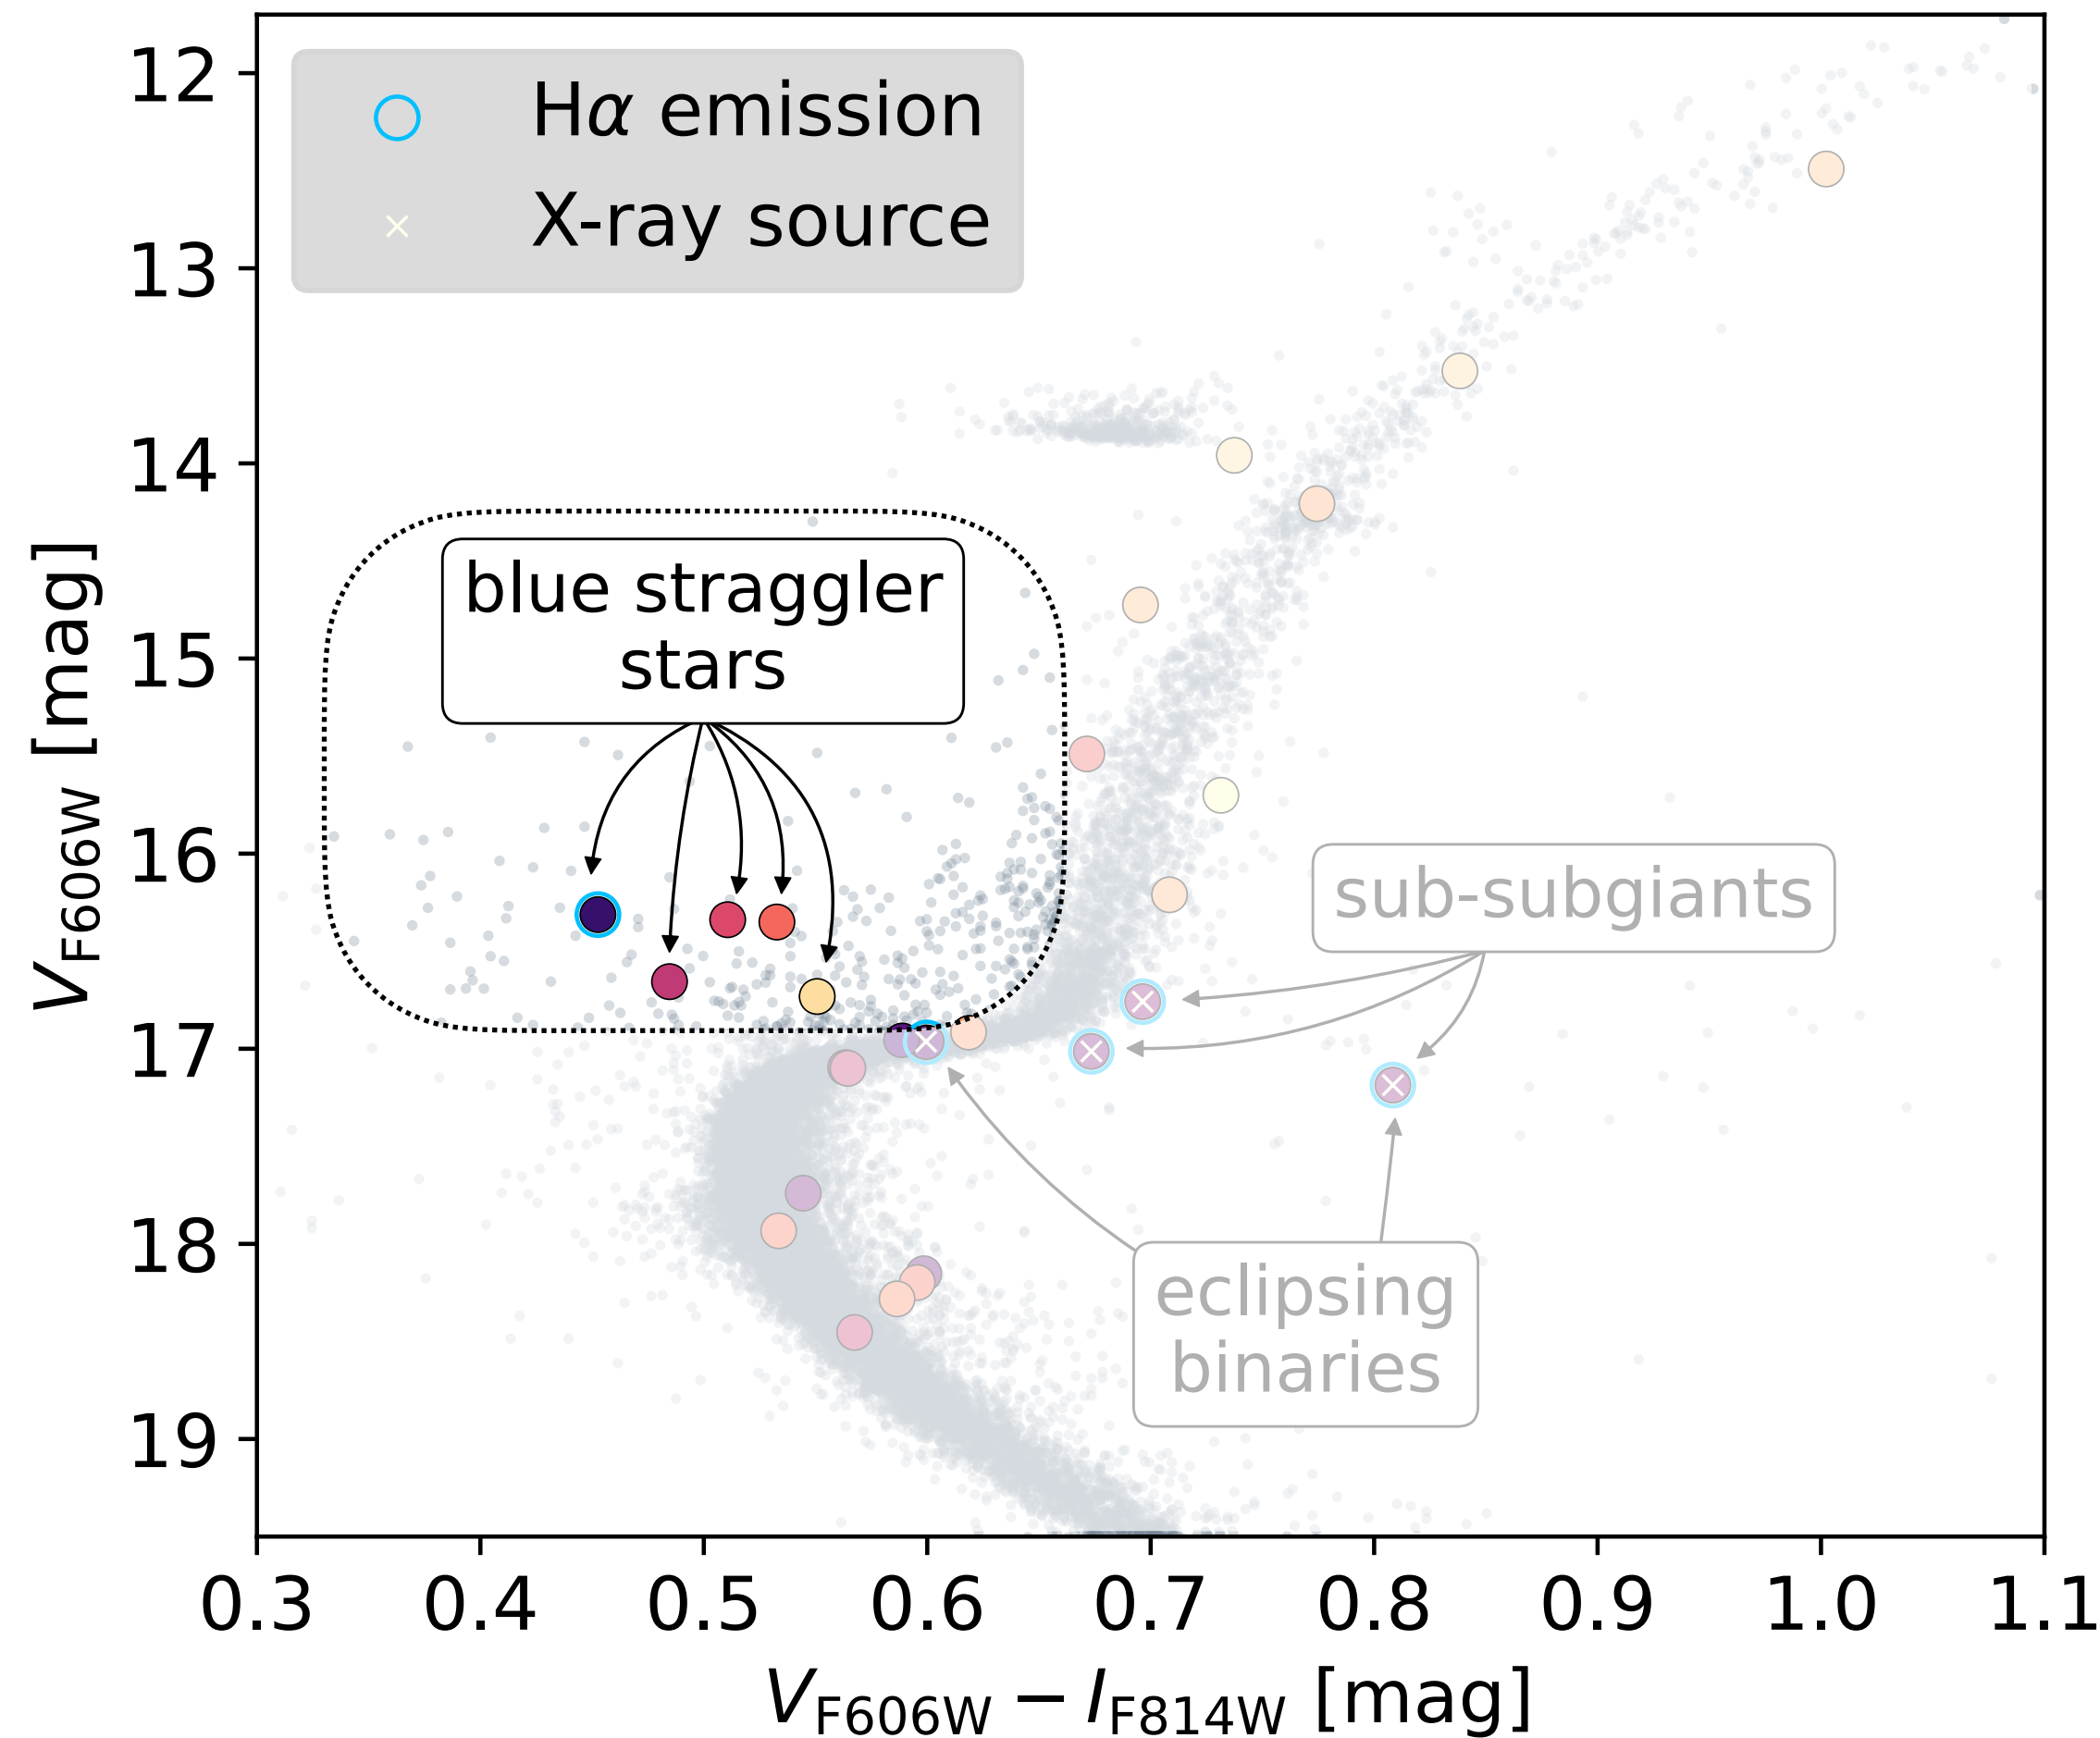

Blue straggler stars (BSS)

Blue straggler stars (BSS)

5 BSS with well-constrained orbital solutions

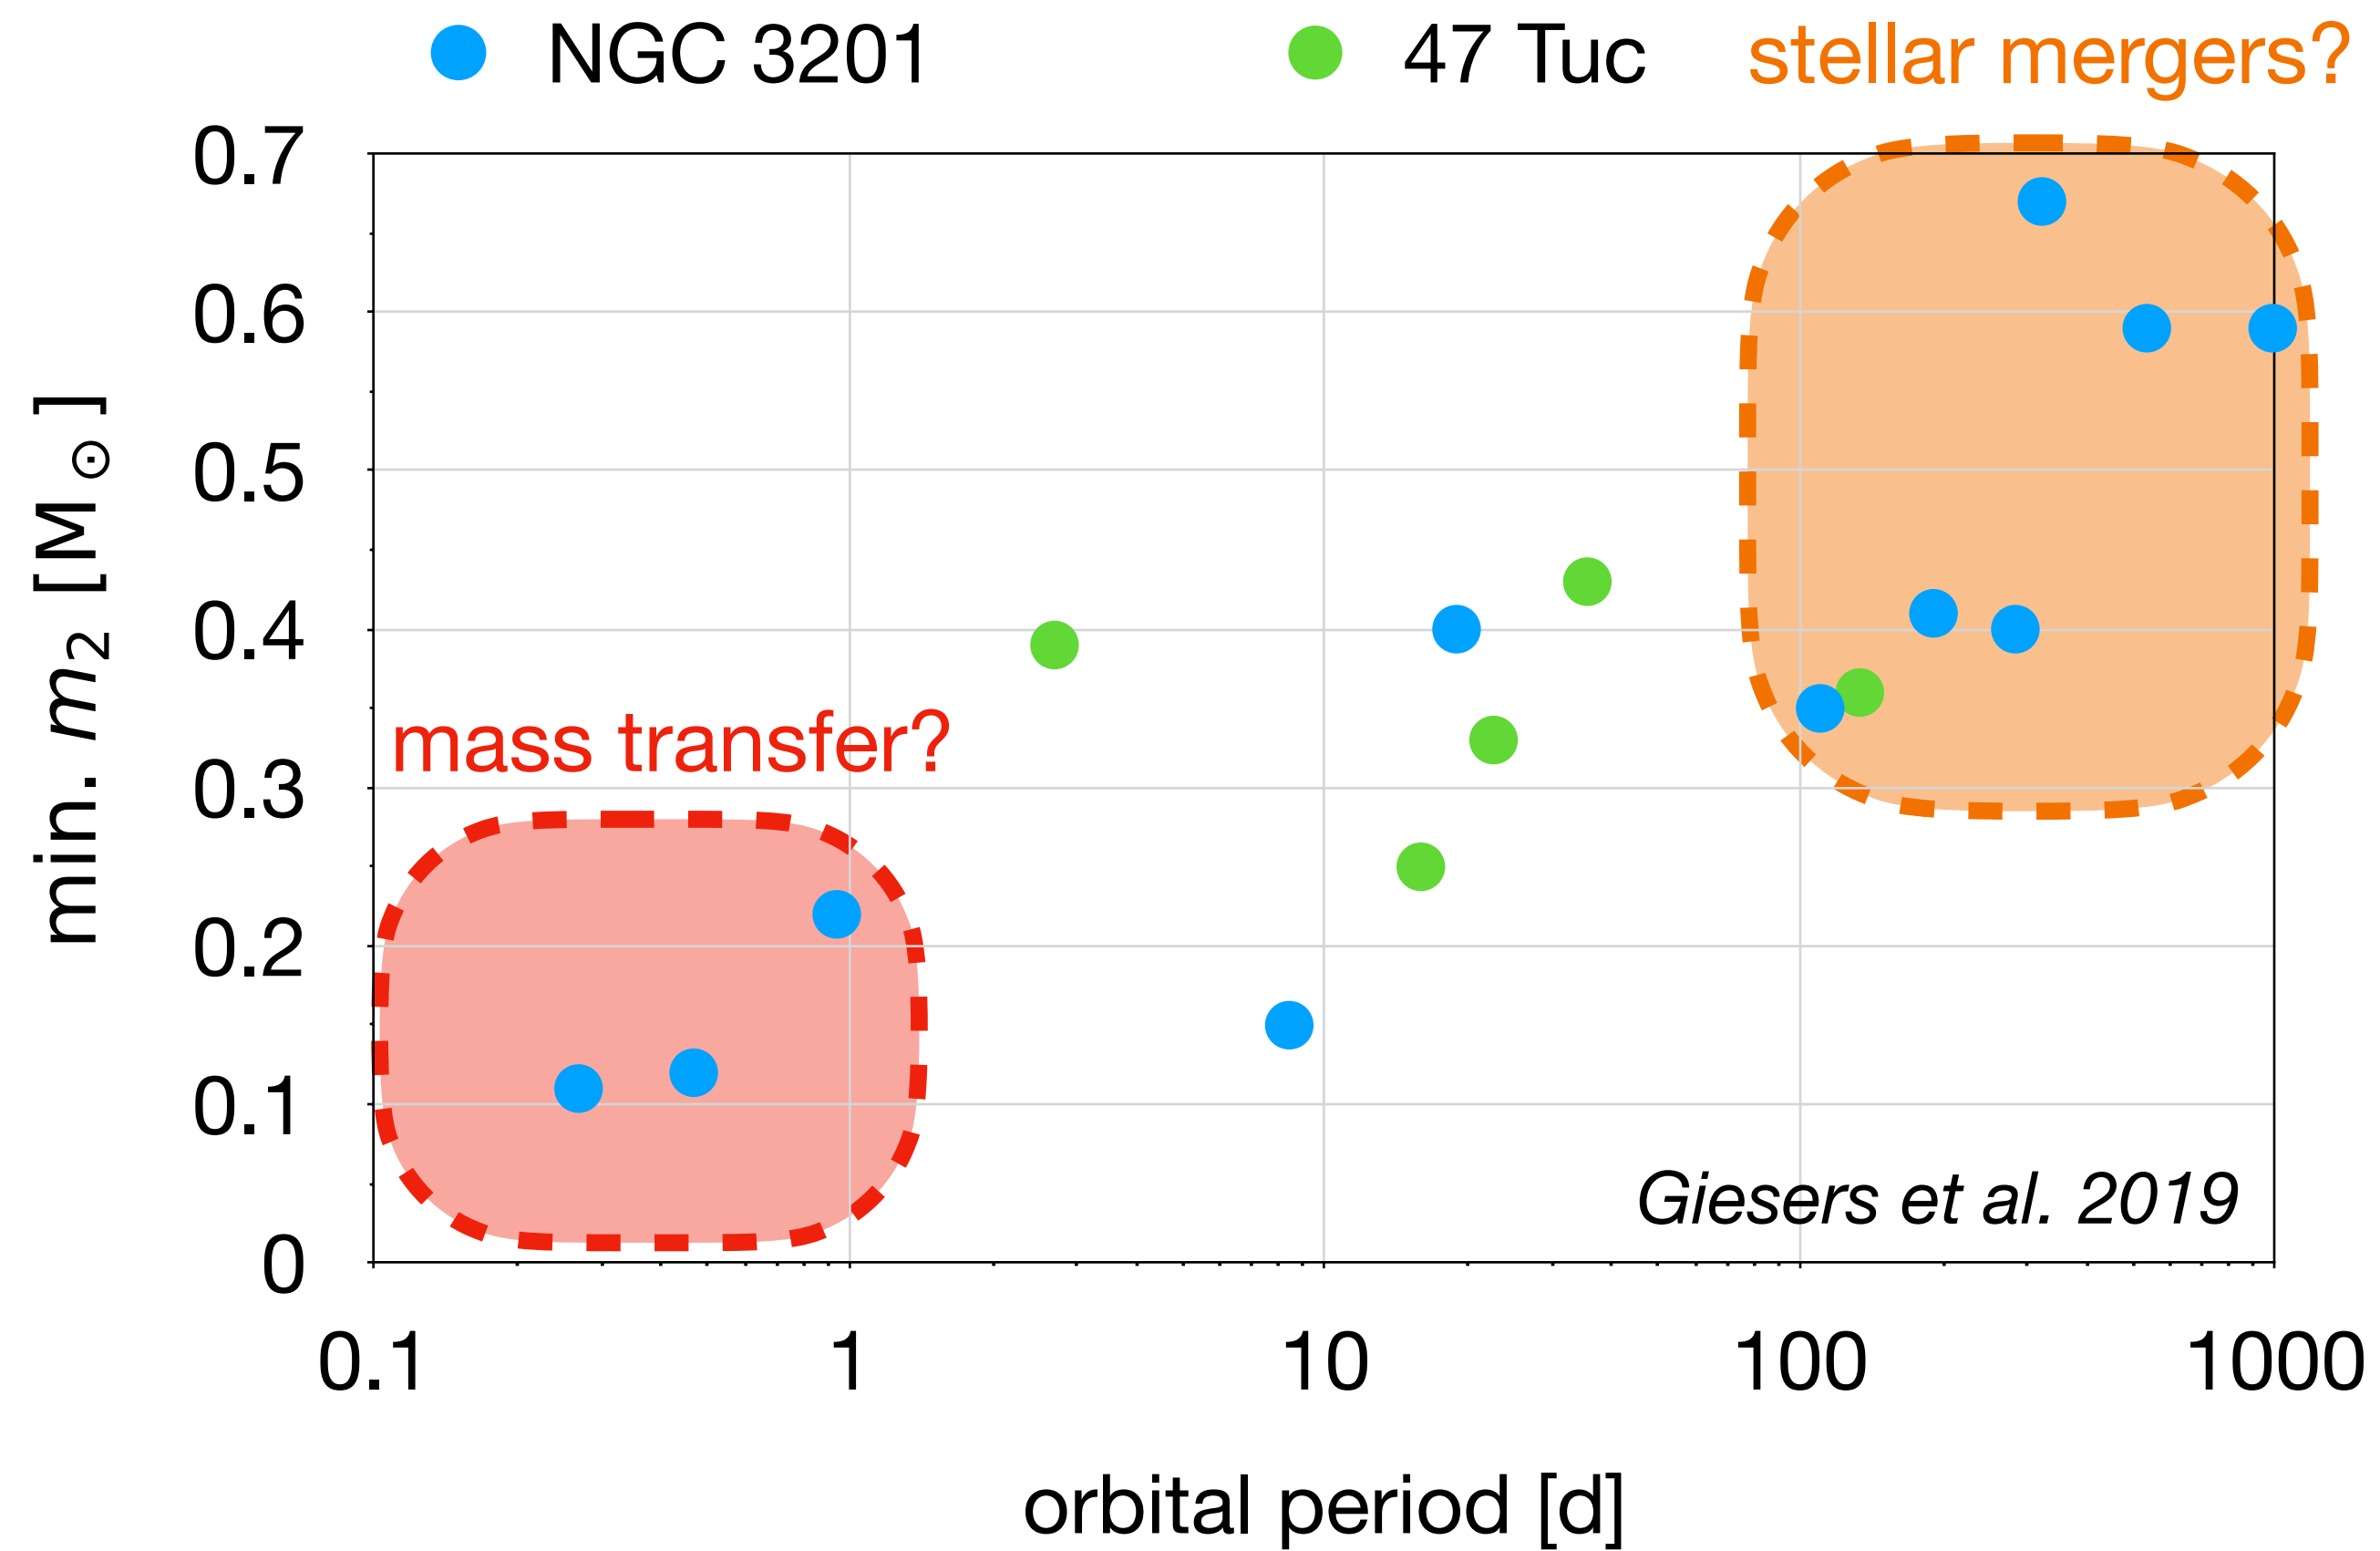

Blue straggler stars (BSS)

Blue straggler stars (BSS)

Blue straggler stars (BSS)

possible interpretation

- A. pattern in NGC 3201 is coincidental
- B. 47 Tuc sample of BSS is not representative
- C. fewer BSS formed via binary mass transfer in 47 Tuc

Summary

- ➔ study binary population of 47 Tuc using multi-epoch spectroscopy from MUSE
- ➔ determine total binary fraction of $(2.6 \pm 0.9)\%$ and **increased binary fraction among BSS**
- ➔ comparison with CMC simulations reveals **scarcity of short-period binaries** with massive companions
