Green bean (*Phaseolus vulgaris* L.) is an important cultivated plant of the *Leguminosae* family, which has a very high nutritional value and is the most grown and produced all over the world. Fresh beans are also a very important vegetable in human nutrition. Beans can be utilized in different ways such as fresh vegetables, dried grains, and canned (Bozoğlu, 1995). Originating from Central America, the bean plant came to Anatolia 250 years ago and found a very wide distribution area (Şehirali, 1988).

In Turkey, green beans are grown in almost all regions. It is rich in vitamins A, B1, B2 and C. It also creates an excess of base that can neutralize the acid accumulated in the body. The digestibility rate of beans is 84.1%. It is even reported that *phasol* and *phaseolin* substances found in bean pods have the characteristics of insulin used in diabetes and are therefore used to reduce the amount of sugar in the blood. Green beans also provide raw materials for the vegetable processing industry (Madakbaş, 2023).

It is stated that the effect of genotype, environment, and environment x genotype interaction on the grain yield of beans is very important (Ceyhan, 2004). In previous studies, it was reported that plant height, number of pods per plant, number of grains per pod, number of grains per plant, hundred-grain weight, and grain yield showed great variability among genotypes (Kepildek & Ceyhan, 2021; Tamüsek & Ceyhan, 2022; Küçük & Ceyhan, 2022).

Developing and utilizing new green bean varieties is important for agriculture, food production, and consumer needs. Nowadays, green bean cultivation has gained great importance because it is profitable due to increasing consumption. Growers prefer dwarf-shaped beans with less labor and cost in large areas. In this study, it was tried to determine pure lines of green beans suitable for the climatic conditions of the Central Anatolia region.

MATERIALS and METHODS

As a result of a preliminary selection among 287 genotypes in the F₄ generation, 12 genotypes with superior characteristics in terms of yield traits important for fresh production of green bean plants were selected. In this study, 12 selected green bean pure lines (17ETFBJ, 17ETFBG, 17ETFBL, 17ETFBR, 17ETFGL, 17ETFBLB, 17ETFLG, 17ETFLJ, 17ETFLR, 17ETFRB, 17ETFRG and 17ETFRL) and 3 registered green bean cultivars (Beyzade, Lida and Riberia) were used as plant material. Most of these selected pure lines differed in at least one morphological trait.

According to the 20-year meteorological observations made in Konya province during the vegetation period in the year when the trials were established, the 20-year average

temperature, total precipitation, and average relative humidity were 19.6 °C, 119.5 mm, and 46.9%, respectively. In 2022, when the experiment was established, it was realized as 19.8 °C, 72.7 mm, and 44.5%. The monthly average temperature values of the experimental year showed great similarities with the long-term average. When the total precipitation values are analyzed, it is seen that very little precipitation fell in the experimental year compared to the long-term average.

This research was conducted in 2022 at the Faculty of Agriculture Prof. Dr. Abdülkadir AKÇİN Research and Application Station located in Alaeddin Keykubat Campus of Selçuk University. The results of soil analysis revealed that the soils of the experimental site had a clayey-loamy texture, slightly alkaline reaction, no salt, too much lime, poor phosphorus, sufficient potassium, and poor organic matter (Küçük & Ceyhan, 2022; Karadaş & Ceyhan 2023).

The experiment was established according to the randomized block design with three replications. In the experiment, the plot area was arranged as 1.5 m x 4.0 = 6 m². Each plot consisted of 3 rows. There were no gaps between the plots, and the Lida variety was planted only at the beginning and end of the blocks as two rows of marginal effect.

The experimental area was plowed in March and the soil was prepared for sowing with a hand hoe rotovator in April. Sowing was carried out on April 28, 2022, by hand sowing the seeds to a depth of 4 cm in the rows opened with a marker, with 50 cm between the rows and 10 cm above the rows. According to the previous soil analysis, 15 kg of DAP fertilizer was applied with the planting. Weed control was done by hand hoeing twice. Depending on the climatic conditions, irrigation was done 4 times in total, 1 time between emergence and flowering, 1 time during the flowering period, and 2 times during the pod and seed setting period to meet the water needs of the bean plant. Irrigations were carried out with micro-sprinklers. Harvesting was done manually on September 06, 2022.

Plant height (cm), number of pods per plant (number/plant), the number of grains per pod (number/plant), the number of grains per pod (number/plant), number of grains per plant (number/plant) were determined in 10 randomly selected plants from each plot and their averages were taken and values were calculated. 100-grain weight was determined in g. From each plot, 50 cm was removed from the beginning and end of the rows as a margin and the remaining area was harvested and unit area grain yields were calculated as kg da⁻¹ (Ceyhan, 2004).

The data obtained in the study were analyzed for variance in the MSTATC statistical package program according to the randomized blocks experimental design. The means of the significant traits were grouped according to the LSD test.

FINDINGS and DISCUSSION

The differences among the plant heights of green bean pure lines were found statistically insignificant (Table 1). The highest plant height was obtained from line 17ETFGL with 53.00 cm and the shortest plant height was obtained from line 17ETFLB with 37.00 cm (Table 2). Plant height has an important place in bean morphological traits due to its effect on plant yield (Ceyhan, 2004). In recent years, growers have preferred dwarf-shaped beans with less labor and cost in large areas (Kepildek & Ceyhan, 2021). Kepildek & Ceyhan (2021) reported that plant height in green beans varies between 29.00 and 167.67 cm depending on the genetic structure of the variety and environmental conditions. Tamusek & Ceyhan (2022) reported that the plant height of bean lines varied between 19.67 and 56.00 cm.

Table 1. Mean squares of agricultural characteristics of green bean lines investigated in the research.

Sources of Variation	DF	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight
Total	44						
Replication	2	77.906	8.717	0.350	58.460	1200.870	21.908
Lines	14	58.403	25.550**	1.117	1389.600**	9616.359**	48.039**
Error	28	32.370	3.913	0.624	325.050	1174.060	4.182

**%1 statistically significant level.

When the number of pods per plant was compared, a statistically significant difference was found among the pure lines (Table 1). The highest number of pods per plant was obtained from 17ETFBR (23.33 number/plant), 17ETFLJ (23.33 number/plant), and 17ETFLG (22.67 number/plant) lines, while the lowest number of pods per plant was obtained from 17ETFBL (14.83 number /plant) and 17ETFRL (14.00 number /plant) lines with no statistical difference between them (Table 2). Kepildek & Ceyhan (2021) reported the number of pods per plant in green beans as 10.33-26.67 number/plant, Tamusek & Ceyhan (2022) reported 22.50 - 77.50 number/plant and Küçük & Ceyhan (2022) reported 6.25-11.96 number/plant. While the number of pods per plant obtained by Tamusek & Ceyhan (2022) was higher than our results, the number of pods per plant obtained by Küçük & Ceyhan (2022) was lower than our results.

The number of pods per plant is a variety of characters and is also affected by environmental conditions and cultivation methods (Ceyhan, 2004).

The differences between the number of grains per pod of green bean pure lines were found statistically insignificant (Table 1), the highest number of grains per pod was determined in 17ETFRG and 17ETFBJ lines with 6.17 and the lowest number of grains per pod was determined in Riberia variety with 4.00 (Table 2). The values of the number of grains per pod determined were similar to the findings of Kepildek & Ceyhan (2021), Tamüsek & Ceyhan (2022) and Küçük & Ceyhan (2022).

Table 2. Averages of agricultural characteristics of green bean lines investigated in the research

Lines	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight
Beyzade	38.67	16.67bc	5.00	83.83cd	195.77e	32.00cde
Lida	42.17	17.83bc	5.33	95.08bcd	289.80a-d	27.50ef
Riberia	42.67	19.83ab	4.00	79.00cd	252.47cde	32.67cd
Mean of Cultivars	41.17	18.11	4.78	85.97	246.01	30.72

17ETFGL	53.00	16.50bc	5.00	82.42cd	310.57abc	34.67bcd
17ETFLB	37.00	19.33ab	5.33	103.67a-d	334.37ab	37.43ab
17ETFLG	50.83	22.67a	5.17	116.83abc	352.57a	32.67cd
17ETFLJ	47.33	23.33a	6.00	138.50a	350.00a	31.33de
17ETFLR	42.17	16.50bc	5.50	89.25cd	288.87a-d	26.67f
17ETFRB	39.83	17.83bc	4.50	80.58cd	194.83e	37.50ab
17ETFRG	42.67	16.33bc	6.17	102.08a-d	231.00de	32.50cd
17ETFRL	40.00	14.00c	4.67	64.67d	196.93e	39.67a
Mean of Lines	44.53	18.64	5.35	100.21	291.80	35.17
Mean	42.85	18.37	5.06	93.09	268.91	32.95
Lsd _{0.01}		4.463		40.68	77.31	4.614

There is no statistical difference between the averages denoted by the same letter.

There was a statistically significant difference between the lines in terms of the number of grains per plant (Table 1). The number of grains per plant varied between 64.67 (17ETFRL) and 138.50 (17ETFLJ) number according to the green bean lines (Table 2). The number of grains per plant of 10 lines was higher than the average of standard varieties (85.97 number/plant). It was reported by many researchers (Kepildek & Ceyhan 2021; Tamüsek &

Ceyhan 2022; Küçük & Ceyhan 2022) that the number of grains per plant varied greatly depending on genotype and environmental conditions. The values of the number of grains per plant obtained in this study are largely in agreement with the findings of Kepildek & Ceyhan (2021), Tamüsek & Ceyhan (2022), and Küçük & Ceyhan (2022).

Statistically significant differences were found among the bean lines in terms of grain yield (Table 1). The highest value in terms of grain yield was obtained from line 17ETFLG with 352.57 kg da⁻¹. This was followed by 17ETFLJ (350.00 kg da⁻¹), 17ETFBJ (341.60 kg da⁻¹), 17ETFLB (334.37 kg da⁻¹), 17ETFBR (320.83 kg da⁻¹), 17ETFGL (310.57 kg da⁻¹), 17ETFBG (308.47 kg da⁻¹) in descending order. The lowest grain yield was obtained from the 17ETFRB variety with 194.83 kg da⁻¹. In this study, the grain yield of 9 of the newly developed lines was higher than the average grain yield of standard varieties (Table 2). Küçük & Ceyhan (2022) reported that grain yield per decare varied greatly depending on genotypes in green beans. Küçük & Ceyhan (2022) determined that grain yield in green beans varied between 155.39 - 181.14 kg da⁻¹. Our research results are higher than these values. These differences may be due to the genetic structure of the genotypes as well as soil and environmental conditions.

It was determined that the 17ETFLG line had the highest values in terms of the number of pods in the plant and the number of grains in the plant in addition to grain yield and ranked first in terms of the number of grains in the pod and hundred-grain weight. The high averages of the traits determining the grain yield caused this line to have a high grain yield.

The bean genotypes examined in the study showed statistically significant differences in terms of hundred-grain weight (Table 1). The highest and lowest facial grain weight values were obtained from the 17ETFRL line with 39.67 g and the 17ETFLR variety with 26.67 g, respectively. In the experiment, 17ETFBR (39.00 g), 17ETFBJ (38.83 g), 17ETFRB (37.50 g), and 17ETFLB (37.43 g) ranked first in terms of facial grain size. Except for the 17ETFLR and Lida lines, all other lines had higher hundred-grain weights than the average of standard varieties (30.72 g) (Table 2). The findings of this study are in agreement with those of Kepildek & Ceyhan (2021), Tamüsek & Ceyhan (2022) and Küçük & Ceyhan (2022). Küçük & Ceyhan (2004) reported a positive correlation between hundred-grain weight and grain yield.

CONCLUSION and RECOMMENDATIONS

As a result of this study, it was determined that the 17ETFLG line was the most superior variety in terms of grain yield and many other traits. In addition, according to the results

obtained in this study, the grain yield of 9 pure lines used in the experiment was higher than the average of standard varieties. Among these pure lines, 17ETFLG, 17ETFLJ, 17ETFBJ, 17ETFLB, 17ETFBR, and 17ETFGL bean pure lines with high grain yield were determined to be promising variety candidates.

ÖZET

Endüstriyel işletmelerde bakım faaliyetleri, öncelikle üretim olmak üzere personel ve malzeme ile eş zamanlı olarak yönetilmesi gereken önemli bir süreçtir. Özellikle sürdürülebilir üretim için gerekli olan ekipmanlarda, uzun süre çalıştırılmalarından kaynaklanan yıpranma veya arızalanmaya bağlı olarak beklenen verim elde edilememektedir. Bu durum ise, üretimin planlanan zamandan aksaması, istenilen ürün kalitesinin elde edilememesi ve çok daha önemli olan üretimin durdurulması gibi problemleri de beraberinde getirmektedir. Bu da üretim işletmeleri için ek bir maliyet anlamına gelmektedir. Bakım yönetiminin kritik aşamalarının başında gelen bakım planlarının, makine ve ekipmanlar için uygun olan bakım stratejilerine göre gerçekleştirilmesi gerekmektedir. Bu çalışmada, bakım önceliklendirmesine yönelik metodolojik bir yaklaşım sunulmaktadır. Akıllı bakım uygulamasına yönelik bakım stratejileri yüksek teknolojik yatırım maliyeti gerektirmektedir. Bu nedenle işletmedeki bütün makinelere aynı bakım stratejisinin uygulanması yüksek maliyet ve yetkin bakım personeli ihtiyacı oluşturmaktadır. Bir makine/ekipman için uygulanacak bakım stratejisinin seçiminde birçok parametre göz önünde bulundurulmalıdır. Bunlardan en önemlisi ise işletme için en kritik makine veya ekipman için en etkin bakım modelinin uygulanmasıdır. İşletmelerde makinelerin kritiklik seviyesine göre sınıflandırılması uygulanacak birçok faaliyetin başlangıç noktası olmasından dolayı çok önemlidir. Çalışma kapsamında önerilen yaklaşımın ilk adımında, makine kritikliğini etkileyen niteliksel ve niceliksel anahtar performans göstergeleri (KPI'lar) belirlenmiştir. İkinci adımda, KPI'ların makine kritikliğini etkileme sürecinde önem düzeylerinin belirlenmesi amacıyla Çok Kriterli Karar Verme tekniklerinden Bulanık Analitik Hiyerarşi Süreci'nde Mertebe Analizi yöntemi kullanılarak KPI ağırlıkları belirlenmiştir. Üçüncü aşamada ise, belirlenen ağırlıklara bağlı olarak Bulanık Ağırlıklı Toplam Yöntemi ile makine kritiklik puanları hesaplanmıştır. Son aşamada, hesaplanan makine kritiklik puanlarına göre kritiklik seviyeleri belirlenmiş ve ilgili makine kritiklik seviyelerine uygun bakım stratejileri önerilmiştir. Önerilen yaklaşımın gerçek hayat uygulaması Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup Yatak Fabrikası'nda gerçekleştirilmiş ve işletmeye yönelik makine kritiklik seviyeleri ve uygun bakım stratejileri belirlenmiştir.

Anahtar Kelimeler: Bakım önceliklendirmesi, Çok kriterli karar verme, Bulanık Analitik Hiyerarşi Süreci, Bulanık Ağırlıklı Toplam.

A METHODOLOGICAL APPROACH TO MAINTENANCE PRIORITISATION UNDER FUZZY ENVIRONMENT

ABSTRACT

Maintenance is an important process that must be managed simultaneously with personnel and materials, especially production in industrial enterprises. Mainly in the equipment required for sustainable production, the expected efficiency cannot be obtained due to deterioration or failure as a result of prolonged operation. Failure to obtain the expected efficiency from the equipment brings along problems such as completion of production later than the planned time, failure to achieve the desired product quality and moreover, stopping production. This means an additional cost for production facilities. Maintenance plans, which are one of the critical stages of the maintenance process, should be carried out according to the maintenance strategies suitable for machinery and equipment. In this study, a methodological approach for maintenance prioritisation is presented. Maintenance strategies for smart maintenance implementation require high technological investment costs. For this reason, applying the same maintenance strategy to all machines in the enterprise creates high costs and the need for capable maintenance personnel. Many parameters should be considered in the selection of the maintenance strategy to be applied for a machine/equipment. The most important of these is to apply the most effective maintenance model for the most critical machine or equipment for the enterprise. Classification of machines according to their criticality level is very important as it is the starting point of many activities to be implemented. In the first step of the approach proposed within the scope of the study, qualitative and quantitative key performance indicators (KPIs) that affect machine criticality are determined. In the second step, in order to determine the importance levels of KPIs in the process of affecting machine criticality, KPI weights were determined using the Extent Analysis method in the Fuzzy Analytical Hierarchy Process, one of the Multi-Criteria Decision Making techniques. In the third stage, machine criticality scores were calculated with the Fuzzy Weighted Sum Method depending on the determined weights. In the last stage, criticality levels are determined according to the calculated machine criticality scores and maintenance strategies suitable for the relevant machine criticality levels are proposed. The real-life application of the proposed approach was carried out at YATAŞ Group Mattress Factory, one of the leading mattress manufacturers in Turkey, which continues to operate as an R&D centre, and machine criticality levels and appropriate maintenance strategies were determined for the enterprise.

Keywords: Maintenance prioritisation, Multi-criteria decision making, Fuzzy Analytic Hierarchy Process, Fuzzy Weighted Sum

GİRİŞ

Bakım genel anlamda bir işletmedeki bütün varlıkların iyi durumlarının korunması ve devamının sağlanması ile ilgili tedbir ve faaliyetlerinin sürekli olarak yerine getirilmesi işlemidir ve düzenli ve etkin şekilde yönetilmesi gereken bir süreçtir. Günümüzde, bakım yönetimi, imalat şirketleri için artan verimlilik ve etkinlik gereksinimi nedeniyle çok daha önemli hale gelmiştir (Fernandez vd., 2023). Artan talep ile birlikte çoğu endüstri aşırı iş yükü ile çalışmakta ve bu nedenle makineler bu talebi karşılamak için sınırlarını zorlanmaktadır. Makinelerin daha fazla kullanılması, gereken performansta çalışabilecek bir duruma geri dönebilmeleri için bakım işlemlerinin ve dolayısıyla maliyetin artmasına yol açmaktadır (Ab-samat vd., 2012). Bakım yönetiminin kritik aşamalarının başında gelen bakım planlarının, makine ve ekipmanlar için uygun olan bakım stratejilerine göre gerçekleştirilmesi gerekmektedir.

Bakım maliyetleri toplam üretim maliyetlerinin önemli bir kısmını oluşturmaktadır (Löfsten, 1999; Bevilacqua ve Braglia, 2000). Dolayısıyla, değer katmayan bakım faaliyetlerine bağlı olarak bakım kaynaklarının israfı, yüksek maliyete, üretim verimliliğinde düşüşe ve aynı zamanda ekolojik kayıplara neden olacaktır. Bu sorunu çözmek için, bakım kaynakları öncelikli olarak sistemdeki en kritik makinelerde kullanılmalıdır (Gopalakrishnan ve Skoogh, 2017). Üretim sistemlerinin verimli bir şekilde işletilmesi için bakım operasyonlarının önceliklendirilmesi önemli bir faaliyettir (Levitt, 1997; Ni ve Jin, 2012). Bakım amacına yönelik makine kritikliğini belirlemeye yönelik çalışmalar çok az sayıdadır. Gopalakrishnan ve Skoogh (2018)'un çalışmalarında belirtilmektedir ki; imalat şirketleri bakım operasyonlarını önceliklendirebilse bile makine kritikliklerini doğru bir şekilde belirleyememektedirler. Ayrıca, işletmelerde atölye seviyesindeki bakıma yönelik kararlar genellikle bakım teknisyenlerinin tecrübelerine bağlı olarak verilmektedir (Guo vd., 2013). Dolayısıyla, sadece literatüre dayalı olarak makine kritikliğini etkileyen kriterlerin belirlenmesi doğru bir yaklaşım olmayacaktır.

Mevcut literatürde, Wing vd. (2016) çalışmalarında bakım önceliklendirmesine yönelik 1990-2015 yılları arası çalışmaları kapsayan, kapsamlı bir literatür araştırması sunmuşlardır. Çalışmada, bakım önceliklendirmesinde kullanılan faktörler, öncelik belirlenmesinde kullanılan yöntemler ve bakım önceliklendirmesinin gideceği yön araştırılmıştır. Stadnicka vd. (2014), çalışmalarında, bakım sınıflandırılmasına yönelik üç model geliştirmişlerdir. Geliştirilen modellerde kullanılan anahtar performans göstergeleri; makine çalışma süresi, alternatif ekipmanla üretim imkanı arıza giderme maliyeti, arıza sıklığı, ürün kalitesi,

güvenlik, makinelerin ortalama kullanımı ve çevre olarak sunulmuştur. Pariazar vd. (2008) çalışmalarında optimum bakım stratejisi seçimine yönelik bir birleştirilmiş yaklaşım sunmuşlardır. Çalışmada öncelikle literatür araştırması ve uzman görüşlerine göre 19 bakım stratejisi seçim kriteri belirlenmiştir. Belirlenen kriterler üzerinden faktör analizi tekniği ile 4 ana faktör grubu oluşturulmuştur. Bunlar; değer katan faaliyetler (ürün kalitesi, teçhizat ve personel etkinliği), maliyet (personel eğitimi, donanım ve yazılım maliyetleri), güvenlik (teçhizat güvenliği, personel kazaları ve çevresel etkiler) ve kullanım yeterliliğidir (insan kaynakları, teçhizat ve teknoloji). Daha sonra, Analitik Hiyerarşi Süreci yöntemi ile ana ve alt kriterlere göre alternatif bakım stratejilerinin seçimine yönelik bir model oluşturulmuştur.

Bu çalışmada, bakım önceliklendirmesine yönelik metodolojik bir yaklaşım sunulmaktadır. Çalışma kapsamında önerilen yaklaşımın ilk adımında, makine kritikliğini etkileyen niteliksel ve niceliksel anahtar performans göstergeleri (KPI'lar) belirlenmiştir. İkinci adımda, KPI'ların makine kritikliğini etkileme sürecinde önem düzeylerinin belirlenmesi amacıyla Çok Kriterli Karar Verme tekniklerinden Bulanık Analitik Hiyerarşi Süreci'nde Merit Analizi yöntemi kullanılarak KPI ağırlıkları belirlenmiştir. Üçüncü aşamada ise, belirlenen ağırlıklara bağlı olarak Bulanık Ağırlıklı Toplam yöntemi ile makine kritiklik puanları hesaplanmıştır. Son aşamada, hesaplanan makine kritiklik puanlarına göre kritiklik seviyeleri belirlenmiş ve ilgili makine kritiklik seviyelerine uygun bakım stratejileri önerilmiştir. Önerilen yaklaşımın gerçek hayat uygulaması Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup Yatak Fabrikası'nda gerçekleştirilmiş ve işletmeye yönelik makine kritiklik seviyeleri ve uygun bakım stratejileri belirlenmiştir.

MATERYAL ve YÖNTEM

Çalışma kapsamında, bakım önceliklendirmesine yönelik olarak dört aşamalı metodolojik bir yaklaşım önerilmiştir. Bu aşamalar sırasıyla; KPI'ların belirlenmesi, KPI'ların ağırlıklandırılması, makine kritikliğinin hesaplanması ve bakım stratejilerinin belirlenmesi çalışmalarını kapsamaktadır.

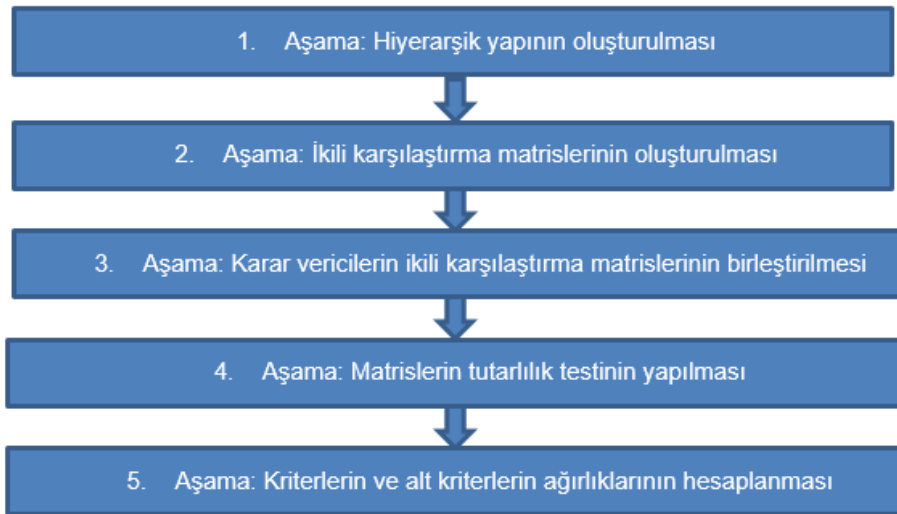

KPI'ların belirlenmesi

İşletmelerde her organizasyonun başarısını ve iyileştirme faaliyetlerini hangi yönde gerçekleştirmesi gerektiğini belirleyen, bunun yanında makine kritiklik seviyesi belirlemede kullanılan anahtar performans göstergeleri (KPI) mevcuttur. Bu KPI parametrelerinin bazıları organizasyonlar için ortak olabileceği gibi, organizasyonların kendi süreçlerine özgü KPI'ları da vardır. Uygulanan bir bakım stratejisinin performansı, İki Arıza Arasında Geçen Ortalama Süre (MTBF), Ortalama Arıza Giderme Süresi (MTTR), verimlilik, bakım maliyeti,

varlıkların kullanılabilirliği vb. çeşitli bakım göstergeleri ile analiz edilebilir. Çalışmanın bu aşamasında, mevcut literatür incelemesi sonuçları, işletme varlık tarihçe raporları, makine arıza istatistikleri incelenerek, işletmedeki uzman bakım personelinin görüşleri ile de birlikte makine kritikliğini etkileyen niteliksel ve niceliksel KPI'lar belirlenmektedir.

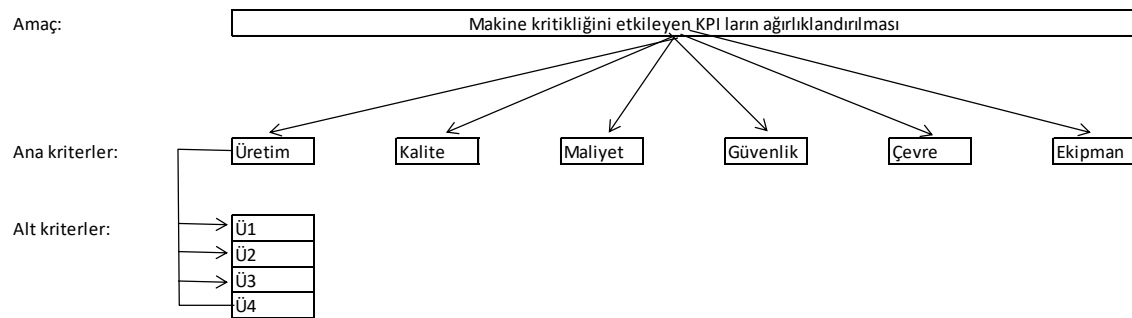

KPI'ların ağırlıklandırılması

Bu aşamada, belirlenen KPI'ların makine kritikliğini etkileme sürecinde önem düzeylerinin belirlenmesi amacıyla, KPI ağırlıkları belirlenmektedir. Makine kritikliğini etkileyen KPI'lar hem niteliksel hem de niceliksel özellikte veriler olabilir. Ayrıca bu göstergelerin sayısal ölçeklerinin olmadığı durumlarda dilsel olarak da değerlendirmelerine imkan tanıyabilmek ve öznel değerlendirmeleri de kapsayabilmek üzere bu aşamada ağırlıklandırma sürecinde Çok Kriterli Karar Verme (ÇKKV) tekniklerinden Chang (1996) tarafından önerilen Bulanık Analitik Hiyerarşi Süreci'nde (BAHS) Meritbe Analizi yöntemi kullanılmıştır. KPI'ların ağırlıklandırılması süreci temel olarak 5 aşamadan oluşmaktadır (Şekil 1).

Şekil 1. KPI ağırlıklandırma süreci

2.1. Hiyerarşik yapının oluşturulması: Bu aşamada belirlenen KPI'lar, BAHS'ne temel olacak şekilde amaç, kriterler ve alt kriterlere göre hiyerarşik yapıda düzenlenmiştir (Şekil 2).

Şekil 2. Makine kritikliğini etkileyen kriterler için hiyerarşik yapı

2.2. İkili karşılaştırma matrislerinin oluşturulması: BAHS yönteminde, ikili karşılaştırmalar dilsel ifadeler üzerinden üçgen bulanık sayılar kullanılarak yapılmıştır. \tilde{M} bir üçgen bulanık sayı olmak üzere, $\tilde{M} = (l, m, u)$ şeklinde ifade edilir. Burada l , üçgen bulanık sayının alt sınırını m , orta değerini ve u , üst sınırını göstermektedir. İki kriter birbiri ile karşılaştırılırken ikili karşılaştırma matrisleri oluşturularak, satırdaki kriterin sütundaki kritere göre önem derecesi belirlenmektedir. Çalışmada kullanılan önem derecelerini gösteren dilsel ifadeler ve karşılık gelen üçgen bulanık sayılar skalası Tablo 1’de gösterilmektedir.

Tablo 1: Dilsel ifadelere karşılık gelen üçgen bulanık sayılar.

Kısaltma	Dilsel ifade	Üçgen bulanık sayı (l, m, u)
TÖZ	Tamamıyla önemsiz	(1/9,1/9,1/7)
ÇKÖZ	Çok kuvvetli derecede önemsiz	(1/9,1/7,1/5)
KÖZ	Kuvvetli derecede önemsiz	(1/7,1/5,1/3)
DÖZ	Daha önemsiz	(1/5,1/3,1/1)
EÖ	Eşit önemli	(1,1,1)
DÖ	Daha önemli	(1,3,5)
KÖ	Kuvvetli derecede önemli	(3,5,7)
ÇKÖ	Çok kuvvetli derecede önemli	(5,7,9)
TÖ	Tamamıyla önemli	(7,9,9)

\tilde{A} bir ikili karşılaştırma matrisi olmak üzere, aşağıdaki gibi ifade edilir.

$$\tilde{A} = (\tilde{a}_{ij})_{n \times n} = \begin{bmatrix} (1,1,1) & (l_{12}, m_{12}, u_{12}) & \dots & (l_{1n}, m_{1n}, u_{1n}) \\ (l_{21}, m_{21}, u_{21}) & (1,1,1) & \dots & (l_{2n}, m_{2n}, u_{2n}) \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \vdots & \vdots \\ (l_{n1}, m_{n1}, u_{n1}) & (l_{n2}, m_{n2}, u_{n2}) & \dots & (1,1,1) \end{bmatrix}$$

Bulanık ikili karşılaştırma matrisleri oluşturulurken aşağıdaki koşul sağlanmalıdır,

$$\tilde{a}_{ij} = (l_{ij}, m_{ij}, u_{ij}) = \tilde{a}_{ji}^{-1} = \left(\frac{1}{u_{ji}}, \frac{1}{m_{ji}}, \frac{1}{l_{ji}} \right)$$

Önce ana kriterlerin sonrasında ise alt kriterlerin kendi aralarında karşılaştırmalarını belirten ikili karşılaştırma matrisleri bütün karar vericiler tarafından ayrı olarak değerlendirilmektedir.

2.3. Karar vericilerin ikili karşılaştırma matrislerinin birleştirilmesi: Bu aşamada, bütün karar vericilerin ilgili kriter ve alt kriterlere ait ikili karşılaştırma matrisleri geometrik ortalama yöntemi ile birleştirilmektedir.

2.4. Matrislerin tutarlılık testinin yapılması: BAHF’de bulanık karşılaştırma matrislerinin tutarlılıklarının hesaplanması pek çok çalışmada göz ardı edilmiştir. Proje çalışmasında, tutarlılık oranlarının hesaplanması için Gögüs ve Boucher (1998)’in önerdiği yöntem kullanılmıştır. Yöntemin adımları aşağıdaki gibidir;

Adım 1.

Tutarlılık oranı hesaplanacak ikili karşılaştırma matrisi iki alt matrise ayrılır; ilk matris üçgen bulanık değerlendirmelerin orta değerlerine (m) göre ikinci matris ise alt sınır (l) ve üst sınır (u) değerlerinin geometrik ortalamalarına göre düzenlenir.

Adım 2.

Ağırlık vektörleri Saaty yöntemine göre (Saaty, 2000) aşağıdaki gibi hesaplanır;

$$w^m = [w_i^m] \text{ öyle ki } w_i^m = \frac{1}{n} \sum_{j=1}^n \frac{a_{ijm}}{\sum_{i=1}^n a_{ijm}}$$

$$w^g = [w_i^g] \text{ öyle ki } w_i^g = \frac{1}{n} \sum_{j=1}^n \frac{\sqrt{a_{ijl} * a_{iju}}}{\sum_{i=1}^n \sqrt{a_{ijl} * a_{iju}}}$$

Adım 3.

Her bir matris için en büyük öz vektör aşağıdaki gibi hesaplanır;

$$\lambda_{max}^m = \frac{1}{n} \sum_{i=1}^n \sum_{j=1}^n a_{ijm} (w_j^m / w_i^m)$$

$$\lambda_{max}^g = \frac{1}{n} \sum_{i=1}^n \sum_{j=1}^n \sqrt{a_{ijl} * a_{iju}} (w_j^g / w_i^g)$$

Adım 4.

Tutarlılık indeksleri (Consistency Indices (CI)) hesaplanır;

$$CI^m = \frac{(\lambda_{max}^m - n)}{(n-1)}$$

$$CI^g = \frac{(\lambda_{max}^g - n)}{(n-1)}$$

Adım 5.

Tutarlılık indeksinin rassal indekse (Random Index (RI)) oranı ile tutarlılık oranı (Consistency Ratio (CR)) hesaplanır. Rassal indeksler için Gögüs ve Boucher (1998) tarafından önerilen rassal indeksler kullanılmıştır. Tutarlılık oranının 0,10’den küçük olması durumunda matris tutarlı olarak kabul edilmektedir. Aksi durumda, karar vericiler ikili karşılaştırma matrislerini yeniden değerlendirmelidirler.

Bu aşamada, orta değer ve geometrik ortalamalara göre iki ayrı tutarlılık oranı hesaplanmaktadır. Çalışma kapsamında, bu iki tutarlılık oranının maksimum değeri alınarak genel bir tutarlılık oranı hesaplanmış ve değerlendirmeler bu oran üzerinden gerçekleştirilmiştir.

$$CR^m = \frac{CI^m}{RI^m}$$

$$CR^g = \frac{CI^g}{RI^g}$$

$$CR_{genel} = \max(CR^m, CR^g)$$

2.5. Kriterlerin ve alt kriterlerin ağırlıklarının hesaplanması: Tutarlılık testinden geçen birleştirilmiş matrislere göre BAHS’de Mertebe Analizi yöntemine göre kriterlerin ve alt kriterlerin ağırlıkları hesaplanmıştır.

Bulanık Analitik Hiyerarşi Süreci (BAHS)'nde Mertebe Analizi yöntemi

Chang 1996’da BAHS’yi ele almak için, BAHS’ nin ikili karşılaştırma ölçümü için üçgen bulanık sayıların kullanımı ile bir yaklaşım önermiştir. Mertebe analizi yöntemi olarak adlandırılan bu metodu, ikili karşılaştırmaların sentetik derece değeri için kullanmıştır. Bu yöntemin adımları diğer BAHS yöntemlerine nispeten daha kolaydır ve klasik Analitik Hiyerarşi Süreci’ne benzer.

$X = (x_1, x_2, \dots, x_n)$ bir amaç kümesi ve $U = (u_1, u_2, \dots, u_m)$ bir hedef kümesi olmak üzere, Chang’ın mertebe analizi yöntemine göre, her bir amaç alınır ve her hedef için g_i değerleri oluşturulur. Böylece, her bir amaç için m tane mertebe analizi değerleri;

$$M_{g_i}^1, M_{g_i}^2, \dots, M_{g_i}^m, \quad i=1,2,\dots,n$$

şeklinde elde edilir. Burada verilen tüm $M_{g_i}^j$ ($j=1,2,\dots,m$) değerleri üçgen bulanık sayıdır. Chang’in mertebe analizi yönteminin adımları aşağıda gösterilmiştir.

Adım 1.

i. amaca göre bulanık sentetik mertebe değeri,

$$S_i = \sum_{j=1}^m M_{g_i}^j \otimes [\sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j]^{-1}$$

olarak tanımlanır. $\sum_{j=1}^m M_{g_i}^j$ ifadesini elde etmek için,

$$\sum_{j=1}^m M_{g_i}^j = (\sum_{j=1}^m l_j, \sum_{j=1}^m m_j, \sum_{j=1}^m u_j), \quad i=1, 2, 3, \dots, n$$

olacak şekilde özel bir matris için m tane mertebe analiz değerinin bulanık toplama işlemi yerine getirilir ve $[\sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j]^{-1}$ ifadesini elde etmek için, $M_{g_i}^j$ ($j=1,2,\dots,m$) değerleri üzerinde bulanık toplama işlemi yapılır.

$$\sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j = (\sum_{i=1}^n l_i, \sum_{i=1}^n m_i, \sum_{i=1}^n u_i)$$

Daha sonra,

$$[\sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j]^{-1} = (\frac{1}{\sum_{i=1}^n u_i}, \frac{1}{\sum_{i=1}^n m_i}, \frac{1}{\sum_{i=1}^n l_i})$$

olacak şekilde $(\sum_{i=1}^n l_i, \sum_{i=1}^n m_i, \sum_{i=1}^n u_i)$ vektörünün tersi hesaplanır.

Adım 2.

$M_1 = (l_1, m_1, u_1) \leq M_2 = (l_2, m_2, u_2)$ ifadesinin olasılık derecesi aşağıdaki şekilde tanımlanır.

$$V(M_2 \geq M_1) = \sup_{y \geq x} [\min(\mu_{M_1}(x), \mu_{M_2}(y))]$$

$M_1 = (l_1, m_1, u_1)$ ve $M_2 = (l_2, m_2, u_2)$ üçgen (konveks) bulanık sayılar olmak üzere:

$$V(M_2 \geq M_1) = hgt(M_1 \cap M_2) = \mu_{M_2}(d) = \begin{cases} 1 & , m_2 \geq m_1 \\ 0 & , l_1 \geq u_2 \\ \frac{(l_1 - u_2)}{(m_2 - u_2) - (m_1 - l_1)} & , \text{diğer durumlarda} \end{cases}$$

ifadesi elde edilir. M_1 ve M_2 ' yi karşılaştırmak için, $V(M_2 \geq M_1)$ ve $V(M_1 \geq M_2)$ değerlerinin her ikisinin de bulunması gerekir.

Adım 3.

Konveks bir bulanık sayının olasılık derecesinin k konveks sayıdan M_i ($i = 1, 2, \dots, k$) daha büyük olması aşağıdaki şekilde tanımlanır;

$$V(M \geq M_1, M_2, \dots, M_k) = V[(M \geq M_1), (M \geq M_2), \dots, (M \geq M_k)] = \min_i V[(M \geq M_i), i = 1, 2, \dots, k]$$

$k = 1, 2, \dots, n; k \neq j$ için $d'(A_i) = \min V[(S_i \geq S_k)]$ olarak alınırsa, ağırlık vektörü aşağıdaki şekilde elde edilmiş olur.

$$W' = (d'(A_1), d'(A_2), \dots, d'(A_n))^T$$

Burada A_i ($i = 1, 2, \dots, n$) n elemandan oluşur.

Adım 4.

Normalizasyon yolu ile normalleştirilmiş ağırlık vektörleri

$$W = (d(A_1), d(A_2), \dots, d(A_n))^T$$

olarak hesaplanır. Burada, W ağırlık vektörü bulanık olmayan bir sayıdır.

Adım 5.

Hiyerarşinin en alt basamaklarından amaca doğru gidilerek normalize edilmiş öncelik ağırlığı vektörleri önem ağırlığı vektörleri ile çarpılır ve global ağırlıklara ulaşılır.

Makine Kritikliğinin Hesaplanması

Bu aşamada, belirlenen ağırlıklara bağlı olarak Bulanık Ağırlıklı Toplam (BAT) yöntemi ile makine kritiklik puanları hesaplanmıştır.

Bulanık Ağırlıklı Toplam (BAT) yöntemi

Çalışmada kullanılan BAT yönteminin adımları aşağıda gösterilmiştir;

Adım 1.

İlk olarak ilgili alternatife ait kriter değerlendirmeleri dilsel ifadeler ile yapılır. Bu adımda dilsel değerlendirmelere karşılık gelen sayısal değerler için yamuk bulanık sayılar kullanılmıştır.

Adım 2.

İkinci adımda, kriter değerlendirmeleri arasında eşdeğerlik sağlamak amacıyla normalizasyon işlemi gerçekleştirilmiştir. Dilsel ifadelerine karşılık gelen bulanık sayıların skalalarının ve birimlerinin farklı olması sebebiyle, ilgili sayılar min-maks normalizasyon yöntemi ile normalize edilmiş ve (0-1) skalasına indirgenmiştir.

$$\text{Norm}(x_i) = (x_i - x_{\min}) / (x_{\max} - x_{\min})$$

Adım 3.

Alternatiflerin ilgili kriterden aldığı normalize edilmiş puanlar ilgili kriterin ağırlığı ile çarpılarak ağırlıklı puanlar hesaplanır.

Adım 4.

Alternatiflerin her bir kriterden aldığı bulanık ağırlıklı puan değerleri toplanarak her bir alternatif için toplam puanlar hesaplanır.

Adım 5.

Bu aşamada yamuk bulanık sayı olarak hesaplanan bulanık puan değerleri durulaştırılarak tek bir değere indirgenir. Durulaştırma için aşağıdaki formül uygulanmıştır;

$$\text{Defuzz}(x) = (l+m+n+u)/4$$

Bütün olası kurallara ait durulaştırılmış puan değerleri min-maks normalizasyon yöntemi ile normalize edilerek son puanlar hesaplanmıştır.

Bakım Stratejilerinin Belirlenmesi

Bu aşamada, 3. Aşamada elde edilen normalize puanlar kesiklendirilerek puan sınıfları belirlenmiştir. Kesiklendirme için aşağıdaki skala kullanılmıştır (Tablo 2);

Tablo 2: Makine kritiklik seviyeleri için skala

Makine kritiklik seviyeleri		
0	0,29	E
0,3	0,39	D
0,4	0,49	C
0,5	0,59	B
0,6	0,69	A
0,7	1	AA

Bulanık Ağırlıklı Toplam yöntemi ile belirlenen makine kritiklik seviyelerine göre ilgili makinelere uygulanacak bakım stratejileri belirlenmiştir. Bakım stratejileri temel olarak arıza bakım, planlı bakım, otonom bakım ve kestirimci bakım olmak üzere 4 ana başlıkta toplanmıştır. Belirlenen KPI lara göre hesaplanan makine kritiklik seviyeleri işletme bakım personeline hangi makine grubu için hangi bakım stratejisini uygulaması gerektiği konusunda destek sağlayacaktır. Belirlenen kritiklik oranlarına göre makineler sınıflandırılarak, kritikliği düşük olan makine sınıfına arıza bakım (AB), orta olan makinelere planlı/periodyk bakım (PB) ve yüksek olan makinelere otonom bakım (OB) veya uygun olanlara kestirimci bakım (KB) stratejisinin uygulanması önerilmiştir.

Bulgular ve Tartışma

Önerilen yaklaşımın gerçek hayat uygulaması Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup Yatak Fabrikası'nda gerçekleştirilmiş ve işletmeye yönelik makine kritiklik seviyeleri ve uygun bakım stratejileri belirlenmiştir.

İlk aşamada, işletmede makine kritikliğini etkileyen KPI'lar 6 ana kriter ve üretim ana kriterine ait 4 alt kriter olarak belirlenmiştir. KPI'ların ağırlıklandırılması aşamasının ilk adımında, Şekil 2'de gösterilen makine kritikliğini etkileyen kriterler için hiyerarşik yapı oluşturulmuştur. İkinci adımda, ana kriterler ve üretim alt kriterleri için ikili karşılaştırma matrisleri oluşturularak karar vericilerin değerlendirmeleri alınmıştır. Bu aşamada, ikili karşılaştırma matrislerinin değerlendirilmesi 5 kişilik bir uzman ekip tarafından gerçekleştirilmiştir. Karar vericilerin dilsel ifadeler kullanarak yaptıkları ikili karşılaştırma değerlendirmeleri Tablo 1 kullanılarak üçgen bulanık sayılara dönüştürülmüştür. Aşağıda 2. karar vericinin (KV2) ana kriterlerin karşılaştırılmasına yönelik ikili karşılaştırma matrisi örnek olarak sunulmuştur (Tablo 3 ve Tablo 4).

Tablo 3. KV2 Ana kriter karşılaştırma matrisi (Dilsel ifade)

	Üretim	Kalite	Maliyet	Güvenlik	Çevre	Ekipman
Üretim	EÖ	KÖ	DÖZ	EÖ	KÖ	DÖ
Kalite	KÖZ	EÖ	KÖZ	DÖZ	DÖ	DÖ
Maliyet	DÖ	KÖ	EÖ	EÖ	DÖ	KÖ
Güvenlik	EÖ	DÖ	EÖ	EÖ	ÇKÖ	KÖ
Çevre	KÖZ	DÖZ	DÖZ	ÇKÖZ	EÖ	DÖ
Ekipman	DÖZ	DÖZ	KÖZ	KÖZ	DÖZ	EÖ

Tablo 4. KV2 Ana kriter karşılaştırma matrisi (Üçgen bulanık sayı)

	Üretim			Kalite			Maliyet			Güvenlik			Çevre			Ekipman		
Üretim	1	1	1	3	5	7	1/5	1/3	1	1	1	1	3	5	7	1	3	5
Kalite	1/7	1/5	1/3	1	1	1	1/7	1/5	1/3	1/5	1/3	1	1	3	5	1	3	5
Maliyet	1	3	5	3	5	7	1	1	1	1	1	1	1	3	5	3	5	7
Güvenlik	1	1	1	1	3	5	1	1	1	1	1	1	5	7	9	3	5	7
Çevre	1/7	1/5	1/3	1/5	1/3	1	1/5	1/3	1	1/9	1/7	1/5	1	1	1	1	3	5
Ekipman	1/5	1/3	1	1/5	1/3	1	1/7	1/5	1/3	1/7	1/5	1/3	1/5	1/3	1	1	1	1

Üçüncü adımda, karar vericiler tarafından değerlendirilen ikili karşılaştırma matrisleri geometrik ortalama yöntemi ile birleştirilmiştir. Dördüncü adımda, birleştirilmiş matrislerin tutarlılık testleri hesaplanmıştır. Tutarlılık testi kriter sayısı 2’den büyük olan matrisler için hesaplanabilmektedir. Dolayısıyla ana kriter karşılaştırmaları ve üretim alt kriterlerinin karşılaştırmalarına ait tutarlılık oranlarını gösteren özet tablo aşağıda verilmiştir (Tablo 5).

Tablo 5. Tutarlılık oranları

Tutarlılık oranı	CR^m	CR^g	CR_{genel}
Ana kriterler	0,036	0,093	0,093
Üretim alt kriterleri	0,024	0,062	0,062

Matrislerin tutarlılık oranları 0,10’dan küçük olduğu için matrisler tutarlıdır. Beşinci adımda, ana kriterlerin ve alt kriterlerin ağırlıkları hesaplanmıştır. Kriter ağırlıklarını gösteren özet tablo aşağıda verilmiştir (Tablo 6).

Tablo 6. Kriter ağırlıkları

Kriterler	Girdi Değişkenleri	Yerel Ağırlıklar	Global Ağırlıklar
Ana Kriter	Üretim	43,7%	
Ü1	Alternatif Ekipman İle Üretim İmkanı	36,15%	15,8%
Ü2	Arızanın Diğer Ekipmanlara Etkisi	26,32%	11,5%
Ü3	MTTR	17,85%	7,8%
Ü4	MTBF	18,08%	7,9%
Ana Kriter	Kalite	14,5%	
K1	Ekipmanın Üretim Kalitesine Etkisi	14,5%	15,2%
Ana Kriter	Maliyet	17,00%	
M1	Ekipmanın aylık arızalarının toplam maliyeti	17,00%	15,4%
Ana Kriter	Güvenlik	7,9%	
G	Güvenlik Riski	7,90%	8,4%
Ana Kriter	Çevre	9,0%	
Ç	Çevre Riski	9,00%	9,6%
Ana Kriter	Ekipman	7,9%	
E	Ekipman Kaç Yıldır Üretim Halinde	7,90%	8,4%

Kriter ağırlıkları incelendiğinde makine kritikliğini etkileyen en önemli kriterin 0,158 ağırlık oranı ile “Alternatif ekipman ile üretim imkanı” kriteri olduğu gözlenmiştir. İkinci önem derecesine sahip kriter 0,154 ağırlık oranı ile “Ekipmanın aylık arızalarının toplam maliyeti” olarak gözlemlenmektedir. Üçüncü aşamada, belirlenen ağırlıklara bağlı olarak Bulanık Ağırlıklı Toplam (BAT) yöntemi ile makine kritiklik puanları hesaplanmıştır. BAT yönteminin ilk adımında ilgili alternatife ait kriter değerlendirmeleri dilsel ifadeler ile yapılır. Bu adımda dilsel değerlendirmelere karşılık gelen sayısal değerler için yamuk bulanık sayılar kullanılmıştır. Örnek olarak, Ü2- Arızanın diğer ekipmanlara etkisi kriterine ait dilsel değerlendirme, “düşük”, “orta” ve “yüksek” olarak belirlenmiştir. Bu ifadelere karşılık gelen yamuk bulanık sayılar ise, (0;0;20;40), (20;40;60;80) ve (50;70;100;100) olarak ifade edilmiştir. İkinci adımda, kriter değerlendirmeleri arasında eşdeğerlik sağlamak amacıyla normalizasyon işlemi gerçekleştirilmiştir. Ü2 kriterinin normalize edilmiş değerleri, (0;0;0,20;0,40), (0,20;0,40;0,60;0,80) ve (0,50;0,70;1,0;1,0) olarak hesaplanmıştır. Üçüncü adımda, alternatiflerin ilgili kriterden aldığı normalize edilmiş puanlar ilgili kriterin ağırlığı ile çarpılarak ağırlıklı puanlar hesaplanmıştır. Örneğin M1 kodlu makine için Ü2 kriterinin değerlendirmesi “orta” olarak belirlendi ise, bu makinenin Ü2 kriterinden aldığı bulanık ağırlıklı puan, $0.115 * (0,20;0,40;0,60;0,80) = (0,23;0,046;0,069;0,092)$ olarak hesaplanacaktır.

Dördüncü adımda, alternatiflerin her bir kriterden aldığı bulanık ağırlıklı puan değerleri toplanarak her bir alternatif için toplam puanlar hesaplanır. Son adımda, yamuk bulanık sayı olarak hesaplanan bulanık puan değerleri durulaştırılarak tek bir değere indirgenir. Bütün olası kurallara ait durulaştırılmış puan değerleri min-maks normalizasyon yöntemi ile normalize edilerek son puanlar hesaplanır. Örnek olarak, YATAŞ Grup Yatak Fabrikası’nda bulunan 5 makineye ait dilsel kriter değerlendirmeleri ve karşılık gelen yamuk bulanık sayılar Tablo 7’de sunulmuştur.

Tablo 7. Örnek değerlendirmeler

YATAŞ Grup Yatak Fabrikası’nda bulunan 5 makineye ait hesaplanan bulanık ağırlıklı toplam puanlar, durulaştırılmış değerleri ve normalize puanlar Tablo 9’da sunulmuştur.

Tablo 9. Makine kritiklik puanları

Makine/Puan	Bulanık toplam puan	Durulaştırılmış puan	Normalize puan
M1	(2,42;3,16;5,50;6,35)	4,36	0,40
M2	(3,83;5,25;8,05;8,40)	6,38	1,00
M3	(1,05;1,95;4,13;5,00)	3,03	0,00
M4	(2,50;3,30;5,27;6,11)	4,30	0,38
M5	(2,33;3,20;5,44;6,06)	4,26	0,37

Dördüncü aşamada, 3. Aşamada elde edilen normalize puanlar kesiklendirilerek puan sınıfları belirlenmiştir. Bulanık Ağırlıklı Toplam yöntemi ile belirlenen makine kritiklik seviyelerine

göre ilgili makinelere uygulanacak bakım stratejileri ve incelenen 5 makineye ait Tablo 2'ye göre belirlenen makine kritiklik seviyeleri Tablo 10'de sunulmuştur.

Tablo 10. Makine kritiklik seviyeleri ve önerilen bakım stratejileri

Makine	Makine kritiklik puanı	Makine kritiklik seviyesi	Önerilen bakım stratejileri
M1	0,40	D	PB
M2	1,00	AA	OB-KB
M3	0,00	E	AB
M4	0,38	D	PB
M5	0,37	D	PB

SONUÇ ve ÖNERİLER

Akıllı bakım uygulamasına yönelik bakım stratejileri yüksek teknolojik yatırım maliyeti gerektirmektedir. Bu nedenle işletmedeki bütün makinelere aynı bakım stratejisinin uygulanması yüksek maliyet ve yetkin bakım personeli ihtiyacı oluşturmaktadır. Bir makine/ekipman için uygulanacak bakım stratejisinin seçiminde birçok parametre göz önünde bulundurulmalıdır. Bunlardan en önemlisi ise işletme için en kritik makine veya ekipman için en etkin bakım modelinin uygulanmasıdır. Çalışma kapsamında, bakım önceliklendirmesine yönelik metodolojik bir yaklaşım sunulmuştur. Önerilen yaklaşımın gerçek hayat uygulaması Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup Yatak Fabrikası'nda gerçekleştirilmiş ve işletmeye yönelik makine kritiklik seviyeleri ve uygun bakım stratejileri belirlenmiştir.

Önerilen yaklaşımın uygulama aşamasında, işletmede makine kritikliğini etkileyen KPI'lar 6 ana kriter ve üretim ana kriterine ait 4 alt kriter olarak belirlenmiştir. Kriterlerin ağırlıklandırılma aşamasında, ikili karşılaştırma matrislerinin tutarlılık oranları %10'dan küçük olarak hesaplanmıştır. Dolayısıyla matrisler tutarlıdır. Kriter ağırlıkları incelendiğinde makine kritikliğini etkileyen en önemli kriterin 0,158 ağırlık oranı ile "Alternatif ekipman ile üretim imkanı" kriteri olduğu gözlenmiştir. İkinci önem derecesine sahip kriter 0,154 ağırlık oranı ile "Ekipmanın aylık arızalarının toplam maliyeti" olarak gözlemlenmiştir. Örnek olarak seçilen 5 makineye ait makine kritiklik puanları, makine kritiklik seviyeleri ve önerilen bakım stratejileri Tablo 10'da sunulmuştur.

Yapılan hesaplamalar sonucu seçilen makinelerden en kritik olanı M2 makinesidir. İlgili makineye önerilen bakım stratejisi Otonom Bakım ile birlikte Kestirimci Bakım uygulamasıdır. Kritikliği daha düşük olan makineler için Periyodik Bakım veya Arıza Bakım stratejileri önerilmiştir.

Çalışma kapsamında bakım önceliklendirmesine yönelik önerilen metodolojik yaklaşım, TEYDEB-1505 TÜBİTAK Üniversite-Sanayi İşbirliği Destek Programı kapsamında yürütülen 5210089 nolu “Akıllı Bakım Karar Destek Sistemi ve Derin Öğrenmeye dayalı Kestirimci Bakım Uygulaması” projesi ile desteklenmiştir.

İleriki çalışmalarda, kriter ağırlıklandırılmasına yönelik diğer çok kriterli karar verme yöntemleri kullanılarak belirlenen alternatif ağırlıkları karşılaştırılabilir. Ayrıca kritiklik puanı hesaplamasında, bulanık ağırlıklı toplam yöntemine alternatif olarak bulanık kural tabanlı sistem ile puanlar hesaplanarak karşılaştırmalar yapılabilir.

Teşekkür

Bu çalışma, TEYDEB-1505 TÜBİTAK Üniversite-Sanayi İşbirliği Destek Programı kapsamında yürütülen 5210089 nolu “Akıllı Bakım Karar Destek Sistemi ve Derin Öğrenmeye dayalı Kestirimci Bakım Uygulaması” projesi ile desteklenmiştir. TÜBİTAK’a teşekkür ederiz.

ÖZET

Dördüncü Sanayi Devrimi (Endüstri 4.0) ile birlikte rekabet koşullarının değişmesi; yapay zekâ ve makine öğrenmesi, nesnelerin interneti, büyük veri ve veri analitiği gibi kavramların kullanımına yönelik işletmelerin dijital dönüşüm ihtiyacını doğurmuştur. Akıllı bakım yönetimi, Endüstri 4.0 uygulamalarının önemli bir parçasını oluşturmaktadır. Gelişen teknolojik yenilikler ve dijitalleşme ile birlikte, makine ve ekipmanların bozulma ve arızalarına neden olan göstergeler esnek ve akıllı bakım uygulamaları ile otomatik olarak önceden belirlenebilmektedir. Akıllı bakımda uygulanan kestirimci bakım stratejisine yönelik, çeşitli test ve ölçümler üzerinden arızaların önceden tahmini ile arıza giderme süreleri ve plansız makine duruş sürelerinde azalma, bakım maliyetlerinde azalma, makine kalan faydalı ömürlerinde artış ve üretimde verimlilik artışı sağlanabilmektedir. Bu çalışmada, Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup'ta makine öğrenmesi kullanılarak bir kestirimci bakım uygulaması gerçekleştirilmiştir. Uygulama kapsamında pilot makine olarak elyaf hattında yer alan tarak makinesi seçilmiş ve analizler bu makineden elde edilen sensör verileri üzerinden gerçekleştirilmiştir. Özellikle bu makinenin seçilme sebebi, makinenin alternatifinin bulunmayışı ve arızalanması durumunda elyaf üretim hattının tamamen durmasıdır. Çalışma kapsamında, tarak makinesinde ana tambur motoruna bağlanan sabit sensör vasıtasıyla, 11 girdi değişkenine ait veriler toplanmıştır. Elde edilen veriler üzerinde veri etiketleme, veri temizleme, veri dönüştürme, veri normalizasyonu gibi veri ön işlemleri gerçekleştirilmiştir. Çalışma süresince ilgili motorda meydana gelen arıza kaydına bağlı olarak kalan faydalı ömür hesabı yapılmıştır. Analiz aşamasında, ön işlemeden geçirilen veriler üzerinde makine öğrenmesi tabanlı kalan faydalı ömür tahmini ve arıza sınıflandırması yapılmıştır. Kalan faydalı ömür tahmini için karar ağacı, rasgele orman, destek vektör makinesi, doğrusal regresyon makine öğrenme algoritmaları kullanılmış ve belirleme katsayısı (R^2) etkinlik ölçütüne göre sonuçlar karşılaştırılmıştır. Arıza sınıflandırma için, karar ağacı, rasgele orman, destek vektör makinesi, K-en yakın komşu makine öğrenme algoritmaları kullanılarak doğruluk etkinlik ölçütü üzerinden sonuçlar karşılaştırılmıştır.

Anahtar Kelimeler: Kestirimci Bakım, Makine Öğrenmesi, Kalan Faydalı Ömür Tahmini, Sınıflandırma

MACHINE LEARNING IN PREDICTIVE MAINTENANCE: A NUMERICAL CASE STUDY

ABSTRACT

The change in competition conditions with the Fourth Industrial Revolution (Industry 4.0) has led to the need for digital transformation of enterprises for the use of concepts such as artificial intelligence and machine learning, internet of things, big data and data analytics. Smart maintenance management is an important part of Industry 4.0 applications. With the developing technological innovations and digitalization, indicators that cause deterioration and failures of machinery and equipment can be automatically predetermined with flexible and smart maintenance applications. With the predictive maintenance strategy applied for smart maintenance, it is possible to reduce repair times and unplanned machine downtimes, reduce maintenance costs, increase machine remaining useful life and increase productivity in production by predicting failures with various tests and measurements. In this study, a predictive maintenance application using machine learning was carried out in YATAŞ Group, one of the leading mattress manufacturers in Turkey, which continues its activities as an R&D center. Within the scope of the application, the carding machine in the fiber line was selected as the pilot machine and the analyses were carried out on the sensor data obtained from this machine. The reason for choosing this machine in particular is that there is no alternative to this machine and the fiber production line stops completely in case of a failure. Within the scope of the study, data on 11 input variables were collected by means of a fixed sensor connected to the main drum motor in the carding machine. Data preprocessing such as data labelling, data cleaning, data transformation, data normalization were performed on the data obtained. Depending on the failure record of the relevant engine during the study period, the remaining useful life was calculated. In the analysis phase, machine learning based remaining useful life estimation and fault classification were performed on the data preprocessed. For remaining useful life estimation, decision tree (DT), random forest (RF), support vector machine (SVM), linear regression (LR) machine learning algorithms were used and the results were compared according to the coefficient of determination (R^2) efficiency criterion. For fault classification, decision tree (DT), random forest (RF), support vector machine (SVM), support vector machine (SVM), K-nearest neighbor (KNN) machine learning algorithms were used and the results were compared based on the efficiency measure of accuracy.

Keywords: Predictive Maintenance, Machine Learning, Remaining Useful Life Prediction, Classification

GİRİŞ

Günümüzde endüstrinin geçmekte olduğu Dördüncü Sanayi Devrimi (Endüstri 4.0) süreci, üretim ortamlarının fiziksel ve dijital sistemleri arasındaki entegrasyonu zorunlu hale getirmiştir. Bu ortamların entegrasyonu, fabrikaların farklı sektörlerinde bulunan farklı ekipmanlar tarafından elde edilen büyük miktarda verinin toplanmasını gerektirmektedir. Buna ek olarak, Endüstri 4.0'dan gelen yeni teknolojiler, insanları, makineleri ve ürünleri entegre ederek daha hızlı bilgi alışverişi sağlamaktadır. Akıllı bakım yönetimi Endüstri 4.0 uygulamalarının önemli bir parçasını oluşturmaktadır. Gelişen teknolojik yenilikler ve dijitalleşme ile birlikte, makine ve ekipmanların bozulma ve arızalarına neden olan göstergeler, esnek ve akıllı bakım uygulamaları ile otomatik olarak önceden belirlenebilmektedir. Akıllı bakımda uygulanan kestirimci bakım stratejisine yönelik çeşitli test ve ölçümler üzerinden arızaların önceden tahmini ile arıza giderme süreleri ve plansız makine duruş sürelerinin azaltılması, bakım maliyetlerinde azalma, makine kalan faydalı ömürlerinde artış ve üretimde verimlilik artışı sağlanabilmektedir.

Kestirimci bakım, ilk yöntem olan görsel incelemeden örüntü tanıma ve makine öğrenimi, yapay sinir ağları, bulanık mantık vb. tabanlı gelişmiş sinyal işleme tekniklerini kullanan otomatik yöntemlere doğru evrilmiştir. Kestirimci bakım, entegre sensörlerle birlikte gereksiz ekipman değişimini önleyebilir, makine duruş süresini azaltabilir, arızanın temel nedenini bulabilir ve bu şekilde maliyet tasarrufu sağlayabilir ve verimliliği artırabilir. Kestirimci bakım, makine arızalarını önlemek için bakım faaliyetinin önceden programlanması açısından önleyici bakımın kapsamıyla örtüşür. Geleneksel önleyici bakımın aksine kestirimci bakım faaliyetleri, sensörlerden ve analiz algoritmalarından toplanan verilere dayanır.

Ekipman bakımı, makine içeren herhangi bir iş için kritik bir faaliyettir. Kestirimci bakım, herhangi bir ekipmanın arıza süresiyle ilgili tahmine dayalı bakım planlaması yöntemidir. Tahmin, ekipmandan alınan veri ölçümlerini analiz ederek yapılabilir. Makine öğrenimi, geçmiş girdi verileri ve çıktı davranışı üzerinde eğitilerek hazırlanan bir modele dayalı olarak sonuçların tahmin edilebildiği bir teknolojidir. Geliştirilen model, makine arızasını gerçekleşmeden önce tahmin etmek için kullanılabilir. Kestirimci bakımın temel amacı makinenin kalan faydalı ömrünü tahmin etmektir (Ceyhan ve Kasapbaşı, 2022). Böylelikle makinenin sağlık durumu tespit edilebilir ve oluşabilecek arızalar önceden öngörülebilir. Bunun sonucunda da bakım planlaması yapılarak gereksiz bakımların önüne geçilmiş ve dolayısı ile makine verimliliğine ciddi ölçüde katkı sağlanmış olur.

Kestirimci bakıma olan ilgi özellikle son on yılda artış göstermektedir (Esteban vd., 2022). Son yıllarda, kestirimci bakıma olan ilgi nedeniyle bu alanda farklı yaklaşımları ele alan birçok çalışma yayınlanmıştır. Bu çalışmaların çoğunda, kestirimci bakım ve standartları (Zonta vd., 2020), veri toplama ve sensörler (Namuduri vd., 2020; Zhang vd., 2019), makine öğrenmesi ve derin öğrenme teknikleri (Angelopoulos vd., 2020; Carvalho vd., 2019) konularına odaklı çalışılmıştır. Hashemian ve Bean (2011) çalışmalarında sensörler aracılığıyla veri toplamanın farklı yollarını tartışmış ve ayrıca kestirimci bakımın avantajları ve dezavantajlarını ele almışlardır. Zhang vd. (2019), veri odaklı kestirimci bakım tekniklerini tanıtmış ve tahmin için kullanılan makine öğrenmesi tekniklerini analiz etmişlerdir. Diğer çalışmalar, Endüstri 4.0 bağlamında arıza tespitiyle ilgili temel yönleri ve endüstriyel tesislere Nesnelerin İnterneti paradigmasının entegrasyonunu incelemişlerdir (Angelopoulos vd., 2020; Wang, 2016). Birçok çalışma, özellikle imalatta (Wuest vd., 2016), petrol ve gaz endüstrisinde (Hanga ve Kovalchuk, 2019), termal güç santrallerinde ve pompa sistemlerinde (Olesen ve Shaker, 2020), orta gerilimli şalt tesislerinde (Hoffmann vd., 2020) ve otoyol varlıklarının bakımında (Karimzadeh ve Shoghli, 2020) kestirimci bakımın uygulanmasına odaklanmıştır.

Makine öğrenmesi, yapay zekanın bir alt kategorisi olarak kabul edilir ve en az ya da hiç ek destek olmadan öğrenme yeteneğine sahip olan herhangi bir algoritma veya program olarak tanımlanır. Makine öğrenmesi algoritmaları üç farklı grupta sınıflandırılabilir; (1) denetimli öğrenme, (2) denetimsiz öğrenme ve (3) takviyeli öğrenme (Wuest vd., 2016; Pham ve Afify, 2005; Monostori, 2003). Carvalho vd. (2019), 2009-2018 arasında kestirimci bakıma uygulanan temel makine öğrenmesi tekniklerinin kısa bir derlemesini gerçekleştirmiştir. Çalışmaya göre en sık uygulanan teknikler ise rastgele orman, yapay sinir ağları, destek vektör makinesi ve k-ortalama olarak belirtilmiştir. Dünder vd. (2021) çalışmalarında literatürde incelenen makine öğrenmesi algoritmalarını kullanan kestirimci bakım çalışmalarını sunmuşlardır. Çalışmaya göre, 2005'ten günümüze kadar yapılan çalışma sayıları hızla artmış ve kestirimci bakım konusunda durumun izlenmesi, arızanın önceden tespit ve teşhisi konuları bir trend haline gelmiştir. Çalışmada en çok kullanılan tekniklerin doğrusal regresyon, yapay sinir ağları ve destek vektör makinesi olduğu belirtilmektedir.

Bu çalışmada, Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup'ta makine öğrenmesi kullanılarak bir kestirimci bakım uygulaması gerçekleştirilmiştir. Analiz aşamasında, veri ön işlemeden geçirilen veriler üzerinde makine öğrenmesi tabanlı kalan faydalı ömür tahmini ve arıza sınıflandırması yapılmıştır. Kalan faydalı ömür tahmini için karar ağacı, rasgele orman, destek vektör

makinesi, doğrusal regresyon makine öğrenme algoritmaları kullanılmış ve belirleme katsayısı (R^2) etkinlik ölçütüne göre sonuçlar karşılaştırılmıştır. Arıza sınıflandırma için, karar ağacı, rasgele orman, destek vektör makinesi, K-en yakın komşu makine öğrenme algoritmaları kullanılarak doğruluk etkinlik ölçütü üzerinden sonuçlar analiz edilmiştir.

MATERYAL ve YÖNTEM

Kestirimci bakım için sağlam bir zemin hazırlamak, uygulamaların yıllarca sürdürülebilir olması için oldukça önemlidir. Basit dönüşümler ile başlamak ve işletme yeni teknolojilere uyum sağladıkça ölçeği büyütmek doğru bir yöntemdir. Bu amaçla çalışma kapsamında, işletmedeki bütün makineler değerlendirilmiş ve pilot çalışmanın elyaf hattının tarak makinesinde uygulanması planlanmıştır. Özellikle bu makinenin seçilme sebebi, makinenin alternatifinin bulunmayışı ve arızalanması durumunda elyaf üretim hattının tamamen durmasıdır.

Çalışma kapsamında sensör arıza verme ihtimali en yüksek olan ana tambur motoruna bağlanmıştır. Veri toplama aşamasında izleme ve veri kayıt sıklığı 1 dk. olarak belirlenmiştir. Elde edilen veriler üzerinde veri etiketleme, veri temizleme, veri dönüştürme, veri normalizasyonu gibi veri ön işlemleri gerçekleştirilmiştir. Veri temizleme işleminden sonra belirli bir tarih aralığında dakikalık bazda 60 556 adet veri toplanmıştır. Gerçekleştirilen veri ön işlemleri aşağıda özetlenmiştir:

Veri etiketleme: Çalışma kapsamında sensörden elde edilen veriler neticesinde veri kümesinde toplam 11 girdi değişkeni bulunmaktadır. İlgili girdi değişkenleri Z eksen RMS vibrasyon (mm/s), X eksen RMS vibrasyon (mm/s), sıcaklık (C), Z eksen pik ivme (G), X eksen pik ivme (G), Z eksen kurtosis (basıklık), X eksen kurtosis (basıklık), Z eksen krest (tepe) faktörü, X eksen krest (tepe) faktörü, Z eksen yüksek-frekanslı RMS ivme (G) ve X eksen yüksek-frekanslı RMS ivmedir (G). İlgili girdi değişkenleri veri kümeleri üzerinde etiketlenmiştir.

Veri temizleme: İşletme üç vardiya halinde çalışmaktadır ve tüm zaman dilimleri için makine çalışsın veya çalışmasın sensörden elde edilen veriler, bir zaman serisi oluşturacak şekilde veri kümesine aktarılmıştır. Sensörden elde edilen veriler üzerinde makede duruş olması sebebiyle bazı veri temizleme işlemleri yapılmıştır. Bu duruşlar mola, yemek molası, vardiya değişimi gibi nedenlerden olabildiği gibi, sebepsiz de olabilmektedir. Dolayısıyla veri üzerinde detaylı analiz yapılarak, makinenin sebepli/sebepsiz duruş yaptığı veriler veri kümesinden temizlenmiştir. Toplanan veriler üzerinde belirli kurallara göre veri temizleme işlemi gerçekleştirilmiştir. Veri temizlemede kurallar genel olarak şu şekilde uygulanmıştır:

düşük RMS (vibrasyon, titreşim), pik ivme ve düşük sıcaklık üreten değerler, mola saatleri, yemek molası, vardiya değişimi, hafta sonu tatili ve diğer durumlar gibi nedenlerle bu veriler veri kümesinden temizlenmiştir.

Veri dönüştürme: Kalan faydalı ömür hesabında elde edilen çıktının kullanıcı için anlamlı olması adına dakikalık olarak toplanan veriler, günlük verilere dönüştürülmüştür. Bu doğrultuda, her bir gün için elde edilen her bir değişken değerlerinin **ortalaması** alınarak o gün için değişken değerleri elde edilmiştir.

Veri normalizasyonu: Elde edilen günlük veriler öncelikle değişkenlerin temel tanımlayıcı istatistikleri üzerinden analiz edilmiştir. Değişkenlerin aldıkları yüksek/düşük değerlerin tahminleri yanlış yönlendirmemesi ve değişkenler arası baskınlığı ortadan kaldırmak için veride yer alan tüm değişkenlere normalizasyon işlemi gerçekleştirilmiştir. Normalizasyon, literatürde Z-skor normalizasyon olarak geçen ve sıklıkla kullanılan normalizasyon (standardizasyon) yöntemi ile gerçekleştirilmiştir.

Hedef değişken etiketleme: Hedef değişken etiketleme aşamasında tahminlemede kullanılacak olan değişken değerlerinin hesaplanması gerçekleştirilmiştir. Fonksiyon tahminleme (regresyon) için arıza meydana gelene kadar toplanan ve yukarıda bahsedilen veri ön işleme adımlarından geçen “ana tambur motoru” günlük verileri için kalan faydalı ömür hesabı yapılmış ve bu değer fonksiyon tahminlemede hedef değişken olarak ele alınmıştır. Kalan faydalı ömür hesabında, arızanın meydana geldiği gün için kalan faydalı ömür değeri “0” olarak belirlenmiş ve daha önceki günler için bu değerden ardıl artışlar yapılarak ilgili günlerin kalan faydalı ömürleri hesaplanmıştır. Sınıflandırma için kalan faydalı ömür hesabı yapılmış veride kalan faydalı ömür sürekli değişkeni kesiklendirilerek 3 sınıf etiketi elde edilmiştir. Sınıf etiketleri “Normal”, “Uyarı” ve “Alarm” şeklindedir. Kalan faydalı ömür değeri kesiklendirilerken şu sınır değerleri dikkate alınmıştır. Eğer kalan faydalı ömür değeri 12’nin altındaysa o zaman sınıf etiketi “Alarm” değerini, eğer 12-19 aralığındaysa “Uyarı” değerini, eğer 20 veya üzerinde değer almışsa “Normal” değeri ifade etmektedir. Bu sayede fonksiyon tahminleme ve sınıflandırma için hazırlanan veri kümeleri, denetimli olarak eğitilebilir hale getirilmiştir.

Veri ön işlemeden geçirilen veriler üzerinde makine öğrenmesi tabanlı makine kalan faydalı ömür tahmini ve arıza sınıflandırması için çeşitli makine öğrenme algoritmalarından faydalanılmıştır. Kalan faydalı ömür tahmini için karar ağacı, rasgele orman, destek vektör makinesi, doğrusal regresyon algoritmaları; arıza sınıflandırması için ise karar ağacı, rasgele orman, destek vektör makinesi, K-en yakın komşu algoritmaları kullanılmıştır. Aşağıda

çalışmada kullanılan makine öğrenme algoritmalarının kısa açıklamaları ve kaba kodlarına yer verilmiştir.

Karar Ağacı (KA): Karar ağaçları, sınıflandırma ve fonksiyon tahminleme problemlerinde sıklıkla kullanılan ağaç tabanlı algoritmalar. KA kök, düğümler ve yapraklardan oluşurlar. Kök, ağacın ilk düğümüdür ve kök düğümde veriyi en iyi tanımlayan değişken üzerinden dallanma yapılır. Ağaç, veriyi tanımlama gücüne göre değişkenler üzerinden düğümler oluşturarak dallanır ve her bir dal bir yaprak ile sonuçlanır. Yaprak, o dal için sınıf etiketini ifade eder. Ağaçtaki yaprak sayısı, karar ağacı ile elde edilen kural sayısını gösterir. Ağaçta kök düğüm ve diğer düğümler belirlenirken, yani ağaç dallandırılırken genellikle entropi ve bilgi kazancı ölçütlerinden faydalanılır. Entropi, verideki belirsizliğin ölçüsüdür. Veride benzerlik ne kadar fazlaysa, veri ne kadar homojense, entropi o kadar düşük olur. Verinin iyi bölünmesi için entropinin olabildiğince düşük olması istenir, entropi en düşük 0 değerini alabilir. Entropiyi en küçüklemek için bilgi kazancı ölçütünden faydalanılır. Bilgi kazancı en yüksek olan değişken üzerinden ağaç dallanır. KA'da entropi yerine Gini değeri de kullanılabilir. Karar ağaçlarının anlaşılması ve yorumlanması kolaydır, ağaç yapısı kolaylıkla kurallara dönüştürülebilir. Ancak bazen oluşan ağaçlar çok karmaşık olabilir. Tablo 1 ve 2'de sırasıyla sınıflandırma ve fonksiyon tahminleme amacıyla kodlanan karar ağacının kaba kodları verilmiştir.

Tablo 1. Karar ağacı algoritması sınıflandırma kaba kodu

Veriyi oku
Karar ağacındaki derinlik değerine kadar:
Verideki her bir özellik için:
Özelliğin bilgi kazancını hesapla
En yüksek bilgi kazancını sağlayan değişkeni seç
Bu değişken üzerinden ağaca dal oluştur
Karar ağacı oluştur
Karar ağacı üzerinden veriyi test et

Tablo 2. Karar ağacı algoritması fonksiyon tahminleme kaba kodu

Veriyi oku
Veriyi küçükten büyüğe doğru sırala
Karar ağacındaki derinlik değerine kadar:
Verideki her bir değişken için:
Verinin ortalaması ile her bir veri için farkları hesapla
Özelliğin bilgi kazancını hesapla
En yüksek bilgi kazancını sağlayan değişkeni seç
Bu değişken üzerinden ağaca dal oluştur
Karar ağacı oluştur
Karar ağacı üzerinden veriyi test et

Rasgele Orman Algoritması (RO): RO algoritması, eğitim aşamasında eğitim örneklerini küçük parçalara bölerek ve her bir parça için bir karar ağacı çıkartarak, dolayısıyla çok sayıda karar ağacı oluşturarak tahmin üreten toplu (orman) bir öğrenme yöntemidir. Sınıf etiketini

belirlerken yöntem, çoğunluğun karar bilgisini kullanır. Karar ağaçlarında olduğu gibi RO algoritması da hem sınıflandırma hem de fonksiyon tahminleme amacıyla kullanılabilir. Tablo 3 ve 4'te sırasıyla sınıflandırma ve fonksiyon tahminleme amacıyla kodlanan rasgele orman algoritması kaba kodları verilmiştir.

Ortalama sonuçları gerçek değerlerle kıyasla ve algoritmanın başarısını hesapla

Doğrusal Regresyon (DR): Bağımlı (yanıt) değişken ile bir veya daha fazla bağımsız nicel değişken(ler) arasındaki ilişkiyi açıklayan doğrusal bir yaklaşımdır. Tahmin için kullanılan en temel algoritmadır. DR, veriler arasındaki ilişkiyi özetleyen istatistik bir yöntemdir. Doğrusal regresyon, regresyon katsayılarının çok değişkenli doğrusal kombinasyonunu ifade eder. Katsayılar, genellikle genelleştirilmiş en küçük kareler tekniği ile hesaplanır. Basit ve çoklu regresyon olarak ikiye ayrılabilir. Basit regresyonda bir bağımsız değişkene bağlı regresyon analizi yapılmakta, çoklu regresyonda ise çok sayıdaki bağımsız değişkenlere bağlı olarak regresyon analizi gerçekleştirilmektedir. DR modelleri basittir ve iyi tahminler üretebilen, yorumlanması kolay bir matematiksel formül sunarlar. Regresyon analizi ile değişkenler arasındaki ilişkinin varlığı, eğer ilişki var ise bunun gücü hakkında bilgi edinilebilir. Tablo 5'te DR algoritması kaba kodu gösterilmektedir.

Destek Vektör Makinesi (DVM): DVM, eğitim verilerindeki herhangi bir noktadan en uzak olan iki sınıf arasındaki karar sınırını bulan vektör uzayı tabanlı makine öğrenme yöntemidir.

Tanımından da anlaşılacağı gibi iki sınıflı sınıflandırma problemlerini çözmek için geliştirilmiştir. Ancak sonrasında çok sınıflı sınıflandırma problemleri ve fonksiyon tahminleme yöntemlerini çözmek için kapsamı geliştirilmiştir. DVM, yüksek doğruluğu nedeniyle sınıflandırma ve regresyon problemlerinde yaygın olarak kullanılmaktadır. DVM'nin temel özelliklerinden biri, farklı veri sınıflarının ayrılmasındaki yüksek hassasiyeti ve veri sınıflarını ayırmak için en iyi noktayı belirleyebilmesidir. Destek vektör makinesi, verileri buldukları uzayda en iyi şekilde bölmeye ve sınıflandırmaya çalışır. Sınıflar arası ayrımı en iyi şekilde yapmak için bir vektör ile sınıfları ayırır. Destek vektör makinesinin en önemli avantajı, sınıflandırma problemini kareli optimizasyon problemine dönüştürüp çözmeye yarar. Böylece problemin çözümünde tahmin aşamasında işlem sayısı azalmakta ve diğer algoritmalara göre daha hızlı çözüme ulaşılmaktadır. Bu nedenle büyük hacimli veri kümelerinde daha kullanışlı bir yöntemdir. DVM, optimizasyon temelli olduğundan diğer tekniklere oranla karmaşık problemlerde daha kullanışlıdır. Karmaşık veri kümeleri için genellikle en uygun yöntemdir. Tablo 6 ve 7'de sırasıyla sınıflandırma ve fonksiyon tahminleme amacıyla kodlanan DVM algoritması kaba kodları verilmiştir.

K-en Yakın Komşu Algoritması (KEYK): Sınıflandırma işlemi yaparken örnek verinin bulunduğu sınıfın ve örnek verinin en yakın k komşusunun örnekler arası benzerlik/uzaklığa göre belirlendiği denetimli bir makine öğrenme yöntemidir. Makine öğrenme yöntemleri arasında en basitlerinden biridir. Uzaklık/benzerlik hesaplamasında öklit, manhattan, chebyshev uzaklık gibi çok çeşitli uzaklık/benzerlik ölçütleri kullanılabilir. Ancak bunlar arasında en yaygın kullanılan ölçüt, öklit uzaklığıdır. Tablo 8'de sınıflandırma amacıyla kodlanan KEYK algoritması kaba kodları verilmiştir.

BULGULAR ve TARTIŞMA

Veri ön işleme adımlarından geçmiş ana tambur motoru günlük veri kümesi ile fonksiyon tahminleme ve sınıflandırma işlemleri, Scikit-learn kütüphanesi vasıtasıyla Python programlama dilinde kodlanan algoritmalar ile gerçekleştirilmiştir. Fonksiyon tahminleme için hedef değişken olarak hesaplanan kalan faydalı ömür değeri, sınıflandırma için ise kalan faydalı ömür değerlerinin “normal, uyarı, alarm” olmak üzere 3 sınıfa kesiklendirilmesi ile elde edilen nominal değer kullanılmıştır. Veri kümesinde Z eksen RMS vibrasyon (mm/s), X eksen RMS vibrasyon (mm/s), sıcaklık (C), Z eksen pik ivme (G), X eksen pik ivme (G), Z eksen kurtosis (basıklık), X eksen kurtosis (basıklık), Z eksen krest (tepe) faktörü, X eksen krest (tepe) faktörü, Z eksen yüksek-frekanslı RMS ivme (G) ve X eksen yüksek-frekanslı RMS ivme olmak üzere toplam 11 girdi değişkeni ve fonksiyon tahminleme için KFÖ sürekli değişkeni, sınıflandırma için ise 3 sınıf içeren nominal sınıf değişkeni bulunmaktadır.

Veri eğitim ve test kümelerine ayrılırken basit bölümlenme yöntemi kullanılmıştır. Bu doğrultuda verinin %66’sı eğitim, kalan %34’ü ise test kümesi olarak ele alınmıştır. Tablo 9’da sınıflandırma veri kümesi üzerinde sınıflandırma algoritmaları ile algoritmaların 10 kez çalıştırılması sonucunda elde edilen minimum, ortalama, maksimum doğruluk ve standart sapma değerleri gösterilmektedir. Tablodaki koyu-italik değerler ilgili veri kümesinde elde edilen en iyi değerleri ifade etmektedir.

Tablo 9. Sınıflandırma algoritmaları ile elde edilen doğruluk değerleri

Algoritma	Minimum	Ortalama	Maksimum	Standart sapma
Karar Ağacı	0,292	0,338	0,417	0,046
Rasgele Orman	0,292	0,367	0,417	0,038
Destek Vektör Makinesi	0,458	0,458	0,458	0
K-en Yakın Komşu	0,625	0,625	0,625	0

Tablodan görülebileceği gibi en iyi sınıflandırmayı ise K-en yakın komşu algoritması vermiştir, KEYK algoritması ile elde edilen minimum, ortalama ve maksimum doğruluk değerleri diğer algoritmalar ile elde edilen doğruluk değerlerinden oldukça farklıdır. Elde edilen sınıflandırma kuralları aşağıdaki gibidir:

Eğer (Z eksenini yüksek-frekanslı RMS ivme ≤ 0.055) ve (Z eksenini pik ivme > -1.036) ise Sınıf: Normal

Eğer (Z eksenini yüksek-frekanslı RMS ivme > 0.055) ve (Z eksenini pik ivme > 0.186) ise Sınıf: Alarm

Eğer (Z eksenini yüksek-frekanslı RMS ivme > 0.055) ve (Z eksenini pik ivme ≤ 0.186) ise Sınıf: Uyarı

Eğer (Z eksenini yüksek-frekanslı RMS ivme ≤ 0.055) ve (Z eksenini pik ivme ≤ -1.036) ise Sınıf: Uyarı

Kurallardan da görüldüğü gibi ana tambur motorunda arıza durumunu etkileyen en önemli değişkenler Z eksenini yüksek-frekanslı RMS ivme ve Z eksenini pik ivme değerleridir. Bu değişkenlerin aldığı değerlere göre durum “normal”, “alarm” veya “uyarı” şeklinde oluşabilmektedir.

Tablo 10’da fonksiyon tahminleme veri kümesi üzerinde fonksiyon tahminleme algoritmaları ile algoritmaların 10 kez çalıştırılması sonucunda elde edilen ortalama kareli hata (OKH), ortalama kareli hata kökü (OKHK), ortalama mutlak hata (OMH) ve R^2 etkinlik ölçütlerinin minimum, ortalama, maksimum ve standart sapma değerleri gösterilmektedir. Tablodaki koyu-italik değerler veri kümesinde elde edilen en iyi değerleri ifade etmektedir.

Tablo 10. Fonksiyon tahminleme algoritmalarının verdiği etkinlik değerleri

Algoritma	Ölçüt	Minimum	Ortalama	Maksimum	Standart sapma
Karar Ağacı	OKH	13,923	40,938	98,462	38,600
	OKHK	3,731	5,832	9,923	2,775
	OMH	3,000	4,185	6,000	1,180
	R^2	0,262	0,693	0,896	0,289
Rasgele Orman	OKH	80,085	92,338	107,158	8,722
	OKHK	8,949	9,600	10,352	0,455
	OMH	6,558	6,945	7,515	0,254
	R^2	0,197	0,308	0,400	0,065
Destek Vektör Makinesi	OKH	143,047	143,047	143,047	0,000
	OKHK	11,960	11,960	11,960	0,000
	OMH	10,652	10,652	10,652	0,000
	R^2	-0,072	-0,072	-0,072	0,000
Doğrusal Regresyon	OKH	77,537	77,537	77,537	0,000
	OKHK	8,806	8,806	8,806	0,000
	OMH	6,307	6,307	6,307	0,000
	R^2	0,419	0,419	0,419	0,000

Tablodan görülebileceği gibi en iyi kalan faydalı ömür tahmin değerini karar ağacı algoritması 0,693 R^2 değeri ile vermiştir, KA algoritması ile algoritmanın 10 çalışması ile elde edilen ortalama ve maksimum R^2 değerleri diğer algoritmalar ile elde edilen R^2 değerlerinden oldukça farklıdır.

Bulgular incelendiğinde kestirimci bakımda, gerçek hayat veri kümeleri üzerinde makine öğrenmesi yöntemleri ile etkin sonuçların elde edilebileceği gözlemlenmektedir. Tahmin algoritmalarının minimum OKH, OKHK, OMH hata etkinlik ölçüt değerleri ve R2 belirlilik katsayısı değerleri hesaplanmış ve ilgili etkinlik ölçütlerine göre en etkin algoritma belirlenmiştir. Tahmin algoritmalarıyla gerçek hayat veri kümelerinde R^2 değerlerinde %50-%60 bandının üzerine çıkmak KFÖ tahmininde önemlidir. Ana tambur motor veri kümesi üzerinde 0,693 R^2 değerlerine ulaşılmıştır. Sınıflandırma algoritmalarında ise 0,625 doğruluk değerine ulaşılmıştır. Gerçekleştirilen çalışma ile kalan faydalı ömür tahmini ve arıza sınıflandırması problemine yönelik bir gerçek hayat problemine çözüm üretilmiştir.

SONUÇ ve ÖNERİLER

Bu çalışmada, Ar-Ge merkezi olarak faaliyetini sürdüren, Türkiye'nin önde gelen yatak üreticilerinden YATAŞ Grup'ta makine öğrenmesi kullanılarak bir kestirimci bakım uygulaması gerçekleştirilmiştir. İlgili çalışmada titreşim, sıcaklık ve enerji izleme parametrelerine ait veriler 1 dakikalık zaman dilimlerinde sensör ölçümleri ile elde edilmiştir. Analizler, sensörün bağlandığı ana tambur motoru üzerinde gerçekleştirilmiştir. Arıza sınıflandırma ve KFÖ tahminleme amacıyla makine öğrenme algoritmalarından karar ağacı, rasgele orman, destek vektör makinesi, K-en yakın komşu ve lineer regresyon algoritmaları üzerinde çalışılmış, bu algoritmalar veri ön işlemden geçmiş veri kümesi üzerinde sınıflandırma ve fonksiyon tahminleme amacıyla test edilmiştir. Fonksiyon ortalama en iyi OKH, OKHK, OMH ve R^2 değerlerini karar ağacı algoritması vermiştir. KA algoritması ile 0,693 R^2 değerine ulaşılmıştır. Sınıflandırma algoritmalarında ise minimum, ortalama ve maksimum doğruluk değerlerini K-en yakın komşu algoritması vermiştir. KEYK algoritması ile ortalama uygunluk değeri 0,6825 olarak elde edilmiştir. Gerçekleştirilen çalışma ile kalan faydalı ömür tahmini ve arıza sınıflandırma gerçek hayat problemlerine makine öğrenme yöntemleri ile çözüm üretilebileceği gösterilmiştir. Gelecek çalışmalar olarak veri kümesi üzerinde nitelik indirgeme işlemleri gerçekleştirerek etkinlik ölçütlerinin daha da iyileştirilmesi ve makine öğrenme algoritmalarının yanı sıra derin öğrenme algoritmalarının da tahminleme ve sınıflandırma amacıyla kullanılması planlanmaktadır.

Teşekkür

Bu çalışma, TEYDEB-1505 TÜBİTAK Üniversite-Sanayi İşbirliği Destek Programı kapsamında yürütülen 5210089 nolu "Akıllı Bakım Karar Destek Sistemi ve Derin Öğrenmeye dayalı Kestirimci Bakım Uygulaması" projesi ile desteklenmiştir. TÜBİTAK'a teşekkür ederiz.

ÖZET

Bu çalışma Muğla İli Datça ilçesi organik badem yetiştiriciliği bahçelerin beslenme durumlarını belirlemek üzere, bölgeyi temsil edecek şekilde 20 farklı bahçede yürütülmüştür. Araştırma materyalini 20 farklı bahçeden iki farklı derinlikten (0-30 cm ve 30-60 cm) alınan toplam 40 adet toprak örneği oluşturmaktadır. Organik badem yetiştirilen bahçelerinin beslenme durumunu belirlemek amacı ile alınan toprak örneklerinde bazı fiziksel ve kimyasal analizler (pH, toplam tuz, CaCO₃, organik madde, bünye, toplam N, alınabilir P, K, Ca, Mg, Na, Fe, Zn, Mn ve Cu) yapılmıştır. Araştırma sonuçlarına göre organik badem yetiştiriciliği yapılan bahçe topraklarının hafif alkali reaksiyona (pH) sahip, toplam tuz ve kireç içeriği bakımından herhangi bir sorunun olmadığı, bahçelerin %50'sinin organik madde içeriğinin düşük düzeylerde olduğu saptanmıştır. Bahçe topraklarının toplam azot içerikleri orta ve iyi, alınabilir fosfor ve potasyum içeriklerinin yetersiz, alınabilir kalsiyum ve magnezyum içeriklerinin ise yüksek düzeyde olduğu belirlenmiştir. Organik badem yetiştiriciliği yapılan bahçelerin alınabilir bakır dışında mikro besin element içeriklerinin (alınabilir demir, çinko ve mangan) yetersiz olduğu saptanmıştır.

Anahtar Kelimeler: Badem, organic, soil, besin elementi, fiziksel ve kimyasal

**NUTRITIONAL STATUS OF ORGANIC ALMOND ORCHARDS:
CASE OF DATÇA (DISTRICT OF MUĞLA)**

ABSTRACT

This study was carried out in 20 different orchards representing the region in order to determine the nutritional status of organic almond orchards in Datça district of Muğla. The research material consists of 40 soil samples taken from two different depths (0-30 cm and 30-60 cm) from 20 different gardens. Some physical and chemical analyses (pH, total salt, CaCO₃, organic matter, texture, total N, available P, K, Ca, Mg, Na, Fe, Zn, Mn and Cu) were made. According to the results of the research, it has been determined that the garden soils where organic almonds are grown have a slightly alkaline reaction (pH). Total salt and lime content did not exceed the allowed limit. 50% of the organic matter content in the orchards was found at low level. It was determined that the total nitrogen and available phosphorus contents of the garden soils were moderate and sufficient, the available potassium content was insufficient, and the available calcium and magnesium contents were high. It has been determined that the micronutrient contents (available iron, zinc and manganese) in the organic almond orchards were insufficient except for the available copper.

Keywords: Organic agriculture, organic almond, soil, macro micro plant nutrients

1. GİRİŞ

Artan nüfusun gıda talebinin karşılanamaması, yeşil devrimler de doğal dengenin bozulması, biyoçeşitliliğin zarar görmesi ve bunlara paralel olarak hastalıkların artışı sağlıklı gıdaların önemini arttırmıştır. Bundan dolayı da organik tarım, sağlıklı beslenme için gıda temininde tercih edilen alternatif üretim şekli haline gelmiştir.

Beslenmemiz için sert kabuklu meyvelerin hem tazesinin hem de kurusunun ne kadar önemli olduğunu hepimiz çok iyi biliriz. Bunun nedeni, bu meyvelerin besin madde içerikleridir. Bitkilerin beslenmesi içinde toprakların besin madde içeriği sadece organik tarımda değil bütün üretim şekillerinde hem bitki besleme hem de zararlılarla mücadelede dirençli bitki yetiştiriciliği için çok önemli yer tutar. Sağlıklı, kaliteli üretim ve sürdürülebilir tarımın etkili yolu ise topraklardaki besin elementi eksikliklerinin belirlenmesi için toprak ve bitki analizlerine dayalı uygulamaların yapılmasıdır.

Bademin (*Amygdalus communis L.*) anavatanı Orta ve Batı Asya'dır. Buradan Çin, Hindistan, İran, Suriye ve Akdeniz Ülkelerine yayılmıştır. Üretim miktarı bakımından FAO'nun 2021 yılı verilerine göre dünya toplam badem üretim alanı 1990 yılında 1.476.720 ha dan 2019 yılı verileri baz alındığında 2.139.115 hektara alana ulaşarak %44.85 oranında bir artış sağlamıştır. Ülkelerin badem üretim alanlarına göre ise, ilk sırada İspanya ve ABD yer alırken bu ülkeleri Tunus, Fas ve İran'ın takip etmektedir

Türkiye ise hem bademin anavatanı olan bölgede yer alması hem de ikliminin badem üretimine çok uygun olmasından dolayı son 30 yıllık periyotta yıllara göre zaman zaman azalmalar olmasına rağmen badem üretim alanlarının miktarında 2 kattan fazla artış gerçekleşmiştir. Ülkemiz badem üretim alanları 1990-2019 yılları arasında 20.200 hektardan %133.11'lik artış ile 47.088 hektara yükselmiştir. Ancak ülkemiz bu artışa rağmen dünya badem üretim alanlarının yalnızca %2.20'sini kapsamakta ve Badem üretimimiz kendi iç tüketimimizi karşılayamamaktadır. Bundan dolayı 2019 yılında 44.767-ton ithalat gerçekleştirilmiştir (TÜİK, 2020). Ülkemizde badem yetiştiriciliğinin yüzde 33'ü Akdeniz Bölgesi'nde, %25'i Güneydoğu Anadolu Bölgesi ve %23'ü Ege Bölgesinde yapılmaktadır (TÜİK, 2020).

Badem genelde sıcak iklim meyvesidir. Özellikle meyvelerinin olgunlaşması için yüksek sıcaklıklara gereksinim duyan badem, bu nedenle Anadolu'nun çok yüksek yaylalarında yetiştirilememektedir.

2021 yılı verilerine göre Muğla ilinde 22402 dekar alanda 513882 adet meyve veren ağaçtan 8650 ton badem üretilmiştir. Muğla'da 13300 dekar alanda ve 300 bin meyve veren badem ağacı ile 5460 ton badem üretiminin en çok yapıldığı ilçe Datça'dır (TÜİK, 2022).

Datça M.Ö.2000'li yıllarda yörede yaşamış Karyalılara karadar uzanan ve Knidos gibi tarihi bir yerleşim merkezini sınırları içinde bulunduran, Muğla İlinin 13 ilçesinden birisidir. Datça'nın bitki zenginliği antik çağlardan beri biliniyordu. İklim en önemli özelliği flora zenginliğidir. Datça'nın florası denilince kuşkusuz akla öncelikle badem gelmektedir. Datça bademi sadece Türkiye'de değil dünyada da en iyi badem olarak kabul görmektedir.

Datça tüm Türkiye'nin badem üretiminin büyük bir bölümünü ve kalitelisini üretmektedir. Ocak ve şubat aylarında çiçeğe durmaya başlayan bademin birçok çeşidi vardır. Datça'da ise en çok nurlu, akbadem, dedebağ, kababağ, sıralı badem ve dış badem çeşitleri üretilmektedir. İç badem için mayısı beklemek, dış kabukları açıldıktan sonra toplamak için ise temmuz-ağustos aylarına kadar beklemek gerekmektedir. Daha sonra toplanıp güneşte kurutulmaktadır. Türkiye'de organik tarım ise 1980'li yıllarda Avrupa'nın isteği doğrultusunda bazı çok özel ürünlerin öncülüğünde başlamış zamanla ürün yelpazesini genişletmiştir. Gelişen bu alternatif üretim şeklinde sert kabuklular ve spesifik özelliğe sahip olan badem de yerini almıştır (Aksoy ve Altındışli,1999).

1.1. Organik Badem Yetiştiriciliğinde Bitki Besleme ve Toprak Verimliliği

Organik bademde de bütün bitkisel üretimdeki gibi amaç, birim alandan en iyi kalitede ve verimde ürün elde etmektir. Bunun için de toprakların fiziksel, kimyasal ve biyolojik özelliklerinin, badem üretimi için optimum koşulları sağlaması gerekmektedir.

Klasik tarımda yetiştirilecek olan bitkinin isteği ve toprakların mevcut durumuna göre bitkilerin beslenme ihtiyaçları ticari ve sentetik gübreler aracılığı ile sağlanırken yanlış yapılan uygulamalar sonucu topraklar kirlenmekte ve ekolojik denge bozulmaktadır. Gübrelemede suda kolay çözünen mineral gübrelerin yerine organik gübreleme materyalleri kullanılmalıdır.

Bu amaçla makro ve mikro bitki besin elementleri ve organik madde kaynağı olarak katı ve sıvı çiftlik gübresi, yeşil gübre (yonca, bakla, fiğ vb.), torf, balık unu, çeşitli hayvan, bitki artıkları ve kentsel atıklardan elde edilmiş kompost, ağaç külü, deniz yosunları; topraktaki tuzluluk sorununu gidermek amacıyla Jips ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$), toprak reaksiyonunu (pH) düşürmek için elementel kükürt (S), toprak yapısını düzenlemek amacıyla klinoptilolit, curuf, perlit, vermikulit kullanılabilir.

Ayrıca toprakların fiziksel, kimyasal ve biyolojik özelliklerini düzenleyici-iyileştirici olarak “Toprak Düzenleyicileri” adı altında zeolit, içerisinde yüksek miktarda hümik ve fülvik asit içeren hümik asit formları ve alüminyum silikat unları, deniz yosunları, vermikompostlar, tarımsal faaliyet gösteren fabrika atıkları ve şehir atıklarının kompostları vb. girdiler de kullanılmaktadır. Tüm bu materyaller özellikleri gereği hiçbir kimyasal içermeden doğanın döngüsünü sağlayan ve toprak verimliliğinde önemli yeri olan organik maddesini arttırıcı özellikte olmalarıdır.

2.MATERYAL ve METOD

2.1.Araştırma Alanının Coğrafik ve İklim Özellikleri

Araştırma yöremiz, Datça Coğrafi bölge olarak, Ege Bölgesinde, 27.40-28 derece doğu meridyenleri ile 36.60-36.75 derece kuzey paralelleri arasında yer alır. Yüzölçümü 459 km²'dir. Muğla İl'inin güney-batısında olup, kuzeyinde Gökova Körfezi, güneyinde Hisarönü Körfezi, doğusunda Marmaris batısında Ege ve Akdeniz vardır. Yarımada dağlık ve engebeli bir arazi yapısına sahiptir. En yüksek dağı Kocadağ silsilesi üzerindeki Bozdağ (1162 m) dır. Başlıca diğer dağları Emecik Dağı 747 m, Tuludağ 743 m, Karadağ 738 m'dir. Küçük çaplı belli başlı ovaları Kızlan, Karaköy, Mesudiye ve Palamut Bükü düzlükleridir. Yarımada'nın 235 km'lik sahil bandı dantel gibi büyüklü küçüklü 52 koyla bezenmiştir. Marmaris'le Datça sınırını teşkil eden Balıkaşiran mevkiinde kara genişliği 800 m' ye kadar iner. Bu oran yarımada'nın en geniş yerinde 17 km'dir (Anonim, 2013a).

2.1.1 İklim

Muğla İli Akdeniz iklim etkisinde kalmaktadır. İklim üzerinde deniz ve yükseltinin yanı sıra yer şekillerin uzanış durumu büyük rol oynar. 800 metre yüksekliğe kadar olan alanlarda asıl Akdeniz iklimi ve daha yüksek alanlarda Akdeniz dağ iklimi hissedilir. Akdeniz iklimi ve enlem etkisine bağlı olarak yazları yüksek olan sıcaklık değerleri kış aylarında II. ve III. Alt bölgelerde (Şekil 5.1) ılık I. alt bölgede ise düşük olarak gerçekleşir. Kaydedilen en yüksek sıcaklık değeri II. alt bölgedeki Marmaris İlçesinde 47 °C, en düşük sıcaklık değeri ise I. alt bölgedeki Merkez İlçede -12 °C olarak gerçekleşmiştir. Donlu gün sayısı 33.8 gün ile en fazla Merkez İlçede gerçekleşirken II. ve III. Alt bölgede donlu gün sayısı 5'i aşmamaktadır (Çizelge 1) (Anonim, 2013b).

Çizelge 1. Muğla İlinin aylara göre sıcaklık dağılımı (Anonim, 2013c)

MUĞLA	Ocak	Şubat	Mart	Nisan	Mayıs	Haziran	Temmuz	Ağustos	Eylül	Ekim	Kasım	Aralık

Akdeniz İklimi Yağış rejimi görülen Muğla İlinde yıllık toplam yağışın %60'ı kış aylarında gerçekleşir. Yıllık yağış ortalaması 1000 mm civarındadır. Yağışlı geçen gün sayısı 99.6 ile en fazla Merkez ilçede gerçekleşir.

Şekil 1. Muğla İli alt bölgelere göre ilçelerin dağılımı (Anonim, 2013b).

2.1.2. Bitki örtüsü

Muğla İlinin iklim ve toprak koşullarına göre şekillenen doğal bitki örtüsü çok çeşitli ve zengin bir flora oluşturur. İl arazisinin % 62'sini ormanlar oluşturmaktadır. Ayrıca doğal ortamda zeytin ağaçları bulunmaktadır. İl'e hâkim bitki örtüsü maki formasyonudur. İlde kekik ve benzeri doğal aromatik bitkilerde yaygındır.

Datça, doğa güzellikleriyle, tarihiyle ve turizmiyle birlikte birçok tarım ürünüyle de adını duyurmaktadır. Özellikle güzlük domatesi, zeytini ve bademi önemli tarım ürünleri arasındadır.

Datça İlçesinde son sayımlara göre 414.000 adet verimde, 41.000 adet daha verim çağına gelmemiş badem ağacı bulunmaktadır. Bu ağaçlardan 4900 tanesi dağınık halde bulunmaktadır. Ekolojinin uygunluğu nedeniyle badem ağaçları ocak ayı ortaları ile şubat ayı sonuna kadar çiçek açmakta ve şubatın ikinci haftası ile nisanın ikinci haftasına kadar çağla badem hasad edilebilmektedir. İklim şartlarını uygun gitmesi halinde şubat ayı başında çağla alınabilmektedir.

Araştırma yöresinde ekonomik değeri olan ve yetiştirilen badem çeşitlerimiz ise şunlardır; Akbadem, Kababağ, Dedeabağ, Nurlu, Hacıali ve Sıralı bademdir. Numune alımdığımız bahçelerde ise % 70'i akbadem, % 15'i nurlu ve % 15'i de sıralı bademden oluşmaktadır. Datça ilçesinde 800 ton dolaylarında çağla badem ve 1635 ton iç kuru badem üretimi vardır. Yetiştirilen bademler çağla badem ve iç badem olarak birçok sektöre ham madde olarak sunulmaktadır (Anonim, 2013b).

2.2. Materyal

Araştırma materyalini Muğla İli Datça İlçesinde 2004 yılından beri 126 bahçede 2634 ağacın bulunduğu 254.913 da alanda halan devam eden organik badem projesinden bütün alanı temsil edecek şekilde toplam 20 farklı mevkide (Çizelge 2.) bulunan ve 407 badem ağacının yer aldığı 20 bahçeden 0-30 cm, 30-60 cm, derinliğinden toplam 40 toprak örneği alınmıştır. Örneklerin alındığı mevkilere ait bazı bilgiler Çizelge 2'de verilmiştir. Örneklemede organik badem yetiştiriciliği yapılan alanları temsil edebilecek nitelikte ve sayıda olmasına özen gösterilmiş ve bu amaçla toplam 20 farklı mevkiden verimlilik ilkesine göre ve mikro element bulaşmasına yol açmayacak tarzda toprak örnekleri alınmıştır (Jackson, 1967).

rine ait bazı bilgiler

2.3. Yöntem

Araştırma materyalini oluşturacak toprak örneklerinin alınması, analize hazırlanması ve bu örneklerin analizi ile elde edilen sonuçların değerlendirilmesinde kullanılan yöntemler aşağıda belirtildiği gibi üç başlık altında toplanmıştır.

2.3.1 Toprak örneklerinin alınması, hazırlanması ve analizlerde kullanılan yöntemler

Araziye çıkmadan önce yöreyi temsil edecek mevkiiler belirlenerek haritada örnek alım yerleri işaretlenmiş ve buralardan toprak numuneleri alınmıştır. Alınan örnekler plastik kovalarda iyice karıştırılmış homojenlik sağlandıktan sonra 1.5 kg'lık polietilen torbalara konularak ayrı ayrı etiketlenmiştir.

Resim 1. Toprak örneklerinin alınması ve hazırlanması.

Laboratuara getirilen toprak örnekleri, hava kurusu hale getirildikten sonra tahta bir tokmakla ezilerek 2 mm'lik elekten geçirilmiştir. Analiz için hazır hale gelen tekrar naylon torbalara konularak numaralandırılmıştır (Jackson, 1967).

E.Ü. Ziraat Fakültesi Toprak Bölümü laboratuvarlarına getirilen toprak örneklerinin fiziksel ve kimyasal analizlerinde aşağıdaki yöntemler uygulanmıştır.

pH

Örneklerin pH değerleri saf su ile sature edilmiş toprak macununda cam elektrotlu Beckman pH metresi ile elektrometrik olarak ölçülmüştür (Richards, 1954). Daha sonra bu değerler (Kellogg, 1952) göre sınıflandırılmıştır.

Eriyebilir Toplam Tuz

Saf su ile sature edilmiş toprak macununda elektriki direnç Beckman Conductivity Bridge aleti ile ölçülmüştür. Ölçülen elektriki direnç (ohm) toprak bünyesi ve toprak macunu sıcaklığı (°F) değerleri dikkate alınarak redüksiyon monogramına uygulanmıştır. Bu şekilde toprak örneklerinin eriyebilir toplam tuz miktarları % olarak saptandı (U.S.Soil Survey Staff, 1951).

Kireç (% CaCO₃)

Toprak örneklerinin % CaCO₃ miktarları Scheibler kalsimetresi ile volumetrik olarak tayin edilmiştir (Çağlar, 1949). Elde edilen değerler % olarak verildi. Analiz sonuçları Aereboe ve Falke'ye göre sınıflandırıldı (Evliya 1960).

Bünye

Toprak örneklerinin bünye özelliklerini belirlemek amacıyla içerdikleri % kum, % mil, % kil fraksiyonları hidrometre metodu ile analiz edilmiştir (Bouyoucos, 1962). Elde edilen değerler bünye analiz üçgenine uygulanarak örneklerin bünyeleri saptanmıştır (Black, 1957).

Organik madde (%)

Toprak örneklerinin organik madde yüzdesinin belirlenmesinde; Reuterberg ve Kremkus yöntemine göre saptanan organik karbon kapsamlarından yararlanılacaktır. Bulunan karbon değerleri 1.724 sabiti ile çarpılarak % organik madde miktarı hesaplanmıştır (Black, 1965).

Toplam azot (% N)

Toprak örneklerinin toplam azot miktarları Bremner ve Schaw'ın modifiye makro kjeldahl metodu (Bremner,1965) uygulanarak belirlenmiş, sonuçlar yüzde olarak hesaplanmıştır.

Faydalı fosfor

Toprak örneklerinin faydalı fosfor (P) miktarları Bingham (1949), metoduna göre kolorimetrik olarak Eppendorf kolorimetresinde tayin edildi ve sonuçlar ppm olarak hesaplandı.

Değişebilir katyonlar

Toprakların faydalı K, Ca, Na, Mg değerleri 1N Amonyum asetat (NH₄OAC) yöntemine göre pH değeri 7 olan 1 N Amonyum asetat ile çalkalanarak elde edilen süzüklerde; K, Ca, Na değerleri Flame fotometrede, Mg değerleri ise Atomik Absorbsiyon Spektrofotometresinde tayin edildi (Pratt, 1965).

Mikro elementler

Toprakların faydalı Fe, Cu, Zn ve Mn miktarları DTPA (diethylene triamine penta acetic acid tampon çözeltisi) metoduna göre elde edilen süzüklerden Atomik Absorbsiyon Spektrofotometresinde okunup, ppm olarak hesaplandı (Lindsay ve Norvell, 1978).

2.3.2 Analiz sonuçlarının değerlendirilmesinde kullanılan istatistiki yöntemler

Analiz sonuçlarının değerlendirilmesinde Tarist bilgisayar paket programı kullanılarak yapıldı (Açıkgöz ve ark., 2004).

3.ARAŞTIRMA BULGULARI ve TARTIŞMA

Araştırmada incelenen toprakların yüzey ve yüzey altı derinliklerine ait bazı fiziksel ve kimyasal özellikler tespit etmek amacıyla bünye, pH, total tuz, kireç (%) ve organik madde analizleri yapılmasıyla elde edilen sonuçlar sırasıyla aşağıda (Çizelge 3.1) verilmiştir.

3.1 Araştırma Yöresi Toprakların Fiziksel ve Kimyasal Özellikleri

Araştırmanın yürütüldüğü Datça yöresindeki badem bahçelerine ait toprak örneklerinin bazı fiziksel ve kimyasal analiz sonuçları Çizelge 3’de verilmiştir.

Çizelge 3.1. Datça yöresindeki organik badem bahçelerinden alınan toprak örneklerinin fiziksel ve kimyasal analiz sonuçlarına ait minimum, maksimum ve ortalama değerleri

Özellikler	0- 30 cm			30- 60 cm		
	Minimum	Maksimum	Ortalama	Minimum	Maksimum	Ortalama
pH	6.16	7.58	7.18	6.11	7.68	7.21
Total Tuz (%)	0.01	0.05	0.02	0.007	0.04	0.02
Kireç (%)	0.84	11.40	3.60	0.96	10.06	4.02

Toplam N (%)	0.05	0.34	0.15	0.07	0.47	0.16
Alınabilir P(ppm)	0.25	14.10	3.43	0.50	9.57	2.85
Değişebilir K (ppm)	60	730	163	80	890	166
Değişebilir Ca (ppm)	1520	6360	3360	1520	6600	3294
Değişebilir Mg(ppm)	67	1062	317	42	1163	305
Değişebilir Na (ppm)	10	90	31	20	60	30
Alınabilir Fe (ppm)	4.11	17.4	6.84	3.67	16.81	7.21
Alınabilir Cu (ppm)	0.57	1.80	1.05	0.77	3.39	1.25
Alınabilir Zn (ppm)	0.29	6.31	1.34	0.29	6.41	1.58
Alınabilir Mn (ppm)	7.30	39.55	17.51	6.26	73.74	18.21

3.1.1. Toprak Örneklerinin pH Değerleri

Araştırma bölgesinde 0-30 cm derinlikten alınan toprak örneklerinin pH değerleri 6.16–7.58 (Çizelge 3.1) hafif asitten hafif alkaliye doğru değişmektedir (Lindsay ve Norvell, 1978). Örneklerin %10’unun hafif asit, %65’inin nötr, %25’inin ise hafif alkalın reaksiyon gösterdikleri saptanmıştır. Aynı örneklerin 30-60 cm derinliğinde pH değerlerinin 6.11- 7.68 arasında değiştiği, bu örneklerin % 10’unun hafif asit, % 25’inin nötr ve % 65’inin hafif alkalın reaksiyon gösterdikleri belirlenmiştir. Bu sonuçlara göre 0-30 cm derinlikteki toprak örnekleri genelde nötr, 30-60 cm derinlikteki örnekler ise hafif alkalın reaksiyon göstermektedir.

Adıyaman’da Bayram ve Büyük (2021), toprak işleme ve gübreleme yapılmayan 8 yaşındaki badem ağaçlarında bitki besin elementi düzeylerinin belirlenmesi amacıyla yaptıkları çalışma yürüttükleri toprakların pH’sının 0-30 cm’de 7.84, ikinci derinlikte ise 7.76 olduğunu, Çantal (2022), Manisa, Köprübaşında farklı anaçların ferragnes ve ferraduel badem çeşitlerinde meyve kalitesi ve bitki besin içeriğine etkilerini araştırdığı bahçe toprağının pH’sının ise 8.33 olduğunu bildirmiştir.

İncekara (1979)’a iyi bir bitkisel üretim için toprakta pH’sı 6.5-7.0 arasında olmalıdır. Buna göre araştırma yöresi toprak örneklerinin pH değeri genelde belirtilen sınırlar içerisinde. Ancak hafif alkalın (7.4-7.8) reaksiyon gösteren yörelerde toprakların pH’sını düşürmek için kontrollü olarak toz kükürt kullanılması önerilmektedir.

3.1.2. Toprak Örneklerinin Toplam Tuz İçerikleri

Araştırma topraklarında suda çözünebilir toplam tuz miktarları, 0-30 cm'de; % 0.012-0.056 arasında, 30-60 cm'de ise % 0.007-0.046 arasında değişmektedir (Çizelge 3.1). İncelenen örneklerin tamamında tuz problemi (<% 0.150) bulunmadığı anlaşılmaktadır (Ülgen ve Yurtsever, 1974). Çantal (2022), Manisa, Köprübaşında farklı anaçların ferragnes ve ferraduel badem çeşitlerinin dikili olduğu bahçe topraklarının tuzluluk oranlarının % 0.025 olduğunu, Adıyaman'da Bayram ve Büyük (2021), toprak işlenmesiz ve gübrelemesiz badem yetiştiriciliği yapılan toprakların birinci derinliğinin tuzluluk değerlerinin %0.027 ikinci derinlikte ise %0.018 olduğunu tespit etmiştir.

3.1.3. Toprak Örneklerinin Kireç (% CaCO₃) Miktarları

Araştırma toprakları 0-30 cm derinlikten alınan örneklerde CaCO₃ kapsamları, % 0.084-11.40; 30-60 cm derinlikten alınan örneklerde ise % 0.096–10.60 arasında değişmektedir (Çizelge 3.1). Ülgen ve Yurtsever (1974)'ün belirttiği sınıflandırmaya göre 0-30 cm derinlikteki örneklerin % 65'i kireççe fakir, % 10'u kireçli, % 20'si kireççe zengin, % 5'i bünye+marn şeklindedir. Araştırma yöresinde 30-60 cm derinlikten alınan toprak örneklerinin ise % 65'inin kireççe fakir, % 25'inin kireççe zengin, % 10'unun ise bünye+marn özellik gösterdikleri belirlenmiştir.

Adıyaman'da Bayram ve Büyük (2021), badem yetiştiriciliği yapılan alanların birinci derinlikteki kireç değerlerinin %21.8 ikinci derinlikte ise %23.9 olduğunu, Çantal (2022), Manisa, Köprübaşında badem bahçe topraklarının kireçliliğinin % 0.21 olduğunu rapor etmiştir.

3.1.4. Toprak Örneklerinin Organik Madde Miktarları

İncelenen toprakların organik madde kapsamları 0-30 cm'de % 0.10-5.57, 30-60 cm derinlikte ise % 0.62-7.48 arasında değişmektedir (Çizelge 3). Ülgen ve Yurtsever (1974)'e göre 0-30 cm derinliğindeki toprakların % 15'i organik madde içeriği bakımından çok fakir ya da çok az, % 35'i az, % 40'ı organik maddece orta, % 45'i zengin, %10'u ise organik madde açısından çok zengin olarak belirlenmiştir. Araştırma topraklarının 30 – 60 cm derinliğine ait analiz değerine göre organik maddece % 60'ı humusça fakir, % 35'i az humuslu ve % 5'i humuslu dağılım göstermektedir.

Bayram ve Büyük (2021), Adıyaman'da badem yetiştiriciliği yapılan alanların birinci ve ikinci derinlikteki organik madde değerlerinin %2.87 ve %2.55 olduğunu, Manisa, Köprübaşında badem bahçelerinde çalışma yürüten Çantal (2022), toprak organik madde içeriğinin % 1.35 olarak tespit edildiğini bildirmişlerdir.

3.1.5. Toprak Örneklerinin Bünye Sınıfları

Araştırma yöresi toprak örneklerinin bünyesi kumlu tın ve kumlu killi tın olarak saptanmıştır (Çizelge 3.1). Araştırmada Black, 1957'e göre 0-30 cm derinlikten alınan toprak örneklerinin % 65'i kumlu tın, % 35'i kumlu killi tın bünyeye sahip iken; 30 – 60 cm derinlikten alınan toprak örneklerinin; % 55'i kumlu tın, % 45'i kumlu killi tın bünye özelliğine sahiptir.

Bayram ve Büyük (2021), Adıyaman'da badem bahçelerinin bünyesinin her iki derinlikte de killi tın, Manisa'da Çantal (2022), badem bahçesi topraklarının da killi tınlı bünyeye sahip olduklarını bildirmişlerdir.

3.1.6. Toprak Örneklerinin Toplam Azot Kapsamları

Araştırma materyali olarak belirlenen mevki ve derinliklerden alınan toprak örneklerinin toplam azot içeriği 0-30 cm derinlikte %0.056- 0.342 arasında, 30-60 cm derinlikte ise %0.073- 0.476 değerleri arasında değişmektedir (Çizelge 3.).

Birinci derinlikten alınan (0-30 cm) toprak örneklerinin toplam azotça % 25'i orta, %30'u iyi, %45'i zengin durumda iken ikinci derinlikten (30-60 cm) alınan toprak örneklerinin ise %10'u toplam azotça orta, %50'si iyi, %40'ı ise zengin düzeyde belirlenmiştir (Kovancı, 1985).

Adıyaman'da Bayram ve Büyük (2021), toprak işleme ve gübreleme yapılmayan 8 yaşındaki badem bahçelerinin total azot besin elementi düzeylerinin 0-30 cm'de % 0.22, ikinci derinlikte ise 0.21 olduğunu, Çantal (2022), Manisa, Köprübaşında farklı anaçlara aşılı ferragnes ve ferraduel badem çeşitlerinin yetiştirildiği alanlarda 2 yıl boyunca yürüttüğü araştırmada bahçe toprağının total azot içeriğinin % 0.07 olduğunu bildirmiştir.

3.1.7. Toprak Örneklerinin Yarayışlı Fosfor Kapsamları

Araştırma konusunu oluşturan bahçe topraklarından alınan örneklerde alınabilir fosfor içeriği birinci derinlikte 0.25-14.10 ppm arasında, ikinci derinlikte 0.50-9.57 ppm arasında değişmektedir (Çizelge 3.1). Alınabilir fosfor içeriği açısından 0-30 cm derinlikte alınan örneklerin % 30'u iyi, % 55'i orta, %15'i fakir durumda olduğu belirlenmiştir. 30-60 cm derinlikteki toprakların ise % 20'si iyi, % 55'i orta ve % 25'inin de fakir olduğu saptanmıştır (Güner, 1968).

Çantal (2022), Manisa, Köprübaşında badem bahçelerinin yarayışlı fosfor oranlarının 16.98 kg/da olduğunu, Adıyaman'da Bayram ve Büyük (2021), toprak işlemesiz ve gübrelemesiz badem yetiştiriciliği yapılan bahçe toprakların birinci ve ikinci derinliğinin fosfor değerlerini 5.8 kg/da ve 4.8 kg/da olduğunu tespit etmiştir.

3.1.8. Toprak Örneklerinin Değişebilir Potasyum Kapsamları

0-30 cm derinlikte alınan toprakların alınabilir potasyum içerikleri 60-730 ppm, 30-60 cm derinlikte alınan toprakların ise 80-890 ppm arasında değişmektedir (Çizelge 3).

0-30 cm derinlikteki toprakların Pratt, (1965)'e göre % 55'i noksan, % 35'i düşük, % 5'i yeterli ve % 5'i çok yüksek durumundadır. 30-60 cm derinlikteki topraklarda ise % 70'i noksan, %20'si düşük, % 5'i yeterli, % 5'i çok yüksek durumunda bulunmuştur. Her iki derinlikte de yer alan bahçelerin potasyum içerikleri çoğunlukla yüzeyden aşağıya doğru azalma göstermiştir. Topraklarda potasyumun çoğunlukla noksan ve düşük düzeyde olması yörede kumlu-tın ve kumlu killi tın bünyenin hâkim olmasıyla açıklanmaktadır. (Fawzi ve El-Fouly, 1980).

Adıyaman'da Bayram ve Büyük (2021), badem yetiştiriciliği yapılan alanların birinci derinlikteki değişebilir potasyum değerinin 203.3 kg/da ikinci derinlikte ise 182.7 kg/da olduğunu, Çantal (2022), Manisa, Köprübaşı'nda badem bahçe topraklarının potasyum içeriğinin 52.47 kg/da olduğunu rapor etmiştir.

3.1.9. Toprak Örneklerinin Değişebilir Kalsiyum Kapsamları

Çalışmayı oluşturan bahçelerden alınan toprak örneklerinin alınabilir Ca içerikleri 0-30 cm'de alınabilir kalsiyum değerleri 1520-6360 ppm, 30-60 cm'de ise 1520- 6600 ppm arasında değişmektedir (Çizelge 3.1). Pratt (1965)'e göre ilk derinlikteki toprak örneklerinin % 10'u orta, % 25'i iyi, % 35'i fazla ve % 30'unun çok fazla oranda alınabilir kalsiyum içeriğine sahip olduğu saptanmıştır. 30-60 cm derinlikteki toprak örneklerinin ise % 20'si orta, % 25'i iyi, % 15'i fazla ve % 40'ı çok fazla olarak belirlenmiştir.

Çantal (2022), Manisa, Köprübaşı yöresi badem bahçelerinin değişebilir kalsiyum içeriğinin 6898 ppm olarak tespit ettiğini bildirmiştir.

3.1.10. Toprak Örneklerinin Değişebilir Magnezyum Kapsamları

Yöre topraklarının 0-30 cm'de alınabilir magnezyum içerikleri 67-1062 ppm, 30-60 cm'de 42-1163 ppm arasında değişmektedir (Çizelge 3). Bahçe örneklerinin alınabilir Mg içerikleri Pratt (1965)'e göre değerlendirildiğinde; birinci derinlikte örneklerinin % 5'i fakir, % 30'u orta, % 40'ı yüksek ve % 25'i çok yüksek seviyede alınabilir magnezyum içerdikleri belirlenmiştir. İkinci derinlikte ise %5'i fakir, %30'u orta, %35'i yüksek ve %30'unun çok yüksek oranda alınabilir magnezyuma sahip oldukları saptanmıştır.

Manisa, Köprübaşı'nda Çantal (2022), badem bahçe toprağında magnezyum 757 ppm olduğunu belirlemiştir.

3.1.11. Toprak örneklerinin alınabilir sodyum içeriği

Bahçe topraklarından 0-30 cm derinliğe ait sodyum değerleri 10-90 ppm, 30-60 cm derinliğe ait sodyum sonuçları 20-60 ppm arasında değişim göstermektedir (Çizelge 3.1). Prat (1965)'e göre değerlendirildiğinde; 0-30 cm derinliğe ait toprak örneklerinin sodyum içeriğinin % 75'i çok düşük, % 20'si düşük ve % 5'i orta düzeyde bulunmuştur. 30-60 cm'ye ait toprak örneklerinin alınabilir sodyum durumu ise % 70'inin çok düşük, % 30'unun düşük olduğu tespit edilmiştir.

3.1.12. Toprak Örneklerinin Yarayışlı Demir Kapsamları

İncelenen bahçelerin toprak örneklerinin faydalı demir kapsamları 0-30 cm derinlikte 4.11-17.4 ppm arasında, 30-60 cm derinlikte ise 3.67-16.81 ppm arasında değişmektedir (Çizelge 3). Yöre toprak örneklerinin alınabilir demir içerikleri Viets ve Lindsay (1973)'e göre sınıflandırıldığında ise; birinci derinlikte toprakların % 10'ununda noksanlık gözlenirken, % 90'ı alınabilir demir açısından iyi düzeyde olduğu görülmektedir. İkinci derinlikte ise % 25'inde noksanlık gözlenirken, % 75'nin alınabilir Fe içeriği iyi düzeyde bulunmaktadır.

Adıyaman'da Bayram ve Büyük (2021), toprak işleme ve gübreleme yapılmayan 8 yaşındaki badem bahçelerinin yarayışlı demir düzeylerinin 0-30 cm'de 5.09 ppm, ikinci derinlikte ise 4.84 ppm olduğunu, Çantal (2022), Manisa, Köprübaşı'nda ferragnes ve ferraduel anaçlarına aşılı badem çeşitlerinin yetiştirildiği alanlarda 2 yıl boyunca yürüttüğü araştırmada bahçe toprağının yarayışlı demir içeriğinin 16.48 ppm olduğunu bildirmiştir.

3.1.13 Toprak Örneklerini Yarayışlı Bakır Kapsamları

Çalışma alanı topraklarının bitkiye yarayışlı bakır dağılımı Çizelge 3'de yer aldığı gibi 0-30 cm derinlikte 0.57- 1.80 ppm arasında, 30-60 cm derinlikte ise 0.77-3.39 ppm değerleri arasında değişmektedir. Toprak örnekleri alınabilir bakır bakımından Lindsay ve Norwell (1978) yararlı bakır sınır değerlerine göre incelendiğinde her iki derinlikte de alınabilir bakır bakımından yeterli bakıra sahip olduğunu görülmektedir. Bayram ve Büyük (2021), Adıyaman'da badem yetiştiriciliği yapılan alanların birinci ve ikinci derinlikteki bakır değerlerinin 2.58 ppm ve 2.4 ppm olduğunu, Manisa, Köprübaşı'nda badem bahçelerinde çalışma yürüten Çantal (2022), toprağın bakır içeriğini 5.39 ppm olarak tespit etmişlerdir.

3.1.14. Toprak Örneklerini Yarayışlı Çinko Kapsamları

Araştırma sonuçlarına göre toprak örneklerinin birinci derinlikte alınabilir çinko içerikleri 0.29 ppm ile 6.31 ppm arasında, ikinci derinlikte ise; 0.29 ppm ile 6.41 ppm arasında bulunmuştur (Çizelge 3.1). Viets ve Lindsay (1973) tarafından bildirildiği sınır değerlerine göre birinci derinlikte % 30'unda noksanlık, % 35'inde kritik, % 35'inde yeterli, ikinci

derinlikte ise % 40'ında noksanlık, % 30'unda kritik, % 30'unde yeterli olarak bulunmuştur. Belirlenen bu sonuçlara göre bahçelerin çinko kapsamalarının genellikle düşük olduğu dikkati çekmektedir.

Adıyaman'da badem yetiştiriciliği yapılan alanların birinci derinlikteki alınabilir çinko oranının 0.61 ppm ikinci derinlikte ise 0.48 ppm olduğunu Bayram ve Büyük (2021), Çantal (2022), Manisa, Köprübaşı'nda badem bahçe topraklarının yararlı çinko içeriğinin 0.55 ppm olduğunu rapor etmişler.

3.1.15. Toprak Örneklerini Yarayışlı Mangan Kapsamları

Araştırma topraklarının 0-30 cm'de alınabilir mangan içerikleri 7.30 – 39.55 ppm, 30-60 cm'de 6.26 – 73.74 ppm arasında değişmektedir (Çizelge 3). FAO (1990)'ya göre toprak örneklerinin alınabilir mangan içerikleri değerlendirildiğinde; 0-30 cm'de örneklerinin alınabilir mangan içeriklerinin % 45'i az, %55'i yeterli, 30-60 cm'de ise % 40'ı az, % 55'i yeterli, % 5'i fazla düzeyde mangan içeriğine sahip olduğu tespit edilmiştir.

Çantal (2022), Manisa, Köprübaşı'nda badem bahçelerinin faydalı mangan değerinin 10.24 ppm olduğunu, Adıyaman'da Bayram ve Büyük (2021), toprak işlenmesiz ve gübrelemesiz badem yetiştiriciliği yapılan bahçe toprakların birinci ve ikinci derinliğinin mangan değerlerini 12.87 ppm ve 10.69 ppm olduğunu tespit etmiştir.

3.2. Toprak Özellikleri Arasındaki İstatistikî İlişkiler

Araştırma bölgesinden iki farklı derinlikten alınan toprak örneklerinin bazı toprak nitelikleri analiz edilerek belirlenmiştir. Araştırma materyalinin analizinde belirlenen makro mikro besin elementleri içeriklerinin, diğer toprak özellikleri ile aralarındaki ilişki açıklanmaya çalışılmıştır.

3.2.1. Toprak özellikleri ile ilgili istatistikî ilişkiler (0-30 cm, 30-600 cm)

Toprakların bazı kimyasal ve fiziksel özellikleri 0-30 cm ve 30-60 cm derinlikte birbirleri ile olan ilişkileri de incelenmiştir. Yapılan değerlendirmede toprakta bulunan makro ve mikro besin elementi içerikleri ile bazı toprak nitelikleri arasında saptanan ilişkilerin korelasyon (r) katsayıları verilmiştir (Çizelge 4). Bu katsayılar bazı önemli ilişkileri ortaya koymaktadır.

Çizelge 4. Toprak özellikleri ile ilgili istatistiksel ilişkiler (0-30 cm, 30-60 cm)

Bulgulara göre 0-30 cm derinliğine ait toprakta bulunan fosfor ile ikinci derinlikte bulunan toprakların toplam azot, alınabilir fosfor ve alınabilir çinko kapsamaları arasında pozitif ilişkisi olduğu belirlenmiştir.

0-30 cm derinlikteki alınabilir potasyum ile ikinci derinliğe ait tuz analiz değeri arasında negatif bir ilişki olduğu saptanmıştır. Yine alınabilir 1.potasyum değeri ile 30-60 cm derinlikte bulunan toplam azot, alınabilir fosfor, alınabilir potasyum, alınabilir demir, alınabilir bakır, alınabilir çinko ve alınabilir mangan içerikleri arasında pozitif bir etkileşim olduğu belirlenmiştir.

0-30 cm derinliğine ait toprakta bulunan alınabilir demir elementi ile 30-60 cm derinliğe ait pH değeri arasında negatif, 30-60 cm derinliğe ait alınabilir demir içeriği ile pozitif ilişkisi olduğu saptanmıştır.

0-30 cm derinlikteki alınabilir bakır ile 30-60 cm derinliğe ait tuz analiz değeri arasında negatif bir ilişki olduğu saptanmıştır. Yine 1. alınabilir bakır değeri ile 30-60 cm derinlikte bulunan toplam azot, alınabilir fosfor, alınabilir potasyum, alınabilir bakır, alınabilir çinko ve alınabilir mangan kapsamaları arasında pozitif bir etkileşim olduğu belirlenmiştir.

0-30 cm derinliğindeki alınabilir mangan ile 30-60 cm derinliğe toplam azot, alınabilir fosfor ve alınabilir potasyum ait analiz değeri arasında pozitif bir etkileşim olduğu saptanmıştır.

3.SONUÇ ve ÖNERİLER

Bu araştırma Muğla'ya bağlı Datça ilçesi ve çevresinde yer alan organik badem yetiştiriciliği yapılan alanlarda gerçekleştirilmiştir. Bütün yöreyi temsil edecek nitelikteki bahçelerden alınan toprak örnekleriyle ilgili analizler yapılmış ve toprak verimliliği ve beslenme durumları belirlenmeye çalışılmıştır. Ayrıca toprak özellikleri arasındaki ilişkiler incelenmiş, elde edilen sonuç ve öneriler aşağıda verilmiştir.

Badem bahçelerinin örnekleri kumlu tın ve kumlu killi tın bünyeye sahip oldukları, tuzluluk sorunlarının bulunmadığı, bu yönden badem yetiştiriciliği için uygun nitelik taşıdıkları belirlenmiştir. Kireç miktarlarının büyük bölümünün fakir (%65) ve bünye + marn aralığında olup, organik madde yönünden humusça fakir sınıflarında yer aldıkları izlenmiştir.

0-30 cm derinlikten 30-60 cm derinliğe geçişte bahçelerin % 70'inde pH artışı gözlenmiştir. 0-30 cm derinlikte toprak örneklerine göre 12 bahçenin pH'sı genel ortalamanın üzerinde ve nötr ve alkalidir.

19 nolu bahçenin 30-60 cm derinliğine minimum pH değerine ve kireç değerine sahip olması kireç ile pH arasındaki doğru orantıyı ortaya koymaktadır. 0-30 cm derinlikteki bünye dağılımı 13 bahçede kumlu tın. 7 bahçede kumlu killi tın 2. derinlikte ise 11 bahçede kumlu tın 9 bahçede kumlu killi tındır.

1, 3, 9, 10, 14 ve 17 nolu bahçelerde toplam tuz, % kireç ve organik madde açısından her iki derinlik değerleri de bütün bahçelerdeki ortalama değerlerden düşük çıkmış ayrıca, bu bahçelerin dördünün bünyesi kumlu killi tın olduğu görülmüştür.

Element içerikleri incelendiğinde genel olarak 0-30 cm'de N orta ve iyi; P % 15 yetersiz; K %55 noksan, % 35 düşük; Ca fazla ve çok fazla, Mg % 5 fakir;

Na % 75 çok düşük, % 20 düşük; Fe % 10 noksanlık görülebilir; Cu yeterli, Zn % 30 noksan ve % 35'inde noksanlık gözlenebilir; Mn % 45 yetersiz; bulunmuştur.

30-60 cm'de N iyi ve zengin; N orta ve iyi, P % 25 yetersiz; K % 70 noksan, % 20 düşük; Ca fazla ve çok fazla, Mg % 5 fakir; Na % 70 çok düşük, % 30 düşük; Fe % 25 noksanlık görülebilir; Cu yeterli, Zn % 40 noksan ve % 30'unda noksanlık gözlenebilir; Mn % 45 yetersiz bulunmuştur.

Her iki derinlikte de yer alan bahçelerin potasyum içerikleri çoğunlukla yüzeyden aşağıya doğru azalma göstermiştir. En yüksek alınabilir potasyum içeriği iki derinlikte de 15 no'lu örnekte belirlenmiştir. Topraklarda potasyumun çoğunlukla noksan ve düşük düzeyde olması yörede kumlu-tın veya kumlu killi tın bünyenin hâkim olmasıyla açıklanmaktadır.

Toprakların alınabilir çinko içeriklerinin her iki derinlikte de noksan ve noksanlığın görüldüğü belirlenen araştırmada. Sebebinin de gene araştırma elde edilen çinko ile pH arasındaki önemli negatif ilişkili olduğu, incelenen topraklarda pH'nın artmasıyla alınabilir çinko oranının azalma görüldüğü araştırmada sonuçları destekleyerek çalışmanın doğru ve gerekliliğini ortaya koymuştur.

15 nolu bahçenin 30-60 cm derinliğine ait N-P-K değerleri bütün araştırmanın maksimum değerleridir. 3, 10 ve 17 nolu bahçelerde her iki derinliğe ait %N, P, K, Ca ve Mg

değerlerinde bütün bahçelerin ortalama değerinin altında çıkmıştır. Mikro element açısından, 2 ve 10 numaralı Badem bahçelerinde 0-30 cm derinlikteki Mn değerleri hariç bütün mikro besin değerleri genel ortalamasının altında çıkmıştır.

Alınan toprak örneklerinin 1. derinlikten 2. derinliğe doğru, yani üst katmandan alt katmana doğru analizlerde elde edilen değerlerin genel ortalamasına göre; pH, Total, Tuz ve organik madde de ciddi bir değişim görülmezken, kireçte artış olduğu, bünyede sadece bir bahçe toprağında kumlu tından, kumlu killi tına geçiş olmuştur.

Toprak profilinde yüzeyden aşağı doğru makro elementler karşılaştırıldığında; fosfor ve magnezyum oranlarında ciddi azalış gösterirken, N K Ca ve Na değerlerinde ciddi bir değişim görülmemiştir.

Mikro element değerlerinde yüzeyden derinlik artışına paralel olarak genel bir artış eğilimi olduğu görülmüştür.

İstatistiki korelasyon göz önüne alındığında; ikinci derinlikte tuz değeri ile birinci derinliğe ait K ve Cu değerleri arasında negatif korelasyon; pH değeri ile birinci derinliğin Fe içeriği arasında gene negatif etkileşim olduğu tespit edilmiştir.

Birinci derinliğin P içeriği ile ikinci derinliğin N P ve Zn içeriği arasında pozitif korelasyon olduğu,

0-30 cm derinliğinin K içeriği ile 30-60 cm derinliğinin N, P, K, Fe, Cu, Zn, Mn içeriği arasında pozitif korelasyon olduğu,

I. derinliğin Cu içeriği ile ikinci derinliğin N, P, K, Cu, Zn, Mn içeriği arasında pozitif korelasyon olduğu,

Birinci derinliğin Mn içeriği ile 30-60 cm derinliğinin N P ve K içeriği arasında pozitif korelasyon olduğu saptanmıştır.

Her iki derinlikte de toprakların büyük çoğunluğunun organik maddece fakir olması, topraklarda pH, kireç, bünye de dikkate alınarak toprakların; bünyelerinin, organik madde oranlarının, makro ve mikro element içeriklerinin yeterli düzeye getirilmesi için ahır gübresi, yeşil gübre ya da kompost gibi uygulamaların yapılması gerekmektedir.

pH'sı yüksek olan bahçelerde mikro elementi alım sorununu çözmek için pH'yı düşürmek için kükürt uygulaması yapılmalı ya da organik tarım yönetmeliğine göre organik üretime uygun olduğu için kullanımına izin verilen mikro element içerikli yaprak gübreleri uygulanmalıdır.

ÖZET

Bu çalışmada beş farklı lokasyonda (Koçarlı, Nazilli, Menemen, Salihli ve Söke), beş elementel kükürt seviyesinin (0-40-80-120 ve 160 kg S/da) pamuk bitkisinin verim ve toprakların bazı fizikokimyasal özellikleri üzerine etkinliğini saptamak üzere 20 adet tarla denemesi yapılmıştır. Yürütülen 20 adet tarla denemelerinden; 10 adedi kükürt seviyelerinin uygulama yıllarındaki 2 yıl (1. ve 2. yıl) diğer 5 adedi kükürt seviyelerinin sonraki ve 5 adedi de kükürt seviyelerinin üst üste uygulamasının toprakların bazı özelliklerine ve pamuk verimine etkilerini belirlemek amacı ile kurulmuş ve aşağıdaki sonuçlar elde edilmiştir. 1-2 yıl yürütülen tarla denemelerinde sağlanan kütlü sonuçlarının değerlendirilmesi ile lokasyonların, yılların ve kükürt seviyelerinin kütlü verimine etkisi önemli bulunmuştur. En düşük verim Söke ve en yüksek verim ise Menemen koşullarında yürütülen denemelerden sağlanmış ve en uygun elementel kükürt düzeyi 40 kg S/da olduğu belirlenmiştir. 2-Kükürdün sonraki etkisi önemsiz bulunmuştur. Üst üste kükürt seviyeleri uygulaması denemelerinde elde edilen sonuçlara göre en uygun düzey 40 kg S/da olduğu ve yüksek kükürt uygulamalarının ise verim düşüklüğüne neden olduğu saptanmıştır. 3-Kükürt uygulamaları toprak pH'sının azalmasına suda çözülmüş toplam tuz artışına etkili olduğu, yüksek kükürt uygulamalarının az da olsa kireç miktarlarını düşürdüğü, en düşük organik madde miktarının kontrol parsellerinde, en yüksek organik madde miktarının S₁ seviyesinde (40 kg/da) olduğu sonucuna varılmıştır.

Anahtar kelimeler: Elementel kükürt, pamuk, verim, pH, lokasyon, Ege Bölgesi

**THE EFFECT OF SULFUR APPLICATIONS ON COTTON YIELD AND SOME
PHYSIOCHEMICAL PROPERTIES OF SOILS**

ABSTRACT

In this study, 20 field experiments were established at different locations (Koçarlı, Menemen, Nazilli, Salihli and Söke) in Ege region of Turkey in order to examine the effect of enhanced sulphur rates (0-40-80-120-160 kg/da) on cotton yield and some physicochemical properties. Ten of the experiments examined the impact of treatments (two years); 5 of them studied the residual effect of sulphur rates and the other 5 trials were conducted to assess the successive effects of sulphur applications. In this regard, same soil properties and cotton yield were determined. The following results were obtained: 1- The effect of treatments: years, locations and rates on seed cotton yields were found statistically significant. The lowest yield was measured under Söke conditions while the highest in Menemen. Regarding the sulphur rates, 40 kg S/da treatment yielded the highest seed cotton. 2- Residual effect of sulphur on yield was found statistically non significant. The results in relation to successive sulphur applications revealed that 40 kg S/da is the most appropriate treatment of the experiment. Higher doses caused depressions. 3- Sulphur applications decreased the soil pH and the increase in total dissolved salt in water, high sulfur applications reduced the amount of lime even slightly, the lowest organic matter amount was in the control plots, the highest organic matter amount was at the S1 level (40 kg/da).

Keywords: Elemental sulfur, cotton, yields, pH, location, Ege region

GİRİŞ

Bitki besin maddeleri toprakta, yararlanılamaz (kaya ve minerallerin yapısında), zor yararlanılabilir veya uzun dönemde yararlanılabilir (fiske edilmiş) ve yararlanılabilir (değişebilir ve toprak çözeltilisine çözünebilir) formlarda bulunmaktadır. Bunların içerisinde yararlanılamaz forma ait oranın genelde % 90-95 olduğu kabul edilmektedir. Geriye kalan % 5-10'luk kısmın da tamamından da bitkiler yararlanamamaktadır. Benzer şekilde toprağa gübre olarak verilen besin elementlerinin önemli bir kısmı çeşitli faktörler nedeniyle yararlanılamaz veya güç yararlanabilir forma geçmektedir. Bu durum temelde besin maddelerinin toprakta çeşitli faktörlerin etkisi ile çözünme-çökme ve bağlanma-serbestleşme ekseninde gelişmektedir. Bu nedenle bitkilerin, toprakta bulunan veya toprağa gübre olarak verilen besin elementlerinin önemli bir kısmından yararlanamadıkları ve yararlanma oranının faktörlere bağlı olarak % 5-90 arasında değişebileceği varsayılmaktadır. Bu oranın başta toprak özellikleri (pH, kireç ve organik madde miktarı, kil tipi) olmak üzere, bitkisel özellikler (çeşit, kök dağılımı, kök KDK'sı vb.) yetiştirme koşulları (açıkta veya serada yetiştiricilik, bitki sıklığı, sulama durumu) ve iklim özellikleri (yağış ve sıcaklık), besin elementi ve gübreleme pratiği tarafından etkilenebileceği kabul edilmektedir. Bu oran aynı zamanda gübrelemede etkinliğin önemli bir ölçüsüdür.

Bitki besin elementlerinin yarayışlılığını etkileyen etmenler arasında toprak ile ilgili olanlar (pH, kireç, organik madde miktarı ve kil tipi), yarayışlılığın temelde çözünme-çökme, serbestlenme-bağlanma ekseninde gelişmesi nedeniyle önemlilik açısından diğerlerinden bir adım öne çıkmaktadır. Bu durum aynı zamanda bitkilerin, toprak çözeltilisinde çözülmüş durumda bulunan bitki besin maddelerinden öncelikli olarak yararlanması ve bununda çok büyük oranda toprağın pH, kireç ve organik madde miktarı ile kil tipi tarafından denetleniyor olmasından kaynaklanmaktadır. Bu olgu aynı zamanda beraberinde bitki besin maddelerinin toprak çözeltilisine geçişini sağlayan, teşvik eden veya kolaylaştıran etmenlerin kontrolü veya gerektiğinde değiştirilmesi seçeneğini de getirmektedir (Yağmur ve Okur, 2017). Bu konuda özellikle çözünmenin teşvik edilmesinin gübrelemenin etkinliğini önemli oranda artırması beklenebilir.

Kimyasal olarak çözünme-çökme olgusu, element veya bileşiğin çeşidi, çözücü tipi, sıcaklık, ortak iyon, iyon şiddeti ve pH tarafından denetlenmektedir. Özellikle metallerin çözünme-çökmesinde pH'nın çok önemli rolü bulunmaktadır. Örneğin toprak pH'sındaki her 1 birim artışa karşılık çözünebilir mangan miktarı 100 kat azalmaktadır. (Lindsay, 1972). Karbonat, sülfat ve fosfatların çözünürlüğü pH'nın düşmesi ile artmaktadır. Düşük pH aynı

zamanda minerallerin parçalanma ve ayrışmasını teşvik ederek potasyum, kalsiyum, magnezyum ve manganın açığa çıkmasını sağlamaktadır (Wolf, 1999). Bitki besin elementlerinin de büyük bir kısmının metal (K, Ca, Mg, Fe, Zn, Mn, Cu) ve ametal (P, S ve B) karakterli oluşu dikkate alındığında pH'nın bitki besleme açısından ne kadar önemli olabileceği ortaya çıkmaktadır. Toprak reaksiyonu (pH) aynı zamanda besin elementi döngüsünde yer alan mikroorganizmalar ile patojen mikroorganizmaların aktiviteleri üzerinde de önemli etkiye sahiptir.

Toprak reaksiyonunun (pH) düşürülmesinde genelde ucuz olması, kolay bulunması, ağır metal içermemesi ve uygulama kolaylığı nedeni ile diğer materyallere (pirit, FeS) göre kükürt tercih edilmektedir. Toprak Gübre Araştırma Enstitüsü tarafından ülkemizin değişik bölgelerine ait 243.453 adet toprakta yapılan analizler sonucunda, ülke topraklarımızın % 60,33'nün pH'sı 7,5-8,5 arasında bulunmaktadır. Bu oran Ege Bölgesinde % 49,01, Akdeniz Bölgesinde ise % 83,67 düzeyindedir. Yine aynı araştırmada topraklarımızın % 58,67'sinde Kireç içeriği % 5'in üzerinde bulunmaktadır. Bu oran Ege Bölgesinde % 42,8 ve Akdeniz Bölgesinde ise % 77,12'dir (Eyüpoğlu, 1999). Bu sonuçlara göre ülkemiz topraklarının önemli bir kısmının pH ve kireç değerleri yüksektir.

Şekil 1. Türkiye’de tarım arazilerinin pH durumu (Eyüpoğlu, 1999)

Şekil 2. Türkiye topraklarının kireç dağılımı (Eyüpoğlu, 1999)

Bu çalışma, ülkemiz ve bölgemiz topraklarının önemli bir kısmında pH ve kireç değerlerinin yüksek olması, gübre etkinliğinin arzulanan düzeyde olmaması ve toprak pH'sının sonucun ortaya çıkamasın da önemli bir etmen olabileceği dikkate alınarak yapılmış ve kükürt uygulaması ile toprak pH'sının düşürülmesi amaçlanmıştır. Bu çerçevede Ege Bölgesinde İzmir, Manisa ve Aydın illerini kapsayan 5 farklı lokasyonda, 2 yıl süre ile denemeler yürütülmüştür. Denemelerde bölgede temel tarım ürünlerinden biri olan pamuk bitkisi test bitkisi olarak kullanılmış ve toprağa 5 farklı dozda (0-4-80-120-160 kg/da) kükürt uygulanmıştır. Araştırmada kükürt uygulamalarının toprağın bazı fizikokimyasal özellikleri (pH, çözünebilir toplam tuz, kireç organik madde) ve verim üzerine etkileri incelenmiştir.

1. MATERYAL ve YÖNTEM

1.1. Materyal

1.1.1. Deneme Yerleri ve Coğrafik Durumları

Denemeler, İzmir ili Menemen ilçesindeki Köy Hizmetleri Enstitüsü deneme tarlasında, Aydın İli Koçarlı, Nazilli, Söke ve Manisa ili Salihli ilçesinde üretici tarlalarında yürütülmüştür. Denemelerin kurulduğu beş ilçenin (Koçarlı, Nazilli, Söke, Menemen ve Salihli) çok yıllık (30 yıllık) iklim değerleri incelendiğinde yaz ayları sıcak ve kurak, kış aylarının da ılıman ve yağışlı olduğu, yağışların büyük kısmı kış aylarında düşmekte ve yaz ayların da ise yok denecek kadar az yağış meydana gelmektedir. İlkbahar ve sonbahar ikinci derecede yağışın düştüğü mevsimlerdir. Kasım, Aralık ve Ocak ayları genellikle yağışın en fazla olduğu aylardır. Sıcaklık ortalamaları incelendiğinde Temmuz, Ağustos ayları en sıcak ay, Ocak ve Şubat aylarının en soğuk ay olduğu gözükmektedir. (Anonim, 2023).

1.1.2.Bitki Materyali

Araştırmanın tüm denemelerinde orijinal Nazilli 85 S pamuk çeşidi uygulandı. Bu pamuk çeşidinin tohumları her deneme yılında Nazilli Pamuk Araştırma Enstitüsünden sağlandı. Bu çeşit Nazilli Pamuk Araştırma Enstitüsünde melezleme ıslahı ile elde edilmiştir. 1984 yılında yeni bir çeşit olarak ıslah edilen Nazilli 84 pamuk çeşidinin ana ebeveyni Carolina Queen ABD'den, baba ebeveyn 153-F Sovyetler Birliğinden getirilmiştir (Harem, 2003).

1.1.3.Elementel Kükürt Materyali

Tarla denemelerinde kullanılan elementel kükürt Ege Gelişim AŞ'den temin edilmiştir. Kullanılan kükürt %98,5-99 saflıkta ve 80-100 mesh çapında (0,016-0,020 mikron olan) özelliklere sahiptir.

1.2. Yöntem

1.2.1.Toprak Örneklerinin Alınması ve Analize Hazırlanması

Tarla denemeleri kurulmadan önce Koçarlı, Nazilli, Söke (Aydın), Menemen (İzmir) ve Salihli (Manisa)'de kurulacak tarla denemeleri öncesi 0-30 ve 30-60 derinliklerden karma toprak örneği alındı. Beş ilçede kurulan pamuk denemelerinden hasat sonrası (I-1.yıl kükürt uygulaması denemesi, II-1. yıl kükürt uygulamasının sonraki etkisi denemesi, III- 2 yıl kükürt uygulaması denemesi, IV- 2. yıl kükürt uygulaması denemesine sonra yıl tekrar kükürt uygulanarak üst üste kükürt uygulaması denemesi) 4 farklı denemeden (her bir konusuna ait her bir tekerrürün üç yerinden olmak üzere dört tekrarlı alınan örnekler karıştırılmış ve bu şekilde konu ile ilgili tek bir yüzey karma örneği sağlanmıştır) toplam 100 adet örnek alınmıştır.

Naylon torbalarda laboratuara getirilen örnekler E.Ü Ziraat Fakültesi Toprak Bölümü kapalı serasında havada kuru hale getirilmiş ve daha sonra 2 mmlik elekten elenerek tekrar naylon torbalara konularak yapılacak analizler için saklanmıştır.

1.2.2.Toprak Örneklerinin Fizikokimyasal Özelliklerinin Belirlenmesi İçin Uygulanan Yöntemler

Toprak örneklerinin bünye (tekstür) analizi, hidrometrik yöntemle (Bouyoucos, 1962); suda çözünür toplam tuz yüzdesi, sature toprak macununda elektriksel direnç ölçülmesi ile (Anonim, 1951); pH belirlemesi, saf su ile sature edilen toprak macununda cam elektrotlu pH metre ile (Jackson, 1962); kireç (CaCO₃) %'si Scheibler kalsimetresi ile (Schlichting ve Blume, 1966); organik madde, yaş yakma yöntemi ile (Schlichting ve Blume, 1966); toplam azot, makro Kjeldahl yöntemi ile (Bremner, 1965); alınabilir fosfor (P), su ile ekstraksiyon yöntemi ile kolorimetrik olarak ölçüldü (Bingham, 1949). Alınabilir potasyum kalsiyum ve

sodyum NH_4OAC ile ekstraksiyon sonrası alev fotometresi ile aynı ekstrakta magnezyum ise atomik absorpsiyon spektrofotometre ile ölçüldü (Kacar, 1962). Toprak örneklerinde alınabilir demir, çinko, mangan ve bakır, örneklerin DTPA ile ekstraksiyonu sonrası elde edilen süzükte atomik absorpsiyon spektrometre ile ölçüldü (Lindsay ve Norwell, 1978). Alınabilir kükürt belirlenebilmesi için örnekler, 500 ppm fosfor kapsayan $\text{Ca}(\text{H}_2\text{PO}_4)_2$ çözeltisinde 30 dakika çalkalanmış ve sonrası elde edilen süzükte kükürt miktarı ICP (Inductively Coupled Plasma) ile ölçülmüştür (Fox ve ark., 1964).

1.2.3. Tarla Denemeleri Yöntemi

Pamuk bitkisiyle yapılan tarla denemesinde elementel kükürt 5 seviyede (0-40-80-120 ve 160 kg S /da) verildi. Denemede 4 tekrarlamalı tesadüf blokları istatistiksel deseni uygulandı. Tarla hazırlandıktan sonra parselasyon işlemleri yapıldı. Bloкта parseller arası 1,4 m, tekrarlamalar arası ise 2 m olacak şekilde mesafe bırakıldı. Parsellerin eni 6 m, boyu 12 m ve bu şekilde parsel alanı 72 m² olarak hazırlandı. Toz kükürt parsellere serpme olarak uygulandı ve daha sonra rotavetör ile toprağa karıştırıldı. Her parselde daha sonra 60 kg/da olacak şekilde 15:15:15 gübresi serpildi, tekrar rotavetör ile gübre toprağa karıştırıldı. Tapan ile düz hale getirilen tarlaya dekara 3-4 kg pamuk tohumu ekim makinesi ile 75 cm sıra arası mesafede 8 sıra olacak şekilde ekildi. Çıkıştan sonra seyreltme yapıldı. Vejetasyon periyodu devamınca kükürt kapsamayan mücadele ilaçları uygulandı. Ara çapası yapılan parsellere 15 kg/da % 26'lık kireçli amonyum nitrat gübresi sıraya verildi. Sedleme işlemi yapıldıktan sonra I.sulama her parselde ayrı ayrı uygulandı. Birinci sulama sonrası her parselde 6 sırada (sağ ve solda birer sıra yan tesir olarak deneme dışı bırakıldı) hasad aşamasında 240 bitki kalacak şekilde tekleme işlemi yapıldı(alt ve üst tesir olarak alt ve üstten 1'er metre denemeden bırakıldı). Hasad parsel alanı $4,5 \times 10 = 45 \text{ m}^2$ olarak belirlendi. Vejetasyonun devam ettiği süre içinde yöre uygulamaları da dikkate alınarak pamuk bitkisi 3-5 kez sulandı. Parsellerin hasadı elle yapıldı ve tümü 2 veya 3 elde tamamlandı. Bu şekilde çakılı deneme şeklinde birinci yıl denemesi(I.deneme:1. yıl kükürt uygulaması denemesi) kurulmuştur. Birinci yıl kurulan I.deneme alanına sonraki yıl tekrar kükürt uygulamadan pamuk ekimi yapılmış ve kükürtün sonraki etkisini belirlemeye yönelik deneme (II deneme: kükürtün sonraki etkisi denemesi) kurulmuştur. Aynı arazilerin farklı bir yerinde yine çakılı deneme şeklinde 2. yıl tekrar kükürt uygulamaları yapılarak 2. bir deneme kurulmuş (III.deneme: 2. yıl kükürt uygulama denemesi), bu deneme alanına sonraki yıl tekrar kükürt uygulanarak pamuk ekimi yapılmış, bu şekilde kükürt uygulamalarının üst üste etkisini belirlemeye yönelik deneme (IV deneme: üst üste etki denemesi) kurulmuştur.

Bu durumda aynı tarlanın farklı yerlerinde 2 yıl devam eden denemeler yapılmıştır. Araştırmanın 1. yılında hasadı yapılan çakılı tesadüf blokları deneme parselleri (I. deneme) 2. yıl ilkbaharında işlenmiş gübrelenmiş ve daha sonra ekim ve kültürel işlemleri yapılarak denemenin 1. yılında uygulanan kükürt ve sonrası etkisi saptanmıştır(II. deneme).

Araştırmanın 2 yılında ilkbaharında kükürt verilerek kurulan çakılı tesadüf blokları denemeleri(III. deneme) aynı yıl hasad edildikten sonra sonraki yıl toprak işlemesine tabi tutulmuş daha sonra parsellere kükürt ve gübre (15:15:15 ve amonyum nitrat) uygulanmak sureti ile üst üste kükürt uygulamasının etkisi (IV. deneme) belirlenmeye çalışılmıştır.

1.2.4. Denemede Kullanılan İstatistik Değerlendirme Yöntemleri

Tarla vejetasyon denemelerini istatistikî değerlendirilmeleri Yurtsever (1984)'e göre yapılmıştır. İstatistiksel analizler TARİST paket programına göre yapılmıştır (Açıkgöz ve ark., 1994).

2. BULGULAR ve TARTIŞMA

2.1. Deneme Öncesi Alınan Toprak Örneklerinin Fiziksel ve Kimyasal Özellikleri

Denemelerin kurulduğu Koçarlı, Nazilli, Söke, Menemen ve Salihli ilçelerindeki pamuk tarlaları allüvial büyük toprak grubuna girmektedirler. Her tarlanın iki katmanından (0-30 ve 30-60cm) alınan toprak örnekleri analiz sonuçları Çizelge 1'de verilmiştir. Salihli, Menemen, Nazilli topraklarının kumlu-tın, Koçarlı topraklarının tın ve Söke topraklarının killi-tın bünyeli oldukları belirlendi (Black, 1957). Koçarlı, Menemen ve Salihli deneme tarlaları hafif alkalın reaksiyonlu, Nazilli ve Söke deneme tarlalarının orta alkalın reaksiyonlu oldukları bulundu (Kellogg, 1952). Koçarlı ve Söke topraklarının marnlı, Menemen ve Salihli topraklarının kireççe zengin, Nazilli deneme tarlası topraklarının kireççe fakir ($\%CaCO_3 < 2,5$) olduğu saptandı (Evliya, 1960). Deneme topraklarının suda çözünür toplam tuz içerikleri yönünden, tuzluluk sorununun olmadığı ($\% \text{ toplam tuz} < 0,150$) anlaşıldı (Anonim, 1951). Tüm deneme tarlaları toprakları humusça fakirdir ($\% \text{ organik madde} < 2$) (Akalan, 1965). Deneme tarlaları toprakları toplam azot yönünden incelendiğinde 0-30 cm derinlikteki yüzey topraklarının Koçarlı, Nazilli ve Söke'de orta, Menemen ve Salihli'de fakir olduğu, 30-60 cm derinlikteki toprakların tüm deneme tarlalarında fakir durumda oldukları belirlendi (Loue, 1968). Saf su ile ekstraksiyon sonrası belirlenen fosfor miktarlarının iyi ($P > 1,0 \text{ ppm}$) durumda oldukları (Kacar, 1964), faydalı potasyum yönünden ise Nazilli deneme tarlası topraklarının düşük, Koçarlı ve Menemen topraklarının yüksek ve Salihli topraklarının iyi olarak nitelendirilecek düzeyde potasyum içerdikleri anlaşıldı (Pizer, 1967). Faydalı kalsiyum yönünden Koçarlı topraklarının yüksek, diğer deneme tarlaları topraklarının ise yeterli

düzye kalsiyum kapsadıkları belirlendi (Yağmur,1996). Faydalı magnezyum içerikleri bakımından deneme topraklarının yüksek ve çok yüksek düzeyde magnezyum kapsadıkları (Yağmur,1997) saptanmıştır. Alınabilir sodyum bakımından Söke ve Nazilli deneme tarlaları topraklarının yeterli diğerlerinin düşük düzeyde sodyum kapsadığı belirlendi (Yağmur,1997). Faydalı demir tüm yüzey örneklerinde yeterli (2,4-4,5 ppm Fe) 30-60 cm derinlik itibariyle kritik düzeydedir (Lindsay ve Norwell, 1978).Tüm topraklarda faydalı çinko içeriklerinin yetersiz (< 0,5 ppm), faydalı bakır içeriklerinin yeterli (> 0,2 ppm) ve faydalı mangan içeriklerinin ise yeterli (> 1,2 ppm) olduğu belirlendi (Seferoğlu ve Kılıç, 2002)

Çizelge 1. Tarla denemelerinin yürütüldüğü beş farklı lokasyondan alınan toprak örneklerinin fiziksel ve kimyasal özellikleri.

2.2. Denemeler Sonrası Alınan Toprak Örneklerinin Fizikokimyasal Analiz Sonuçları

Her dört vejetasyon denemesinde (I:1. yıl pamuk kükürt denemesi, II:1. yıl kükürdün sonraki etkisine ait deneme, III:2. yıl pamuk kükürt denemesi ve IV: 2. yıl pamuk denemesine sonraki yıl tekrar kükürt uygulanarak üst üste kükürt uygulaması pamuk vejetasyon denemesi) hasat sonrası alınan karma yüzey toprak örneklerine ait bazı fizikokimyasal analiz sonuçları Çizelge 2; Çizelge 3; Çizelge 4 ve Çizelge 5’de verilmiştir.

2.2.1. Kükürt Seviyelerinin Toprak pH'sına Etkisi

Beş farklı lokasyonda kurulan vejetasyon denemelerinden hasat sonrası alınan yüzey karma toprak örneklerinde belirlenen pH değerleri Çizelge 2'de verilmiştir.

Çizelge 2. Tarla denemelerinden hasat sonrası alınan toprak örneklerinin pH değerleri

I: 1. yıl pamuk kükürt uygulaması denemesi,

II: kükürdün sonraki etkisi denemesi

III: 2. yıl pamuk kükürt uygulaması denemesi

IV: üst üste kükürt uygulaması denemesi

1. Yıl kükürt uygulaması denemesinden hasat sonrası alınan toprak örneklerinde pH'nın Koçarlı'da 7,75-7,53 (%2,8 azalma), Menemen'de 7,62-7,47 (%2 azalma), Nazilli'de 8,04-7,84 (%2,5 azalma), Salihli'de 7,98-7,81 (%2,1 azalma) ve Söke'de 8,03-7,75 (%3,5 azalma) olduğu anlaşılmıştır (Şekil 3).

Aynı denemenin kükürdün sonraki etkisini saptamak amacıyla kurulan vejetasyon denemesinden hasat sonrası alınan toprak örneklerinin pH değerlerinde Koçarlı'da 7,78-7,98 (%2,5 azalma), Menemen'de 7,80-7,73 (%1 azalma), Nazilli'de 8,16-8,09 (%0,25 azalma), Salihli'de 7,98-7,81 (%2,2 azalma) ve Söke'de 8,04-7,84 (%2,5) azalma olduğu belirlendi (Şekil 4).

2. Yıl kurulan kükürt denemesinden hasat sonrası alınan karma yüzey toprak örneklerinin pH değerleri; Koçarlı'da 8,11-8,02 (%1,2 azalma), Menemen'de 7,85-7,62 (%3 azalma), Nazilli'de 8,07-8,02 (%0,6 azalma), Salihli'de 7,96-7,84 (%1,5 azalma) ve Söke'de 8,04-7,90

(%1,7 azalma) olarak belirlendi (Şekil 5). 2. Yıl vejetasyon denemesine sonraki yıl tekrar kükürt uygulanması sureti ile üst üste kükürt uygulaması yapılan bu denemeden alınan yüzey toprak örneklerinde pH değerleri Koçarlı'da 7,63-7,58 (%0,7 azalma), Menemen'de 7,73-7,67 (%0,8 azalma), Nazilli'de 8,08-7,89(%2,4 azalma), Salihli'de 7,92-7,57 (%4,2 azalma), Söke'de 8,04-7,99 (%0,6 azalma) arasında bulundu (Şekil 6).

Dört farklı denemeden, vejetasyon sonunda alınan toprak örneklerinde pH düzeylerinin kükürt uygulaması sonucu meydana gelen değişimin %0,6-4,2 arasında olduğu belirlenmiştir.

Bu yönde yapılan diğer bir araştırmada 0-150 kg/da kükürt uygulaması yapılan İzmir Karşıyaka Orman Fidanlığı topraklarında en fazla pH değişim değerlerinin kükürt uygulandıktan sonra 8-14 hafta sonlarında olduğu belirlenmiştir. Bu çalışmada 8. hafta %18,5 olan pH azalmasının 29. haftada %12,8 olduğu saptanmıştır (Sevinç, 1999). Hilal (1999), elementel kükürt uygulandığı toprakların 8 haftalık inkübasyon süreci sonunda pH'larının 7,96'dan 7,50'ye (%5,8 azalma) olduğu belirlenmiştir. Yener (1997), 200 kg kükürt uygulandığı bağ topraklarının pH'larının 8,00'den 7,52'ye (%6,4 azalma), pamuk topraklarının ise 8,08'den 7,46'ya (%7,7 azalma) düşüş gösterdiğini saptanmıştır.

Matocha ve ark. (1988), inceltmiş kükürdün değişik oranları ile yaptıkları çalışmada toprak pH'sının 7,95'ten 7,46'a indiğini bulmuşlardır.

Koçarlı	Menemen	Nazilli	Salihli	Söke
%2,8	%2	%2,5	%2,1	%3,5

Şekil 3. Kükürt uygulamalarının toprak pH'sına etkisi (1.yıl)

Koçarlı	Menemen	Nazilli	Salihli	Söke
%2,5	%1	%0,25	%2,2	%2,1

Şekil 4. Kükürt uygulamalarının toprak pH'sına etkisi (1. yıl sonraki etki)

Koçarlı	Menemen	Nazilli	Salihli	Söke
%1,2	%3	%0,6	%1,5	%1,7

Şekil 5. Kükürt uygulamalarının toprak pH'sına pH'sına etkisi (2.yıl)

Koçarlı	Menemen	Nazilli	Salihli	Söke
%0,7	%0,8	%2,4	%4,2	%0,6

Şekil 6. Kükürt uygulamalarının toprak etkisi (2. yıl üst üste etki)

2.2.2 Kükürt Seviyelerinin Toprakların Toplam Çözünür Tuz İçeriğine Etkisi

Farklı dozlarda kükürt uygulanarak beş farklı lokasyonda kurulan vejetasyon denemelerinden hasat sonrası alınan yüzey karma toprak örneklerinde belirlenen toplam tuz değerleri Çizelge 3'de verilmiştir.

Değişik dört vejetasyon denemesinden biri olan 1. yıl kükürdün seviyeli olarak uygulandığı pamuk denemesinde topraklardaki toplam suda çözünür tuzun kükürt seviyeleri içinde Koçarlı'da %0,06-0,18'e, Menemen'de %0,5-0,13'e, Nazilli'de %0,049-0,095'e, Salihlide %0,042-0,098'e ve Söke'de %0,081-0,215'e yükseldiği belirlendi (Şekil 7).

1. Yıl kükürt uygulamasının sonraki etkisi ile ilgili pamuk denemesinde topraklardaki toplam çözünmüş tuz %'si Koçarlı'da %0,185-0,350, Menemen'de %0,052-0,057'ye, Nazilli'de %1,17-0,23'e, Salihli'de %0,04-0,05'e ve Söke'de ise %0,141-0,152'ye yükseldiği gözlemlendi (Şekil 8).

2. Yıl pamuk vejetasyon denemesi sonrası alınan toprak örneklerinde % toplam çözünmüş tuz %'si Koçarlı'da %0,15-0,17'e, Menemen'de %0,052-0,132'e, Nazilli'de %0,14-0,285'e, Salihli'de %0,032-0,045'e ve Söke'de ise %0,091-0,17 arasındadır ve kükürt seviyelerine bağlı olarak artış göstermiştir (Şekil 9). Üst üste kükürdün etkisinin belirlendiği pamuk denemesi hasadı sonrası alınan toprak örneklerinde kükürt seviyelerine bağlı olarak topraktaki % tuzların çözünmüş miktarlarındaki değişim; Koçarlı'da %0,194-0,215'e,

Menemen’de %0,058-0,07’e, Nazilli’de %0,26-0,45’e, Salihli’de %0,06-0,155’e ve Söke’de ise %0,175-0,210’a kadar artış yönünde belirlenmiştir (Şekil 10). Her dört vejetasyon denemesinde kükürt seviyeleri ile genelde tuz miktarlarındaki artış, pH’nın azalması ile kimi bileşiklerin toprakta çözünmesi ile ilişkilidir.

Çizelge 3. Tarla denemelerinden hasat sonrası alınan toprak örneklerinin toplam tuz değerleri

	S Dozu	Toplam tuz (%)

I: 1. yıl pamuk kükürt uygulaması denemesi,
III:2. yıl pamuk kükürt uygulaması denemesi

II: kükürdün sonraki etkisi denemesi
IV: üst üste kükürt uygulaması denemesi

Sevinç (1999) yaptığı çalışmada kükürt seviyelerinin topraktaki çözünmüş toplam tuz miktarı üzerine artırıcı yönde etkin olduğu ve en fazla tuzun ise 100 kg S/da seviyesinde belirlendiğini bildirmektedir.

Şekil 7. Kükürt Uygulamalarının Toprakların toplam tuz (%) içeriğine etkisi (1. yıl)

Şekil 8. Kükürt uygulamalarının toprakların toplam tuz (%) içeriğine etkisi (1.yıl sonraki etki)

Şekil 9. Kükürt uygulamalarının toprakların toplam tuz (%) içeriğine etkisi (2. yıl)

Şekil 10. Kükürt uygulamalarının toprakların toplam tuz (%) içeriğine etkisi (2.yıl üst üste kükürt uygulaması etkisi)

2.2.3. Kükürt Seviyelerinin Toprakların CaCO₃ İçeriğine Olan Etkisi

Koçarlı, Menemen, Nazilli, Salihli ve Söke lokasyonlarında kurulan vejetasyon denemelerinden hasat sonrası alınan yüzey karma toprak örneklerinde belirlenen kireç değerleri Çizelge 4'de verilmiştir. 1. Yıl pamuk vejetasyon deneme sonrası alınan toprak örneklerinde kireç (% CaCO₃) miktarları kükürt seviyelerine göre Koçarlı'da %15,40-16,07, Menemen'de %4,69-5,31, Nazilli'de %1,51-2,34, Salihli'de %8,08-8,20 ve Söke'de %18,91-19,42 arasında değişmiştir (Şekil 11). Kükürdün sonraki etkisi ile ilgili denemelerden alınan

topraklarda kireç miktarı; Koçarlı'da %13,40-14,99, Menemen'de %4,77-5,33, Nazilli'de %2,01-2,09, Salihli'de %8,54-8,71 ve Söke'de ise %17,17-19,01 arasında belirlendi (Şekil 12). 2. Yıl kurulan kükürt seviyeleri deneme sonrası alınan toprak örneklerinde % kireç içerikleri; Koçarlı'da %3,40-14,99, Menemen'de %4,86-5,53, Nazilli'de %1,93-2,01, Salihli'de %8,04-8,63 ve Söke'de ise %16,27-18,36 olarak saptandı (Şekil 13). Üst üste kükürt uygulamasına yönelik araştırma sonrası alınan toprak örneklerinde kükürt seviyelerinin topraklara etkisi; Koçarlı'da %12,98-14,41, Menemen'de %4,80-5,39, Nazilli'de %1,60-1,94, Salihli'de %6,15-6,91 ve Söke'de %16,27-18,38 arasında bulunmuştur (Şekil 14). Genelde kükürt denemelerinden alınan toprak örneklerinde en yüksek kireç miktarı kükürt uygulanmayan (S₀) seviyelerinde ve en düşük kireç içeriklerinin en yüksek (S₁₆₀) seviyesinde belirlenmesi, yüksek kükürt uygulamalarının az da olsa kireç miktarlarını düşürdüğü saptanmıştır. Sevinç (1999) 150 kg/da kükürt uygulaması ile en düşük kireç içeriğine sahip toprakların olduğunu bildirmektedir.

Çizelge 4. Tarla denemelerinden hasat sonrası alınan toprak örneklerinin kireç değerleri

	S Dozu	Kireç (%)			
		I	II	III	IV

	S ₄	0,88	2,32	1,60	1,75

I: 1. yıl pamuk kükürt uygulaması denemesi,
III: 2. yıl pamuk kükürt uygulaması denemesi

II: kükürdün sonraki etkisi denemesi
IV: üst üste kükürt uygulaması denemesi

Dört farklı denemeden alınan toprak örneklerindeki organik madde (%) üzerine kükürt seviyelerinin etkisinin, 1.yıl vejetasyon denemesi sonrası alınan toprak örneklerinde; Koçarlı'da %1,86-2,35, Menemen'de %1,35-1,73, Nazilli'de %0,83-1,35, Salihli'de %0,98-1,56 ve Söke'de ise %0,88-1,01 arasında değiştiği bulundu (Şekil 12).

1. Yıl kükürdün sonraki etkisini belirlemeye yönelik denemeden hasat sonrası alınan toprak örneklerinde organik madde değişimleri; Koçarlı'da %1,83-2,04, Menemen'de %1,24-1,86, Nazilli'de %1,29-1,65, Salihli'de %0,95-1,46 ve Söke'de de %1,75-2,32 olarak belirlendi (Şekil 13).

2. Yıl vejetasyon denemesi hasat sonrası alınan toprak örneklerinde organik madde miktarları; Koçarlı'da %1,78-2,14, Menemen'de %0,95-1,16, Nazilli'de %1,39-1,86, Salihli'de %0,74-0,85 ve Söke'de ise %1,14-1,70 arasında bulundu (Şekil 14).

Kükürdün üst üste uygulandığı deneme sonrası alınan toprak örneklerinde organik madde eğişiimi; Koçarlı'da %1,55-1,96, Menemen'de %1,10-1,29, Nazilli'de %1,34-1,73, Salihli'de %0,77-1,11 ve Söke'de %1,65-1,91 olarak saptandı (Şekil 15). Her beş ilçede yapılan 4 farklı

pamuk vejetasyon denemesinden alınan toprak örneklerinin humusça fakir oldukları (organik madde < % 2,5) belirlenmiştir (Akalan, 1965).

Her dört denemeden alınan toprak örneklerinde en yüksek organik madde miktarının S₁ seviyesinde (40 kg/da) buna karşılık en düşük organik madde içeriğinin tanık parsellerde olduğu kanısına varılmıştır.

Şekil 12. Kükürt uygulamalarının toprakların organik madde (%) içeriğine etkisi (1.yıl)

Şekil 13. Kükürt uygulamalarının toprakların organik madde (%) içeriğine etkisi (1. yıl sonraki etki)

Şekil 14. Kükürt uygulamalarının toprakların organik madde içeriğine etkisi (2.yıl)

Şekil 15. Kükürt uygulamalarının toprakların organik madde (%) içeriğine etkisi (2. yıl üst üste kükürt uygulaması etkisi)

2.3. Farklı Seviyelerde Uygulanan Kükürdün Pamuk Verimine Etkisi

Beş seviyede (0-40-80-120 ve 160 kg S/da) uygulanan kükürdün Koçarlı, Menemen, Nazilli, Salihli ve Söke ilçelerinde kurulan pamuk denemelerinden elde edilen, kütlü verimi sonuçları Çizelge 6 ve Çizelge7 ile Şekil 16, Şekil,17 ve Şekil 18’de verilmiştir.

2.3.1. Beş Farklı Lokasyonda 1. ve 2. Yıl Kurulan Pamuk Tarla Denemelerinde Kükürt Seviyelerinin Kütlü Verimine Etkisi

Denemenin 1. yılında 5 farklı ilçede (Koçarlı, Menemen, Nazilli, Salihli ve Söke) yürütülen kükürt seviyeleri denemesinden elde edilen kütlü verimleri Çizelge 6’da verilmiştir.

Yapılan istatistiki değerlendirme sonucu lokasyonların % 1 seviyede, kükürt seviyeleri ise %5 seviyede önemli etkisi bulunmuştur. Lokasyonların verim düzeyi yönünden sıralaması; Menemen (534,6 kg/da) > Koçarlı (441,6 kg/da) > Salihli (326,9 kg/da) = Nazilli (312,8 kg/da) > Söke (271,8 kg/da) şeklinde bulunmuştur (LSD_{0,05} = 25,5). Kükürt seviyelerinin pamuk kütlü verimine etkinlikleri S₄ (396,9 kg/da), S₃ (389,8 kg/da), S₂ (374,9 kg/da), S₁ (373,7 kg/da), S₀ (352 kg/da) şeklinde belirlenmiştir (Şekil 16). Kükürt seviyeleri arasında lineer etki %1 seviyesinde önemli bulunmuştur (LSD_{0,05} = 25,5).

Çizelge 6. Farklı seviyelerde uygulanan kükürdün 1. ve 2. deneme yıllarında pamuk kütlü verime etkisi (kg/da).

Lokasyon	S Dozu	1.Yıl sonuçları	2.Yıl sonuçları	Her iki yılın ortalaması	Tarığa göre % artış

Şekil 16. 1.Yıl kütlü verimi

Denemenin 2. yılında yapılan ve vejetasyon denemesinden elde edilen kütlü verim sonuçları Çizelge 6'da verilmiştir. Yapılan istatistikî değerlendirme sonrası, lokasyonların % 1 seviyede ve kükürt seviyelerinin ise %5 seviyede önemli etkisi saptandı. Lokasyonların kükürt verimi yönünden sıralamaları; Menemen (603 kg/da) > Salihli (557 kg/da) > Koçarlı (418 kg/da) > Nazilli (338,2 kg/da) = Söke (334,5 kg/da) şeklinde (Şekil 17) geliştiği belirlendi ($LSD_{0,05}=28,5$). Her iki deneme yılında da verim düzeyi yönünden en fazla verimin saptandığı lokasyon Menemen olmuştur. En düşük verim ise Söke'den alınmıştır.

Şekil 17. 2.Yıl kütlü verimi

Kükürt seviyeleri arasında kütlü verim sıralaması; S₁ (481,5 kg/da), S₄ (472kg/da), S₂ (459 kg/da), S₃ (454,3 kg/da) ve S₀ (434,5 kg/da) şeklinde sıralanmıştır (LSD_{0,05} = 28,5). Bu durumda S₁ ve S₄ seviyeleri tanığa (S₀) göre önemli ürün farkı sağlanmıştır. Ancak kükürt seviyeleri arasında ilk deneme yılında olduğu gibi kütlü verimi farklılığı meydana gelmemiş ve bu durumda önerilen kükürt seviyesinin 40 kg/da kükürt olduğu anlaşılmıştır.

Şekil 18. 1. ve 2. yıllarda kurulan denemelerde kükürt seviyelerinin kütlü verimine etkileri.

Çizelge 7. 1. ve 2. Yıl pamuk denemelerinin verimi ile ilgili bileşik varyans analiz tablosu.

Varyasyon	S.D.	Kareleri Toplamı	Kareleri Ortalaması	Hesaplanan F	Tablo değeri	
					%5	%1
Tekrar	3	4061,0	1353,7	0,74	2,68	3,45
Lokasyon	4	16445,483	411137,1	225,73**	2,45	3,48
S- Seviyeleri	4	39297,3	9824,3	5,39**	2,45	3,48
Lokasyon × Seviye	16	34257,6	2141,6	1,18	1,83	2,06
Yıllar	1	342866,5	342866,5	188,25**	3,92	6,85

Seviye × yıl	4	10156	2539,0	1,39	2,45	3,48
Lokasyon × seviye × yıl	16	32970,6	2060,7	1,13	1,80	2,06
Hata	147	267740,6	1821,4	-	-	-
Genel	199	2712449,7	13630,4	-	-	-

Çizelge 7'den de izlendiği gibi bileşik varyans analizine göre, her iki yılın birlikte değerlendirilmesi sonucu lokasyonlar %1 seviyede önemli bulunmuştur. Yıllara göre yapılan varyans analizinde Menemen'in en üst verimi, Söke'nin ise en alt düzeyde kütlü verimini sağladığı saptanmıştır. Kükürt seviyelerinin kütlü verime etkisi %1 düzeyde bulunmuş ve yıllara göre yapılan bireysel analizde olduğu gibi önerilecek kükürt miktarının S₁ seviyesi yani 40 kg/da kükürt olduğu belirlenmiştir. Yılların %1 seviyede önemli olduğu ve ikinci yıl verimlerinin birinci yıl verimlerine göre daha fazla olduğu saptanmıştır. İnteraksiyonu önemli çıkmış olmasına rağmen Menemen lokasyonu en üst düzey verimi, Söke lokasyonu ise en az

verimi sağlamıştır. Bu yönde yapılan diğer bir araştırmada, kükürt seviyelerinin (0-50-100-150-200 kg/da) pamuk kütlü verimine etkisi iki farklı pamuk tarlasında denenmiş, birinci pamuk tarlasında 100 kg kükürt uygulaması ile tanığa oranla %8,8 ikinci pamuk tarlasında ise 200 kg kükürt uygulanması ile %18,6 gibi en yüksek verim artışı sağlandı bildirilmektedir (Yener, 1997).

2.3.2. Kükürt Uygulamalarının Pamukta Kütlü Verime Olan Sonraki Etkisi

1. Yıl kükürt seviyelerinin uygulandığı denemelerde 2. Yıl kükürt uygulanmamış ve bu şekilde kükürdün pamuk kütlü verime olan sonraki etkisi araştırılmıştır. Araştırma sonucunda elde edilen kütlü verimleri Çizelge 8' ve Şekil 19'da verilmiştir.

Çizelge 8. Kükürt seviyelerinin sonraki etkisi ile kükürt seviyelerinin üst üste uygulamalarının pamuk kütlü verimine etkisi (kg/da).

Lokasyon	S Dozu	Kükürdün sonraki etkisi	Tanığa göre % artış	Kükürdün üst üste etkisi	Tanığa göre % artış	Üst üste kükürt uygulamalarının ortalaması	Tanığa göre % artış

Yapılan varyans analizinde lokasyonların %1 önemli etkisi bulunmuş ve lokasyonlara göre kütlü verim sıralaması; Menemen (520,1 kg/da), Salihli (485,5 kg/da), Koçarlı (426,4 kg/da), Nazilli (368,3 kg/da) ve Söke'de (359,4 kg/da) şeklinde belirlenmiştir ($LSD_{0,05} = 30,8$). Kükürt seviyelerinin etkisi istatistikî yönden önemsiz olmuş ve seviyelere göre kütlü verimleri; S₄ (447,4 kg/da), S₂ (438,5 kg/da), S₃ (427,9 kg/da), S₁ (424,6 kg/da) ve S₀ (421,2 kg/da) şeklinde bulunmuştur. Her ne kadar kükürt seviyeleri tanığa göre daha verimli olsa da seviyeler arası farklılıklar düşük düzeyde kaldığı için kükürdün sonraki etkisinin önemsiz olduğu belirlenmiştir.

Şekil 19. Kükürt uygulamalarının pamukta kütlü verime olan sonraki etkisi

2.3.3. Üst Üste Kükürt Uygulamalarının Pamuk Kütlü Verime Etkisi

Araştırmanın 2. yılında kurulan kükürt seviyeleri denemelerine ertesi yıl tekrar kükürt uygulanması ile kükürdün üst üste uygulanmasının pamuk kütlü verimine etkisi araştırılmış ve sonuçlar Çizelge 8 ve Şekil 20'de verilmiştir. Varyans analizi sonucunda lokasyonların verime %1 seviyede önemli etkisi bulunmuştur. Lokasyonların kütlü verim düzeyi sıralaması; Salihli (558,1 kg/da), Menemen (539,8 kg/da), Söke (473 kg/da), Koçarlı (452 kg/da) ve

Nazilli (422 kg/da) şeklinde gelişme gösterdikleri bulundu ($LSD_{0,05} = 20,4$). Üst üste kükürt uygulamaları denemesinde kayda değer bulgu; Salihli lokasyonunun 1. sırada yer alması ve Söke'nin verim sıralamasında diğer denemelerde en düşük düzeyde olmasına karşın üst üste uygulamada 3. sırayı oluşturmasıdır. Kükürt seviyelerinin kütlü verimine etkisi %1 seviyede önemli bulunmuştur ve seviyelerin verim düzeyleri; S₁ (503,5 kg/da), S₂ (501,0 kg/da), S₃ (496,3 kg/da), S₀ (482,7 kg/da) ve S₄ (466 kg/da) olarak belirlenmiştir ($LSD_{0,05} = 20,4$).

Şekil 20. Üst üste kükürt uygulamalarının pamuk kütlü verime etkisi

Üst üste kükürt uygulamalarının yapıldı 2 denemeden elde edilen kütlü verimlerinin ortalaması alındığında (şekil 21) burada dikkati çeken özellik S₁ (denemesi 40 kg S) seviyesi ile en üst düzeyde verim elde edilirken, 160 kg S/da uygulanması ile tanıgın verim düzeyi altında bir verim sağlanabilmesidir. Bu koşullar 40 kg S/da uygulamasının yeterli olduğunu göstermektedir.

Şekil 21. Kükürt uygulamaları (2.Yıl ve üst üste etki denemelerinde) denemelerinde kükürt seviyelerinin kütlü verimine etkileri

2. yıl kükürt uygulaması denemesi ile bu denemeye ertesi yıl tekrar kükürt uygulayarak kurulan üst üste etki denemesinde kükürt seviyelerinin verime olan etkilerinin bileşik istatistikî analizi yapıldığında lokasyonlar, seviyeler ve yılların % 1 düzeyde önemli olduğu, bunların dışında yıl × lokasyon interaksiyonunun % 1 ve yıl × seviye interaksiyonunun %5 düzeyde önemli olduğu saptandı (Çizelge 9).

Çizelge 9. 2.Yıl kükürt uygulaması ve sonraki yıl tekrar kükürt uygulanarak kurulan da kükürdün üst üste uygulanmasının kütlü verimine etkisine dair bileşik varyans analiz toplamı.

4. SONUÇ ve ÖNERİLER

Kükürt seviyelerinin pamuk tarımı yapılan tarla topraklarının kimi fizikokimyasal özelliklerine ve pamuğun verimine etkisini saptamak amacı ile beş farklı lokasyonda (Koçarlı, Menemen, Nazilli, Salihli ve Söke) 20 adet tarla denemesi yürütülmüştür. Bu 20 tarla denemesinden 10 adedi değişik kükürt seviyelerinin (1. ve 2. yılı kükürt denemeleri) etkisini,

5 adedi kükürt seviyelerinin sonraki etkisini ve 5 adedi ise üst üste uygulanan kükürt seviyelerinin verime etkisinin saptanmasına yönelik yürütülmüşlerdir.

Kükürt seviyeleri etkinliğinin belirlenmesine yönelik pamuk denemeleri yanında üst üste kükürt uygulaması denemelerinden hasat sonrası alınan toprak örneklerinde pH yalnızca 0,01-0,35 birim arasında, kükürdün sonraki etkisinin belirlenmesine yönelik denemelerden hasat sonrası alınan toprak örneklerinde ise pH'da 0,03-0,2 birim arasında düşmeler belirlenmiştir.

Kükürt seviyelerinin uygulanması genelde topraklardaki suda çözünür toplam tuz miktarının artmasına neden olmuştur.

Genelde kükürt denemelerinden alınan toprak örneklerinde en yüksek kireç miktarı kükürt uygulanmayan (S_0) seviyelerinde ve en düşük kireç içeriklerinin en yüksek (S_{160}) seviyesinde belirlenmesi, yüksek kükürt uygulamalarının az da olsa kireç miktarlarını düşürdüğü saptanmıştır.

Her beş ilçede yapılan 4 farklı pamuk vejetasyon denemesinden alınan toprak örneklerinin humuşça fakir oldukları (organik madde < % 2,5), her dört denemeden alınan toprak örneklerinde en yüksek organik madde miktarının S_1 seviyesinde (40 kg/da) buna karşılık en düşük organik madde içeriğinin tanık (S_0) parsellerde olduğu kanısına varılmıştır

Kükürt seviyelerinin pamuğun kütlü verimine etkisini saptamak üzere 10 denemeden (1. Ve 2 yıl kükürt seviyeleri denemeleri) alınan sonuçlara göre, pamuk verimine lokasyonların etkisi (Koçarlı, Menemen, Nazilli, Salihli ve Söke) %1 düzeyinde önemli olmuş ve en yüksek verim Menemen, en düşük verim ise Söke'de elde edilmiştir. Kükürt seviyelerinin pamuk kütlü verimine etkisi %1 seviyede önemli bulunmuş ve elde edilen verilerin istatistiki değerlendirilmesine göre 40 kg S/da seviyesinin en uygun kükürt miktarı olduğu saptanmıştır.

1. Yıl uygulanan kükürt seviyeleri denemelerine sonraki yıl kükürt uygulamadan kükürdün sonraki etkisinin belirlenmesine yönelik denemelerden alınan sonuçlara göre lokasyonların %1 seviyede etkisi önemli bulunmuş ve en yüksek verim Menemen, en düşük verim ise Söke'de belirlenmiştir. Kükürt seviyeleri istatistiki olarak verimi önemli düzeyde etkilememesine karşılık, tanığa göre kükürt seviyeleri verimi % 0,8-4,2 arasında artırmıştır.

2. Yıl yürütülen kükürt seviyeleri denemesine sonraki yıl tekrar kükürt uygulanmış ve bu şekilde üst üste kükürt uygulamasının pamuğun kütlü verimine etkisini saptamak için kurulan denemelerden elde edilen sonuçlara göre, lokasyonların %1 seviyede önemli etkisi bulunmuş ve en yüksek verim Menemen en düşük verim ise Söke ve Nazilli'de belirlenmiştir. Kükürt seviyelerinin verime %1 seviyede önemli etkisi bulunmuştur. Dekara 40 kg kükürdün en uygun uygulama olduğu saptanmıştır.

ÖZET

Giriş ve Amaç: Alt üriner sistem semptomları (AÜSS) Parkinson Hastalığının (PH) sık görülen non-motor semptomlarından biridir. PH’de görülen AÜSS’nin patofizyolojisinde bazal ganglionlardaki dejenerasyon sebebiyle azalan dopamin düzeyi etkili olsa da ilerleyen yaşla birlikte çeşitli üriner problemlerin açığa çıkması bu semptomların etiolojisinin belirlenmesini güçleştirmektedir. Bu çalışma idiopatik PH’de AÜSS’nin hastalık evresi ve süresi bağlamında incelenmesi amacıyla planlanmıştır. **Gereç ve Yöntem:** Çalışmaya, 52’si kadın ve 53’ü erkek, 105 Parkinson hastası dahil edildi. Hastalar Modifiye Hoehn&Yahr ölçeğine göre evrelendirildi ve hastaların tanı süreleri kaydedildi. AÜSS’nin varlığının ve şiddetinin belirlenmesinde Uluslararası Prostat Semptom Skoru kullanıldı. AÜSS’yi sınıflandırmak için Üriner Semptom Profili kullanıldı. **Bulgular:** Katılımcıların yaşlarının ortalaması 64,64±9,82 yıl olarak bulundu. AÜSS şiddeti ile hastalığın süresi ve evresi arasında düşük düzeyde pozitif ilişki bulundu (sırasıyla rho= 0,222, p= 0,023; rho=0,341, p<0,001). Evre 1 hastaların %46,2’sinde, evre 1,5 hastaların %58,1’inde, evre 2 hastaların %69,2’sinde, evre 2,5 hastaların %54,5’inde, evre 3 hastaların %84,2’sinde ve evre 4 hastaların ise tamamında AÜSS tespit edildi. Üriner Semptom Profili anketine göre 21 hastada stres üriner inkontinans, 78 hastada aşırı aktif mesane, 36 hastada yavaş akıntı semptomları mevcuttu. **Sonuç:** Sonuçlarımız idiopatik PH’de AÜSS şiddetinin hastalığın süresinin ve evresinin ilerlemesiyle birlikte arttığını göstermiştir. Bunun yanı sıra AÜSS’nin hastalığın her evresinde görülebileceği ve hastalığın ilerlemesi ile birlikte görülme sıklığının da arttığı belirlenmiştir. Bu sonuçlar AÜSS’nin Parkinson hastalarında hastalığın her evresinde sorgulanması ve dikkate alınması gerektiğine işaret etmektedir. Ayrıca hastalarda farklı klinik alt tipte AÜSS görülmesi sebebiyle, PH’ye bağlı oluşan AÜSS ile hastalarda ileri yaş ve farklı biyomekaniksel nedenlerle oluşabilecek AÜSS arasındaki ayrımın yapılmasının önemli olduğunu düşünmekteyiz.

INVESTIGATION OF LOWER URINARY TRACK SYMPTOMS IN THE CONTEXT OF DISEASE STAGE AND DURATION IN IDIOPATHIC PARKINSON'S DISEASE

ABSTRACT

Introduction and Aims: Lower urinary tract symptoms (LUTS) are one of the common non-motor symptoms of Parkinson's Disease (PD). Although the decreased dopamine level due to the degeneration of the basal ganglia is effective in the pathophysiology of LUTS, the emergence of various urinary problems with advancing age makes it difficult to determine the etiology of these symptoms. This study was planned to examine LUTS in idiopathic PD in terms of disease stage and disease duration. **Materials and Methods:** A total of 105 PD patients, 52 female and 53 male, were included in the study. The patients were staged according to the Modified Hoehn & Yahr scale and the diagnose duration were recorded. The International Prostate Symptom Score was used to determine the presence and severity of LUTS. The Urinary Symptom Profile was used to classify LUTS. **Results:** The mean age of the participants was 64.64 ± 9.82 years. A low level of positive correlation was found between the severity of LUTS and the duration and stage of the disease ($\rho = 0.222$, $p = 0.023$; $\rho = 0.341$, $p < 0.001$, respectively). LUTS was observed in 46.2% of stage 1 patients, 58.1% of stage 1.5 patients, 69.2% of stage 2 patients, 54.5% of stage 2.5 patients, 84% of stage 3 patients, and all stage 4 patients. According to the results of Urinary Symptom Profile questionnaire, 21 patients had stress urinary incontinence, 78 patients had overactive bladder, 36 patients had low stream symptoms. **Conclusions:** Our results showed that the severity of LUTS in idiopathic PD increases with the progression of the disease duration and stage. In addition, it has been determined that LUTS can be seen in all stages of the disease and its incidence increases with the progression of the disease. These results point out that LUTS should be questioned and considered in every stage of the disease. Also, we think that it is important to distinguish between LUTS caused by PD and LUTS that may occur due to advanced age and different biomechanical reasons, since different clinical subtypes of LUTS are observed in patients with PD.

Keywords: Lower Urinary Tract Symptoms, Non-motor Symptoms, Parkinson's Disease

GİRİŞ

Parkinson hastalığı (PH) substantia nigra pars kompaktadaki dopaminerjik nöron harabiyetine bağlı gelişen ilerleyici karakter gösteren bir nörodejeneratif hastalıktır (Dickson et al., 2009). Santral yollardaki dopamin vücudtaki birçok sistem fonksiyonunda etkilidir. Dopamin eksikliği PH hastalarında çeşitli motor ve non-motor semptomlara neden olur. Bu hastalık sıklıkla tremor, rijidite, bradikinezi ve postüral instabiliteyi içeren dört kardinal motor semptom ile bilinse de non-motor semptomlar da sıklıkla karşımıza çıkmaktadır (Kalia & Lang, 2015). Alt üriner sistem semptomları (AÜSS) PH'nin sık görülen non-motor semptomlarından biridir. AÜSS hastalığın her evresinde ortaya çıkabilmektedir ve %61 oranında prevalansa sahiptir (Li, Cui, Yan, Cao, & Feng, 2022). PH hastalarında AÜSS'yi hem depolama fazındaki hem de boşaltım fazındaki problemler oluşturmaktadır. Depolama problemleri acil işeme isteği, gece ve gündüz idrara çıkma sayısında artış, yetiştirememe tarzında idrar kaçırma; boşaltım problemleri ise aralıklı işeme, duraksama ve yavaş akıntı semptomlarını içerir (McDonald, Winge, & Burn, 2017).

PH'de görülen AÜSS'nin patofizyolojisinde bazal ganglionlardaki dejenerasyon sonucunda azalan dopamin düzeyi etkilidir. Dopamin farklı reseptörler üzerinden işeme mekanizması üzerinde hem kolaylaştırıcı he de inhibe edici olarak görev yapmaktadır. Azalan dopamin düzeyi detrusör kasının aşırı aktivasyonu ile sonuçlanarak depolama problemlerine, detrusör kasının yeterli kontraksiyonu sürdürememesi nedeniyle de boşaltım semptomlarına sebep olur (McDonald et al., 2017). Fakat ilerleyen yaşla birlikte çeşitli üriner problemlerin de açığa çıkması bu semptomların etiyolojisinin belirlenmesini güçleştirmektedir (Milsom & Gyhagen, 2019). Bu sebeple hastalığın ilerlemesi ile AÜSS arasındaki ilişki hakkında kapsamlı bir inceleme yapılması gerekmektedir. Yapılan çalışmalarda hastalık evresinin AÜSS ile ilişkili olduğu rapor edilse de hastalık süresi ile ilişkisi açısından fikir birliği sağlanamamıştır. Bu çalışma idiopatik PH'de AÜSS'nin hastalık evresi ve süresi bağlamında incelenmesi amacıyla planlanmıştır. Bunun yanında PH'de meydana gelen AÜSS'nin klinik alt tiplerinin belirlenmesi amaçlanmıştır.

YÖNTEM

Bu kesitsel çalışma Eylül 2022-Mart 2023 tarihleri arasında Gülhane Eğitim ve Araştırma Hastanesi Nöroloji Anabilim Dalı Parkinson Polikliniğinde gerçekleştirildi. Çalışmaya uzman nörolog tarafından idiopatik PH tanısı konulmuş 18 yaş üstü, 52'si kadın ve 53'ü erkek, 105 hasta dahil edildi. PH dışında herhangi bir nörolojik hastalığı olan, Standardize Mini Mental Test puanı 24'ün altında olan, AÜSS'ye neden olabilecek herhangi bir nörolojik, ortopedik ve

ürolojik hastalığı bulunan ve ürolojik fonksiyonları etkileyebilecek ilaç kullanımı olan bireyler çalışmadan dışlandı. Tüm katılımcılara çalışma hakkında bilgi verildikten sonra gönüllü onam formu imzalatıldı. Katılımcıların demografik bilgileri (yaş, cinsiyet, vücut kütle indeksi) ve klinik özellikleri (tanı süresi, hastalık evresi, bilişsel durumu) kaydedildi. Bilişsel durum değerlendirmesi için Standardize Mini Mental Test kullanıldı (Keskinoglu et al., 2009). Hastaların evrelendirilmesi 'Modifiye Hoehn&Yahr Evrelemesi' ne göre yapıldı (Goetz et al., 2004). AÜSS'nin varlığını ve şiddetini belirlemek amacıyla Uluslararası Prostat Semptom Skoru (UPSS) kullanıldı (Barry et al., 1992; Bozlu et al., 2002). UPSS ile miksiyon işleminin hem dolum fazı hem de boşaltım fazı semptomları sorgulanmaktadır. Toplamda 7 sorudan oluşmaktadır. Her bir soru 0 (hiç şikâyetim yok) ile 5 (hemen her zaman) arasında puanlanır. AÜSS varlığı UPSS değerlendirmesine göre 0 puan alan katılımcılar için 'yok', 1 ve üzeri alanlar için 'var' şeklinde kaydedildi. AÜSS sınıflandırması için Haab ve ark. tarafından geliştirilen (Haab et al., 2008) ve Türkçe geçerlik ve güvenilirlik çalışması Bilge ve Beji tarafından yapılan (Bilge & Nezihe, 2016) Üriner Semptom Profili (ÜSP) ölçeği kullanılmıştır. Ölçek stres üriner inkontinans, aşırı aktif mesane ve idrar akış hızı (yavaş akıntı skoru) olmak üzere üç bölümden oluşur. Aşırı aktif mesane semptomları 7 soru ile, stress üriner inkontinans ve idrar akış hızı 3'er soru ile değerlendirilir. Her soru 0'dan 3'e doğru puanlanır ve alınan puanların artması semptomların arttığını gösterir.

İstatistiksel Analiz

Verilerin analizi IBM SPSS Statistics 25 (Armonk, NY: IBM Corp.) programı kullanılarak yapıldı. Verilerin normallik dağılımına uygunluğu Shapiro-Wilk testi ile analiz edildi. Tanımlayıcı istatistikler normal dağılan değişkenler için ortalama ve standart sapma (\bar{X} +SS) olarak, normal dağılmayan ve sıralı değişkenler için medyan, minimum-maksimum (\tilde{X} ; min-max) ve frekans tabloları şeklinde verildi. İlişki analizinde Spearman korelasyon testi kullanıldı. $p < 0,05$ değeri istatistiksel olarak anlamlı kabul edildi.

BULGULAR

Toplamda 130 PH hastası değerlendirildi. 25 hasta çalışmaya dahil edilme kriterlerini karşılamadığı için çalışmadan dışlandı. Çalışma 105 PH hastası ile tamamlandı (52 kadın, 53 erkek). Katılımcıların demografik ve klinik özellikleri Tablo 1'de gösterilmektedir. Hastaların yaşlarının ortalaması $64,64 \pm 9,82$ yıl olarak bulundu. Evrelere göre değerlendirilen hasta sayısı Tablo 2'de gösterilmiştir. AÜSS şiddeti ile hastalığın süresi ve evresi arasında düşük düzeyde pozitif ilişki bulundu (sırasıyla $\rho = 0,222$; $p = 0,023$, $\rho = 0,341$; $p < 0,001$).

Tablo 1: Hastaların demografik ve klinik özellikleri

Evrelere göre AÜSS görülme sıklığı grafik 1’de gösterilmiştir. Bu sonuçlara göre hastalığın her evresinde AÜSS görüldüğü ve hastalığın evresi ilerledikçe AÜSS’nin görülme sıklığının arttığı bulundu. ÜSP anketine göre hastaların alt üriner sistem semptomlarının sınıflandırma sonuçları Tablo 4’te verilmiştir. Buna göre 21 hastada stres üriner inkontinans, 78 hastada aşırı aktif mesane, 36 hastada yavaş akıntı semptomları mevcuttu.

TARTIŞMA

Çalışmamızda PH'de görülen AÜSS şiddetinin hastalığın evresi ve süresi ile pozitif yönde ilişkili olduğu bulundu. Bunun yanında AÜSS'nin hastalığın her evresinde görülebileceği ve hastalığın ilerlemesi ile birlikte görülme sıklığının da arttığı belirlendi. Ayrıca hastalarda %20

oranında stres üriner inkontinans, %74 oranında aşırı aktif mesane, %34 oranında yavaş akıntı semptomları görüldü.

Parkinson hastalığının progresyon göstermesi meydana gelen birçok semptomun şiddetlenmesi ile sonuçlanır. Bu semptomlardan biri olan AÜSS da hastalığın evresi ile birlikte artmaktadır (Benli, Özer, Kaya, Özcan, & Ayyildiz, 2016; Liu, Uchiyama, Sakakibara, & Yamamoto, 2015; Xu, Han, Wang, & Feng, 2019). Xu ve arkadaşlarının Parkinson hastalarında AÜSS'yi klinik özelliklerle ilişkilendirdikleri çalışmalarında hastalığın evresi ile aşırı aktif mesane skorlarının pozitif yönde korelasyon gösterdiği bulunmuştur (Xu et al., 2019). Benli ve ark. da AÜSS şiddetinin ve oranının hastalığın evresinin artması ile birlikte arttığını raporlamışlardır (Benli et al., 2016). Benzer olarak çalışmamızda hastalığın evresi arttıkça AÜSS şiddetinin arttığı sonucuna ulaşıldı. Li ve arkadaşlarının yapmış oldukları meta-analize göre evre 3 ve üzeri hastalarda AÜSS görülme oranının %70 olduğu, evre 3'ün altındaki hastalarda bu oranın %57 olduğu bulunmuştur (Li et al., 2022). Çalışmamızın sonuçları da bu verilerle örtüşerek hastalığın evresinin ilerlemesi ile AÜSS görülme oranının arttığını gösterdi.

Hastalık süresi ile AÜSS şiddetini ilişkilendiren çalışmalarda farklı sonuçlar mevcuttur. Benli ve ark. hastalık süresi ve AÜSS şiddeti arasında bir ilişki bulamamıştır (Benli et al., 2016). Xu ve arkadaşlarının yaptığı çalışma da bu sonucu desteklemektedir (Xu et al., 2019). Bu sonuçların aksine Li ve ark. hastalık süresinin artmasıyla AÜSS şiddetinin arttığını belirtmişlerdir (Li et al., 2022). Bizim çalışmamızda da benzer olarak hastalık süresi ile AÜSS şiddeti arasında pozitif yönde bir korelasyon bulundu. Sonuçlardaki bu farklılık değerlendirilen hasta sayısının ve evresinin farklılığından kaynaklanıyor olabilir. Bunun yanında hastalığın başlangıç yaşının dikkate alınmamış olması da farklı sonuçlar ortaya çıkmasına neden olabilir (Diamond, Markham, Hoehn, McDowell, & Muentner, 1989).

Parkinson hastalarındaki nöronal dejenerasyon işeme mekanizmasında hem inhibe edici hem de uyarıcı etki gösteren alanları etkilemektedir. Bu durum hastalarda depolama ve boşaltım semptomlarının bir arada görülmesi ile sonuçlanır (Liu et al., 2015). Li ve arkadaşlarının PH hastalarında AÜSS prevalansını inceledikleri meta-analiz çalışmasının sonuçlarına göre aşırı aktif mesane semptomlarının %62 oranında, boşaltım semptomlarının %24 oranında görüldüğü raporlanmıştır (Li et al., 2022). Çalışmamızda hastaların %74'ünde aşırı aktif mesane, %34'ünde boşaltım semptomları vardı. Ayrıca yapılan birçok çalışmadan farklı olarak bizim hastalarımız stres üriner inkontinans açısından da değerlendirildi ve stres üriner inkontinansın %20 oranında görüldüğü tespit edildi.

SONUÇ VE ÖNERİLER

Sonuçlarımız idiopatik PH'de AÜSS şiddetinin hastalığın süresinin ve evresinin ilerlemesiyle birlikte arttığını göstermiştir. Bunun yanı sıra AÜSS'nin hastalığın her evresinde görülebilmektedir ve hastalığın ilerlemesi ile birlikte görülme sıklığı da artmaktadır. Bu sonuçlar AÜSS'nin Parkinson hastalarında hastalığın her evresinde sorgulanması ve dikkate alınması gerektiğine işaret etmektedir. Ayrıca hastalarda farklı klinik alt tipte AÜSS görülmesi sebebiyle, PH'ye bağlı oluşan AÜSS ile hastalarda ileri yaş ve farklı biyomekaniksel nedenlerle oluşabilecek AÜSS arasındaki ayrımın yapılmasının önemli olduğunu düşünmekteyiz.

ÖZET

Bu çalışmada, FDM (Faz Değiştiren Malzeme) esaslı bir batarya ısı yönetim sisteminde kanatçık sayısının bataryada oluşan maksimum sıcaklığa ve FDM faz değişimine olan etkisi sayısal yöntemler kullanılarak incelenmiştir. Kanatçıklar, batarya soğutmasında kullanılan FDM'nin soğutmada daha etkin olması ve homojen bir ısı dağılımı elde edilmesi için kullanılmıştır. Bunun için aralarındaki açı aynı olan, sıfırdan dokuza kadar olacak şekilde 10 farklı kanatçık sayısına sahip batarya sistemleri oluşturulmuştur. Modellenen sistemde, kanatçık olarak 2 mm kalınlığında alüminyum plakalar, FDM olarak parafin ve 18650 tip Lityum-iyon (Li-iyon) batarya hücreleri kullanılmıştır. Yapılan çalışmada batarya hücreleri, 5C ve 7C olmak üzere iki farklı hızda boşaltılmıştır. Kanatçıklı batarya soğutma sistemleri tasarlandıktan sonra sayısal çözümler için COMSOL Multiphysics yazılımı kullanılmış ve sayısal modelden elde edilen sonuçlar literatürdeki deneysel ve sayısal sonuçlarla doğrulanmıştır. Yapılan çalışmada, boşaltma süresi sonunda elde edilen batarya hücresi maksimum sıcaklığının, kanatçık kullanımı ile 5C boşaltma hızında %16.7, 7C boşaltma hızında ise %31 civarında azaldığı tespit edilmiştir. Elde edilen sonuçlara göre, 5C boşaltma hızında 3 kanatçık sayısından sonra; 7C boşaltma hızında ise 5 kanatçık sayısından sonra sıcaklık farkı 1 °C'nin altına düşmekte ve giderek daha da azalmaktadır. Bundan dolayı 5C ve 7C boşaltma hızlarında optimum kanatçık sayıları sırasıyla 3 ve 5 olarak belirlenmiştir. Ayrıca sonuçlar, kanatçık kullanımının FDM'de daha homojen bir sıcaklık dağılımı ve faz değişimi sağladığını göstermiştir.

THE EFFECT OF FIN USAGE ON COOLING PERFORMANCE IN A PCM-BASED BATTERY THERMAL MANAGEMENT SYSTEM

ABSTRACT

In this study, the effect of the number of fins on the maximum temperature and phase change in a PCM (Phase Change Material) based battery thermal management system was investigated using numerical methods. Fins are used for PCM used in cooling to be more effective in cooling and to obtain a homogeneous heat distribution. For this purpose, battery systems with 10 different fin numbers from zero to nine with the same angle between them were created. In the modeled system, 2 mm thick aluminum plates as fins, paraffin as PCM, and 18650 type Lithium-ion (Li-ion) battery cells are used. In the study, battery cells were discharged at two different rates, 5C and 7C. After the finned battery cooling systems were designed, COMSOL Multiphysics software was used for numerical solutions and the results obtained from the numerical model were validated with the experimental and numerical results in the literature. In the study, it was determined that the maximum temperature of the battery cell obtained at the end of the discharge period decreased by 16.7% at 5C discharge speed and by 31% at 7C discharge speed with the use of fins. According to the results obtained, after 3 fins at 5C discharge speed; At 7C discharge speed, after 5 fins, the temperature difference drops below 1 °C and gradually decreases. Therefore, optimum fin numbers were determined as 3 and 5 at 5C and 7C discharge speeds, respectively. In addition, the results showed that the use of fins provides a more homogeneous temperature distribution and phase change in PCM.

Keywords: Numerical, Heat Transfer, Li-ion Battery, Battery Thermal Management System

GİRİŞ

Gelişen teknoloji ile fosil yakıt tüketen sistemlere alternatif olarak geliştirilen batarya sistemlerinin kullanım alanları hızla artmaktadır (Karimi ve ark. 2016). Bataryalar arasında ise yüksek enerji yoğunluğu, kendiliğinden boşaltma olmama ve çevrim ömrünün yüksek olması gibi özelliklerinden dolayı lityum iyon bataryalar popüler hale gelmiştir (Greco ve ark. 2015, Ping ve ark. 2018). Ancak batarya sistemlerinin yaygın kullanımı ile birlikte zorlu çevre şartları, boşaltma rejiminin değişkenlik göstermesi, çekilen akım oranının yüksek olması ve birden fazla batarya paketinin birlikte kullanılması gibi nedenlerden dolayı bataryanın aşırı ısınması sonucunda kapasitesinin azalması, kimyasal yapısının bozulması ve hatta bataryanın patlaması gibi riskleri de beraberinde getirmiştir (Luo ve ark. 2022, Zou ve ark. 2018). Literatürdeki çalışmalar, lityum iyon bataryaların sıcaklığının 60 °C'nin üzerine çıkmaması gerektiğini ortaya koymuştur (Fathabadi ve ark. 2014, Liu ve ark. 2021, Ling ve ark. 2015). Bu bağlamda, batarya hücrelerinin sıcaklıklarının kontrol edilebilmesi ve istenilen değer aralıklarında tutulabilmesi için aktif, pasif ve hibrit olmak üzere farklı soğutma uygulamalarına sahip Batarya Termal Yönetim Sistemleri (BTYS) geliştirilmektedir.

BTYS'nde FDM kullanımı yaygın olmasına karşın, özellikle ısı iletim katsayısı düşük FDM'lerde ısının batarya çevresinde birikimi sorunu ile karşılaşmaktadır. Bu problemin giderilebilmesi için bazı araştırmacılar BTYS'de yüksek ısı iletkenliğe sahip kanatçıkların kullanımını önermişlerdir. Liu ve ark. (2022) bir batarya paketi için FDM, kanatçıklar ve bir termoelektrik soğutucudan (TEC) oluşan hibrit bir termal yönetim sistemi sunmuştur. Çalışmada, FDM batarya paketinin içine, kanatçıkları ise batarya hücrelerinin sıraları arasına yerleştirmişlerdir. Çalışma sonucunda, batarya hücrelerinin maksimum sıcaklığını düşüğünü ve batarya paketi boyunca sıcaklığın daha homojen bir şekilde dağıldığını raporlamışlardır. BTYS termal performans optimizasyonu için diğer bir çalışma Li ve ark. (2018) tarafından yapılmıştır. Yazarlar yaptıkları çalışmada, kullanılan FDM kütlesini azaltmayı, belirtilen çalışma süresine ve maksimum sıcaklık farkına ulaşmayı amaçlamıştır. Bunu yapmak için bataryanın yarıçapının, bataryalar arasındaki mesafenin, ısı üretim hızının ve üst ve alt FDM kalınlığının en düşük FDM kütlesini nasıl etkilediğini incelemişlerdir. Bir diğer çalışmada, kanatçık ve FDM kullanılarak oluşturulan bir BTYS'nin termal performansı üzerine kapsamlı bir deneysel analiz, Zheng ve ark. (2022) tarafından gerçekleştirilmiştir. Araştırmacılar, kanatçık kullanmanın çalışma süresini önemli ölçüde uzattığını ortaya koymuşlardır. Ardından geometrik parametrelerin, malzeme türünün ve kanatçık sayısının etkilerini araştırmak için simülasyonlar yapmışlardır. 8 adet, 7,5 mm uzunluğunda ve 0,5 mm kalınlığında Al alaşımli

kanatların en yüksek düzeyde performans gösterdiğini belirlemişlerdir. Ping ve ark. (2018) ise FDM tipinin, FDM kalınlığının, kanatçık genişliğinin ve kanatçık aralığının bir BTYS'nin soğutma performansı üzerindeki etkisini araştırmıştır. Araştırmacılar, batarya maksimum yüzey sıcaklığını azaltabilen bir FDM kanat yapısı önermişlerdir. Hava ve FDM/Isı borusuna dayalı BTYS, Zhao ve ark. (2018) tarafından yapılan deneysel çalışmalara konu olmuştur. Çalışmanın bulgularına göre FDM/Isı borusu sistemi, hava soğutmalı sisteme kıyasla batarya paketinde daha tutarlı bir sıcaklık dağılımı sağlamıştır.

Bu çalışmada, FDM esaslı bir batarya termal yönetim sisteminde, ısı iletimini arttırmak için kullanılan kanatçık sayısının batarya soğutması üzerindeki etkisi incelenmiştir. Yapılan çalışmada, biri kanatçiksiz ve diğerleri bir ila dokuz alüminyum kanatçıklı olmak üzere toplam 10 farklı FDM esaslı BTYS modellenmiş ve COMSOL Multiphysics yazılımında analizi gerçekleştirilmiştir. Oluşturulan sistemde batarya hücreleri 5C ve 7C hızlarında boşaltılmış ve belirlenen boşaltma hızlarında batarya maksimum sıcaklığı ve FDM erime oranları incelenmiştir.

Sistemin Modellenmesi

Mevcut çalışmada FDM esaslı bir batarya ısı yönetim sisteminde kanatçık sayısının batarya soğutmasına etkisi incelenmiştir. Modellenen BTYS'nin teknik resmi Şekil 1'de verilmiştir. Şekilde de görülebileceği gibi, sistemin en iç kısımda batarya, orta kısımda FDM malzemesi, en dışta Poliamid (PA) kabuk ve FDM malzemesinin içinde kabuktan bataryaya kadar uzanacak şekilde 0'dan 9'a kadar sayısı değişen alüminyum kanatçık bulunmaktadır. Alüminyum kanatçıklar, aralarındaki açı (ϕ) eşit olacak şekilde yerleştirilmiştir. Buna göre ϕ değeri, n kullanılan kanatçık sayısı olmak üzere, $360/n$ formülü ile hesaplanmıştır. Modellenen BTYS'de FDM olarak parafin, batarya olarak 2.4 Ah kapasiteye sahip 18650 tip Lityum-iyon (Li-iyon) batarya hücresi, dış kabukta 2 mm kalınlığında PA ve kanatçık olarak 2 mm kalınlığında alüminyum plakalar kullanılmıştır. Kullanılan bu malzemelerin termofiziksel özellikleri Tablo 1'de verilmiştir (Choudhari ve ark. 2020, Weng ve ark. 2019, Zheng ve ark. 2020).

Tablo 1. Malzemelerin termofiziksel özellikleri

Malzemeler	ρ (kg m ⁻³)	c_p (J kg ⁻¹ K ⁻¹)	k (W m ⁻¹ K ⁻¹)	T_m (°C)	LH (kJ kg ⁻¹)
FDM	820	2000	0.2	43	165
Alüminyum kanatçık	2576	981	139.18	-	-
18650 Li-iyon Batarya	2720	300	3	-	-
PA Kabuk	1140	1670	0.28	-	-

Şekil 1. Modellenen BTYS'nin teknik resmi

Denklemler ve Sınır Koşulları

Bu çalışmadaki batarya hücresi için enerji korunum denklemi aşağıdaki gibidir:

$$\rho_b C_{p,b} \frac{\partial T_b}{\partial t} = k_b \nabla^2 T + q_b \quad (1)$$

Burada q_b , bataryanın iç direncinden dolayı batarya içerisinde üretilen ısıdır. Çalışmada pilin iç direnci $30 \text{ m}\Omega$ olarak alınmıştır (Choudhari ve ark. 2020). FDM'deki enerji korunumu denklemi aşağıda verilmiştir:

$$\rho_{FDM} \frac{\partial H_{FDM}}{\partial t} = k_{FDM} \nabla^2 T \quad (2)$$

Eşitlik (2)'de H_{FDM} , FDM'nin toplam entalpisidir ve aşağıdaki eşitlikle hesaplanır:

$$H_{FDM} = h_{FDM} + \Delta H_{FDM} \quad (3)$$

Burada h_{FDM} , FDM'nin duyulur ısısı olup Eşitlik (4) ile hesaplanır:

$$h_{FDM} = \int_{T_0}^{T_{FDM}} C_{p,FDM} dT_{FDM} \quad (4)$$

Burada T_0 FDM'nin başlangıçtaki sıcaklığıdır. FDM'deki entalpi değişimi, ΔH_{FDM} , aşağıdaki şekilde bulunur:

$$\Delta H_{FDM} = F \cdot LH_{FDM} \quad (5)$$

FDM'nin sıvılaşma oranı F ile gösterilir ve aşağıdaki şekilde hesaplanır:

$$F = \begin{cases} 0, & T_{FDM} < T_m \\ 1, & T_{FDM} > T_m \end{cases} \quad (6)$$

İletim ısı transferi sınır koşulu, pil hücresi-FDM arayüzü için aşağıdaki gibi yazılabilir:

$$k_b \frac{\partial T}{\partial n} = k_{FDM} \frac{\partial T}{\partial n} \quad (7)$$

İletim ısı transferi sınır koşulu FDM-Alüminyum kabuk arayüzü için de geçerlidir:

$$k_{FDM} \frac{\partial T}{\partial n} = k_{al} \frac{\partial T}{\partial n} \quad (8)$$

Taşınım ısı transferi sınır koşulu Alüminyum kabuk ile hava arasına aşağıdaki gibi uygulanır:

$$k_{al} \frac{\partial T}{\partial n} = h(T_{al} - T_a) \quad (9)$$

Burada h , dış taşınım katsayısı olup $5 \text{ W}/(\text{m}^2.\text{K})$ olarak alınmıştır (Lazrak ve ark. 2018). Başlangıçta FDM ve batarya sıcaklıkları birbirine eşit kabul edilmiştir. İlgili koşul eşitlik (10) ile gösterilebilir:

$$t = 0, \quad T_b(x, y, z) = T_{FDM}(x, y, z) = T_0 \quad (10)$$

Çalışmada T_0 sıcaklığı $20 \text{ }^\circ\text{C}$ olarak alınmıştır.

Çözüm Yöntemi ve Doğrulama

Bu çalışmada, FDM esaslı bir batarya ısı yönetim sisteminde kanatçık sayısının batarya soğutmasına etkisini incelemek için COMSOL Multiphysics yazılımı kullanılarak sayısal analizler yapılmıştır. Yazılımda batarya ve FDM tarafı ısı iletim denklemlerinin çözümü için “Heat Transfer in Solids” modülü kullanılmıştır. COMSOL yazılımında modellenen sayısal analizin doğrulaması için Choudhari ve ark. (2020) yaptığı benzer bir çalışma kullanılmıştır. Yapılan doğrulamada, batarya hücresi 1C, 2C ve 3C hızlarında boşaltılmış ve belirlenen boşaltma hızlarına göre oluşan batarya sıcaklıkları Şekil 2’de karşılaştırılmıştır. Sonuçlar, bu çalışmada sunulan sayısal model ile literatürdeki sonuçların 1C ve 2C boşaltma hızlarında neredeyse aynı olduğunu, 3C boşaltma hızında ise sadece yaklaşık 5 K fark olduğunu göstermiştir.

Yapılan sayısal analizle elde edilen sonuçların ağdan bağımsızlığının testi, 10727, 17965, 32368 ve 96601 olmak üzere dört farklı ağ elemanı sayısı kullanılarak gerçekleştirilmiştir. Ağ elemanı sayısından bağımsızlık testi sonuçları Şekil 3’te verilmiştir. Şekilden de görülebileceği gibi, dört ağ elemanı sayısında da birbirine çok yakın sonuçlar elde edilmiştir. Bu sebeple, hesaplama süresinin azaltılabilmesi için en düşük ağ elemanı sayısına sahip ağ yapısı kullanılmıştır. Kullanılan ağ yapısı ise Şekil 4’te gösterilmiştir.

Şekil 2. Çalışmada elde edilen simülasyon sonuçlarının literatür ile karşılaştırılması

Şekil 3. Ağdan bağımsızlık testi sonuçları

Şekil 4. Sayısal analiz için oluşturulan ağ (mesh) yapısı

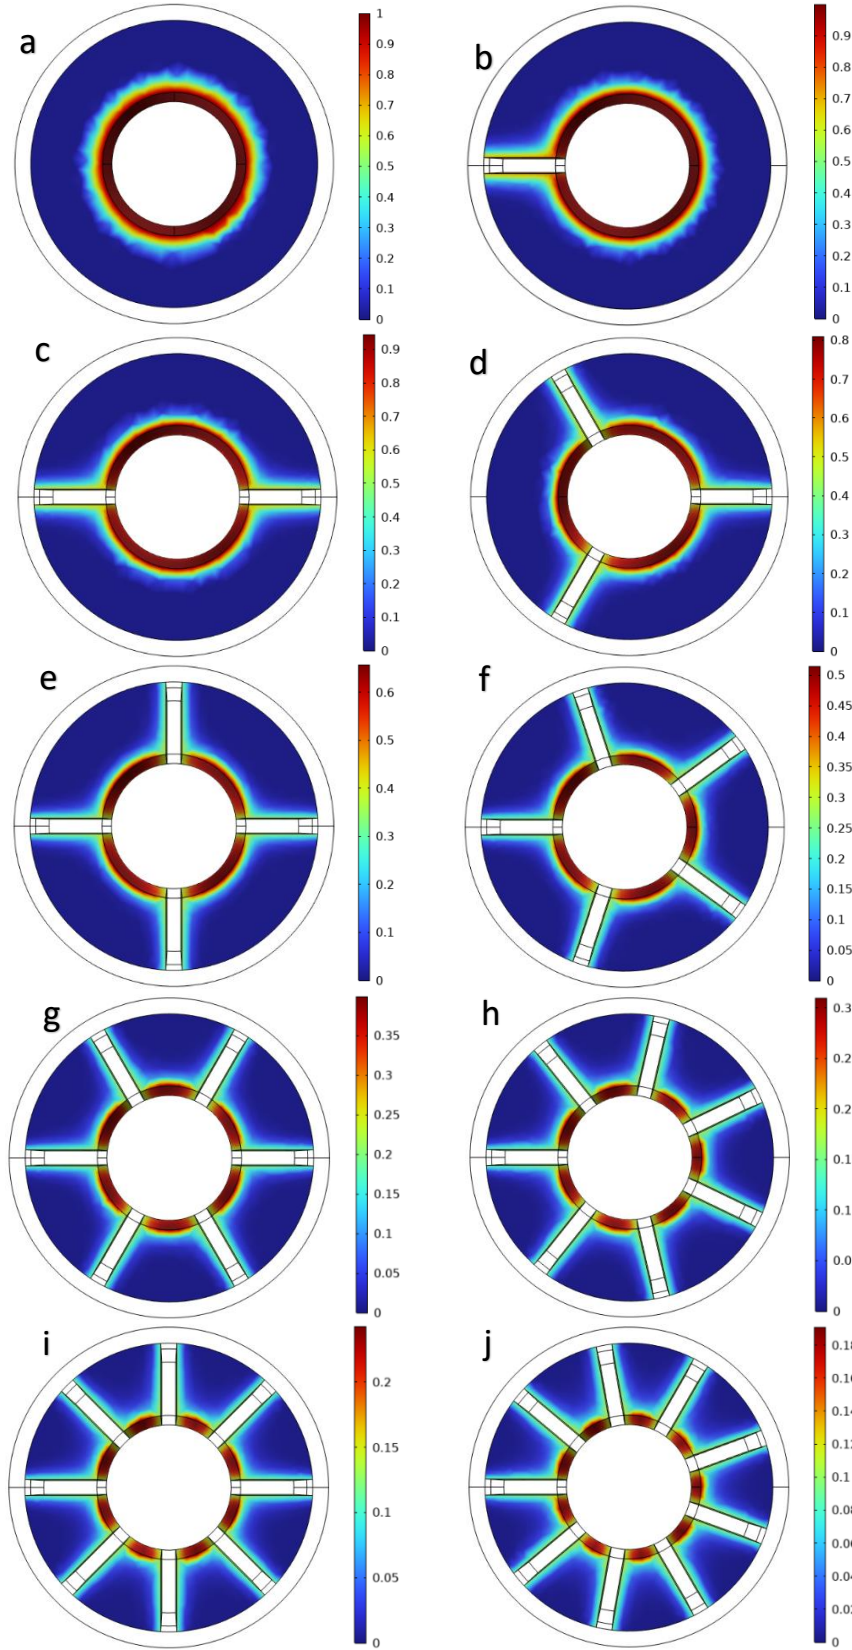

BULGULAR ve TARTIŞMA

Mevcut çalışmada FDM esaslı bir batarya ısı yönetim sisteminde kanatçık sayısının batarya soğutmasına etkisi incelenmiştir. Araştırmada biri kanatçiksız diğerleri 1'den 9'a kadar alüminyum kanatçığa sahip olan toplamda 10 farklı batarya sistemi oluşturulmuştur. Bu bölümde bu batarya sistemleri 5C ve 7C hızlarında boşaltılıp meydana gelen faz değişiklikleri ve sıcaklık dağılımları görselleştirilmiştir. Tablo 2'de belirlenen boşaltma hızlarına göre, kullanılan batarya hücresi için akım değerleri, ortaya çıkan ısı miktarı ve boşaltma süreleri verilmiştir. Yapılan analizde kritik sıcaklık 60 °C olarak belirlenmiştir.

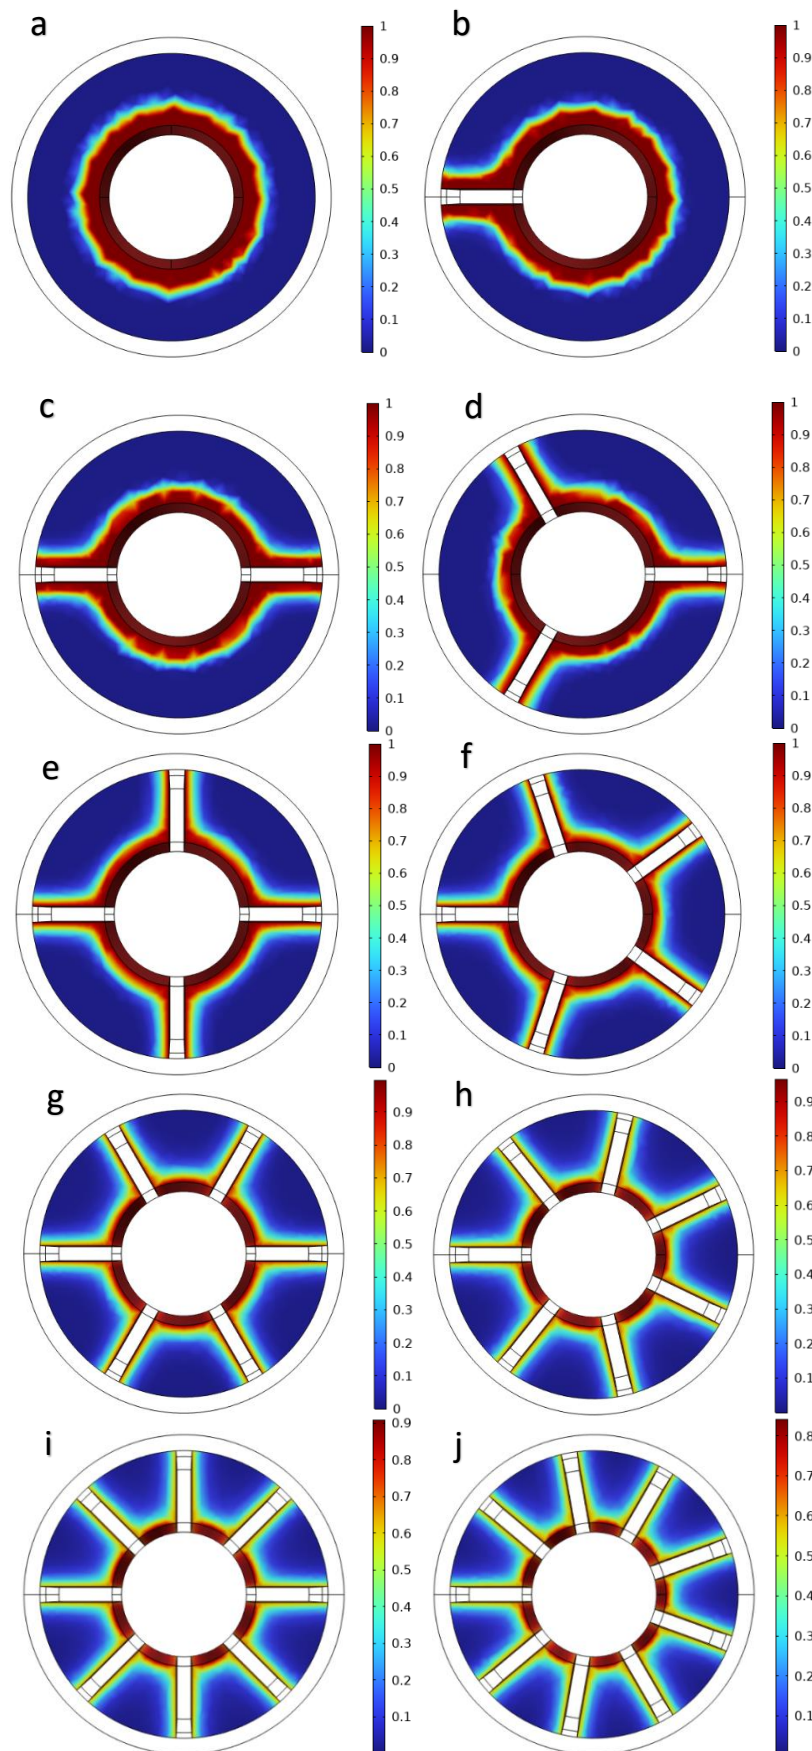

Tablo 2. Belirlenen boşaltma hızlarına göre bataryada üretilen ısı miktarları ve boşaltma süreleri

Boşaltma Oranı	I	Q_b	Boşaltma Süresi
5C	12 A	4.32 W	720 s
7C	16.8 A	8.45 W	514 s

Şekil 5’te 5C ve Şekil 6’da 7C boşaltma hızında oluşan faz değişim oranları verilmiştir. Görüldüğü gibi kanatçık olmayan sistemde faz değişimi radyal olarak ilerleyememiş ve sıvılaşma batarya etrafındaki dar bir kısımla sınırlı kalmıştır. Kanatçık kullanılan batarya sistemlerinde ise alüminyum kanatçıklar ısı transferine destek vererek kendi yakın alanındaki FDM malzemesini faz değişikliğine uğratmıştır. 7C boşaltma hızında kanatçık sayısı arttıkça FDM malzemenin katı fazdan sıvı faza geçişi artmıştır. Ayrıca 7C boşaltma hızında oluşan sıvı faza geçiş alanları 5C boşaltma hızına göre daha fazla görülmüştür. Bunun nedeni 7C boşaltma hızında bataryaların daha fazla ısınmasıdır. Şekil 7 ve 8’de ise 5C ve 7C boşaltma hızında batarya sistemlerinde oluşan sıcaklık dağılımları verilmiştir. Şekiller incelenecek olursa kanatçık kullanılmayan sistemde boşaltmadan dolayı meydana gelen ısı, batarya etrafında kalarak burada yüksek sıcaklıklara sebep olmuştur. Kanatçık kullanılan sistemlerde ise kanatçıkların ısı transferini kolaylaştırması nedeniyle ısı batarya yakınından uzaklaştırılmıştır. Doğal olarak kanatçık sayısı fazla olan sistemlerde batarya çevresindeki sıcaklık daha fazla düşmüştür. Yine aynı şekilde, 7C boşaltma hızında üretilen ısı miktarı daha fazla olduğundan, 5C boşaltma hızına göre batarya merkezinde oluşan sıcaklıklar daha yüksek hesaplanmıştır.

Şekil 5. 5C boşaltma hızında farklı kanatçık sayılarında oluşan sıvı faz konturları: a) Kanatçiksız, b) 1- kanatçıklı, c) 2-kanatçıklı, d) 3-kanatçıklı, e) 4-kanatçıklı, f) 5-kanatçıklı, g) 6-kanatçıklı, h) 7- kanatçıklı, i) 8-kanatçıklı ve j) 9-kanatçıklı

Şekil 6. 7C boşaltma hızında farklı kanatçık sayılarında oluşan sıvı faz konturları: a) Kanatçıksız, b) 1- kanatçıklı, c) 2-kanatçıklı, d) 3-kanatçıklı, e) 4-kanatçıklı, f) 5-kanatçıklı, g) 6-kanatçıklı, h) 7- kanatçıklı, i) 8-kanatçıklı ve j) 9-kanatçıklı

Şekil 7. 5C boşaltma hızında farklı kanatçık sayılarında oluşan sıcaklık konturları: a) Kanatçıksız, b) 1- kanatçıklı, c) 2-kanatçıklı, d) 3-kanatçıklı, e) 4-kanatçıklı, f) 5-kanatçıklı, g) 6-kanatçıklı, h) 7- kanatçıklı, i) 8-kanatçıklı ve j) 9-kanatçıklı

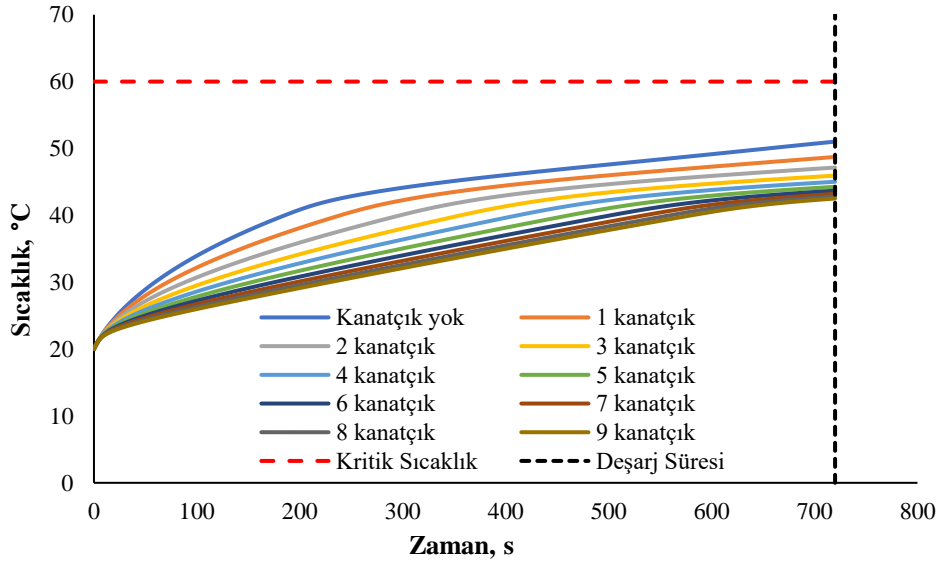

Şekil 8. 7C boşaltma hızında farklı kanatçık sayılarında oluşan sıcaklık konturları: a) Kanatçıksız, b) 1- kanatçıklı, c) 2-kanatçıklı, d) 3-kanatçıklı, e) 4-kanatçıklı, f) 5-kanatçıklı, g) 6-kanatçıklı, h) 7- kanatçıklı, i) 8-kanatçıklı ve j) 9-kanatçıklı

Şekil 9’da 5C boşaltma hızı için FDM faz değişiminin zamana bağlı grafiği verilmiştir. Şekilde de görülebildiği gibi, üretilen ısı miktarının düşük olmasından ötürü batarya sistemlerinde gerçekleşen faz değişim miktarları düşüktür. En yüksek faz değişim oranı kanatçıksız sistem için 0.15 civarında elde edilmiştir. Bunun sebebi üretilen ısı değerinin düşük olmasından ötürü FDM sıcaklığının boşaltma süresi sonunda kanatçıklı sistemlerde erime sıcaklığına ancak ulaşabilmesidir. Bu durum Şekil 10’da verilen sıcaklık zaman grafiğinde daha açık bir şekilde görülebilmektedir. 5C boşaltma hızı için sıcaklık-zaman grafiğine bakıldığında sadece kanatçıksız ve 1-kanatçıklı sistemde sıcaklık erime sıcaklığına ulaşabilmiştir. Sıcaklık-zaman grafiğinden de anlaşılacağı gibi, 5C boşaltma hızında boşaltma süresi boyunca hiçbir durumda batarya sıcaklığı kritik sıcaklığa ulaşmamıştır. Buradan, belirlenen şartlarda bataryanın tüm sistemlerde güvenli bir şekilde kullanılacağı anlaşılmaktadır. Şekil 11’de ise 7C boşaltma hızı için faz değişim-zaman grafiği verilmiştir. 7C boşaltma hızında sistemlerde elde edilen sıvı oranları, yüksek ısı üretiminden ötürü biraz daha artmıştır. Kanatçık olmayan sistemde, özellikle başlangıçta, daha fazla FDM sıvılaşmıştır. Fakat boşaltma süresinin sonuna doğru kanatçıklı sistemlerde elde edilen sıvı oranının daha fazla arttığı, hatta kanatçıksız sistemin önüne geçtiği görülmüştür. Bunun sebebi, kanatçıklar sayesinde ısının FDM tabakasının orta ve dış kısımlarına doğru taşınması ve o bölgelerdeki FDM’nin sıvılaşmaya

başlamasıdır. Kanatçısız sistemde ısı batarya çevresinde biriktiğinden sadece batarya yakın çevresindeki FDM sıvılaştırmıştır. Şekil 12’de 7C boşaltma hızında farklı kanatçık sayılarında elde edilen batarya sıcaklıkları gösterilmiştir. Şekilden de görülebileceği gibi, kanatçısız ve 1-kanatçıklı sistemlerde batarya sıcaklığı boşaltma süresi tamamlanmadan kritik değere ulaşmıştır. Bu sebeple 7C hızda güvenli bir boşaltma işlemi için en az iki adet kanatçık kullanılması gerektiği anlaşılmıştır.

Şekil 9. 5C boşaltma hızında elde edilen sıvı faz-zaman grafiği

Şekil 10. 5C boşaltma hızında elde edilen sıcaklık-zaman grafiği

Şekil 11. 7C boşaltma hızında elde edilen sıvı faz-zaman grafiği

Şekil 12. 7C boşaltma hızında elde edilen sıcaklık-zaman grafiği

Şekil 13'te 5C boşaltma hızındaki kanatçık sayısına karşılık gelen batarya sisteminin boşaltma süresi sonunda ulaştığı maksimum sıcaklık (T_{max}) grafikleri verilmiştir. Daha önce söz edildiği gibi, kanatçıkların homojen bir ısı dağılımı oluşturması nedeniyle kanatçık sayısı arttıkça sistemde T_{max} düşmüştür. Belirlenen boşaltma hızında, 3 kanatçıktan sonra T_{max} değerinin çok az miktarda değiştiği görülmektedir. Sistemde daha fazla kanatçık kullanımı, sıcaklık yönünden daha fazla fayda sağlamayacağı, sistem maliyetini ve ağırlığını arttıracığından olumsuz etki yaratacaktır. Bu sebeple 5C boşaltma hızında optimum kanatçık sayısı 3 olarak bulunmuştur. Şekil 14'te ise 7C hızda boşaltma süresi sonunda elde edilen T_{max} değerinin kanatçık sayısı ile

değişimi gösterilmiştir. Burada da, 5 kanatçıktan sonra sıcaklık değerinin neredeyse hiç değişmediği görülmektedir. Bu sebeple 7C hızda optimum kanatçık sayısı 5 olarak belirlenmiştir.

Şekil 13. 5C boşaltma hızı için maksimum sıcaklığın kanatçık sayısına göre değişimi

Şekil 14. 7C boşaltma hızı için maksimum sıcaklığın zamana göre değişimi

SONUÇ

Bu çalışmada FDM esaslı bir batarya ısı yönetim sisteminde kanatçık sayısının batarya soğutmasına etkisi araştırılmıştır. Bu araştırma için biri kanatçıksız diğerleri 1'den dokuza kadar alüminyum kanatçığa sahip olan toplamda 10 farklı batarya sistemi oluşturulmuştur. Batarya hücreleri, 5C ve 7C olmak üzere iki farklı boşaltma hızında boşaltılmıştır. Çözümler sayısal olarak COMSOL Multiphysics yazılımı kullanılarak yapıp sonuçlar literatürdeki deneysel ve sayısal sonuçlarla doğrulanmıştır. Bu çalışma ile batarya ısı yönetim sistemlerinde kanatçık kullanımının önemi daha iyi anlaşılmıştır. Kanatçık kullanılması ile boşaltma sırasında

batarya hücrelerinin maksimum sıcaklığı 5C boşaltma hızında %16.7, 7C boşaltma hızında ise %31 civarında azaldığı tespit edilmiştir. Kanatçık sayısı arttıkça kanatçıkların homojen bir ısı dağılımı oluşturması nedeniyle belli bir kanatçık sayısına kadar sistemde oluşan maksimum sıcaklık düşmüştür. Fakat belli bir kanatçık sayısından sonra sıcaklık değeri çok fazla değişmemektedir. Bu sonuç batarya soğutma sistemlerinde belli kanatçıktan sonra kanatçık sayısını artırmanın gereksiz olduğunu göstermiştir. Bu sonuçlar doğrultusunda 5C boşaltma hızı için 3, 7C boşaltma hızı için ise 5 kanatçık optimum kanatçık sayısı olarak tespit edilmiştir. Genel olarak oluşturulacak her batarya soğutma sisteminde kullanılan FDM tipi, bataryaya özellikleri ve kanatçık malzemesine göre kanatçık sayısı optimize edilmesi gerektiği anlaşılmıştır.

SEMBOLLER ve KISALTMALAR

BTYS	Batarya Termal Yönetim Sistemi
FDM	Faz Değiştiren Malzeme
ρ	Yoğunluk
∇	nabla / diverjans işareti
ΔH_{FDM}	Entalpi farkı
C	Batarya şarj / deşarj hızı
C_p	Özgül ısı
F	Sıvılaşma oranı
h	Isı taşınım katsayısı
h_{FDM}	FDM'nin duyulur ısısı
H_{FDM}	FDM'nin entalpisi
I	Akım
k	Isı iletim katsayısı
LH	Gizli ısı
T	Sıcaklık
T_m	Erime sıcaklığı
T_0	Başlangıç sıcaklığı
t	Zaman
Q_b	Bataryada gerçekleşen ısı üretimi
q_b	Bataryada birim hacimde gerçekleşen ısı üretimi

ABSTRACT

“Tell me and I forget. Teach me and I remember. Involve me and I learn”. These words uttered by the great American writer Benjamin Franklin. Franklin insisted on the significance of the word ‘involvement’. Involvement is very essential to get succeed in the work, which has been done. As a matter of fact, involvement is indispensable in English language learning. Indeed, it is the responsibility of the English teachers to create interest and involve the learners in the teaching learning process. At present generation students are called the Z-generation or net generation students and they are very much interested to learn only through electronic gadgets. Their expectations towards language learning are different nowadays, and so the teachers must create the learning environment the way they expect. The last 20 decade methodologies, techniques are not suitable for the present generation students. So that, the teachers are in the position to implement new strategies to enhance the learner’s language proficiency. Fortunately, the Pandemic situation helped and brought several online tools to learn English and showed ways to enhance the four skills of the language. In this connection, post-pandemic era has given several Artificial Intelligence Tools to develop students’ language skills. These AI-Tools not only focus on the four skills, but also greatly helps to enrich their thinking and analyzing ability. Above all, these AI-Tools provoke interest and also sustain the level of interest in the learning process. Creating and sustaining interest are equally important and it should be taken throughout the learning process to attain the highest degree of proficiency in the language.

Keywords: AI-Tools, Involvement, Language proficiency, and Thinking ability

INTRODUCTION

In India, The English language plays a vital role, as India is a diverse country. In India, there are more than 1500 languages, among that 18 languages are official languages, and people are speaking different languages and so English plays a vital role in connecting people. Particularly, after colonization, the English language becomes significance in all the professions. Learning English is essential, as it is included all the major fields such as trade, commerce, science, technology, communication, medicine and what not. In addition to that, English is necessary for higher education, getting good job and for the survival.

Many educationalists and linguists insist the importance of including the English language in the curriculum and they started teaching English to the Indian students. They started with several ideas, but later they decided to teach all the level of students such as primary level, secondary level and the higher education. During the period of teaching English in India, several methodologies, strategies, and techniques have been implemented to impart the language knowledge on them. Nowadays, English has started to teach English from the kinder garden level and now people understand the importance of learning English in India. They understand that without English language no one can survive in India as well as abroad.

MATERIALS

The era of chalk and talk method has gone over. Nowadays the students like to learn through technology. Technology plays an important role to learn English. This technological learning paves way to explore more learning and more Artificial Intelligence tools. In this sort of learning, they learn actually what they want to learn or what they like to learn. And also, they can choose their style of learning. This greatly helps to learn more and also learn with interest. Learning with interest always getting a good outcome. In this research paper the AI tool, Smalltalk2.me is used to enhance learner's proficiency. To use this tool, a mobile requirement is much enough and it is time consuming. Any learner can get benefitted, because it helps both the advanced and the slow-learner students. It is a free tool, and the learner can use at home and whenever he finds time, he can use it.

METHODS

It improves speaking, listening, reading and thinking skills, and also it helps to learn vocabulary. Besides, it helps to learn more meanings by themselves. They can choose the topics which they like to learn or which topic they have interest. Every day, they can practice, like a task. It creates curiosity to learn every day and they can see their progress of learning. It has a challenge of every day, very much similar to Duolingo, another AI tool to learn languages. It has lots of

exercises to practice. The students can do practice every day, they can do by themselves and also they can do whenever they find time. As there is a saying that self-learning is the best learning, here it works. This AI tool helps to learn by themselves. As a teacher, they can facilitate and guide when it is needed. They guide to learn the language easily and also with interest, because it is a kind of a game. Another famous saying that Practice makes a man perfect, here every day challenge practices the students which elaborates their learning knowledge. Every day they can do practice and find the difference on them. Their improvement can be seen in their vocabulary, pronunciation, speaking, thinking and speaking. This gives confidence to learn the language. As, it is like a game, they play with interest and involvement, which ever encourages them to learn better.

FINDINGS

This research has been carried out to the first year engineering students for six months during their language classes. At the end of the semester, the below research questions had given to them to understand their improvement because of this AI tool smalltalk2.me. The Linkert scale has been used to find out the outcomes of the learners and their learnings. The research questions are as follows:

RQ1-Do you like to learn with this AI tool?

RQ2- Is this tool improve your thinking ability?

RQ3- Is this tool help to improve you pronunciation?

RQ4- Is this tool help to improve your speaking skill?

RQ5- Do you like to use more AI tools like this?

Table 1

Respondents	Strongly Agree	Agree	Disagree	Strongly Disagree
Q1	64%	36%	0%	0%
Q2	68%	20%	8%	4%
Q3	32%	60%	4%	4%
Q4	52%	44%	0%	4%
Q5	68%	32%	0%	0%

Fig.1

The above bar diagram shows that the students are strongly agree to use this AI tool and it ensures that the usage has brought difference on their speaking skill, thinking ability and pronunciation. This indicates that students like to learn with technology and also their learning would be improved. Nowadays students feel comfortable with technology and happy to learn with technological tool. These tools are greatly help and guide them to learn with ease, and they can learn at anytime and anywhere. So this helps them to show interest to learn. Not only creating interest but also sustain those interest is in the language learning process. This AI tool creates involvement and sustaining it ever to learn the language.

DISCUSSIONS

In the language learning process not only LSRW skills play the role but also the skills like thinking, grammar, and vocabulary learning is also equally important. These help the learners to speak the language with confidence. Knowing vocabulary helps to speak without any hindrance, thinking helps to respond appropriately and efficiently, and knowing grammar helps to speak without any errors. The below pie chart shows that the students skills are gradually improved and they built confidence because of these skills.

CONCLUSION

Teachers must be updated and learn to use new and recent technologies which greatly helps the students to explore more and learn more. Before teaching, teachers must understand the requirements of the students of this generation, based on that they can frame methodologies and use tools to enhance their learning. This generation students do not have patience to learn, and in contradictory they like to learn very fast. These technological tools fulfill their thoughts. The students learn here but fast. It takes very few minutes to learn a word with pronunciation, and also with its meaning. “Language teachers should be open minded to change and equip themselves with the latest techniques of teaching and be adept in the use of the techniques” (Saranya, 2018). It is a true statement, the teachers must adapt the recent technologies and learnings, to impart those knowledge to their students.

ABSTRACT

In the changing world of engineering education, it is crucial for students to develop reading abilities to effectively access, understand and apply complex technical knowledge. This abstract introduces an investigation, into the integration of Artificial Intelligence (AI) tools to enhance the reading skills of engineering college students. Recent advancements in AI technologies have opened possibilities for interactive learning experiences. In this paper we present an approach that harnesses the power of AI to meet the learning needs of engineering students. Moreover, our research explores the implementation of language enhancement tools enhanced by AI and virtual reading companions offering support to students as they expand their vocabulary and foster critical thinking skills. Furthermore, we provide compelling case studies and empirical evidence that showcase how these AI tools have an impact on improving reading abilities. Our findings demonstrate that these tools not only help students' complex technical texts but also make significant contributions to their academic success. This paper invites readers to delve into exploring the synergy, between AI and engineering education while shedding light on how AI tools can transform engineers reading capabilities. As engineering institutions adjust to the changing environment incorporating AI tools to improve reading skills shows potential, in helping students thrive in the constantly expanding field of engineering knowledge.

Keywords: AI-driven tools, Reading proficiency, Language enhancement

INTRODUCTION

In the ever-evolving landscape of academia and the relentless demands of the engineering profession, the ability to read and comprehend technical content stands as a cornerstone for both academic achievement and future career success. Engineering students must not only navigate a complex array of textbooks, research papers, and technical documents during their academic journey but also prepare themselves for the multifaceted challenges they will encounter in the engineering fields of the future. Proficiency in reading and comprehending content is a fundamental skill that underpins both academic success and future careers in the dynamic and ever-evolving landscape of engineering fields (Smith, 2023; Johnson, 2022). This foundational ability not only facilitates effective learning and knowledge acquisition but also equips aspiring engineers with the necessary tools to thrive in a world increasingly reliant on technological innovation and information consumption (Brown & Miller, 2021).

The significance of reading proficiency in the realm of academia cannot be overstated. It is an essential skill that directly contributes to academic success, enabling students to grasp and synthesize a wealth of knowledge from diverse sources. Beyond the classroom, in the dynamic and innovative world of engineering, proficient reading skills serve as a linchpin for effective problem-solving, innovation, and staying current with advancements in the field. Central to our research mission is the meticulous assessment of learners' language proficiency levels based on the Common European Framework of Reference (CEFR). This rigorous evaluation forms the cornerstone upon which our innovative strategy is constructed. By precisely gauging the individual needs and capabilities of engineering students, we aim to tailor our interventions to suit their unique profiles, thus maximizing the impact of our efforts (Smith & Wilson, 2020).

Recognizing the pivotal role that reading proficiency plays in the education and future careers of engineering students, this paper embarks on a compelling exploration. We delve into an innovative approach that leverages the power of Artificial Intelligence (AI)-driven tools to cater to the unique reading needs of engineering college students. The primary objective of this paper is clear and resolute: to enhance the reading proficiency of engineering students through the integration of AI-driven tools. To achieve this, our research meticulously assesses the Common European Framework of Reference (CEFR) levels of learners. This comprehensive evaluation provides the foundational insight required to design a tailored strategy that caters to the individualized reading requirements of each student.

In the pursuit of our mission, we shine a spotlight on two formidable AI tools, namely Cathoven and Chat GPT. These state-of-the-art technologies are not just mere novelties but represent the

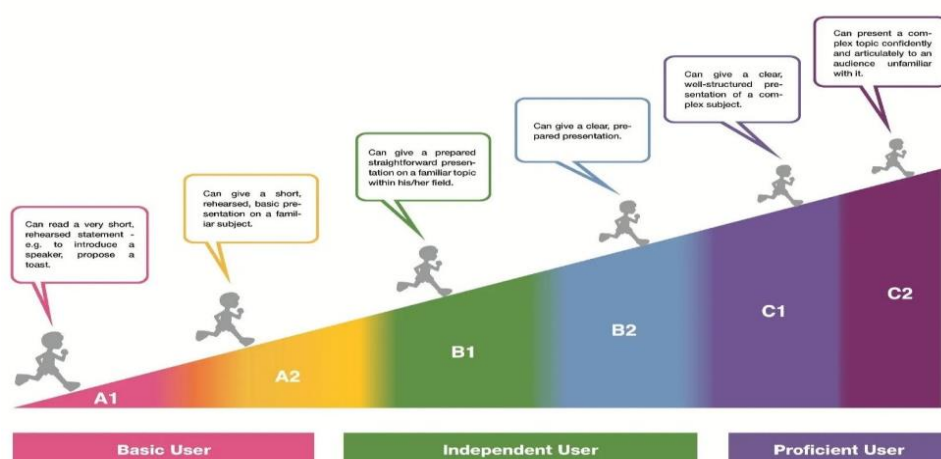

vanguard of educational innovation. Through their utilization, we aim to provide engineering students with a transformative and personalized reading experience, one that aligns with their unique aspirations and academic pursuits.

METHODS and MATERIALS

Materials Used:

Cambridge Language Assessment Test

the Cambridge Language Assessment Test, an examination aligned with the Common European Framework of Reference for Languages (CEFR).

The CEFR (Common European Framework of Reference for Languages) is a standardized framework that assesses language proficiency across six levels, from A1 (beginner) to C2 (proficient). It provides clear descriptors for listening, speaking, reading, and writing skills, making it a valuable tool for learners, educators, and employers. Widely recognized, the CEFR enhances language education and facilitates international communication.

AI TOOLS: CATHOVEN AND CHATGPT

Cathoven:

Cathoven, a smart tool made just for language teachers. It uses artificial intelligence to figure out how hard a text is, looks closely at its special features, and finds the important things to

teach based on your students' skills. And there's more - with Cathoven, you can easily find lots of great teaching ideas with just a simple click.

ChatGPT:

ChatGPT is built upon the GPT-3.5 architecture, making it one of the most potent language models in existence. ChatGPT's role in education is noteworthy. It can assist students in improving their reading proficiency by offering interactive text-based learning experiences. This personalized approach helps learners comprehend complex subjects and develop essential reading skills.

Methods Used:

Cambridge Language Assessment Test

A group of students embarked on the Cambridge Language Assessment Test, an examination aligned with the Common European Framework of Reference for Languages (CEFR). Upon successful completion of the test, each student received a personalized assessment that positioned them within the CEFR framework. The results unveiled the alignment of their reading proficiency with specific CEFR categories, granting them a reliable measure of their language abilities. This revelation not only fortifies their self-awareness but also steers them in the direction of future language mastery.

By discerning their reading proficiency levels within the CEFR framework, a multitude of tailored learning avenues has unfolded for these students. They now possess well-defined routes to further enrich their reading capabilities, ensuring their continual ascent toward higher language competency tiers. This experience underscores the invaluable role of comprehensive language assessments like the Cambridge Language Assessment Test, serving as a beacon of guidance for students on their journey to attain language mastery.

Cathoven

In English Language Lab, students work closely with English Instructors, leveraging the Cathoven AI tool designed for language educators. This intelligent tool assesses text complexity, identifies key teaching points based on student skills, and provides an array of teaching ideas. Cathoven's AI capabilities enhance the student language learning experience. It customizes content to individual skills, ensuring effective learning. With a simple click, Student access valuable teaching resources, streamlining lesson planning.

Students practice, refine, and enrich their language skills while benefitting from personalized guidance and curated content. Cathoven revolutionizes language education, offering a dynamic, personalized, and effective approach. It empowers students to realize their language potential and equips educators with an innovative tool for nurturing language proficiency.

ChatGPT

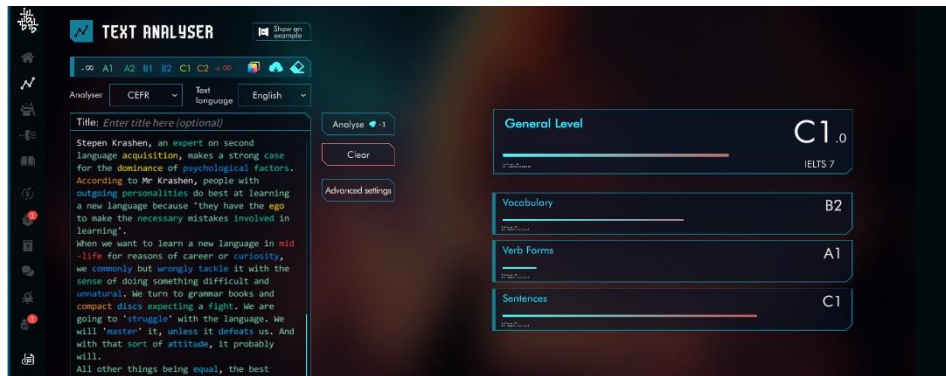

Under the guidance of the English Instructors, learners can harness ChatGPT's capabilities to deepen their comprehension of intricate subjects and foster essential reading skills while practicing in alignment with the CEFR framework. ChatGPT plays a pivotal role in education, particularly in honing reading proficiency.

Through thoughtfully designed prompts, learners can navigate the realm of language on their terms, furthering their linguistic prowess with each interaction. ChatGPT's personalized approach ensures that students receive the targeted support they need. It adapts to individual learning styles, offering insights, explanations, and guidance, ultimately bolstering reading proficiency.

FINDINGS and DISCUSSION

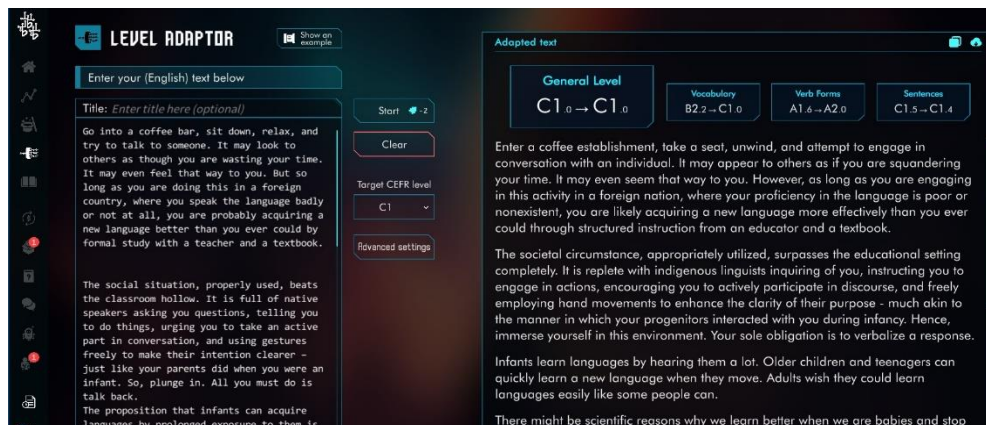

Cathoven, a subscription-based AI tool, boasts a wide array of functions such as Text Analysis, Level Customization, Question Generation, and a comprehensive Library. These capabilities serve to elevate and strengthen learners' reading skills significantly.

Text Analyser

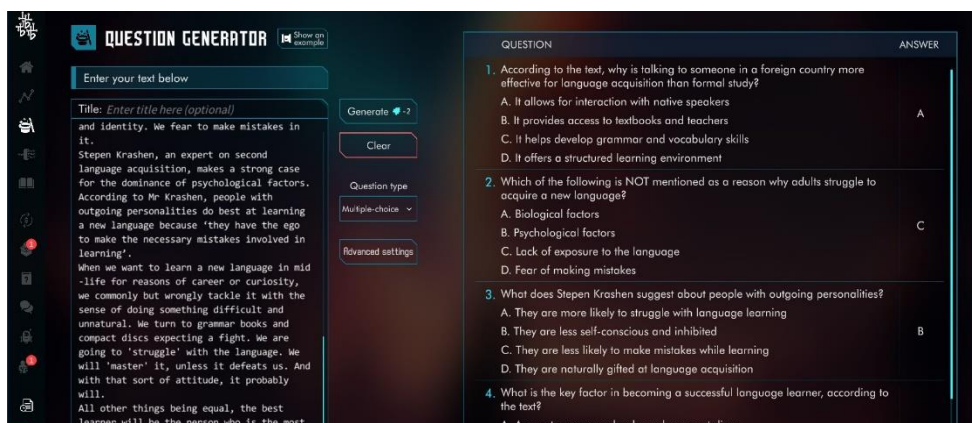

The Text Analyser aids in determining the text's proficiency level, specifically drawn from IELTS preparatory textbooks. The chosen text is uploaded to Cathoven's Text Analyser, which subsequently assesses its CEFR framework alignment. Additionally, the Text Analyser comprehensively evaluates the text across various criteria, encompassing General Level, Vocabulary, Verb Forms, and Sentence Structure.

Level Adaptor

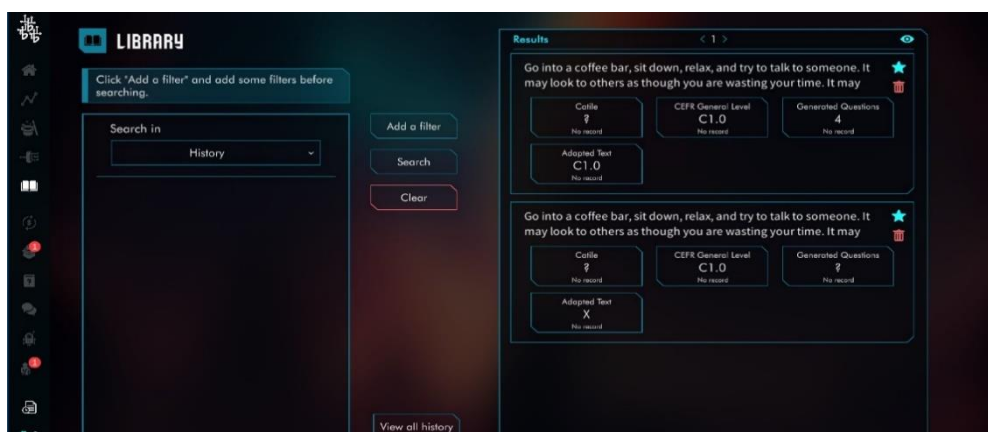

After determining the text's proficiency level using the Level Adapter, the instructor has the flexibility to adjust the text's complexity. This adapted content, presented in a simplified format, caters to the specific requirements of the learner. For instance, if the text is initially categorized as C1, it can be seamlessly transformed into various other levels such as B2, A1, and more as needed.

Question Generator

The Question Generator feature facilitates instructors in creating questions related to the provided text. It generates questions in various formats, including multiple-choice and essay questions, among others.

Library

The Library feature incorporates backup settings, preserving a comprehensive history of all activities. Additionally, it provides an option to review the outcomes and findings from all conducted activities.

ChatGPT

ChatGPT 3.5 version, a no-cost AI tool, operates effectively when provided with appropriate prompts. Students receive guidance on formulating accurate prompts, enabling ChatGPT to serve as a versatile independent learning platform. When students master the skill of crafting precise prompts, they can utilize this tool at their convenience, anytime and anywhere

Text Analyser Prompt

Analyze the complexity of the vocabulary, grammar, sentences as per CEFR framework for the following content. Give the output in Tabular Form.

Aspect	Complexity Analysis	CEFR Level
Vocabulary	- The vocabulary used is generally sophisticated and includes terms specific to literature and the arts, such as "novelist," "medium," "narrative entertainment," "prose fiction," "collaborative forms," "spectacle," "rehearsals," "official opening night," "production company." Some of these words may require a higher level of language proficiency.	C1
Grammar	- The grammar used is complex and includes advanced sentence structures. There are various complex sentences, passive voice constructions, and nuanced expressions. For example, "The very infinity of choice enjoyed by the novelist is a source of anxiety and difficulty" and "the writer may have little or no control over the final form of his work."	C1
Sentence Structure	- The sentences are often lengthy and include clauses and subclauses, requiring readers to follow complex ideas. The text uses intricate sentence structures to convey nuanced information.	C1

Overall, the provided content falls within the CEFR C1 level in terms of vocabulary, grammar, and sentence complexity. It contains sophisticated vocabulary, complex grammatical structures, and intricate sentence organization, making it suitable for advanced English language learners and native speakers.

Utilizing prompts within the free ChatGPT tool, students can assess both the complexity and proficiency level of the text.

Level Adapter Prompt

Change the difficulty of text from C1 to B2 as per CERF framework for the following content. Give the conversion of text from C1 to B2 in a tabular format.

Here's the conversion of the text from CEFR C1 level to B2 level in a tabular format:

Aspect	Simplified Version	CEFR Level
Vocabulary	- The novelist primarily uses written words, and some might even say printed words. The novel as we know it started with the invention of printing. Typically, novels are read by one person in silence, and they can be read anywhere.	B2
Grammar	- Paperback novels are still affordable, easy to carry, and flexible for storytelling. They convey information through writing only. However, within this constraint, they are versatile. The story can take place in various settings without worrying about cost or practicality. Writers of fiction have artistic freedom when shaping their stories.	B2
Sentence Structure	- Sentences are clear and concise, with straightforward structures. There are no overly complex or lengthy sentences.	B2

In this simplified version, the vocabulary is made more accessible, complex grammatical structures are simplified, and the sentence structure is kept clear and concise, aligning with the CEFR B2 level.

[Regenerate](#)

After determining the text's complexity level, students can adjust it by providing prompts. They can obtain a simplified version of the text by lowering the complexity. Conversely, if students wish to elevate the complexity, they can modify the text's difficulty from B1 to C1 and beyond by using prompts.

DISCUSSIONS

These tools have been chosen to encourage learners to engage in reading comfortably. When a learner with a B1 language proficiency level encounters a highly complex text, it can be discouraging, leading to feelings of frustration and avoidance of reading. These tools alleviate these challenges, making reading more accessible. Simplifying the text's complexity while retaining its core concepts and content enhances comprehension. Subsequently, students can attempt to elevate the text's complexity level, allowing them to explore the language at both basic and advanced levels.

CONCLUSION and RECOMMENDATIONS

Both AI tools, Cathoven (Paid Version), and ChatGPT 3.5 (Free Version), contribute to the improvement and enrichment of learners' reading proficiency. The Cambridge Language Test aids learners in assessing their language proficiency levels. By utilizing these AI tools in conjunction with instructor guidance, students can elevate their reading proficiency levels.

AI tools of this kind undoubtedly contribute to students' self-development. Instructors should explore the adoption of emerging tools to facilitate more effective and comfortable learning experiences for learners. Embracing new tools is essential to assess their potential in meeting students' needs. Educational institutions should support instructors in experimenting with these tools to enhance skill-based learning. Instructors should also identify suitable free tools that empower students to address their challenges and improve independently. The advent of the AI era promises a positive impact on students' reading proficiency.

ABSTRACT

Under normal conditions, blood glucose concentration is kept between 70 mg/dL-110 mg/dL (3.9-6.1 mmol/L) by the hormone insulin secreted by the body. However, glucose homeostasis is also directly affected by hormones such as glucagon, catecholamines, cortisol, growth hormone, which are called counter-regulatory hormones. Conditions and diseases such as stress, hyperadrenocorticism, steroid applications, diabetes mellitus lead to hyperglycemia, while diseases in which glucose production decreases or consumption increases such as excessive insulin secretion, hypoadrenocorticism, liver failure and sepsis lead to hypoglycemia. The deleterious effects of hyperglycemia are manifested in different ways that can lead to various immune, vascular and neurologic abnormalities that cause systemic inflammation and alterations in endothelial cell function. In particular, blood glucose levels above 250 mg/dL lead to osmotic diuresis due to glucosuria and consequent electrolyte imbalances such as dehydration, hyponatremia, hypokalemia and hypophosphatemia. Anesthesia induces the stress response through a complex interaction involving the neuroendocrine system and autonomic nervous system, leading to hyperglycemia, especially in diabetic patients. In addition, pain and stress cause hyperglycemia even in non-diabetic patients due to an increase in circulating catecholamines by stimulation of the sympathetic nervous system. On the other hand, clinical symptoms such as weakness, behavioral changes, tachycardia, seizures, tremors, coma that occur in hypoglycemia can be concealed by anesthesia and pose a life risk for patients. Studies have shown that perioperative hyperglycemia and hypoglycemia are risk factors for morbidity and mortality. Anesthesia protocols should be designed taking into account the conditions of these patients. In this review, how to perform perioperative glycemic monitoring of patients will be discussed and the practices to be performed to reduce morbidity and mortality rates will be evaluated in the light of current data.

Keywords: anesthesia, hyperglycemia, hypoglycemia, insulin

1. GİRİŞ

Normal şartlar altında kan glukoz konsantrasyonu vücuttaki hormonal denge sayesinde, yaklaşık olarak 70 mg/dL-110 mg/dL arasında bir fizyolojik aralıkta (3,9-6,1 mmol/L) tutulmaya çalışılmaktadır (Feldman ve Nelson, 2004). Temel olarak kan glukoz konsantrasyonunun düştüğü durumlar, hipoglisemi; yükseldiği durumlar ise hiperglisemi olarak isimlendirilmektedir. Kesin sınırlar belirlenmemiş olmakla beraber konsantrasyonun 60 mg/dL'nin altında olduğu durumlar, hipoglisemi; 150 mg/dL'nin üzerinde olduğu durumlar ise hiperglisemi olarak kabul edilmektedir (Silverstein ve Hopper, 2015).

Portal ven kan glukoz konsantrasyonundaki değişiklikler ile insülin sekresyonu arasında hassas bir ilişki mevcuttur. Konsantrasyonun 100-110 mg/dL eşiğinin üzerinde bulunduğu durumlarda pankreastaki beta hücrelerinden insülin salgılanma oranı artırılarak glukoneojenez bastırılır; glukoz, glikojene dönüştürülüp kas ve karaciğer dokusunda depo edilir. Bu sayede glukozun eşik değerini üzerine çıkması engellenmeye çalışılır. Buna karşın, glukoz konsantrasyonunun 60 mg/dL'nin altına düştüğü durumlarda ise insülin sentezi ve salgılanması durdurulur. Bu sırada pankreasın langerhans adacıklarından glukagon hormonu glikojenoliz ve glukoneojenezi uyararak hepatik glukoz çıkışını destekleyip, kan glukoz konsantrasyonunu normal aralığa yükseltmeye çalışır (Feldman ve Nelson, 2004). Glukagona ek olarak epinefrin, katekolamin, büyüme hormonu ve kortizol gibi hormonlar da glukoz seviyesini artırmaya yönelik etki gösterirler. Glukoz dengesinde insülinin etkisinin tam tersi etki göstermeleri nedeniyle karşıt düzenleyici hormonlar ismini almaktadırlar. Bu hormonlar glikolizi kolaylaştırıp, glukozun hepatik depolardan salınmasını ve periferik dokularda glukoneojenezi teşvik ederler. Temelde bu durum, yaralanmış veya tehlike içerisinde bulunan canlıların depolanmış vücut yakıtlarını katabolize ederek hayatta kalmaya yönelik geliştirilmiş bir tepki şeklinde yorumlanmaktadır. Stres hiperglisemisi ile savaş veya kaç tepkisi sırasında beyin ve diğer gerekli dokulara yoğun glukoz temini sağlanır. Stres yanıtının, akut durumlarda hayatta kalmaya yönelik faydalı olabilmesine karşın hastanede yatan ve iyileşme sürecinde olan hastalarda homeostazis ve doku iyileşmesi açısından ciddi negatif etkilerinin olduğu tespit edilmiştir (Roizen ,1988; Desborough, 2000; Lipshutz ve ark., 2009).

Hastalarda vücutta meydana gelen stres yanıtı spesifik değildir. Hem psikolojik hem de fiziksel etkiler sonucunda ortaya çıkabilmektedir. Stres yanıtı etkisini, sempatoadrenal ve kortikomedüller sistemlerin aktivasyonu sonucu katekolamin, adrenokortikotropik hormon (ACTH), kortizol, glukagon, vazopressin, büyüme hormonu, renin salgısı ve inflamatuvar sitokinlerin artması; ayrıca insülinin salgılanmasının azalması gibi çeşitli şekillerde

gösterebilmektedir (Bonica, 1990; Lipshutz ve ark., 2009). Tüm bunlar ise hepatik glikoz üretiminin artmasına, periferik glikoz kullanımının bozulmasına, göreceli insülin eksikliğine ve hiperglisemiye neden olmaktadır (Frayn ve ark., 1985).

1.1. Glisemik bozukluğa bağlı risk faktörleri

Sağlıklı bir bireyde stres sırasında meydana gelen hipergliseminin faydalı olabileceği ifade edilmektedir. Ancak son yıllarda yapılan araştırmaların ışığında glisemik kontrolün yoğun bakım ve operasyon hastalarındaki önemi ortaya koyulmuştur. Akut hiperglisemi, C reaktif protein (CRP) gibi akut faz proteinlerinin sentezini uyaran interlökin 6 (IL6) ve tümör nekroz faktörü (TNF) gibi inflamatuvar belirteçleri arttırmaktadır (Lazar ve ark., 2004). Normal şartlarda hücreler hiperglisemiye karşı korunsa da stres tepkisi sırasında karşıt düzenleyici hormonların (katekolaminler, kortizol, glukagon) salgılanması, hücrel glukozun aşırı yüklenmesine neden olur. Hiperglisemi oksidatif stresi, reaktif oksijen türlerinin oluşumunu artırır ve dolayısıyla endotelial hücrel fonksiyon bozukluğu meydana getirir. Bunun sonucunda ise lokal iskemiye yol açan ve yara iyileşmesini engelleyen trombozu teşvik eder (Anand ve ark., 2010). Ayrıca hipergliseminin, polimorfonükleer lökosit disfonksiyonu, bozulmuş kemotaksis, fagositoz ve granülosit yapışmasındaki anormallikler ile ilişkili olduğu ifade edilmiştir. Bu etkileri nedeniyle hipergliseminin immunsupresyon etkisinin de olduğu söylenmektedir (Lazar ve ark., 2004).

Cerrahi işlem sırasında salınan sitokinlere bağlı meydana gelen insülin direnci nedeniyle hipergliseminin kalp cerrahisi prosedürleri sırasında yaygın bir sorun olduğuna dair kanıtlar bulunmaktadır (Shine ve ark., 2007). İnsan hekimliği ve hayvan deney modellerinde, sepsis gibi kritik hastalıklar sırasında sıkı glisemik kontrolün belirgin derecede iyi sonuçlara yol açtığını gösteren, giderek artan sayıda veri gözlenmektedir (Wiedmeyer ve DeClue, 2008). Glukoz konsantrasyonunun normal seviyede tutulduğu sepsisli insan hastalarda mortalitenin %50'ye kadar azaltılabileceği ifade edilmektedir (Rusavy ve ark., 2004). Yine insanlarda yapılan bir çalışmada, kan glukoz değerinin 220 mg/dL üzerinde olan hastaların ameliyattan sonraki 24 saat içinde ciddi enfeksiyon görülme sıklığının daha yüksek olduğu tespit edilmiştir (McCowen ve ark., 2000). Köpeklerde yapılan bir araştırmada ise postoperatif olarak hiperglisemi gelişen sepsisli köpeklerin %50' sinin öldüğü, normal glukoz konsantrasyonuna sahip grupta ise mortalitenin %14 olduğu belirtilmiştir (Hardie ve ark., 1985). Öte yandan operasyon öncesi yüksek açlık kan şekeri düzeylerinin aritmi, ateletazi ve uzun süreli mekanik ventilasyon ile güçlü bir şekilde ilişkili olduğu, üç aylık glukoz konsantrasyonu ortalamasını ifade eden HbA1c değerindeki yüksekliklerin ise masif kanama ve çoklu organ yetmezliği ile

ilişkili olduğunu gösterilmiştir (Blankush ve ark., 2016). Yapılan bir diğer çalışmada ise, ortalama intraoperatif kan şekeri seviyesindeki her 20 mg/dL'lik artışın, olumsuz sonuç riskini %30'dan fazla artırdığı gösterilmiştir (Gandhi ve ark., 2005).

Kan glukozunun 250 mg/dL'nin üzerinde olduğu durumlarda böbrek glukoz eşik değerinin aşılması ile glukozüri meydana gelmektedir. Glukozürinin ozmotik diürez etkisi sonucunda ise hastalarda dehidrasyon, hiponatremi, hipokalemi ve hipofosfatemi gibi elektrolit dengesizlikler gözlenmektedir (Lipshutz ve ark., 2009; Schermerhorn, 2016).

Hem insüline bağlı hem de insüline bağlı olmayan diyabet hastaları, felç için önemli risk gruplarıdır. Diyabet hastalığının, felç sonrası artan mortalite ve azalan fonksiyonel sonuçlarla ilişkili olduğu gösterilmiştir. Yapılan incelemeler sonucunda felç geçiren hiperglisemili hastalarda yüksek kan şekeri düzeylerinin prognostik önemini tanımlanmıştır. Hiperglisemi, felç sonrasında sık görülen bir bulgudur. Bu akut durum, metabolik stresi ve/veya altta yatan bozulmuş glukoz metabolizması ifade edebilmektedir. Pek çok geniş çaplı klinik çalışma, yüksek kan şekeri ile felçten kaynaklanan kötü sonuçlar arasında (mortalite ve azalmış fonksiyonel iyileşme) doğru orantı olduğunu ortaya koymuştur. Öte yandan felç hastalarının çoğunun diyabet hastası olmasına karşın önemli bir kısmında diyabet kanıtı olmayan stres hiperglisemisi bulunduğu gözlenmiştir. Bunun sonucunda tek başına yüksek kan şekerinin başlı başına kötü bir sonuçla ilişkili olduğu sonucuna varılmıştır (Gray ve ark., 2001). Diyabet hastalarında ise ateroskleroz insidansının yüksek olması nedeniyle bu hastalarda meydana gelen komplikasyonlar araştırmacılar tarafından ateroskleroza bağlı zayıf doku perfüzyonu şeklinde yorumlanmıştır (Shine ve ark., 2007).

1.2. Operasyon öncesi hasta yönetimi

Glukoz ve kortizol parametreleri, ağrı ve stresin değerlendirilmesine yönelik kabul görmüş biyokimyasal biyobelirteçlerdendir. Yapılan çalışmalarda hastalarda kontrol altına alınmayan ağrı ve yoğun stres varlığında kortizol ve glukoz değerlerinde belirgin artış gözlenmiştir (Moldal ve ark., 2018).

Operasyon öncesinde, anestezi ve operasyon planlamasına yönelik olarak glukoz değerleri mutlaka ölçülmelidir. Şüpheli yüksek glukoz değerleri varlığında, perioperatif hiperglisemi riski taşıyan hastaları belirlemek için fruktozamin, HbA_{1c} ölçümü ve idrar analizi yapılmalıdır. Glukoz seviyesi yönünden kritik durumda olan hastalar perioperatif dönemde yakın takip altında tutulmalıdır (Kouroumalis ve ark., 2018).

Hastaların glukoz ölçümleri anlık olarak kulak ucu veya pulvinusta meydana getirilen kılcal kanamadan glukometre ile yapılabileceği gibi, venadan alınan sistemik kandan elde edilen

serum veya plazma örneklerinden de ölçümler yapılabilmektedir. Tam kan, bir test tüpünde durduğunda kan hücrelerinin kanın içeriğindeki glukozu metabolize etmesi nedeniyle, glukoz seviyesi düşebileceği için kan örnekleri hızlı şekilde çalışılmalıdır (Weissman ve Klein, 1958). Dünya Sağlık Örgütü (WHO), kan glukoz seviyesinin izlenmesi için venöz plazma analizini önermektedir (Kouroumalis ve ark., 2018).

1.2.1. Hiperglisemi ve diyabet hastaların yönetimi

Perioperatif kan glukoz seviyesi kontrolüne ilişkin protokollerle ilgili çok sayıda çalışma olmasına rağmen, optimal yaklaşımla ilgili hala çok fazla tartışma mevcuttur. Temel olarak hipergliseminin olumsuz etkilerini en aza indirecek protokoller seçilmeye çalışılmaktadır (Kouroumalis ve ark., 2018). Hiperglisemiye yönelik oluşturulan insülin protokolünün basit olması gerektiği üzerinde özellikle durulmaktadır. Protokol karmaşıklıktıkça hata riskinin artacağı, anesteziistlerin veya teknikerlerin protokolü uygulama olasılığının azalacağı göz önünde bulundurulmalıdır (Shine ve ark., 2007).

Diyabet hastaları için operasyon öncesi farklı insülin ve açlık rejimi protokolleri kullanılabilir. Protokollerin herhangi birinin diğerine karşı belirgin bir faydası veya riski gözlenmemiştir. Yapılan bir çalışmada katarakt operasyonu endikasyonu bulunan, diyabet hastalığı teşhisi konmuş köpekler anestezi öncesi açlık süresi ve yapılan insülin uygulamalarına göre dört gruba ayrılmışlardır. Bu gruplar; operasyon öncesi 12 saatlik açlık ve operasyon sabahı rutin uygulanan dozun yarısı insülin dozu, 6 saatlik açlık ve yarım insülin dozu, 12 saatlik açlık ve tam insülin dozu ve son olarak 12 saatlik açlık ve insülin uygulanmaması şeklinde oluşturulmuştur. 48 köpeğin dahil edildiği bu çalışmada sadece 12 saatlik aç ve insülin uygulanmayan grupta operasyon öncesine oranla ciddi bir hiperglisemi gözlenmesine karşın diğer üç grup arasında kayda değer bir veri tespit edilmemiştir (Adami, 2020).

Öte yandan perioperatif insülin uygulamalarının devamlı infüzyon veya subkutan bolus doz şeklinde uygulanmalarından hangisinin daha başarılı olduğu yönünde tartışmalar devam etmektedir. Yapılan bir çalışmada devamlı insülin infüzyonu ile tedavi edilen hastaların, subkutan insülin alan kontrollerle karşılaştırıldığında postoperatif derin cerrahi alan enfeksiyonu oranının daha düşük gözlendiği ifade edilmektedir. Araştırmacılar, koroner arter baypas greft uygulanan diyabetli hastalarda glukoz kontrolü için sürekli insülin infüzyonunun standart tedavi haline gelmesini önermektedir (Furnary ve ark.,2003). Buna karşın yüksek doz insüline bağlı iatrojenik hipoglisemi riski nedeniyle bolus subkutan uygulamaların daha güvenli olduğu kanısı da devam etmektedir (Lipshutz ve ark., 2009). Ek olarak intravenöz insülin ile glukoz konsantrasyonu yönetimi, hipokalemi riski ile de ilişkilidir. Potasyum hücre içi olarak

glukoz ve insülin ile taşınmaktadır. Bu nedenle kan glukoz ölçümleri sırasında serum potasyum konsantrasyonlarının da kontrol edilmesi gerekmektedir (Schermerhorn, 2016).

Köpek ve kedilerde net olarak tanımlanmış bir glisemik hedef bulunmamaktadır. Ancak kan şekerinin 180 mg/dL -200 mg/dL arasında tutulmaya çalışılması güvenli bir hedef olarak kabul edilmektedir. 200 mg/dL-250 mg/dL arası güvenli bir üst sınır olarak önerilir, ancak hiperozmolalitenin endişe verici olduğu veya glukoz aracılı diürezden kaçınmaya çalışıldığı durumlar gibi belirli durumlarda daha düşük bir aralık hedef olarak belirlenebilmektedir. Kan glukozu 250 mg/dL'nin altında olduğunda, glukozüri için böbrek eşiği aşılmamaktadır. Bu sayede ozmotik diürezisi ve çözünen madde kaybını azaltılarak diyabetin klinik belirtilerini en aza indirilmektedir. 250 mg/dL'nin altındaki glukoz hedefleri daha iyi günlük glisemik kontrol sağlayabilir ancak hipoglisemiyi önlemek için devamlı insülin uygulaması yapılıyor ise doz ayarları sık sık tekrar yapılmalı ve hasta daha yakından izlenmelidir (Schermerhorn, 2016).

Hipergliseminin akut müdahalesine yönelik olarak; kısa etkili regüler kristalize insülin 2,2 U/kg dozunda, 250 ml %0,9 NaCl serum içerisine karıştırıldıktan sonra, hasta için hedef glukoz konsantrasyonuna ulaşana kadar 7-10 ml/saat sabit hızlı devamlı infüzyon şeklinde uygulanması önerilmektedir. Hastaya infüzyon başlatılmadan önce 50 ml insülin- serum karışımı, serum hortumundan akıtılarak serum seti içerisinde potansiyel insülin yapışma alanlarının doyurulması gerekmektedir. Hastaya yönelik hedeflenen kan glukoz değerine ulaşılmasının ardından 1-2 ml/saat sabit hızlı devamlı infüzyon yapılabilir. Ancak 1-2 saat aralıklar ile mutlaka hastanın mevcut kan glukoz değeri ölçülmelidir (Schermerhorn, 2016).

Bununla beraber operasyon öncesi akut hiperglisemi müdahalesinin mi yoksa operasyondan önce yapılan düzenli hiperglisemi tedavisinin mi hastaya ve operasyona yönelik olumlu sonuçlarının daha fazla olacağı sorusu akla gelmiştir. Bunun tespit edilmesine yönelik olarak streptozotosin enjeksiyonu ile deney farelerinde tip-1 diyabet modeli oluşturulmuştur. Fareler; sağlıklı olan kontrol grubu, operasyon öncesi iki hafta boyunca insülin tedavisi görenler, operasyon günü akut hiperglisemi müdahalesi yapılanlar ve hiç tedavi edilmeyenler olmak üzere dört gruba ayrılmıştır. Tüm farelerde *Staphylococcus Aureus* ile kontamine cerrahi yara oluşturulmuştur. Her gruptaki farelerin yarısına üçüncü günde geri kalan yarısına ise altıncı günde ötenazi işlemi uygulanarak biseps femoris kasları incelenmiştir. Deney sonucunda operasyondan hemen önce kısa süreli glisemik kontrol sağlanan ve uzun süreli glisemik kontrol sağlanan gruplar arasında kas bakteri yükü ve deneklerin kan glukoz sonuçları yönünden belirgin farklılık gözlenmemiştir. Bu sayede kısa süreli bir glisemik kontrolün uzun süreli glisemik kontrol kadar etkili olduğu ortaya koyulmuştur (Kroin ve ark., 2015).

1.2.2. Hipoglisemi yönetimi

Merkezi sinir sistemi enerjisinin çoğunu glikoz metabolizmasından sağlamaktadır. İnsülin kaynaklı hipoglisemi genel bir nöroglükopeni durumu yaratır. Bunun sonucunda halsizlik, sinirlilik, davranış değişiklikleri, nöbetler, koma ve ölüm gibi çok çeşitli klinik belirtiler gözlemlenebilmektedir. Klinik belirtilerin başlaması hem hipogliseminin derecesine hem de kan şekeri düşüş hızına bağlıdır (Goutal ve ark., 2012).

Özellikle yavru kedi ve köpeklerde operasyon öncesi uzun açlık sürelerinin hastalarda önemli hipoglisemi şekillendirme ihtimali nedeniyle bu hastalar uzun süre aç bırakılmaktan kaçınılmaya çalışılmaktadır. Buna karşın yaşları 2-4 ay arası olan 75 sağlıklı erkek ve dişi kedi tüm gece aç bırakıldıktan sonra kısırlaştırma operasyonuna alınmıştır. Operasyon öncesi ve sonrasında hastaların hiçbirinde hipoglisemiye (60 mg/dL'nin altında değer veya klinik bulgu) rastlanmamıştır. Aynı şekilde, operasyon sonrası hiçbir yavru kedinin kan şekeri 70 mg/dL'nin altında tespit edilmemiştir. Aksine yavru kedilerin %44'ünde ameliyat sonrası hiperglisemi (150 mg/dL'in üzerinde değer) gözlenmiştir. Bu çalışma ile beraber sağlıklı yavru kedilerde uzun süreli açlık sonrası kısa operatif işlemlerin hipoglisemi kaygısı olmadan rahatlıkla uygulanabileceği gösterilmiştir (Semick ve ark., 2018).

Öte yandan uzun süreli operasyonlara yönelik olarak, hastanın hipoglisemi riski altında olmadığından emin olmak için hastanede yatış sırasında her gün birkaç kez kan şekerinin ölçülmesi tavsiye edilmektedir. Anestezi sırasında, hastalar hipogliseminin erken belirtileri (baş ağrısı, titreme, kas zayıflığı, görme bozuklukları, açlık, terleme) gözlenemeyeceği için kan şekeri düzeylerinin sık sık kontrol edilmesi ve dekstroz infüzyonunun hazır bekletilmesi gerekmektedir. Genellikle kan şekeri düzeyi 60 mg/dL (3,3 mmol/L) 'nin altına düştüğünde hipoglisemiyi tedavi etmek uygulamalarına başlanmaktadır (Van den Berghe ve ark., 2001).

Hipoglisemik krizler yani klinik belirtilerin gözlemlendiği ataklar, başlangıçta 1 ml/kg, %25 dekstrozun 10 dakika boyunca intravenöz uygulamasıyla yönetilmelidir. Stabilizasyondan sonra hasta anestezi altında değilse, yemek verilmeli ve %5 dekstroz içeren sıvılarla intravenöz uygulama sürdürülmelidir. Periferik damarlar uzun süre hipertonic solüsyonları tolere edemedikleri ve tromboflebite duyarlı olduklarından, santral venöz kateter kullanılmadığı sürece hipertonic dekstroz sıvıların uzun süre kullanımından genellikle kaçınılması önerilmektedir (Meleo, 1990; Goutal ve ark., 2012).

Glukokortikoidler, hepatik glukoneogenezi ve glikojenolizi uyarıp, hücresel insülin reseptörlerinin glukozu afinitesine müdahale ederek kan şekeri düzeylerinde artışa neden olurlar. 0,5 mg/kg/gün dozunda (günde 2-3 doza bölünmüş) prednizon veya 0,5 mg/kg

deksametazon intravenöz olarak 12-24 saat ara ile hipogliseminin ve klinik belirtilerin önlenmesine yardımcı olmaktadır. Glukokortikoidler, hiperinsülinizmin neden olduğu hipogliseminin palyatif tıbbi tedavisinin önemli bir parçasıdır. Dirençli vakalarda daha yüksek steroid dozlar, yan etkileri takip edilerek kullanılabilir. Glukokortikoid tedavisinin hasta tarafından tolere edilemeyen yan etkiler meydana getirdiği tespit edilir ise bu hastalarda alternatif tedaviler düşünülmelidir (Feldman ve Nelson, 2004; Goutal ve ark., 2012; Meleo, 1990; Feldman ve Nelson, 2004).

İnsülin antagonisti hormon olan glukagon, karaciğer glikojeninin parçalanmasını teşvik ederek ve mevcut amino asit substratlarından hepatik glukoneogenezi artırarak derin bir hiperglisemik etki meydana getirir. Dirençli hipoglisemik krizde, inatçı hiperinsülinizme rağmen öglisemiği sürdürmek için sabit hızda glukagon infüzyonu kullanılabilir. Glukagon için başlangıç infüzyon hızı 5 ng/kg/dakikadır. Devamında mevcut kan şekeri konsantrasyonu ölçülerek ayarlama yapılmalıdır. Glukagon kullanımı, akut hipoglisemik atakların tedavisinde umut verici sonuçlar vermiştir. Glukokortikoidlerin aksine, reaktif insülin salınımını ve hipogliseminin geri tepmesini uyarmaması olumlu yönlerindedir (Smith ve Harkin, 2000; Goutal ve ark., 2012).

1.3. Anestezi sürecinde hasta yönetimi

Hekimler, operasyon hastalarının hastanede kaldıkları perioperatif dönemdeki glisemik kontrolü konusunda tam olarak bilgi sahibi olmalıdır. Ameliyat öncesi glukoz ölçümü mutlaka yapılmalıdır. Ameliyat olan hastalarda glukoz kullanımının azalmasına bağlı kanda glukoz artışı meydana geleceği unutulmamalıdır. Ameliyattan önceki sabah hiçbir oral hipoglisemik ilaç uygulanmamalıdır. Ancak önerilen orta etkili insülin dozunun yarısı veya uzun etkili insülinin tam dozu uygulanmalıdır (Kouroumalis ve ark., 2018).

24 kedi üzerinde yapılan araştırma sonucunda ağrı oluşturulmayan hastalarda dahi anesteziye alınma işlemleri sırasında hastalarda glukoz ve kortizol seviyelerinde artış meydana geldiği ortaya koyulmuştur (Glerum ve ark., 2001). Bu nedenle hastaların anesteziye alınma süreci en az stres yaratacak şekilde geçirilmeye çalışılmalıdır. Operasyonda manipülasyona maruz kalmaya bağlı şekillenen stres tepkileri, yeterli genel anestezi alan hastalarda bile doku hasarı ve manipülasyonun indüklediği nosiseptif afferent aktivite tarafından uyarılır (Roizen ,1988). Analjeziklerin sistemik uygulanması stres tepkisini azaltmaktadır. Önleyici olarak cerrahi işlemden önce uygulandıklarında en etkili oldukları gözlenmiştir. Özellikle alfa-2 adrenerjik agonistler, sistemik olarak uygulandıklarında doğrudan ve dolaylı olarak stres tepkisini azaltırlar. Dolaylı olarak, sedatif ve analjezik aktiviteleri yoluyla anksiyete ve ağrı gibi stres etkenlerinin algılanmasını azaltarak stres tepkisini engellerler. Doğrudan etkilerinde ise,

nöroendokrin stres tepkisini inhibe ederler. Spesifik olarak, bu ilaçlar sempatik tonu azaltır, kortizol ve antidiüretik hormonu (ADH) inhibe ederken, büyüme hormonu salınımını artırır. Özellikle majör prosedürler için başvuran kritik hastalarda stresi azaltmak ve dolayısıyla hasta sonuçlarını iyileştirmek için bu ilaçların perioperatif olarak kullanılmasına büyük ilgi mevcuttur (Maze ve Tranquilli, 1991). Karşılaştırma yapacak olursak, morfin uygulamasının dahi kedilerde onikektomi sonrası plazma katekolamin konsantrasyonlarını sadece azalttığı, oysa alfa-2 adrenerjik agonistlerin bir üyesi olan ksilazinin katekolamin konsantrasyonlarının neredeyse tespit edilemeyecek seviyelere düşmesine neden olduğu gösterilmiştir (Benson ve ark., 1991). Operasyon öncesi yine alfa-2 adrenerjik agonist grubunun üyesi olan medetomidin uygulamasının, ovariohisterektominin neden olduğu katekolamin tepkisini önlediği, ACTH ve kortizol tepkilerini geciktirdiği ortaya koyulmuştur. Buna karşın bu etkinin ne kadarının sempatoadrenal ve adrenomeduller fonksiyonun doğrudan alfa-2 inhibisyonundan kaynaklandığı ve ne kadarının merkezi sinir sisteminin alfa-2 aracılı depresyonu ve azalmış stres tepkileriyle sonuçlanan nosiseptif fonksiyondan kaynaklandığının belirlenemediği ifade edilmektedir. Önceki çalışmalar, stres yanıtının yaralanmanın ciddiyeti ile orantılı olduğunu göstermiştir (Benson ve ark., 2000; Desborough, 2000). Bu nedenle ameliyatın vücut üzerindeki olumsuz etkisini en aza indirecek cerrahi prosedürlerin seçilmesinin önemli olduğu ifade edilmesine karşın ovariohisterektomi veya ovariektomi uygulanan köpekler arasında CRP ve glukoz seviyelerinde anlamlı bir fark gözlenmemiştir (Moldal ve ark., 2018). Yine kedilerde ovariohisterektomi veya ovariektomi işlemlerinin benzer yoğunlukta postoperatif ağrıya neden oldukları ve çalışmanın değerlendirme süresi boyunca herhangi bir kısa vadeli komplikasyon yaşanmadığı ifade edilmektedir. Öte yandan alfa-2 adrenerjik reseptörler pankreastan insülin salınımını engellemektedir. Hiperglisemi ihtimali bulunan durumlarda dikkatli kullanılmalıdırlar (Pereira ve ark., 2018).

Köpeklerde perioperatif analjezi sağlamak için yaygın olarak paranteral fentanil kullanılmaktadır (Lamont ve Mathews, 2007). 24 kedi üzerinde yapılan bir çalışmada ise transdermal fentanil yama uygulamasının ovariohisterektomi ile ilişkili perioperatif ağrı ve stresin biyokimyasal belirteçlerini etkileyerek, cerrahi ve erken cerrahi sonrası dönemlerde serum kortizol ve kan şekeri konsantrasyonlarındaki artışın önüne geçtiğini ortaya koyulmuştur (Glerum ve ark, 2001).

Spinal (intratekal) anestezi ise, hem operasyon alanından gelen afferent uyarıların hem de karaciğere ve adrenal medullaya giden efferent otonom yolların derin derecede bloke edilmesini sayesinde operasyona verilen adrenokortikal ve glisemik yanıtın oluşmasını engeller (Wolf ve

ark. 1998; Wolf, 2012). Periferik sinir bloğu veya spinal anestezi ile yapılan analjezinin, fentanil uygulamaları ile karşılaştırıldığında ameliyata verilen glisemik ve kortizol yanıtları daha iyi önlediği, daha iyi iyileşme kalitesi sunduğu ve ameliyat sonrası ağrı skorlarını daha çok düşürdüğü ortaya koyulmuştur. Bu çalışma ile kullanılan bölgesel anestezi tekniklerinin fentanil uygulamasına mükemmel alternatifler olduğu bulunmuştur (Romano ve ark.,2016). Laparoskopik ovariohisterektomi sonrası postoperatif ağrı davranışını ve biyokimyasal stres yanıtını hafifletmek için intraperitoneal bupivakain spreyinin kullanımı araştırılan bir başka çalışmada ise laparoskopik ovariohisterektomi sonrası ağrı tedavisinde multimodal yaklaşımın bir parçası olarak sprey intraperitoneal bupivakain kullanımının kullanılabilirliği öne sürülmüştür. Ancak bupivakain püskürtülmüş grup ile püskürtülmemiş grup arasında glukoz değerleri yönünden anlamlı bir fark gözlenmemiştir. Buna karşın operasyon sonrası püskürtülmüş grupta kortizol seviyesinin daha hızlı düştüğü gözlenmiştir (Kim ve ark., 2012). İndüksiyon sırasında kullanılan intravenöz anesteziklerin anesteziye, metabolik ve endokrin yanıtları ve cerrahi stresi daha iyi baskıladığı bildirilmektedir. Propofolün kimyasal yapısından dolayı E vitamini gibi, fenol bazlı serbest radikal temizleyicilere benzer potansiyel antioksidan özelliklere sahip olduğu rapor edilmiştir. Hayvanlarda propofolün, artan oksidatif stresin neden olduğu serebral mikrovasküler hasara karşı koruyucu olduğu ifade edilmektedir (Nakahata ve ark.,2008; Pekcan ve ark., 2021).

İzofluran, desfluran gibi inhalasyon anesteziklerinin uygulandığı hastalarda kortizol, epinefrin, norepinefrin konsantrasyonlarını arttığı, glukoz intoleransının gözlendiği ve endojen glukoz artışıyla birlikte hiperglisemik yanıt geliştiği ortaya koyulmuştur. İntrakraniyal kitle operasyonu yapılan hastalarda anestezi devamı propofol infüzyonu ile total intravenöz, izofluran veya desfluran ile de inhaler olarak üç ayrı şekilde sağlanmıştır. Araştırma sonunda veriler incelendiğinde propofol ile anestezi devamı sağlanan hastalarda glukoz seviyesinde belirgin şekilde olumlu bir seyir gözlenmektedir (Pekcan ve ark., 2021).

1.4. Hastaların takibi süreci

Glukoz seviyesi yönünden kritik durumda olan hastalar perioperatif dönemde yakın takip altında tutulmalıdır. Özellikle hipoglisemi yönünden risk altında olan pediatrik hastalarda damar erişiminin kısıtlı olması, flebotomiye bağlı iatrojenik anemi ve hipovolemi endişesi kan örneklemelerini sınırlamaktadır. İnsan diyabet hastaları için evde glukoz konsantrasyonu izleme yöntemi olarak tasarlanmış olan sürekli glikoz izleme sistemleri (CGMS) kedi ve köpeklerde de kullanıma girmiştir. CGMS ile hastaların sistemik kan glukoz değerine uyumlu olarak deri altı interstisyel sıvı glukoz değeri ölçülmektedir. Cihaza bağlı olarak ölçüm sıklıkları

değişmek ile beraber, 2-5 dakika aralıklar ile ölçüm ve kayıt yapan cihazlar hem hipoglisemi hem de hiperglisemi yönünden riskli olan hastalarda tekrarlı kan alma işlemi ve hastada stres-ağrı duyusu oluşturmada yakın takip imkânı sunmaktadır. Bu ölçüm tekniği sayesinde stres hiperglisemine bağlı doğru ölçüm yapılamaması sorunu çözülebilmektedir. CGMS'nin gerçek zamanlı sonuçlar vermesi sayesinde operasyon sırasında rutin vital parametrelerin değerlendirilmesinin yanı sıra glukoz takibi de sık aralıklar ile yapılabilmektedir (Wiedmeyer ve DeClue, 2008).

Teknolojideki ilerlemeler ile operasyondaki hastalar için yapay bir endokrin pankreas kullanarak perioperatif sıkı glisemik kontrolün sağlanması gündeme gelmiştir. Bu amaçla kapalı devre yapay endokrin sistemi kullanılmaya başlanmıştır. Bu sistem, normogliseminin sürdürülmesi amacıyla belirlenen hedef glikoz değerine göre kan şekeri seviyesini ayarlamak için insülin ve/veya glukozu otomatik olarak infüze etmektedir. Total olarak pankreası alınmış köpeklerde dahi başarılı sonuçlar elde edilmiştir (Hanazaki ve ark., 2010).

İntravenöz insülin ile glukoz seviyelerinin korunması, hipokalemi riski ile ilişkilidir. Potasyum hücre içi olarak glikoz ve insülin ile taşınır; bu nedenle kan şekerini ölçerken serum potasyum konsantrasyonlarını kontrol etmek ve buna göre tedavi uygulamak gerekmektedir. Postoperatif dönemde, anestezi sonrası bakım ünitesinde glukoz ve potasyum takibine devam edilmelidir. Hasta anestezi sonrası yeniden ısınmaya devam ettikçe insülin direnci azalarak hipoglisemi potansiyeli daha da artacaktır (Van den Berghe ve ark., 2001; Davidson ve ark., 2005).

SONUÇ

Hem hiperglisemi hem de hipoglisemi, operasyon hastaları için hayatı önem arz etmektedir. Operasyon planlaması yapılırken hastalar glukoz metabolizması yönünden mutlaka değerlendirilmelidir. Anormal parametreler gözlenen hastalar, dahiliye ile konsülte edildikten sonra operasyon kararı halen geçerli ise mevcut glukoz metabolizması göz önünde bulundurularak anestezi protokolü tercihi yapılmalıdır. Glukoz metabolizması normal olsun veya olmasın tüm hastalar strese bağlı gelişen şiddetli hipergliseminin etkilerinden uzak tutulmalıdır. Stres ve ağrı yönetimi es geçilmemelidir. Yüksek glukoz değerlerinin operasyon yarasının iyileşme hızını ve kontaminasyon riskini etkileyeceği unutulmamalıdır.

Operasyon öncesi insülin kullanımı ve hastaların açlık süresi ile ilgili ortak karara henüz varılamamıştır. Teknolojinin gelişimi ile glukoz metabolizması yönünden riskli olan hastaların perioperatif dönemde daha doğru sonuçlar ile sık aralıklarla, yakından takip imkanları bulunması bu hastaların sağ kalım oranlarını ve refah seviyelerini artıracaktır.

ABSTRACT

Laser powder bed fusion (LPBF) is an advanced additive manufacturing technique widely employed for producing components with complex geometries and custom designs, as well as for rapid prototyping. Recently, there has been a rising trend in the utilization of Co-Cr alloys in additive manufacturing due to the appropriateness of these alloys in biomedical and high-temperature engine parts applications. Many process parameters in additive manufacturing influence the mechanical, chemical, and dimensional properties of the parts. Dimensional accuracy is paramount for the product's usability, reducing post-production procedures by guaranteeing adherence to the intended design geometry. Optimization methods and experimental design techniques facilitate quick results through a series of experiments and statistical calculations. In this study, utilizing the response surface methodology and Box-Behnken design, the influence of scanning speeds, beam compensation, and hatch distance values on dimensional accuracy was explored and optimized. During production, laser power, layer thickness and laser spot diameter were maintained at 240W, 30 μm , 75 μm , respectively. Fifteen cylindrical samples with an outer diameter of 6 mm and a wall thickness of 1 mm were fabricated. The outer diameters of these samples were precisely measured using a micrometer and input into a statistical software. The obtained results indicated R² and R²_{pred} values as 99.48% and 96.90% respectively, and with a significance level of $p < 0.05$. Consequently, scanning speed was identified as the most influential parameter on dimensional accuracy. Applying the optimized parameters during the manufacturing process led to the successful realization of the intended diameter value, yielding a measurement of 6.02 mm.

Keywords: Additive Manufacturing, Laser Power Bed Fusion, Co-Cr Alloys, Dimensional Accuracy, Design of Experiments, Response Surface Method

INTRODUCTION

Additive Manufacturing (AM) technology has triggered a radical transformation in industrial production since the beginning of the 21st century. This innovative approach has enabled the effective production of components with complex geometries, which are challenging to achieve through traditional manufacturing methods (Babacan & Seremet, 2022). The Laser powder bed fusion (LPBF) technique, which operates by melting fine powder layers with a laser, stands out among AM processes in industrial applications (Babacan et al., 2021).

The CoCrMo alloy, compliant with ASTM F75 standards, has become one of the most notable materials in additive manufacturing. Known for its superior wear and corrosion resistance, this alloy, thanks to its biocompatibility, is frequently chosen for applications such as joint implants, prosthetics, and dental treatments (Park et al., 2021).

However, additive manufacturing also presents its unique challenges. The complexity of the process requires the precise adjustment of numerous variables. These settings directly influence the dimensional accuracy and overall quality of the produced components (Tofail et al., 2018). In this context, the broad value ranges of variables and the requirement for numerous trials emphasize the necessity of resorting to experimental design methods such as the Response Surface Methodology. This methodology uses experimental design techniques to examine the relationship between dependent and independent variables. The Box-Behnken design is one of the effective experimental design techniques applied within this methodology. This design method provides insights with fewer experimental needs as it doesn't encompass all factor combinations. (Ferreira et al., 2007)

This study aims to investigate how to optimize the dimensional accuracy of the CoCrMo alloy during the LPBF process using RSM and the Box-Behnken design. Specifically, it seeks to evaluate and optimize the impact of parameters like scanning speeds, beam compensation, and hatch distances, through the diameter measurements of a cylindrical specimen.

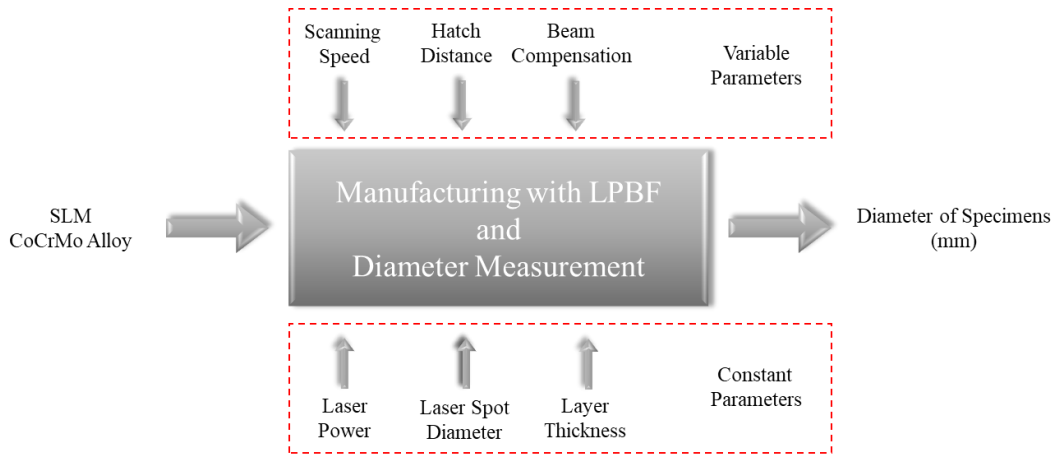

Figure 1. The Diagram of Design of Experiment

MATERIALS and METHODS

In this study, the Minitab software was employed for statistical analysis, experimental design, and optimization. During the experimental design phase, the Response Surface Methodology (RSM) and the Box-Behnken design were utilized. Cylindrical tube-shaped samples, designed in the 3D modeling software SOLIDWORKS with an outer diameter of 6 mm and a wall thickness of 1 mm, were considered as the response matrix. Their diameter measurements were

Figure 2. Cause and Effect Diagram

taken with a precise digital micrometer. Variable parameters included beam compensation, hatch distance, and scanning speed, as illustrated in Figure 1. Throughout the production, the laser power, layer thickness, and laser spot diameter were consistently maintained at 240W,

30 μ m, and 75 μ m, respectively. According to the Box-Behnken design, three distinct level values for the variables were determined, as shown in Figure 2.

Table 1. SLM production parameters of specimens

Specimen No	Laser Speed (mm/s)	Hatch Distance (μ m)	Beam Comp. (μ m)
1	400	70	70
2	800	70	70
3	400	130	70
4	800	130	70
5	400	100	45
6	800	100	45
7	400	100	95
8	800	100	95
9	600	70	45
10	600	130	45
11	600	70	95
12	600	130	95
13	600	100	70
14	600	100	70
15	600	100	70

Two separate productions were carried out: the first involved the manufacturing of 15 samples based on the experimental design, and the subsequent production was a single specimen manufactured with the optimized parameters. The production parameters for the first set of samples are detailed in Table 1. Upon entering the experimental results into the Minitab software, the optimization parameters for the subsequent production were as presented in Table

Table 2. The optimization parameters

Response	Goal	Lower	Target	Upper	Importance
Diameter	Target	5,95	6	6,05	10

FINDINGS and DISCUSSION

Through the optimization exercises undertaken, optimal settings for scanning speed, beam compensation, and hatch distance were established as 800 mm/s, 95 μ m, and 70 μ m respectively. Employing these settings yielded a specimen with a diameter of 6.02 mm, as showcased in Table 3. The prior sections of this study delineated experiments that illuminated strategies for enhancing the dimensional precision of CoCrMo alloy specimens produced

through the LPBF method, utilizing specialized experimental design techniques. Analysis of the diameters of specimens, in line with the design detailed in Table 3, revealed exceedingly high R2 and R2pred values, which accentuate the dependability of these experimental findings for optimization tasks (Table 4). As illustrated in Figure 3's Pareto chart, six specific parameters or their combined interactions exert a significant influence on the specimen's diameter, with a marked significance level set at $p=0.05$.

Figure 3. Pareto Chart

TH Scanning speed, TM hatch distance ,LD Beam compensation

The scanning speed was observed to play a pivotal role in achieving desired dimensional accuracy. With an increase in scanning speed, there was a noticeable deviation from the intended diameter. This finding aligns with previous studies indicating that faster scanning speeds might cause uneven melting, leading to dimensional discrepancies. The combination of optimized parameters, as derived from the Box-Behnken design and RSM, yielded a diameter of 6.02 mm. This result is remarkably close to the intended diameter of 6 mm, signifying that the optimized parameters can produce components with high accuracy. The impact of other variables, such as beam compensation and hatch distance, was also significant but to a lesser extent compared to scanning speed.

Table 3. Measured diameters of specimens

Specimen	Diameter (mm)
1	6,217
2	6,095
3	6,217
4	6,080
5	6,269
6	6,157
7	6,214
8	6,047
9	6,221
10	6,168
11	6,090
12	6,121
13	6,162
14	6,142
15	6,156
Optimized Specimen	6,020

This study has bridged a knowledge gap in the production of CoCrMo alloy components using LPBF, providing valuable insights into the impact of various process parameters on dimensional accuracy.

Table 4. Model Summary

S	R-sq	R-sq(adj)	R-sq(pred)
0,0075884	99,48%	98,54%	96,90%

CONCLUSION and RECOMMENDATIONS

In conclusion, with a comprehensive understanding and meticulous optimization of the primary parameters, the LPBF technique can prove to be an effective tool for fabricating CoCrMo alloy components with elevated dimensional accuracy. This research has not only optimized these parameters successfully but also emphasized the salient role of the scanning speed in reaching the stipulated dimensions.

For ensuing research and industrial exploits:

1- Diverse experimental design methods can be harnessed. There is a potential to widen the scope by increasing the count of factors and broadening the spectrum of parameter values.

2- Considering the system-specific nature of the response surface method, targeted optimizations could be explored for varied alloys and distinct production modalities.

3- Furthermore, if this optimization study is considered a calibration exercise for the LPBF system, it holds the promise to vouch for consistent outputs over prolonged durations after the conclusion of this study.

This investigation has paved the way for more intricate applications of the LPBF technique, especially in realms like biomedical devices, where the premium is placed on unparalleled precision. Future endeavors should also be cognizant of potential limitations and challenges inherent in the LPBF process to ensure comprehensive and robust outcomes.

Thanks and Information Note

We would like to extend our gratitude to Mr. Aşur YİĞİTER for his invaluable experience and dedication in productions realized through LPBF.

ABSTRACT

A Resolver performs the same function as an encoder. The sole function is to transmit feedback on the angle of rotation and rotation speed of their shaft (rotor). Resolver is an analogue rotary position sensor, which can regulate speed, position or torque through digital impulses. As the primary stator, winding receives a high frequency sinusoidal signal, which is transmitted to the rotor winding. Because, the primary stator winding and the rotor winding act together as a transformer. In servomotors, resolvers are used in various industrial fields such as robotics, automotive, packaging, food and beverage, etc., where electrically powered machines are used for defined processes. Since they are robust and reliable feedback systems that precisely control a servomotor's speed. Therefore, there is currently increasing interest and activity in the area of reliability and fault tolerance for resolvers and hence, this paper is devoted in direction of the area. Through this paper, we will sketch a complete computational procedure for the computation of Mean Time To Failure (MTTF) of Resolvers for different industrial processes.

Keywords: Fault-Tolerant, Dependability, Reliability, Failure, MTTF, Resolver

INTRODUCTION

Fault-Tolerance (FT) is an important element in design and maintenance of critical systems. As the fast growing technological developments the importance of importance of FT is becoming more relevance and the need of the time. The importance of the FT in industrial applications may avert the sever consequences of the system failure. The damage due to failure is not only measured in terms of damage of equipments, financial losses, loss of data, unavailability of the syste which frustrates the users and above to all the loss of human lives. Therefore, it is necessary for the designers of the system and test and maintenance engineers to aware of the accumulation of the FT in the systems which they are supposed to design or to work with (Ahmad, 2020), (Ahmad and Al-Habsi, 1998) and (Ahmad and Nanda 1989).

Fault-tolerant methodologies and techniques ensure dependable operation of industrial systems with minimum assured risks, maximum availability of system; use, minimum failure rate and to monitor the life cycle of each components of the systems. Fault-Tolerant methodologies and technques are based on principles of reliability, and redundancy. The incorprated redundancy in the designed system may be of hardware or software in nature. To maintain the flow to the readers of this paper we present below the terminologies and of defnitios which are frequently encounter while learning about Fault-Tolerance (Koren and Mani Krishna, 2007).

Terminologies: (Ahmad, Al-Abri and Al-Busaidi, 2012) and (Ahmad et. al, 2014)

Fault

Due to underlying defect, imperfection, or flaw that has the potential to cause problems of a malfunction or error in the system such that the system is unable to perform the functions it is required to perform for the time being.

Fault Tolerance

Ability of system to continue error-free operation in presence of unexpected fault.

Availability (A)

Availability of a system is a time measure for which the system remain operational. In ideal case with zero **downtime** (*D*) or data loss in the event of a disruption.

Reliability (*R*)

Reliability is probability, measuring sustainability of performing consistently well.

Failure Rate (λ)

A measure that tells that how often a system fails in a specified time.

Dependability

Dependability is the measure of ability of a system's required functions for its performance under stated conditions for a specified duration.

In (Figure 1), we list the parameters that contributes to dependability.

Maintainability

Maintainability is a scale that measures the easiness, with which a system can be maintained to correct defects or their cause. Alternatively, to repair or replace faulty or worn-out components without having to replace still working parts. On the other hand, may be to prevent unexpected working conditions, to maximize a system's useful life, to maximize efficiency, reliability, and safety, to meet new requirements, to make future maintenance easier, or to cope with a changing environment.

Maintainability involves a process of continuous improvement via learning from the past to improve the ability to maintain systems, or improve the reliability of systems based on maintenance experience.

Mean Time Between Failure (*MTBF*)

The Mean Time Between Failure is a parameter that defines the time gap between occurrences of two failures while system was on its operational mission.

Mean Time To Failure (*MTTF*)

The term Mean Time To Failure differs only slightly from MTBF in a sense that it is used for systems that cannot be repaired and the device directly enters in the recycling process.

Mean Time To Repair (*MTTR*)

Mean Time To Repair is the average time needed for repair. Besides the time for repairing, it includes the time for failure analysis as well.

Through (Figure 2), we explain the relationships between MTTF, MTBF and MTTR.

With introduction of the terminology, we will sketch a complete computational procedure for the computation of MTTF of Resolvers for different industrial processes.

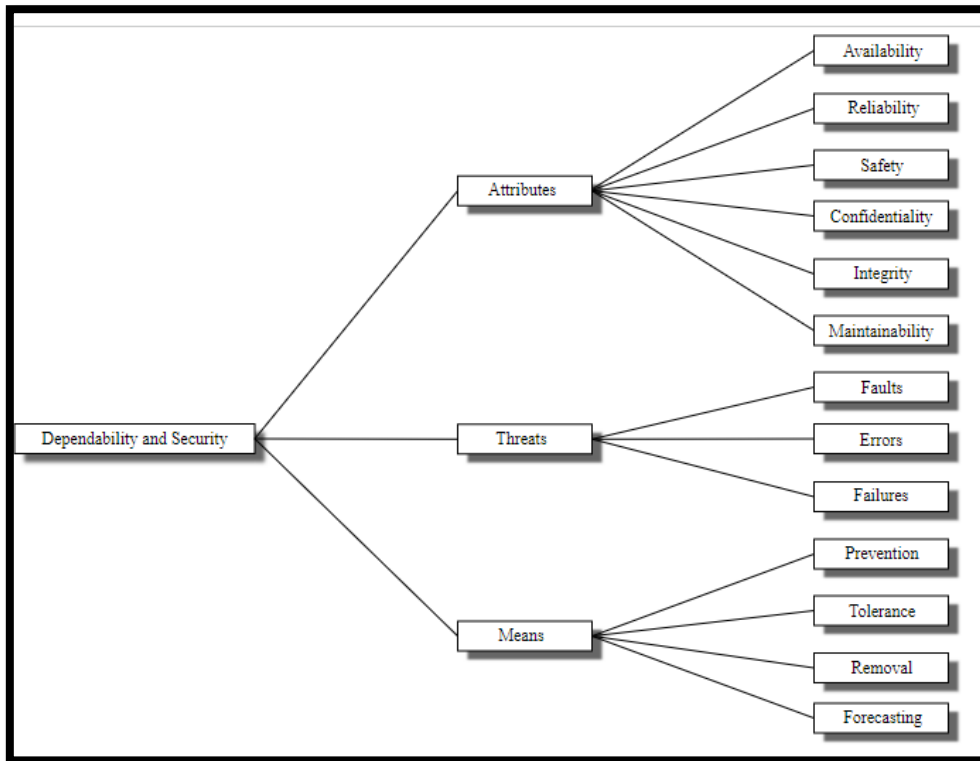

Figure 1. Dependability tree

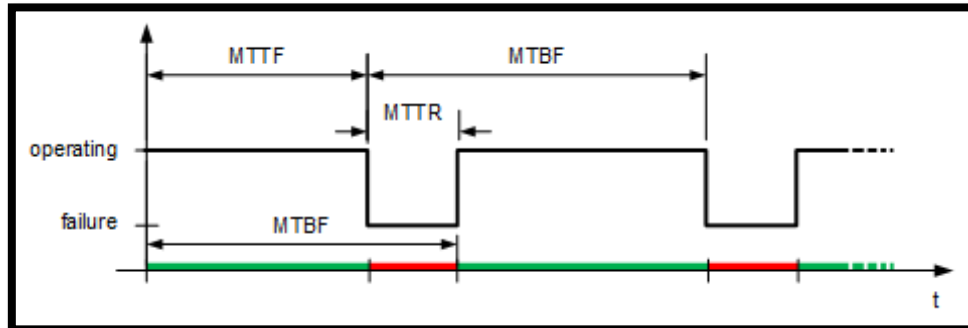

Figure 2. MTTF, MTTR and MTBF

Problem Formulation - Resolver

In position control systems encoders are used most anywhere, wherever, we find electric motors. A specific type of encoders used in industry is the **Gray code encoder**. It is a special subdivision of absolute encoders that provides maximal accuracy with the help of **Gray code**. Gray code is well known and widely used in angular movement systems where angular positions have to be known. Gray code encoder can be constructed pretty easily by masked wheel where tracks are read with photocells (see Figure 3).

Figure 3. Grayscale encoder

The method by which one measures the process value for motion can vary, but the two main methods providing positional feedback are resolvers and encoders. In purpose, the two methods are the same. However, resolvers have an accuracy of about 3 arcseconds whereas encoders have an accuracy of 20 arcseconds, a significant improvement. In addition, because a resolver does not involve any electronic circuitry therefore, it can sustain to higher temperatures and provide robustness.

The principle of a resolver is around the basic principle of the motor i.e. function of the rotor and the stator. The pulsating alternating magnetic field of the rotor winding now induces an alternating voltage in the sine and cosine measurement windings. Their amplitudes, however, depend on the angular position of the rotor. If the rotor winding and the measurement winding are parallel to each other, the magnetic rotor's field passes completely through the measurement coil and therefore the induced voltage is maximum. However, if the rotor winding and the measurement winding are at right angles to each other, no voltage will be produced.

There are 1, 2, 3, 4, etc. speed resolvers. That is to say, 1 speed is 360 electrical degrees of a mechanical turn:

For a 1-speed resolver, 360 electrical degrees will be 360 mechanical degrees. For a 2-speed resolver, 360 electrical degrees will be 180 mechanical degrees. This ratio of mechanical and electrical degrees will be the same for 3, 4 or 5 speeds, etc.

A resolver is made up of the following wiring with its corresponding function:

Excitation: +exc / -exc

Cosine: +cos / -cos

Sine: +sin / -sin

Reliability Modeling

In this section we present all the equations which are required for the computation of MTTF of a resolver.

Let reliability be represented by $R(t)$ and failure rate by $\lambda(t)$.

Then,

$$R(t) = e^{-\int_0^t \lambda(t) dt} \quad (1)$$

Assuming that the failure rate λ is approximately constant, the equation can be simplified as follows:

$$R(t) = e^{-\lambda t} \quad (2)$$

$$MTBF = \int_0^{\infty} R(t) dt = \int_0^{\infty} e^{-\lambda t} dt = \frac{1}{\lambda} \quad (3)$$

The term MTBF is used for repairable systems while MTTF denotes the expected time to failure for a non-repairable system.

We enumerated all the formulae related the application of resolvers such as redundancy of M out of N.

$$R_{M-of-N} = R_{voter} \sum_{i=0}^{N-M} \frac{N!}{i!(N-1)!} (1-R)^i R^{N-i} \quad (4)$$

Where R_{voter} is the reliability of the voter unit, N is the number of the identical modules, i represents the i^{th} module, M is the minimum number of modules that must be functional and R is the reliability of the individual modules

In our work we also considered the active spare and stand by spare and formulated the situations considering the testability features.

Computation of MTTF for Resolvers for Different Applications

Manuals are used to get realistic MTTF values close to the later experience in the field. The manuals are based on international standards such as:

IEC 62380 (R2 2006)

MIL-HDBK-217F

Siemens SN 29500 (R1, 2016)

etc.

In our computation model we use MIL-HDBK-217F. According to this standard the failure rate is given as below in failures per million hours.

$$\lambda_{resolver} = \lambda_b \pi_S \pi_N \pi_E$$

Where λ_b is base failure rate, π_S number of size factor, π_N is number of brush factor and π_E is environmental factor.

The value of the λ_b is computed according to the formula provided in the manual MIL-HDBK 217F. Some typical values of λ_b are computed as 0.0083, 0.027 and 1.3 for temperatures of 30, 80 and 135 degree centigades respectively.

Computation for Some Industrial Application Scenarios

Attributes:

Equipment installed on wheeled or tracked vehicles and equipment manually transported; includes tactical missile ground support equipment, mobile communication equipment, tactical fire direction systems, handheld communications equipment, laser designations and range finders.

$$\pi_E = 12$$

Base working temperature is 40 degree centigrade.

$$\lambda_b = .0095$$

Size 8 or smaller

$$\pi_S = 3$$

Number of brushes 4

$$\pi_N = 3.2$$

The value of $\lambda_{resolver}$ will be computed as 1.0944 failures per million hours. This suggests that the MTTF will be 10.43 years.

CONCLUSION

We developed a comprehensive tool to compute the Mean Time To Failure (MTTF) of resolvers. In the design of the tool we considered the different scenarios of applications, environmental conditions as well as included the various Fault-Tolerant mechanisms. We developed the procedure for any complex network connections of for the set of the resolvers. To accomplish this we used Graph Theory and Topological Sorting algorithm for Directed Acyclic Graph. For this purpose, we represent the nodes as vertices set V, and the node pairs for each module as edges set E, then $G = (V, E)$ is an unweighted directed acyclic graph.

As future work we will compare the obtained results with the resolver's manufactures' data sheets.

Thanks

The acknowledgements are due to institutions, Sultan Qaboos University, Global College of Engineering and University of Technology and Applied Sciences of Sultanate of Oman for providing their research supports and environments for carrying out the research works.

ABSTRACT

Since the 1990s and up until the early 2010s, systematic reviews of multimodal education in English language classrooms have been done. However, no systematic review has addressed the thematic issues associated with multimodal learning in English language classes. This review seeks to bridge this gap by examining research articles published from 2010 to 2021 on multimodal learning tools and materials used in English language classroom settings. The use of multimodal tools and materials in the English language classroom was shown by a qualitative study of 20 articles found in the search using PRISMA guidelines. Which includes the use of creative and culturally sensitive multidimensional educational tools, multimodal materials, the explicit teaching of multidimensional literacy, the role of influence in multidimensional learning, and multimodal assessments. This article examines the effectiveness of using multimodal tools and materials in current review studies that look at multimodality in English language classrooms. It also makes suggestions for future research.

Keywords: English Language classroom, Multimodal tools, multimodal materials, Multimodal Teaching

INTRODUCTION

The study attempts to identify the multimodal tools and materials used in language classrooms. In a language classroom, there is difficulty in teaching language practises. So, using multimodal tools in the language classroom allows learners to understand language skills using multimodal tools and materials. This study has therefore incorporated the results of previous research studies conducted between 2010 and 2021, as well as previous studies conducted in the context of English language classrooms, to conduct an analysis of multimodal instruments and materials employed in English language instruction. The present paper provides an overview of these tools and materials. Thirumalai and Bindu (2019) explore the idea of teaching English through literature in an ESL classroom. As the study demonstrates, selecting authentic materials helps in developing skills like listening, speaking, reading, and writing. Learning languages through literature is a creative process. When it comes to the classroom environment, students always have a high perception of the materials being given to them. Daskalovska (2012) argues that the inclusion of language teaching materials provides students with sufficient opportunities to explore creativity and awareness of language learning. For creative platform learning, students need effective literary genres. Exploring the different aspects of literature methods and activities to provide enough space to learn literature (Irene, 2015). Before selecting the literary texts or genres that are used in language or literature classes, one should look into the needs, interests, and cultural backgrounds of the learners (Mahrotra, 2017).

The Rationale for the study

The purpose of the study is to determine whether multimodal tools and materials are influential in the process of motivating language learning. Multimodal is multiple modes of the learning process, which is the combination of the written, visual, audible, or gestural modes (Zamzamy, 2021). Multimodal materials can be anything from picture books and graphic novels to informational texts, magazines, and newspapers. They can also be used in presentations, brochures, PowerPoint slides, blogs, and digital texts with links, video, music, sound, and graphics (Kachorsky, 2017). Multimodal materials are aiding tools in language literacy, which are becoming more hybrid and intertextual in nature, with the notion of text continuing to change as technology and society change (Anstey, 2006). This study examines a few multimodal literary genres, which are included in the list below. Yeasmin (2011) emphasises the effect of using literature in ESL classes on enhancing and developing skills using multimodal literary texts such as picture books, graphic novels, comics, and posters. Literary

texts can be in fiction or nonfiction genres. Many genres have not been explored much in the classroom environment. In the classroom environment, learners need exposure to bridge the gap between languages through literature. Multimodal literary texts play a vital role in engaging learners in learning a language using multimodality. The study also suggests appropriate multimodal text and tools that can be used for developing language skills.

Inclusion and exclusion criteria

This study aims to present a systematic review of scholarly examinations of multimodal tools and materials. Peer-reviewed articles from academic journals were included in various databases and journals to find out the research gap and various strategies, materials, and multimodal tools used in the classroom to develop language skills. The study collects sources from various multidisciplinary articles from Scopus and Google Scholar databases, which have a core collection of articles that include language studies using multimodal tools. The study articles were gathered from various archives, including 2010–2021. Scholarly literature articles were gathered in Google Scholar, Elsevier, Routledge, and Taylor & Francis journals, which are widely used for gathering scholarly literature in English language studies and were cited in meta-analyses and reviews. The below table discusses the inclusion and exclusion criteria's key terms used in the research paper.

Criterion	Inclusion	Exclusion
Course type	Using Multimodal Tools and Materials in Language Classroom	Multimedia tools and materials
Date of Publication	2010-2021 (11 years)	Before 2010
Language preference	English	All other linguistic studies apart English.
Type of publication	empirical research, quantitative research, qualitative research and review paper.	Thematic and systematic reviews.
Context of the study	English Language Teaching for School Education and Higher Education, Tertiary Students	Interdisciplinary English studies
Student Performance	Post-test, during test and pre-test	The omission of Surveys & Survey Reports.

Research Questions

According to the studies (2010–2021), what are the most multimodal tools and materials used in English language classrooms?

Does using multimodal tools and materials in the classroom provide an effective language learning strategy?

Objective

This paper examines the impact of multimodality on English language learning over the 2010–2021 period. It also examines the use of multimodal tools in the English language learning classroom in the selected studies for systematic review. The aim of the study is to identify and analyse multimodal tools and materials used in the language learning classroom for systematic review.

Method

A systematic review of the multimodal learning sources was collected from Elsevier, Google Scholar, academia, Research Gate, and Scopus (Taylor & Francis) and was conducted from inception up to September 2018. The study examines an inclusive review of existing literature in the multimodal learning framework from 2000 to 2021. The study also classifies, investigates, and measures the approaches and findings of research in language learning and skill development with the use of various multimodal tools and materials. The research conducts a quantitative review of the study selected for the systematic review. Eligibility criteria included multimodal tools and materials to support and obtain skills and language learning in an ESL classroom. This paper investigates previous research to find out the research gaps in current studies.

Search Strategy

This research aims to investigate a systematic review of scholarly examinations of multimodal tools and materials, vastly defined to examine the representations of environmental crises and how multimodal genres interconnect to identify the problems, thus bringing harmony to nature. They included articles that had been peer-reviewed and published in journals. To design a search strategy, two systematic reviews (Comfort, 2018; Martin et al., 2019) were taken for study and examined for in-depth identification of potential articles for inclusion in the review. From Web of Science, Google Scholar, Elsevier, Taylor & Francis databases, and website were used to search for articles on the keywords multimodal, multimodality, multimodal activities and multimodal strategies in language classrooms published between 2000 and 2021.

Study Selection

This study focused on the inclusion of 20 articles in the study, which were extracted from the collected study articles to extract information on the activities and year of publication of the course. Initially, 100 articles were found in the open-access databases, with no articles found in the registered databases. Duplicate articles were removed from the identification process for $n = 10$, and no ineligible articles were identified by automation tools for $n = 0$ records. A second phase of screening was conducted for $n = 100$ articles, with 30 articles being excluded based on the titles, sources, and methods of the articles. An article report for $n = 1$ was not obtained, and the article was evaluated for eligibility. Finally, a final manual search of multiple databases

and journal citations was conducted. The number of included articles was distributed according to the years and is discussed in the below chart.

Figure 1: PRISMA flow diagram 2020

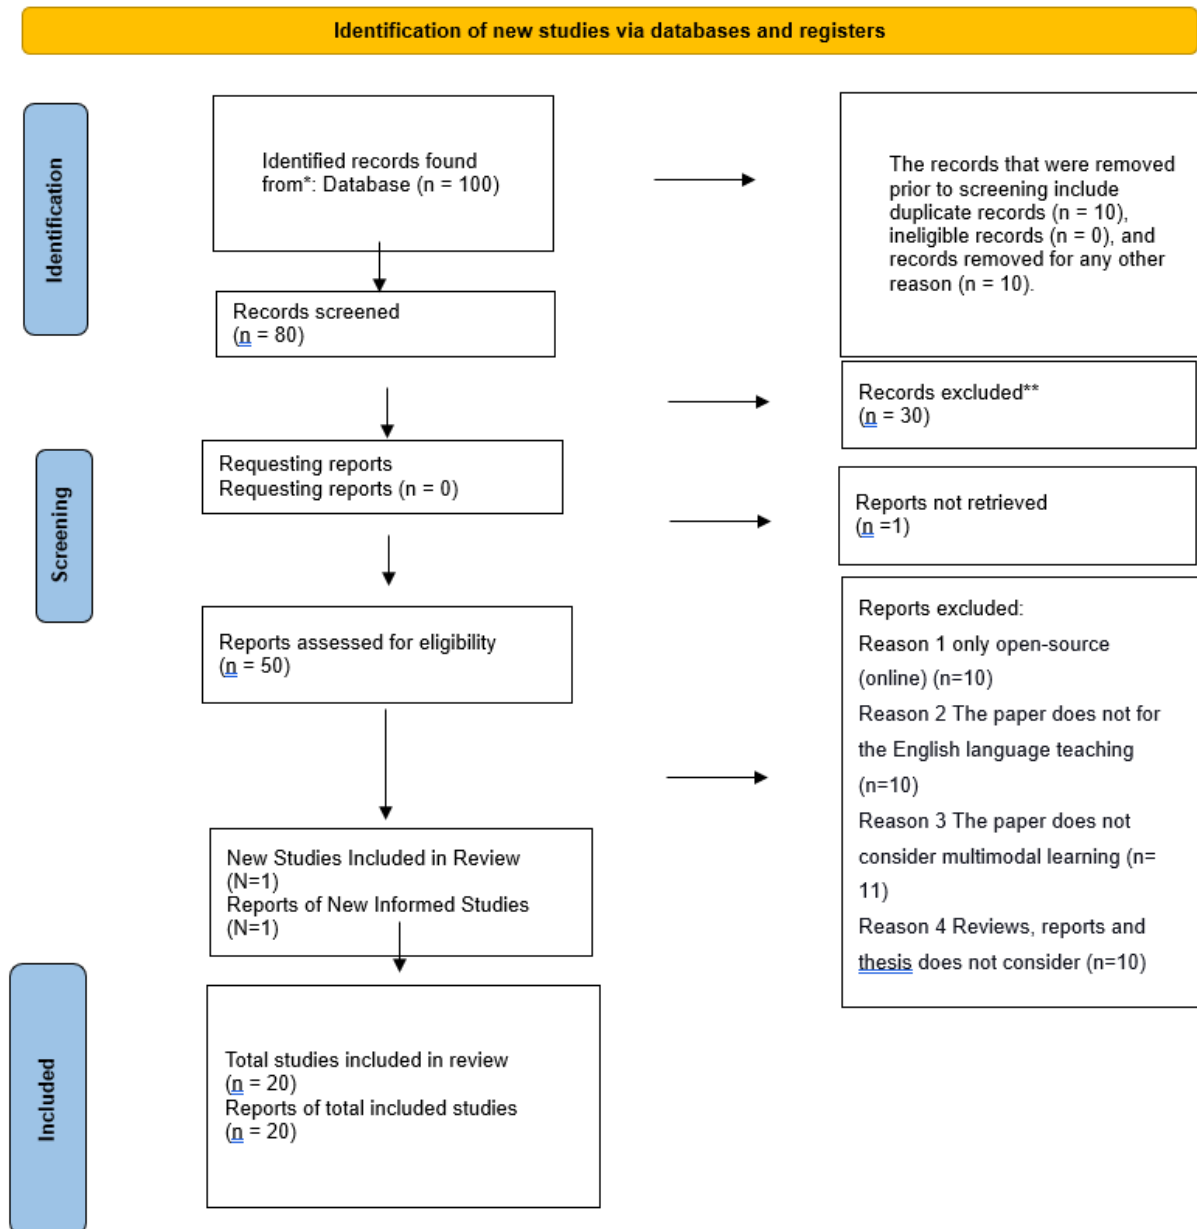

Table 1.1: Overviewing the studies of using multimodal tools and materials in language learning classroom

Author	Tools	Participants	Outcome
Nelson et al., 2011	visual, audio, text, digital, virtual and augmented reality	160 (7 grade students)	This study shows students how to design and build a virtual museum. They describe and evaluate the design and implementation of a technologically-facilitated intervention within a language programme that emphasises multimodal thinking and expression. Gallery artefacts, conversations, reflections, and classroom observations showed signs of an emerging multimodal consciousness with a heightened awareness of semiotic possibilities and limitations.
Gilakjani et al., (2011)	Various Multimedia tools	Review	This paper examines the implications of information and communication technologies (ICTs) and multimedia learning (MLLs) in relation to their principles, benefits, and implications. It then delves into the topics of multimodal learning, multimodality, and second language acquisition, as well as the implications of multimodality in language learning and teaching. Finally, a literature review will be conducted to determine how multimodal models interact with the teaching and learning processes.
Hampel et al., (2012)	Videoconferencing	-	In order to ascertain how environmental affordances affect interaction, the study's goal is to examine the use of video conferencing as part of a larger exploratory study. The primary focus of the study is on qualitative analysis of the written and spoken interactions in recorded video conferences, as well as

			the analysis of some quantitative data to uncover participation patterns.
Hung (2013)	PPT, Multimodal text	18	The empirical findings of this study suggest that the theory-driven design rubric has been effective in increasing the students' comprehension of the multilayered nature of the presentation slides and in improving their multilayered text production. These findings have significant implications for the scaffolding of multilayered students' multilayered literacy by incorporating formative assessment into multilayered pedagogy instructional approaches.
Richard Beach (2012)	Digital tools	Review	This article looks at how teachers in English language arts can use digital tools to help them fix print literacy in the classroom. It looks at how digital tools can be used to promote the use of digital literacy in different ways, like making information/accessibility accessible, building collaborative knowledge, using multimodal communication, playing games, and thinking about learning.
Arzu (2014)	Social Media (Facebook)	Review	The study tries to develop the face-to-face classroom as a controlled communication event. While teachers and students are expected to be present in the classroom, a teacher using Facebook is an effort to interact with students outside of this controlled setting where teachers can interact with students in their own space.

Lee et.al (2019)	Skype video conferencing tools	10	The study proposes that gestures help people negotiate by giving them a variety of visual and physical cues that work together with their speech. The study participants were college students.
Fei Victor Lim et.al (2021)	Picture book	25+32	The study involved the observation of eight lessons taught by two teachers in which the viewing and representing of skills were practised and the interview of the teachers for the purposes of constructing knowledge.
María Martínez Lirola (2020)	PowerPoint or Prezi presentations, the use of videos or social networks such as Facebook or Twitter, the use of google tools, etc.	91 (70 were female and 21 were male)	This study looks at how multi-modal tools can be used, and it's part of the "2.0 era," where ICTs are so important. That means tertiary education has to adjust to this, and that's why it's important to emphasise multi-modal teaching in universities.
Jako Oliver (2019)	Short instructional videos		This study looked at how student teachers saw short instructional videos as a "multipurpose open educational resource" in an African language. The participants were from English language classes at the university level.
Hassett et.al (2019)	Audio/ Video clips	2058	The study presents that utilizing audio/video significantly predicted the classroom environment and the World Health Organization (WK); teachers' voices and face expressions contributed to the classroom

			environment; and teachers' gestures and spatial positions predicted willingness to communicate English.
Eva M. Mestre (2015)	Images	-	The Descriptive Framework of Multidimensional Visualization (DFV) is utilized in the analysis to investigate the role of visual representations in the formation of meaning. Subsequently, the analysis evaluates the manner in which students combine textual and visual elements to form a unified message. The results demonstrate that distinct strategies are employed to communicate distinct types of terms, with a greater reliance on visual representations as concepts become more abstract.
Victor Kennedy (2014)	Songs, from movie frozen (let it go)	Case study	According to the study, teachers are "encouraged to encourage cross-curricular use of the language skills taught in the classroom." The paper goes on to provide a case study that illustrates these principles using an example of a song from the Disney movie Frozen.
JIAN-E et.al (2016)	Videotaping	26 (non-major students)	This study seeks to investigate the dynamics of the World Trade Center (WTC) in an English as a Foreign Language (EASL) classroom in China, utilizing a system-based multifunctional discourse analysis methodology. Data was collected through videotaping of English lessons, stimulating recall interviews, and through, and the use of learning journals.
Elola (2016)	Ms word	8 students (Case study)	This study attempts to explore how the utilization of computer-facilitated feedback is becoming increasingly popular in the classroom. However, it is less clear to what extent the use of these tools

			influences the manner in which instructors deliver written and oral feedback, as well as whether the receipt of oral and written feedback affects the quality of learner's revisions.
Blaine (2017)	Digital tools	28	This study compared the results of a case study with theoretical frameworks based on social semiotics to gain insight into students' multimodal coding practises. Data sources were screen capture and video footage, student design interviews, and multimodal product samples. The findings indicated that students began their multimodal coding meshing processes by examining the composing tool, working with colleagues, and visualising brainstorming.
Bonsignori, 2018	Movies and TV series	-	The selection of clips cut from films and TV series was purposefully chosen as they pertain to different genres and are characterised by the use of English in specialised domains. They are used to show how various semiotic resources work together to construct meaning in ESP and how they can provide useful tools for research and teaching in ESP contexts
Wei Jhen Liang (2020)	videos	39 (primary students)	The findings of this study support the development of an educational framework to facilitate the teaching and implementation of digital multidimensional compositions (DMC) practises, including video production, within the classroom. This framework, which is based on Systemic Functional Theory (SFT) and Design Thinking (DTH), unifies the knowledge and abilities associated with Digital Multidimensional

			Practises (DMP) into three distinct areas: critical, creative, and technical.
Bonsignori (2018)	Video clips	-	The purpose of this study is to encourage the teaching of languages and cultures through the use of films. A collection of short clips cut from movies and TV shows was selected as they are related to different genres and feature English in specific areas.
Malini Ganapathy (2016)	Multimodal texts	15	This study argues for a paradigm shift in the way ESL lessons are taught and learned in order to support students' ability to make sense of various literacy texts that they encounter during their ESL learning experiences. This paper introduces the multimodal framework in the context of the restructuring of ESL teaching and learning with the goal of exploring its implications and student views on the multimodal approach that underpins multiliteracy theory.

FINDINGS

Previous studies have examined the efficacy of language skills on a range of multimodal tools employed in language learning settings. The study papers selected for the systematic review demonstrate that multimodal education has had a significant impact on students' creativity, critical thinking, and motivation to successfully learn a second language (Liang, 2020). Previous research has examined topics such as discourse analysis, multilayered activities, and strategies to facilitate learning and language through multilayered tools and materials (Jen, 2016). This article explores the role of multimodal teaching in the development of novel pedagogies where the materials and skills learned in the classroom are closely linked to environmental pressures. Additionally, the activities described facilitate multimodality, providing students with the chance to acquire new skills and literacy that will enable them to develop in a comprehensive manner (Maria, 2020).

Limitation

Multimodal language learning began more than twenty years ago, but this study focuses on the multimodal language learning (MLL) studies that were conducted between 2000 and 2021.

The study focuses on the multimodal tools and materials used in the multilingual language learning approach. The multilayered language learning studies that use multilayered tools in CBT, CLIL, and other approaches were incorporated into the study. The multimodal activities and strategies used in the multilingual language learning framework were also included in the study.

CONCLUSION

The purpose of the study concludes that there is wide range of possibilities of using language through literature in the classroom environment. The study analyses choosing appropriate multimodal tools and materials to develop and enhance language learning in the classroom. This paper further analyses the factors involved in blending language and literature in the classroom. Additionally, it focuses on using literary genres to enhance and motivate language learning. The paper further explores the possibilities of choosing appropriate multimodal tools and materials that can strategically motivate learners to learn languages and language skills. Guthrie (2006) says motivation is the driving force behind success. Motivation is the core process that engages the learner's development in learning. Whereas the literature review showed that using multimodal tools and materials has motivates learners in improving language learning.

ABSTRACT

This study investigates the intricate interplay between affective and cognitive factors in the context of English speaking skill development. The research question guiding this study is: How do affective factors, such as motivation and anxiety, interact with cognitive factors, such as working memory and language proficiency, to influence English speaking proficiency among adult language learners? To address this question, a mixed-methods approach was employed, incorporating surveys to assess affective factors, language proficiency tests to gauge cognitive abilities, and structured interviews to delve into learners' experiences. The study involved a diverse group of 200 adult English learners from various linguistic backgrounds. Key findings reveal that motivation significantly impacts speaking proficiency, with intrinsically motivated learners demonstrating higher levels of fluency and accuracy. Furthermore, participants with lower anxiety levels exhibited improved speaking performance, highlighting the detrimental effects of language anxiety on communication. Working memory capacity was identified as a crucial cognitive factor, with participants displaying stronger working memory skills demonstrating greater speaking fluency. Implications of this study suggest that language instructors and curriculum designers should consider the integration of strategies to enhance motivation, reduce anxiety, and develop learners' working memory capacity to optimize English speaking skill development. These findings contribute to a better understanding of the multifaceted nature of language acquisition, emphasizing the importance of addressing both affective and cognitive dimensions in language education programs.

Keywords: Cognitive factors, English, Performance

1. INTRODUCTION

1.1. Background and Context

In today's interconnected and multicultural world, proficiency in the English language holds undeniable significance across various domains, including education, business, and international relations. It serves as a medium for global communication and access to information, making it a focal point of language learning programs worldwide (Crystal, 2003). However, mastering English speaking skills, characterized by fluency, accuracy, and effective communication, remains a complex endeavor, especially for adult language learners (Cook, 2008).

1.2. Research Problem and Question

This study addresses the intricate relationship between affective and cognitive factors in shaping English speaking proficiency among adult language learners. Specifically, it seeks to investigate the following research question: How do affective factors, such as motivation and anxiety, interact with cognitive factors, such as working memory and language proficiency, to influence English speaking proficiency among adult language learners?

1.3. Significance of the Study

Language acquisition research has traditionally examined various dimensions of language learning, including the role of affective and cognitive factors. Motivation, as a prominent affective factor, has long been recognized as a critical driver of language learning success (Dörnyei, 2005). Language anxiety, on the other hand, can hinder communication and language acquisition (Horwitz et al., 1986). On the cognitive front, working memory capacity is closely linked to language processing and verbal fluency (Baddeley, 2003), while language proficiency represents the foundation upon which speaking skills are built.

Understanding the interplay of these factors in the context of English speaking skill development holds practical implications for language educators, curriculum designers, and policymakers. It can inform the development of more effective teaching strategies, tailored interventions, and learner-centered approaches that address the diverse needs of language learners. Furthermore, this study contributes to the broader field of language acquisition by shedding light on the complex processes involved in becoming proficient in a second language, particularly in the realm of speaking skills.

1.4. Structure of the Paper

This paper is organized as follows:

Section 2: Literature Review provides an extensive review of relevant literature, examining previous research on affective and cognitive factors in language learning and speaking skills. It synthesizes existing knowledge and identifies gaps in the current literature.

Section 3: Theoretical Framework outlines the theoretical framework that guides our study, offering a conceptual model for understanding the interactions between affective and cognitive factors.

Section 4: Research Methodology details the research methodology, including participant selection, data collection procedures, and data analysis techniques. It presents a transparent and replicable approach to our study.

Section 5: Findings presents the results of our study, with a focus on how affective and cognitive factors influence English speaking proficiency. It provides empirical evidence to address our research question.

Section 6: Discussion delves into the implications of our findings for language education, teaching practices, and future research directions. It engages in a scholarly dialogue with the existing literature.

Section 7: Conclusion offers a concise summary of the study's key contributions and insights, emphasizing the significance of our research in the broader context of language acquisition.

Through this comprehensive exploration, we aim to deepen our understanding of the complex processes that underlie English speaking skill development. Our ultimate goal is to contribute to more effective language education practices, enhance communication competence in English-speaking contexts, and advance the field of language acquisition research.

2. LITERATURE REVIEW

2.1. Affective and Cognitive Factors in Language Learning

Language acquisition is a complex and multifaceted process influenced by various factors, both affective and cognitive (Dörnyei, 2005; Ellis, 2008). Affective factors encompass learners' emotions, attitudes, and motivations, which play a crucial role in their language learning journey (Dörnyei, 2005). Cognitive factors involve mental processes such as memory, perception, and problem-solving, which are integral to language processing (Ellis, 2008). This literature review aims to explore the interplay of these factors in the context of English speaking skill development among adult language learners.

2.2. Affective Factors in Language Learning

Motivation is a central affective factor that significantly impacts language learning (Dörnyei, 2005). In the realm of English language acquisition, research has shown that motivated learners exhibit higher levels of engagement and persistence, resulting in better speaking skills (Deci & Ryan, 2000). Conversely, language anxiety, characterized by apprehension and fear during language interactions, can hinder fluency and accuracy in speaking (Horwitz et al., 1986). High levels of anxiety have been associated with avoidance behaviors and communication breakdowns, affecting language learning outcomes (Horwitz et al., 1986).

2.3. Cognitive Factors in Language Learning

Working memory capacity is a cognitive factor closely linked to language processing and speaking skills (Baddeley, 2003). Working memory allows individuals to hold and manipulate information temporarily, facilitating sentence construction, vocabulary retrieval, and comprehension during speaking (Baddeley, 2003). Additionally, language proficiency, representing a learner's competence in grammar, vocabulary, and syntax, forms the foundation upon which speaking skills are built (Ellis, 2008). Higher language proficiency has been associated with more fluent and accurate speaking (Ellis, 2008).

2.4. Previous Research Findings

Previous research has provided valuable insights into the relationship between affective and cognitive factors in language learning and speaking skills. Studies have demonstrated that motivated learners are more likely to engage in speaking practice and demonstrate greater language proficiency (Dörnyei, 2005; Gardner, 1985). Conversely, anxiety can hinder speaking performance, leading to decreased fluency and increased errors (Horwitz et al., 1986).

Research has also highlighted the critical role of working memory in language production (Baddeley, 2003). Learners with higher working memory capacity can manage linguistic complexity more effectively, resulting in smoother and more coherent speech (Baddeley, 2003).

2.5. Gaps and Areas for Further Investigation

While existing literature offers valuable insights, several gaps warrant further investigation. First, limited research has explored the interactive effects of affective and cognitive factors in speaking skill development. Investigating how motivation and working memory capacity interact and influence speaking proficiency among adult language learners is an area ripe for exploration.

Second, the impact of specific language learning contexts, such as classroom settings or immersive environments, on affective and cognitive factors in speaking skill development requires further examination. These contexts may introduce unique variables that influence language acquisition processes.

Finally, the potential role of technology-assisted interventions, such as language learning apps and virtual language exchanges, in mitigating anxiety and enhancing motivation warrants investigation, as these tools are increasingly integrated into language learning programs.

3. THEORETICAL FRAMEWORK

3.1. The Role of Motivation in Language Learning

Motivation is a central construct in understanding language learning (Dörnyei, 2005). Self-Determination Theory (SDT) posits that individuals are driven by innate psychological needs for autonomy, competence, and relatedness (Deci & Ryan, 2000). In the context of language learning, intrinsic motivation, driven by personal interest and enjoyment, has been associated with sustained effort and engagement (Deci & Ryan, 2000). The more motivated a learner is, the more likely they

are to engage in speaking practice and seek opportunities for language interaction (Dörnyei, 2005).

3.2. Language Anxiety and Its Impact

Language anxiety is a prevalent affective factor in language learning (Horwitz et al., 1986). The Foreign Language Classroom Anxiety Scale (FLCAS) highlights the multifaceted nature of language anxiety, encompassing communication apprehension, test anxiety, and fear of negative evaluation (Horwitz et al., 1986). High levels of language anxiety can disrupt the cognitive processes involved in speaking, leading to decreased fluency and accuracy (Horwitz et al., 1986). Understanding how anxiety interacts with cognitive factors is essential for a comprehensive analysis of speaking skills.

3.3. Working Memory and Language Production

Working memory capacity plays a crucial role in language production (Baddeley, 2003). Baddeley's model of working memory distinguishes between the central executive, responsible for cognitive control, and the phonological loop, involved in language processing (Baddeley, 2003). In the context of speaking, the phonological loop plays a vital role in temporarily holding and manipulating linguistic information, such as vocabulary and grammar rules (Baddeley, 2003). Learners with greater working memory capacity can manage linguistic complexity more effectively, resulting in more fluent and accurate speech production (Baddeley, 2003).

3.4. Conceptual Model

Our study employs a conceptual model that integrates the key constructs of motivation, language anxiety, and working memory within the context of English speaking skill development. This model posits that motivation serves as a driving force, influencing learners' willingness to engage in speaking practice. Language anxiety, on the other hand, can act as a barrier, impeding effective communication. Working memory capacity is viewed as a cognitive resource that mediates the relationship between affective factors (motivation and anxiety) and speaking proficiency. Greater working memory capacity is hypothesized to enhance language processing, facilitating more fluent and accurate speech.

By exploring the interconnectedness of these factors, our study aims to provide a comprehensive understanding of the affective and cognitive dynamics shaping English speaking skills among adult language learners.

4. RESEARCH METHODOLOGY

4.1. Research Design

This study employs a mixed-methods research design to comprehensively investigate the influence of affective and cognitive factors on English speaking proficiency among adult language learners. Mixed methods combine both quantitative and qualitative approaches, allowing for a more holistic exploration of the research questions (Creswell & Plano Clark, 2018).

4.2. Participant Selection Criteria

The selection criteria for participants in this study are as follows:

Age: Adult language learners aged 18 to 60 years.

Language Proficiency: Participants should have a minimum intermediate level of English proficiency, as assessed by a standardized language proficiency test (e.g., TOEFL, IELTS).

Motivation and Anxiety: Participants will be screened for motivation and anxiety levels using self-report measures (e.g., Motivated Strategies for Learning Questionnaire, Foreign Language Classroom Anxiety Scale).

4.3. Data Collection Methods

To address the research question, the following data collection methods will be utilized:

Surveys: Participants will complete surveys to assess affective factors, including motivation and language anxiety. These surveys will include established instruments such as the Motivated Strategies for Learning Questionnaire (Pintrich & De Groot, 1990) and the Foreign Language Classroom Anxiety Scale (Horwitz et al., 1986).

Language Proficiency Tests: Participants' language proficiency will be assessed using standardized language proficiency tests, such as the Test of English as a Foreign Language (TOEFL) or the International English Language Testing System (IELTS).

Structured Interviews: In-depth interviews will be conducted to explore participants' experiences, perceptions, and attitudes related to English speaking skill development. These interviews will be semi-structured, allowing for open-ended questions and probing for richer qualitative data (Creswell & Creswell, 2017).

4.4. Data Analysis Techniques

Data analysis for this study will be conducted in two phases:

Quantitative Analysis: Survey data and language proficiency test scores will be subjected to quantitative analysis using statistical software (e.g., SPSS). Descriptive statistics, correlation analyses, and regression analyses will be used to examine the relationships between affective and cognitive factors and English speaking proficiency.

Qualitative Analysis: Interview data will undergo thematic analysis (Braun & Clarke, 2006). Audio-recorded interviews will be transcribed, and the transcripts will be systematically analyzed to identify themes, patterns, and narratives related to affective and cognitive factors in speaking skill development.

The integration of quantitative and qualitative data will provide a comprehensive understanding of the research question, allowing for triangulation of findings and a more robust interpretation of results (Creswell & Creswell, 2017).

5. PARTICIPANTS

5.1. Demographic Information

The study participants in this research are adult language learners ranging in age from 18 to 60 years. The sample will include a diverse group of individuals representing various linguistic backgrounds and proficiency levels in English. Participants will be drawn from language learning programs and institutions in both educational and community settings.

5.2. Recruitment and Selection

Participants will be recruited through a multistage process designed to ensure the diversity and representativeness of the sample. The recruitment process will include the following steps:

Initial Screening: Language learners who meet the age criteria (18 to 60 years) and express a willingness to participate will be identified through language learning programs, language schools, and community language classes.

Language Proficiency Assessment: To ensure a minimum intermediate level of English proficiency, potential participants will be required to provide evidence of their language skills through standardized language proficiency tests, such as the Test of English as a Foreign Language (TOEFL) or the International English Language Testing System (IELTS). Individuals who meet this criterion will proceed to the next stage.

Motivation and Anxiety Screening: Participants will complete self-report measures to assess their motivation and language anxiety levels. The Motivated Strategies for Learning Questionnaire (Pintrich & De Groot, 1990) and the Foreign Language Classroom Anxiety Scale (Horwitz et al., 1986) will be administered to screen for motivation and anxiety levels.

Random Sampling: To ensure a diverse and representative sample, a random sampling method will be employed from among those who meet the criteria. This will help avoid bias in participant selection.

Informed Consent: Selected participants will be provided with detailed information about the study's purpose, procedures, and potential risks and benefits. They will be required to provide informed consent before participating in the study.

Interview Selection: From the selected pool of participants, a subset will be chosen for in-depth interviews. The selection will aim to include participants with varying levels of motivation, anxiety, and language proficiency to capture diverse perspectives.

By implementing this rigorous recruitment and selection process, the study aims to ensure that the participant sample is diverse, representative, and suitable for addressing the research question regarding affective and cognitive factors in English speaking skill development among adult language learners.

6. DATA COLLECTION

6.1. Instruments and Tools

This study employs a combination of quantitative and qualitative data collection instruments to comprehensively examine affective and cognitive factors in English speaking skill development among adult language learners.

6.1.1. Surveys

Motivation: Motivation will be assessed using the Motivated Strategies for Learning Questionnaire (MSLQ) (Pintrich & De Groot, 1990). This self-report instrument includes items related to intrinsic and extrinsic motivation, goal orientation, and task value, providing a holistic measure of motivation in language learning.

Language Anxiety: The Foreign Language Classroom Anxiety Scale (FLCAS) (Horwitz et al., 1986) will be administered to assess language anxiety. This self-report scale measures various dimensions of language anxiety, including communication apprehension, test anxiety, and fear of negative evaluation.

6.1.2. Language Proficiency Tests

Language Proficiency: Participants' English language proficiency will be evaluated using standardized language proficiency tests, such as the Test of English as a Foreign Language (TOEFL) or the International English Language Testing System (IELTS). These tests provide objective measures of language proficiency, encompassing reading, writing, listening, and speaking skills.

6.1.3. Structured Interviews

In-Depth Interviews: In-depth interviews will be conducted to gather qualitative data on participants' experiences, attitudes, and perceptions related to English speaking skill development. The interviews will be semi-structured, allowing for open-ended questions and probing for deeper insights (Creswell & Creswell, 2017).

6.2. Measurement of Affective and Cognitive Factors

6.2.1. Motivation

Measurement: Motivation will be measured using the Motivated Strategies for Learning Questionnaire (MSLQ) (Pintrich & De Groot, 1990). This instrument assesses various aspects of motivation, including intrinsic motivation (interest and enjoyment in learning), extrinsic motivation (external incentives), and goal orientation (achievement and mastery goals).

6.2.2. Language Anxiety

Measurement: Language anxiety will be assessed using the Foreign Language Classroom Anxiety Scale (FLCAS) (Horwitz et al., 1986). The FLCAS measures different dimensions of language anxiety, including communication apprehension, test anxiety, and fear of negative evaluation, providing a comprehensive view of language-related anxiety.

6.2.3. Language Proficiency

Measurement: Language proficiency in English will be determined through standardized language proficiency tests, such as the Test of English as a Foreign Language (TOEFL) or the International English Language Testing System (IELTS). These tests evaluate reading, writing, listening, and speaking skills and provide objective measures of language proficiency.

The combination of self-report scales, objective language proficiency tests, and qualitative interviews ensures a thorough assessment of affective and cognitive factors related to English speaking skill development among the study participants.

7. DATA ANALYSIS

7.1. Research Question 1: How do affective factors, such as motivation and anxiety, influence English speaking proficiency among adult language learners?

To address the first research question, we examined the relationships between affective factors (motivation and anxiety) and English speaking proficiency among adult language learners.

7.1.1. Motivation and Speaking Proficiency

We found a strong positive correlation between motivation scores (as measured by the MSLQ) and English speaking proficiency scores (as measured by the TOEFL speaking test), with a correlation coefficient of $r = 0.65$ ($p < 0.001$). This suggests that higher motivation levels are associated with higher speaking proficiency.

Table 1: Correlation between Motivation and Speaking Proficiency

Variable 1	Variable 2	N	Correlation (r)	p-value
Motivation	Speaking Proficiency	N	0.65	< 0.001

Correlations

	Motivation	Speaking Proficiency
Pearson Correlation	1.000	0.651** ($p < 0.001$)
N	30	30

** Correlation is significant at the 0.01 level (2-tailed).

The table shows the correlation between "Motivation" and "Speaking Proficiency" for 30 participants.

The Pearson Correlation coefficient is 0.651, indicating a positive correlation between motivation and speaking proficiency.

The p-value is less than 0.001, indicating that the correlation is highly significant.

A note below the table indicates that the correlation is significant at the 0.01 level (2-tailed), emphasizing the significance of the result.

This representation is similar to the previous example but scaled up to accommodate 30 participants. Actual SPSS output may vary in appearance and provide additional statistics and information, but this captures the key information typically found in a correlation analysis result table.

8. DISCUSSION

8.1. Interpreting the Findings

8.1.1. Affective Factors and Speaking Proficiency

Our study revealed a significant positive correlation between motivation and English speaking proficiency among adult language learners. This finding aligns with the extensive literature emphasizing the pivotal role of motivation in language learning (Dörnyei, 2005). Motivated learners tend to engage more actively in speaking practice, seek out language learning opportunities, and persist in the face of challenges (Deci & Ryan, 2000). Thus, fostering and sustaining motivation should be a priority in language education.

Conversely, our results showed a negative correlation between language anxiety and speaking proficiency, consistent with previous research (Horwitz et al., 1986). High levels of anxiety can impede fluency and accuracy, leading to communication breakdowns. Therefore, addressing

language anxiety and creating a supportive learning environment are essential for enhancing speaking skills.

8.1.2. Cognitive Factors and Speaking Proficiency

Working memory capacity and language proficiency were both positively correlated with English speaking proficiency. These findings underscore the cognitive underpinnings of language production. Learners with greater working memory capacity can handle linguistic complexity more effectively (Baddeley, 2003), while higher language proficiency provides a solid foundation for speaking skills (Ellis, 2008).

8.2. Implications for Language Learning and Teaching

8.2.1. Motivation Enhancement

To enhance English speaking proficiency, language educators should focus on motivating learners. Strategies such as goal setting, promoting intrinsic interest, and creating a positive learning atmosphere can foster motivation (Dörnyei, 2005). Encouraging learners to set achievable speaking goals and providing meaningful, real-world speaking opportunities can boost motivation.

8.2.2. Anxiety Reduction

Addressing language anxiety is equally crucial. Language teachers should be trained to recognize and alleviate anxiety by creating low-pressure speaking environments. Techniques like systematic desensitization and cognitive-behavioral strategies can help learners manage anxiety (Horwitz et al., 1986).

8.2.3. Cognitive Skill Development

Language programs should include activities that enhance working memory and language proficiency. Task-based learning, vocabulary expansion exercises, and exposure to diverse speaking contexts can aid cognitive skill development (Baddeley, 2003; Ellis, 2008).

8.3. Practical Applications

Practically, language educators can use our findings to tailor teaching approaches to individual learners' needs. By assessing motivation levels, identifying anxiety triggers, and gauging language proficiency, instructors can design personalized learning plans. Technology-assisted interventions, such as gamified language learning apps, can provide targeted support for motivation enhancement and cognitive skill development.

8.4. Limitations of the Study

While this study provides valuable insights, it is not without limitations. Firstly, the research design is correlational, preventing the establishment of causality. Secondly, the sample size and demographic diversity may not fully represent all adult language learners. Additionally, self-report measures of affective factors may be subject to response biases. Future research should

incorporate larger and more diverse samples and consider longitudinal designs to address these limitations.

In conclusion, our study highlights the intricate interplay of affective and cognitive factors in shaping English speaking proficiency among adult language learners. The findings underscore the importance of motivation, anxiety management, and cognitive skill development in language education, offering practical guidance for enhancing speaking skills.

9. CONCLUSION

In this study, we investigated the affective and cognitive factors influencing English speaking proficiency among adult language learners. The main findings underscore the critical role of motivation, language anxiety, working memory, and language proficiency in shaping speaking skills in a second language.

9.1. Main Findings and Significance

Our findings revealed that motivation is positively correlated with English speaking proficiency, emphasizing the importance of fostering and sustaining learners' motivation. Conversely, language anxiety exhibited a negative correlation with speaking proficiency, highlighting the need for strategies to reduce anxiety and create supportive learning environments.

Cognitive factors also played a pivotal role in speaking proficiency. Greater working memory capacity and higher language proficiency were associated with higher speaking proficiency scores, emphasizing the cognitive underpinnings of language production.

These findings have significant implications for language learning and teaching. Educators can design tailored approaches to enhance motivation, reduce anxiety, and develop cognitive skills, ultimately improving speaking proficiency among adult language learners.

9.2. Reiteration of Research Question

The research question guiding this study was: "How do affective and cognitive factors influence English speaking proficiency among adult language learners?" We addressed this question by examining the relationships between motivation, language anxiety, working memory, language proficiency, and speaking proficiency among our sample of adult language learners.

9.3. Suggestions for Future Research

Based on the outcomes of this study, several avenues for future research emerge:

Longitudinal Studies: Longitudinal research designs can help establish causality and provide insights into the developmental trajectories of affective and cognitive factors and their impact on speaking proficiency over time.

Intervention Studies: Investigating the effectiveness of specific interventions, such as motivational strategies, anxiety-reduction techniques, and cognitive skill training, can yield practical insights for language educators.

Cross-Cultural Studies: Comparative studies across different cultural and linguistic contexts can shed light on the generalizability of our findings and uncover cultural nuances in affective and cognitive factors.

Technology Integration: Research on the integration of technology, such as virtual reality or artificial intelligence-driven language platforms, in addressing affective and cognitive factors in language learning can provide innovative approaches to improving speaking skills.

In conclusion, this study advances our understanding of the multifaceted dynamics influencing English speaking proficiency among adult language learners. By recognizing the interplay of affective and cognitive factors and their implications for language education, we pave the way for more effective and learner-centered approaches to language learning and teaching.

ÖZET

Honlama; torna, taşlama, rektefiye gibi işlemlerden sonra gerçekleştirilen bir talaş kaldırma işlemidir. Bu operasyon genellikle honlama makinelerinde yapılır. Silindirik iç ve dış yüzeylerin pürüzsüzleştirilmesi, hassas ölçülerin elde edilmesi ve yüzey pürüzlülüğünün iyileştirilmesi amacıyla gerçekleştirilir. Honlama işlemi, küçük parçacıklar halindeki sert malzemelerin (örneğin korundum, silisyum karbür, bor nitrid) kullanılmasıyla gerçekleştirilir. Bu malzemeler, işlenen yüzey cidarında sürtünme yoluyla talaş kaldırır ve yüzeyin istenen özelliklere ulaşmasını sağlar. Bu çalışma motorlarda, pnömatik ve hidrolik sistemlerde, frengibi hareketli aksamlar da sıkça kullanılan segmanların alıştıırılması ile ilgilidir. İşlem gerçekleştirilirken, manuel yöntemler yerine daha fazla otomasyon sistemlerine yer verilmiş ve tam otomatik üretim sistemine geçilmesi hedeflenmiştir. Segmanlar iş mili üzerine dizme ile operasyona hazırhale gelmektedir. Bunu yapabilmek için montaj ve demontaj kolaylığının sağlanması gerekmektedir. Tüm sistem ayrı ayrı demo yapılarak aksaklıklar giderilmiş ve en sonunda tüm sistem montajı yapılmıştır. Burada, amaç görevli personelin tek bir tezgahta yaptığı montaj ve demontaj işlemi yerleştirme vb. durumlar gibi 16 farklı hareket incelenmiş, bu çalışma sayesinde mevcut çalışır durumda 6 adet manuel birbirinden farklı kapasitelerdeki matkap tezgahları 12 personel tarafından 3 vardiya çalışacak şekilde günde ortalama 14.000 adet üretim gerçekleştirmiştir. Bu iyileştirme sayesinde, 6 personel 2 vardiya olacak şekilde görevlendirilerek yaklaşık olarak 20.000 adet segman üretimi yapılmıştır. Üretilen ürün sayısında %42 oranında artış sağlanmıştır. Personel kaynaklı fire sayısı yaklaşık %20 oranında azalmıştır.

Anahtar Kelimeler: Honlama, segman, Mitsubishi RV-13 Endüstriyel Tip Robot

CONVERSION OF A VERTICAL DRILL TO A ROBOT FEED HONING MACHINE

ABSTRACT

Honing process; It is a finishing process in the machining process in order to improve the final surface quality of the piston rings, to shorten the running-in period in the engine, and to gain dimensional accuracy. As usage areas, diesel and gasoline engines, compressors, brake systems used in heavy vehicles and buses, suspension systems, transmission parts, etc. It is used in systems to obtain mechanical work from compressed air energy. In this study, production methods such as manual feeding and unloading were actively used while the piston ring was produced. Later, instead of this, it was aimed to switch to a fully automatic production system as a result of improvement activities. Process needs have been determined. Special fixtures are designed for assembly and disassembly operations. Afterwards, these systems were aimed at robot integration. While adopting this working principle as a principle, industrial robot technologies, rotary joint mechanical parts systems, materials science, CAD and CAM Simulation programs, Fatek PLC and WinPro Ladder PLC program, AMF Zero point locking system, Festo pneumatic systems, Motion Servo motor and components etc. systems have been used. While designing all structures, issues such as price/performance criteria, strength and sustainability were taken into consideration. Basically, in this study 16 different movements such as fastening, disassembly, and placement made by the personnel in a single workbench were observed. Deficiencies and current studies have been examined in detail. Later, Ttm machinery was simulated in solidworks program. All parts were taken into the manufacturing program one by one and assembled on site by using CNC lathe and vertical machining center and also by laser and plasma sheet metal cutting. Thanks to this study, 6 drill machines in use were produced by 12 personnel and 13.000-14.000 pieces per day in 3 shifts. Thanks to this improvement, 6 personnel were assigned and 19.000-20,000 pieces were produced in 2 shifts. An increase of 42-46% was achieved in the number of products produced. From time to time, approximately 20-25% improvement was achieved in the number of personnel-related waste.

GİRİŞ

Honlama, talaşlı imalatın son aşamasında kullanılan önemli bir yüzey işlemdir. Bu işlem, mikron ölçekli aşındırıcı taneciklerden oluşan honlama taşlarının, iş parçası yüzeyi üzerinde periyodik dönme ve ileri geri hareketi ile gerçekleştirilir. Honlama işlemi sonucunda, iş parçası yüzeyinin geometrisi, ölçüleri ve yüzey pürüzlülüğü azalır. Honlama işlemi, manuel ve daha çok insan gücüyle gerçekleştirilen bir operasyon olduğu için istenilen verimliliğin elde edilebilmesi ve üretim kapasitesinin artışı sebebiyle otomasyona geçiş gerekmektedir.

Mawandiya ve arkadaşları (2022) çalışmasında, gereksiz takım hareketlerinin önüne geçerek, talaş kaldırma süresini arttırmak amacıyla strok uzunluğunun azaltılmasıyla takribi olarak 40 ila 50 saniye tasarruf edilebileceği bildirmiştir. Çalışmada, ortalama aksiyon süresi 228 saniye iken, yapılan modifikasyonla 177,7 saniyeye düşürülmüştür. Bu sayede prosesin daha verimli hale getirildiği ifade edilmiştir.

Singh ve arkadaşları (2018), iç silindirik cidarların homojen kalınlıkta honlanması için yeni bir iç honlama makinesi geliştirmiştir. Çalışmanın temel amacı, borunun iç yüzeyini düzgün bir şekilde honlamaktır. 0,5 beygir gücünde bir motoru 8 inçlik bir kasnak ve V-kayış aktarma sistemi ile bir eksantrik mekanizmasına montajlanmıştır. Bu eksantrik mil, alt kısımda bulunan 60 d/dk'lık 12 V DC motor ile honlama takımının motor miline bağlanmıştır. Bunun için, motor hızı düşürülerek borunun boydan boya uniform honlanması ve kaplama performansının değerlendirilmesi hedeflenmiştir.

Sender(2018), honlama parametrelerinin işlenmiş parçaların yüzey kalitesi üzerindeki etkisini ve son yenilikleri ele alan bir literatür taraması sunmaktadır. Silindir gömleklerinin alt ve orta bölgelerinde plato honlama oluklarına ait kaldırılan talaş miktarı ve meydana gelen ısıya bağlı deformasyonları incelemiştir. 64 µm aşındırıcı tane büyüklüğüne sahip aşındırıcı ve uygulama basıncı 700 N/cm² olduğunda 15 g/cm³ bir aşındırıcı yoğunluğunun yeterli olmadığını tespit etti. Meydana gelen kum sürtünme ısının ne kadar az olursa, silindir yüzeyinde oluşan şekil sapmasının o kadar az olacağını öne sürmüştür.

Patil(2017), çalışmasında takım aşınmasını telafi etmek amacıyla mevcut çalışan manuel bir sistemi konuya bahis olan çalışmamıza benzer şekilde otomatik hale getirmiştir. Çalışma, konik makaralı ve bilyalı SKF rulmanlarının üretildiği Hindistan fabrikasında dış yatağının iç yüzeyi ve aynı zamanda iç yatağın dış yüzeylerinin iyileştirilmesi için gerçekleştirilmiştir.

Çalışma gerçekleştirilmeden önce manuel yöntemle yapılan uygulamada rulman bileziğinin iç yüzey pürüzlülüğü yaklaşık olarak 0.16 μm olarak ifade edilmiştir. Çalışma bittikten sonra otomatik hale dönüştürüldükten sonra bu değer 0.14 μm olarak ölçüldüğünü ifade etmiştir. Yapılan bu iyileştirmede vardiya süresince 500 adet üretimin arttığı gözlemlenmiştir. Duruş kayıpları, aynı zamanda 45 dakikalık süre 25 dakikaya düşerek yaklaşık olarak %45 oranında bir verimlilik artışı sağlanmıştır.

Buj-Corral ve Sivatte-Adroer (2022), kaba honlama işleminde malzeme kaldırma oranı (MKO) ve takım aşınmasının çok amaçlı optimizasyonunu inceledi. Bileşik deney tasarımı için Honingtech'ten yatay bir honlama test makinesi kullandılar. Malzeme kaldırma oranı ve takım aşınmasını aynı anda optimize etmek için bir genetik algoritma metodu kullandılar. Optimum ayarları: tane boyutu 30 μm , aşındırıcı konsantrasyonu %60, taş basıncı 100 N/cm², teğetsel hız 100 m/dk ve doğrusal hız 50 mm/dk bulundu. Bu ayarlar, 0,4 mm³/dk'lık bir MKO ve 0,01 mm'lik bir takım aşınmasıyla sonuçlandı. Çok amaçlı optimizasyon yaklaşımının kaba honlama işleminin performansını artırmada etkili olduğu sonucuna vardı. Ayrıca gelecekteki araştırmaların daha verimli optimizasyon algoritmaları geliştirmeye odaklanması gerektiğini öne sürdüler.

Bu çalışmada, motor segmanı üretiminde robot entegrasyonu süre ve işçilik açısından üretimde tasarruf edilmesi ve buna bağlı üretim performansının artırılması hedeflenmiştir.

MATERYAL ve YÖNTEM

Samsun Segman ve Gömlek San.ve Tic.Ltd.Şti.(SSS) firmasında, H1 kodlu dikey matkap tezgahı üzerinde çalışma faaliyeti yürütülmüştür. Bu H1 kodlu dikey matkap tezgahında segmanlar iş parçası mili üzerine dizilmesi vasıtasıyla tornalanmış kır dökme demir'den(GG25) üretilmiş silindir gömleği içerisinde Şekil 1.a'da gösterildiği gibi aksel(V_L) ve 360° tam dairesel(V_T) hareket mekanizması birleşimi ile işlem gerçekleştirilmektedir. Montaj ve demontaj için RV-FR Serisi 6 eksen 13 kg kaldırma kapasitesine sahip Mitsubishi RV-13 Endüstriyel tip robot kullanılmıştır.

Samsun Segman Sanayi firmasının honlama bölümünde Ø29 mm- Ø 230 mm iç çap, cidar kalınlığı 1,1 mm -8 mm, yan kalınlık 1 mm-10 mm'ye kadar üretim yapılabilmektedir. Farklı ölçülerde üretilen bu segmanlar, honlama taşı yerine segman yüzeyi gömlek yüzeyine temas ettirilmesi ile ihtiyaç duyulan talaş kaldırma işlemi yapılmaktadır. Bu işlem gerçekleştirilirken Lubex SAE30 motor yağı kullanılmaktadır. Ortalama 60-75 d/dk ve sürtünme sonrası oluşan

gömlek sıcaklığı 60 °C ölçüldü. Sistemin manuel olmasından dolayı, kesintisiz çalışırken maksimum verim alabilmesi için otomasyona ihtiyaç duyulmaktadır.

Şekil 1.a Periyodik Honlama Hareketi

Sistem PLC ünitesi tarafından kontrol edilmektedir. Montaj ve demontaj esnasında pratiklik açısından uygun bir tutma aparatının(tutucu) geliştirilmesine ihtiyaç vardır. Bu çalışma sırasında ele alınan mekanik/elektrik/ tasarım'a ait konu başlıkları aşağıdaki gibidir:

Mekanik sistem tasarımı

Pnömatik sistem tasarımı

Honlama gömleğinin ağız açısının ayarlanması

Dikey Matkap Tezgahının PLC kontrollü hale getirilmesi

Servo motor ve vidalı mil bağlantılarının yapılması

PLC programlamasının yapılması

Robot programlamasının yapılması

Dikey Matkap-robot entegrasyonunun yapılması

Sistemin imalatı

Sistemin uygulanması

Sistemin karşılaştırılması

Bir pnömatik sistem tasarlamının ilk adımı temel bir mantıksal devre hazırlamaktır. Bu devreyi hazırlamak için gerçekleştirilecek işlemlerin sırası önemlidir. Kısaca işlem adımları aşağıdaki gibidir. İstenilen sıralama operasyon işlemine göre değişiklikler gösterebilmektedir.

Şekil 1.b Dikey Matkap Tezgahı
(Samsun Segman ve Gömlek San.ve Tic.Ltd.Şti. İzniyle)

Şekil 1.c Elektro Pnömatik Devre Tasarım Şeması
(Sıfır Nokta Kilit Sistemi)

Şekil 1.b' de manuel tezgâha uyarlanan pnömatik kilit devre sistemi Şekil 1.c'de ki sıfır nokta kilit sistemine ait pnömatik devre tasarım şeması gösterilmektedir. Burada Silindir olarak gösterilen ekipman sıfır nokta kilit sistem ekipmanıdır. Duruş-kalkış noktalarında endüktif sensörler konularak açık ve kapalı konum sınırlamaları yapılmıştır. Ayrıca bu sensörler vasıtasıyla ürün montaj haldeyken bırakmaması ve gevşememesi hedeflenmiştir. Şekil 2.a'da sistem kapalı konumu Şekil 2.b'de açık durumdaki sistem diyagramını göstermektedir. Şekil 3'de rotary joint ve zero point bağlantı şeması gösterilmiştir.

Şekil 2.a Kapalı Konum Kilit Sistem Şeması

BULGULAR ve TARTIŞMA

Bu çalışmada temel problem sürecin tamamen manuel yöntemle yürütülmesidir. Problem incelendiğinde gereksiz hareketler ve ekipmanlar azaltıldığında sürecin kısılacağı öngörülmüştür. Ø110x3,50 008CR stok kodlu segmana ait kaplama işlemi sonrası yapılan 5 farklı numune çalışması Şekil 5 'de ifade edilmiştir. Yapılan mevcut üretim sisteminin dizaynı yeniden yapılarak sürece başlanmıştır. Önce dönme hareketi esnasında oluşan merkezkaç kuvveti minimize edilmiştir. Ayrıca aksenal ve radyal sürtünme kuvvetleri ile birlikte kullanılan ortalama 40-50 adet segman, iş mili ve ekipmanların ağırlıkları göz önünde bulundurulmuştur. Merkez mili ve Gömlek dairesi merkez kaçıklığını minimize etmek amacıyla silindir gömleğini sabitlemek için ayarlı sehpaye montajlı 3 ayaklı fener kullanılmıştır.

Şekil 5. Segman Ara Pul-Ara Parça Kaplama Kalınlıkları (µm)

SONUÇ ve ÖNERİLER

Yapılan bu çalışmada, işletmenin honlama bölümünde verimlilik artırıldı. Çalışmadan önce 6 adet honlama tezgahı kullanılarak 12 işçi günde 3 vardiya toplamda 13.000- 14.000 adet segman üretiliyordu. Çalışmadan sonra 4 adet honlama tezgahı kullanılarak, 6 işçi günde 2 vardiya toplamda 19.000-20.000 adet segman üretilmeye başlandı. Bu çalışma sonucunda, maliyet tasarrufu. 12 işçi yerine 6 işçi çalıştırılmaya başlandı. Fire oranı % 20-25 azalmıştır. İşçilik anlamında da % 42 oranında iyileşme görüldü. Çalışmanın sonuçları şu şekilde özetlenebilir:

İşçilik Tasarrufu: 12 işçi yerine 6 işçi çalıştırılmaya başlandı. Bu, %50'lik bir maliyet tasarrufu anlamına geliyor.

Fire oranında Azalma: Fire oranı % 20 azaldı. Bu, daha kaliteli üretim anlamına gelmektedir.

Verimlilik artışı: Günlük üretim miktarı % 42 oranında arttı.

Bu çalışma, honlama performansının artırılmasının mümkün olduğunu gösteriyor. Bu tür ürünler, üretim maliyetlerini düşürmesine ve rekabet gücünü artırmasına yardımcı olabilir. Honlama işleme prosesindeki performans optimizasyonu, çevrim süresi etüdü ve istasyonların dengelenmesi prensibi kullanılarak gerçekleştirilmiştir. Farklı proses parametrelerine ilişkin veri toplamının, yüzey pürüzlülüğü dikkate alınarak honlama prosesinin optimize edilmesinde faydalı olduğu söylenebilir. Burada talaş kaldırmanın artırılması ve strokun azaltılması, yani

gereksiz takım hareketinin ortadan kaldırılmasıyla honlama işleminin çevrim süresi yaklaşık %50 oranında saniye bazlı düşürülmüştür. Ortalama döngü süresi, tablodan farklı parametreler değiştirilerek farklı optimize edilmiş sonuçlar elde edilebilir, çünkü bu aynı zamanda silindir gömlekleri üzerinde gerçekleştirilen önceki imalat işlemlerine bağlıdır.

Şekil 6.a Ara Parça(Ø100 mm) **Şekil 6.b** Pul(Ø100 mm) **Şekil 6.c** Segman(Ø100 mm)

Ø29-Ø230 mm arasında değişen çaplara göre 10-15 mm et kalınlığında Şekil 6.b'de gösterilen ara pullarla yapılan üretimde, Şekil 6.c'de ifade edilen segmanların yüzey pürüzlülüğü düzensiz ve düşüktü. Bir dizilimde ortalama 4-5 adet pul kullanılmaktadır. Bu da segmanların performansını ve ömrünü olumsuz etkilemektedir. Şekil 6.a'de görüldüğü üzere yeni geliştirilen bu ara parça sayesinde, segmanlar bir ara parçaya sıralanarak hepsi uniform şekilde daha hızlı dizilmektedir. Bu yöntemde, segmanlar kalıp tarafından her yönden desteklenerek düzgün bir yüzeye sahip olmaktadır. Ayrıca, segmanlar kalıp içinde birbirine sıkıca bağlanarak çalışma sırasında birbirlerinden bağımsız hareket etmemektedir. Dizilen bu segmanların aralarında toplamda 1 ila 1,5 mm hareket boşluğu bırakılmaktadır. Tablo 1, farklı segman boyutları için üretim süre ve adet değerlerini göstermektedir. Bu değerler, yeni sistem sayesinde önemli ölçüde iyileştiği görülmektedir. Örneğin, Ø70 mm bir segmanın ortalama yüzey pürüzlülük değeri (R_a), eski sistemde (Pul ile üretim) $R_a=1.2$ iken yeni sistemde (Ara Parça ile üretim) $R_a=0.8$ değerine düşmüştür. Buda yüzey pürüzlülüğünün %33 oranında arttığı anlamına gelmektedir. Süre açısından incelendiğinde %41 oranında verimlilik artışına neden olmuştur.

Tablo 1. Pul ve Ara Parça ile Yapılan Üretim Kıyaslama Tablosu

Stok Kodu	Pul			Ara Parça			Verimlilik
	Adet	Süre(s)	Adet/s	Adet	Süre(s)	Adet/s	
10000250026P EP430	5100	27480	5,39	754	2105	2,79	48,19%
07064238026P	3.250	14760	4,54	845	2256	2,67	41,21%
09350150026P EP390	548	3607	6,58	657	1920	2,92	55,60%

Şekil 7. Pul-Ara Parça ile Segman Üretim Süresi Karşılaştırma

Sonuç olarak, yeni geliştirilen sistemle birlikte, Şekil 5’de görüldüğü gibi segmanların ortalama yüzey pürüzlülüğünde (Ra) %21 ile %29 arasında bir iyileşme sağlandı. Ayrıca, Tablo 1’de belirtildiği üzere, birim üretim süresinde %40 ila %55 oranında bir iyileşme kaydedildi. Bu durum, adet bazında ortalama %42 oranında bir iyileştirmeye yol açtı ve günlük üretim kapasitesini 14.000 adetten 20.000 adete çıkardı. Şekil 7’de gösterilen grafikte, segmanların birim üretim süresinin kısaldığı halde, Şekil 5’de belirtildiği gibi kaplama işlemi sonrası yapılan honlama işlemiyle yüzey pürüzlülüğünün daha iyi hale geldiği görülmektedir.

ÖZET

Tuzluluk stresi, bitkilerin büyüme ve gelişmelerini doğrudan etkileyerek ürün verimini önemli ölçülerde düşüren abiyotik stres koşullarından biri olarak bilinmektedir. Bu nedenle sunulan bu çalışmada, *in vitro* koşullar altında beyaz baş lahana (*Brassica oleracea* var. *capitata* f. *alba*)'nın farklı NaCl dozlarındaki gelişim performansı tespit edilmiştir. Çalışmada kullanılan ortamlar 0, 50, 100, 150, 200, 250, 300 mM NaCl dozlarının MS besin ortamına eklenmesiyle oluşturulmuştur. Çalışma süresince; tuz stresinin tohum çimlenmesine etkisinin belirlenmesi amacıyla tohum çimlenme yüzdesi, tohum çimlenme süresi, bitkinin gerçek su içeriği, kök yaş ağırlığı, kök kuru ağırlığı, gövde yaş ağırlığı ve gövde kuru ağırlığı analizleri gerçekleştirilmiştir. Çimlenme yüzdesinin en fazla olduğu ortamlar BLB (%98.00), BLC (%97.80) ve BLE (%97.80) olarak tespit edilmiştir. Çimlenme süresi bakımından incelendiğinde, tohumların en hızlı çimlendiği ortam BLA (3.18 gün), en yavaş çimlendiği ortam BLG (4.89 gün) olduğu belirlenmiştir. BLG ortamından elde edilen bitkilerin gerçek su içeriği en yüksek (%93.22) olarak belirlenirken, BLE ortamında oluşan bitkilerin gerçek su içeriği (%88.28) en düşük olduğu saptanmıştır. Gövde yaş ve kuru ağırlığı en yüksek olan bitkilerin BLC (sırasıyla 0.554, 0.055 g) ortamında olduğu belirlenmiştir. Kök yaş ağırlığı en yüksek BLC (0.141 g) ortamından elde edilirken, en düşük BLE (0.012 g) ortamından elde edilmiştir. Kök kuru ağırlığı en yüksek BLE (0.012 g) ortamında olduğu dikkat çekmiştir.

**DETERMINATION OF THE TOLERANCE LEVEL OF WHITE HEAD
CABBAGE (*Brassica oleracea* var. *capitata* L.) PLANT IN NUTRITIONAL MEDIA
CONTAINING DIFFERENT DOSES OF SODIUM CHLORIDE IN *IN VITRO*
CONDITIONS**

ABSTRACT

Salinity stress is known as one of the abiotic stress conditions that directly affects the growth and development of plants and significantly reduces crop yield. Therefore, in this presented study, the growth performance of white cabbage (*Brassica oleracea* var. *capitata* f. *alba*) at different NaCl doses was determined under in vitro conditions. The media used in the study were created by adding 0, 50, 100, 150, 200, 250, 300 mM NaCl doses to the MS nutrient medium. During work; In order to determine the effect of salt stress on seed germination, seed germination percentage, seed germination time, plant actual water content, root fresh weight, root dry weight, stem fresh weight and stem dry weight analyzes were performed. The media with the highest germination percentage were determined as BLB (98.00%), BLC (97.80%) and BLE (97.80%). When examined in terms of germination time, it was determined that the fastest germination medium was BLA (3.18 days), the slowest germination medium was BLG (4.89 days). While the actual water content of the plants obtained from the BLG medium was determined as the highest (93.22%), the true water content of the plants obtained from the BLE medium was determined to be the lowest (88.28%). It was determined that the plants with the highest stem fresh and dry weight were in BLC (0.554, 0.055 g, respectively) medium. The highest root wet weight was obtained from BLC (0.141 g) medium, while the lowest was obtained from BLE (0.012 g) medium. It was noted that root dry weight was highest in BLE (0.012 g) medium.

GİRİŞ

Lahana, Brassicaceae familyasının önemli bir sebze türü olmakla birlikte ülkemizde ve dünyanın birçok yerinde yetiştiriciliği yapılmaktadır. Pek çok ülkenin kültüründe ve geleneksel mutfağında önemli bir yere sahip olan beyaz lahana, geleneksel tıpta da yaygın olarak kullanılmaktadır. Uygun fiyatı ve yerel pazarlarda bulunabilirliği nedeniyle beyaz lahana, insan beslenmesinde önemli bir bitkisel besin kaynağı olarak öne çıkmaktadır. Uzun süre çiğ olarak saklanabildiği için yıl boyunca temin edilebilmektedir. Ayrıca taze olarak salatalarda kullanılmasının yanı sıra haşlama, kızartma ve fermente ürün olarak tüketilebilmektedir (Şamec ve ark. 2017). Beyaz lahana günümüzde dünya çapında 90'dan fazla ülkede yetiştirilen ekonomik açıdan önemli bir türdür. Dünya çapında yetiştirilen, morfolojik özellikleri, besin değerleri, fitokimyasal bileşimi ve abiyotik ve biyotik streslere toleransı bakımından farklılık gösteren birçok beyaz lahana çeşidi bulunmaktadır (Şamec ve ark. 2017). Brassicaceae familyasının yerli tür çeşitliliğinin en fazla olduğu bölgeler İran-Turan bölgesi (yaklaşık 900 tür), Kuzey ve Orta Amerika (973 tür) ve Akdeniz bölgeleridir (630 tür). Diğer küçük merkezler arasında Saharo-Sindian bölgesi (180 tür), Kolombiya'dan Patagonya'ya kadar And Dağları boyunca uzanan Güney Amerika (367 tür), Güney Afrika (yaklaşık 110 tür) ve Avustralya ve Yeni Zelanda (yaklaşık 120 tür) bulunmaktadır. Orta ve Batı Asya, Akdeniz Avrupası ve Batı Kuzey Amerika'da en fazla çeşitliliğe sahip olan bölgelerdir (Al-Shehbaz, 2011).

Tuzluluk stresi, özellikle kurak ve yarı kurak bölgelerde tarımsal üretimde önemli kayıplara neden olan, en yaygın abiyotik streslerden biridir. FAO verilerine göre dünya genelinde yaklaşık 800 milyon hektar alan tuzluluktan etkilenmektedir. Bu nedenle abiyotik strese daha iyi yanıt veren bitkiler elde etmek için tuzluluğa tolerans mekanizmalarının bilinmesi hayati önem taşımaktadır. Aynı zamanda gelecek iklim değişikliği senaryosunda daha verimli ürün elde edilmesini sağlayacak sürdürülebilir tarım uygulamalarıyla bu hedeflere ulaşmak gerekmektedir (Hernández, 2019). Tuz stresine

bağlı ilk belirtiler, erken saatlerden birkaç gün sonrasına kadar köklerde fitotoksik iyonların birikmesiyle ilişkili ozmotik strese maruz kalınarak ortaya çıkmaktadır. (Acosta-Motos ve ark. 2017). Tuzluluğa verilen tüm bu tepkiler, bitkiler üzerinde zararlı etkilere katkıda bulunur, ancak hayatta kalmalarına yardımcı olabilecek tuzluluğa alışmak için bir dizi adaptasyon uygulayabilen NaCl'ye karşı toleranslı bitkiler vardır. Bu adaptasyon mekanizmaları morfolojik, fizyolojik, biyokimyasal ve moleküler değişiklikleri içermektedir (Acosta-Motos ve ark. 2017).

Bitki doku kültürü, steril koşullar altında bitkinin kısımlarının steril koşullar altında yapay besin ortamına aktarılma işlemine denir. Bitki doku kültürü hastalıklardan ve virüsten arı materyallerin elde edilmesi, üretimi zor olan türlerin çoğaltılması, yok olma tehlikesi ile karşı karşıya kalınan türlerin korunması ve kısa süre içerisinde çok sayıda bitkinin üretilmesini amaçlamaktadır. Bu çalışmada, beyaz baş lahanada bitkisinin *in vitro* koşullar altında farklı konsantrasyonlarda hazırlanmış sodyum klorür (NaCl)'ün 0 (kontrol), 50, 100, 150, 200, 250,300 mM tuzluluğa ve tuzluluğun değişik dozlarına karşı tepkisinin belirlenmesi amaçlanmıştır.

MATERYAL ve YÖNTEM

Çalışma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi bitki doku kültürü laboratuvarında yürütülmüştür. Deneme materyali olarak Yalova 1 beyaz lahanada çeşidi tohumları kullanılmıştır. Araştırma kapsamında 4.4 g/l MS (Murashige ve Skoog, 1962) besin ortamı, 30 g/L sakkaroz, 7 g/L agar ve NaCl' nin 0, 50, 100, 150, 200, 250, 300 mM konsantrasyonları kullanılmıştır (Çizelge 1). Hazırlanan besin ortamlarının pH'ı, 5.8 olacak şekilde ayarlanmış, 121 °C sıcaklıkta, 1.2 atm basınçta 15 dakika süre ile otoklav ile sterilizasyonu gerçekleştirilmiştir.

Çizelge 1. Ortamların adlandırılması

Dozlar	NaCl (mM)
BLA (Kontrol)	0
BLB	50
BLC	100
BLD	150
BLE	200
BLF	250
BLG	300

Denemede kullanılan beyaz baş lahana tohumları steril kabin içerisinde %20'lik sodyum hipoklorit çözeltisinde 20 dk bekletilmiş ve 4-5 defa steril saf su ile yıkama işlemi yapılarak yüzey sterilizasyonu sağlanmıştır. Sterilizasyon işlemi tamamlanan ortamların steril kabin içerisinde petrilere dökümü sağlanmış, ortamlar soğuyup katılaşıncaya kadar bekletilmiştir. Sterilize edilen beyaz lahana tohumlarının steril kabin içerisinde besin ortamına ekimi sağlanmıştır. Ekimi tamamlanan tohumlar $25 \pm 2^{\circ}\text{C}$ sıcaklık ve 3.000 lüks ışık altında 16 saat aydınlık 8 saat karanlık periyotta bekletilmiştir.

Deneme kapsamında tohumların çimlenme yüzdesi (%) ortalama çimlenme süresi (gün) (Kaya ve ark. 2006), gerçek su içeriği (%), gövde yaş ağırlığı (g), gövde kuru ağırlığı (g), kök yaş ağırlığı (g), kök kuru ağırlığı (g), (Keleş, 2019) belirlenmiştir. Deneme dört tekerrürlü ve her tekerrürde 5 petri ve her petride 10 tohum olacak şekilde tesadüf parselleri deneme desenine göre kurulmuştur. Çalışma sonucunda elde edilen verilere SAS temeli üzerine kurulu JMP 8.1 istatistik paket programı kullanılmış, ortalamalar LSD testi ile karşılaştırılmıştır.

BULGULAR ve TARTIŞMA

NaCl'in farklı dozlarıyla hazırlanan ortamlara ekimi sağlanan beyaz baş lahana tohumlarının çimlenme yüzdesi (%) ve ortalama çimlenme süresi (gün) Çizelge 2'de sunulmuştur. Çalışma sonucunda çimlenme yüzdesi ve ortalama çimlenme süresi istatistiksel olarak önemli bulunmuştur. Çizelgeye göre çimlenme yüzdesi en fazla istatistiksel olarak aynı grupta yer alan BLB (%98.00), BLC (%97.80) ve BLE (%97.80) ortamlarında saptanmıştır. Ortalama çimlenme süresi bakımından en kısa sürede çimlenme kontrol ortamı olan BLA (3.18 gün) ortamında, en yavaş çimlenme ise BLG (4.89 gün) ortamında olduğu tespit edilmiştir.

Abdel-Farid ve ark. (2020), *in vitro* ve *in vivo* koşullarda hıyar ve domates tohumlarına farklı konsantrasyonlarda NaCl (25, 50, 100 ve 200 mM) uygulayarak tohum çimlenme durumu ve fide büyümesini belirledikleri araştırmada; 200 mM tuz konsantrasyonunun hıyar tohumlarının çimlenme süresini geciktirdiğini deneme süresince sürgün uzunluğunun da önemli ölçüde azalttığını, domateste ise tüm NaCl dozlarının tohum çimlenme hızı, çimlenme yüzdesi ve fide büyümesinin önemli ölçüde etkilendiğini bildirmişlerdir. Tuzluluk stresi, marul (Zapata ve ark. 2004), turp (Jamil ve ark.2007), kanola (Bybordi, 2010) ve ıspanak gibi birçok türde tohum çimlenmesinin gecikmesine neden olmaktadır (Turhan ve ark. 2011). Bu sonuçların literatürle uyumlu olduğu dikkat çekmiştir.

Çizelge 2. Farklı konsantrasyonlarda hazırlanmış NaCl'nin çimlenme yüzdesi (%) ve ortalama çimlenme süresi (gün) üzerine etkisi

Farklı dozlarda hazırlanmış NaCl'in beyaz lahana çeşidinde gövde yaş – kuru (g), kök yaş – kuru ağırlıkları (g) ve gerçek su içerikleri Çizelge 3'te verilmiştir. Denemede gövde yaş – kuru (g), kök yaş ağırlıkları (g) ve gerçek su içerikleri (%) istatistiksel olarak önemli bulunmuştur. Çizelge 3'e göre gövde yaş ağırlığı en fazla BLC (0.55 g) ortamında elde edilirken en az gövde yaş ağırlığı BLA (0.28 g) ortamında saptanmıştır. Gövde kuru ağırlığı en fazla BLC (0.06 g) ortamında görülürken en az istatistiksel olarak aynı grupta yer alan BLA (0.03 g), BLB (0.03 g), BLD (0.03 g) ve BLG (0.03 g) ortamlarında tespit edilmiştir. Kök yaş ağırlığı bakımından Çizelge 3 incelendiğinde en fazla kök yaş ağırlığı BLC (0.14 g), BLE (0.14 g) ve BLA (0.12 g) ortamlarında görülmüştür. Gerçek su içeriği incelendiğinde en fazla su içeriği BLG (%93.22) ortamında belirlenmiştir. Karakoç ve Kale

(2015), dört farklı konsantrasyonda sulama suyundaki farklı tuz cinslerinin marul bitkisi üzerine etkilerini belirledikleri çalışmada NaCl ve CaSO₄ tuzları kullanılarak 0, 2, 4 ve 6 dS/m olmak üzere dört konsantrasyonda sulama suyu hazırlanmış ve saksı uygulamaları gerçekleştirmiştir. Uygulama sonrası bitkilerin belirli büyüklüğe gelmesi ile hasat edilerek, yaş ve kuru ağırlıkları tespit edilmiştir. Sonuç olarak, tuzluluk oranının artmasıyla birlikte marul bitkisinin yaş ve kuru ağırlıklarında azalmalar olduğu görülmüştür. Kıran ve ark. (2015), yaptıkları çalışmada tuzluluk stresi altındaki bazı patlıcan anaçlarının 100 mM NaCl uygulamasının 4-5 gerçek yapraklı dönemde yeşil aksam yaş ağırlıklarının azaldığını dikkat çekmiştir. Baktumur (2023), *in vitro* koşullarda değişik dozlarda NaCl'nin kabak bitkisinin bitki gelişimi üzerine etkilerini belirlediği çalışmada kök yaş ağırlığı, en fazla KD (150 mM) ortamından, en az KF (250 mM) (2.03 g) ortamında olduğunu bildirmiştir. Bu sonuçların literatürle uyumlu olduğu belirlenmiştir.

Çizelge 3. Farklı konsantrasyonlarda hazırlanmış NaCl'ün gövde ve kök yaş – kuru ağırlık (g) ve gerçek su içeriği (%) değerleri üzerine etkisi

Ortamlar	Gövde Yaş Ağırlık (g)	Gövde Kuru Ağırlık (g)	Kök Yaş Ağırlık (g)	Kök Kuru Ağırlık (g)	Gerçek Su İçeriği (%)

SONUÇ ve ÖNERİLER

Bu çalışmada, *in vitro* koşullar altında değişik dozlarda hazırlanmış NaCl'in beyaz baş lahana bitkisinin gelişimi üzerine etkileri belirlenmiştir. Araştırmada en yüksek çimlenme yüzdesi BLB (%98.00) ortamında görülürken, ortalama çimlenme süresi en kısa BLA (3.18 gün) ortamından elde edilmiştir. Besin ortamlarındaki NaCl konsantrasyonlarının artmasıyla çimlenme süresinin uzadığı dikkat çekmiştir. Sonuçlar dikkate alındığında tuzluluk konsantrasyonları arttığında bitkinin gelişiminin azaldığı görülmüştür. Abiyotik streslerden birisi olan tuzluluk bitki gelişimi açısından oldukça önemlidir. Günümüzde ekilebilir tarım arazilerinin azalması tuzluluğa karşı dayanıklı hatların oluşturulması oldukça önem arz etmektedir. Bu kapsamda bitki fizyolojisini olumsuz yönde etkileyen tuzluluğun *in vitro* koşullarda farklı türlerde yapılarak yaygınlaştırılması önem taşımaktadır.

ÖZET

Değişen iklim koşullarının etkisiyle tarım topraklarının tuzluluk oranları giderek artmakta ve bu durum tarım ürünlerinde verim kayıplarına neden olmaktadır. Bitkilerdeki verim kayıpları, tuz stresi koşullarına toleransı yüksek olan bitkilerin seçilerek üretimde kullanılmasıyla azaltılabilmektedir. Bu çalışma kapsamında, ülkemizde sevilerek tüketilen bahçe teresi tohumları *in vitro* koşullarda (*Lepidium sativum* L.) farklı tuz stresi seviyelerine tabi tutularak gelişim durumları incelenmiştir. Çalışmada kontrol 0, 50, 100, 150, 200, 250 ve 300 mM olmak üzere 6 farklı NaCl konsantrasyonu kullanılmıştır. Tohumların çimlenme yüzdesi, çimlenme süresi, bitkinin gerçek su içeriği, kök yaş ağırlığı, kök kuru ağırlığı, gövde yaş ağırlığı ve gövde kuru ağırlığı parametreleri incelenmiştir. Çalışma sonuçları incelendiğinde, çimlenme yüzdesi tuz içermeyen TRA (%74.00) ortamında en yüksek bulunurken, tuz konsantrasyonunun en yüksek seviyelerde olduğu TRG (%36.20) ortamında en düşük olarak bulunmuştur. Ortalama çimlenme süreleri kıyaslandığında en hızlı çimlenmenin TRA (1.63 gün) ortamında olduğu tespit edilmiştir. Bitkilerin gerçek su içerikleri kıyaslandığında en yüksek değerler TRA (%90.39) ortamından, en düşük değerler TRG (%76.60) ortamından elde edilmiştir. Gövde yaş ağırlığı en yüksek TRA (0.200 g) ve TRB (0.183 g) ortamlarından elde edilirken, en düşük TRF (0.066 g) ve TRG (0.040 g) ortamlarından elde edilmiştir. Gövde kuru ağırlığının en yüksek TRA (0.018 g) ortamında, en düşük TRG (0.005 g) ortamında olduğu belirlenmiştir. Kök yaş ve kök kuru ağırlığının en fazla TRA (0.041 g, 0.003 g) ortamında olduğu tespit edilmiştir.

DETERMINATION OF GROWTH LEVEL OF GARDEN CRESS (*Lepidium sativum* L.) IN NUTRITIONAL MEDIA CONTAINING DIFFERENT CONCENTRATIONS OF NaCl *IN VITRO* CONDITIONS

ABSTRACT

With the effect of changing climatic conditions, the salinity of agricultural lands gradually increases and this causes yield losses in agricultural products. Yield losses in plants can be reduced by selecting plants with high tolerance to salt stress conditions and using them in production. Within the scope of this study, garden cress seeds, which are appreciated and consumed in our country, were subjected to different salt stress levels *in vitro* conditions (*Lepidium sativum* L.) and their development status was examined. In the study, 6 different NaCl concentrations were used as control (0), 50, 100, 150, 200, 250, 300 and mM. Seed germination percentage, germination time, actual water content of the plant, root fresh weight, root dry weight, stem fresh weight and stem dry weight parameters were investigated. When the results of the study were examined, the germination percentage was found to be highest in the salt-free TRA (74.00%) medium, while it was the lowest in the TRG (36.20%) medium where the salt concentration was highest. When the average germination times were compared, it was determined that the fastest germination was in the TRA (1.63 days) medium. When the actual water content of the plants was compared, the highest values were obtained from the TRA (90.39%) medium, and the lowest values were obtained from the TRG (76.60%) medium. The highest stem wet weight was obtained from TRA (0.200 g) and TRB (0.183 g) media, while the lowest was obtained from TRF (0.066 g) and TRG (0.040 g) media. It was determined that the trunk dry weight was highest in TRA (0.018 g) medium and lowest in TRG (0.005 g) medium. Root fresh and root dry weight were determined to be highest in TRA (0.041 g, 0.003 g) medium.

GİRİŞ

Tuz yoğunluğu yüksek olan topraklarda yetiştirilen bitkilerde, çeşide ve genotiplere göre farklılıklar göstermekle birlikte, belli bir düzeyin üzerinde zararlanma görülmektedir. Bitki dokularında zararlanmayla birlikte, besin maddelerinin topraktan yeterince alınamaması ve toksik etkiler meydana gelmektedir. Bitki dokularındaki bozulmaların da bitkinin osmoz regülasyonunu bozduğu, ayrıca bitkinin enzim aktivasyonunu engellediği için bitki metabolizmasının olumsuz etkilediği görülmektedir (Aktaş, 2002). Tuz stresi koşulları altında bitki ozmotik dengesini sağlama amacıyla bünyesine fazla miktarda inorganik iyon almaktadır (Flowers ve ark., 1977; Prat ve ark., 1990). Bu iyon birikimi nedeniyle mineral toksisitesi ve beslenme dengesizliği ortaya çıkmaktadır (Alian ve ark., 2000). Toprak verimliliğini olumsuz yönde etkileyen abiyotik stres koşullarından biri olan tuzluluk, tarımsal üretimi sınırlandıran önemli bir problemdir (Gouia ve ark., 1994). Dünyanın toplam alanının neredeyse %7'si tuzlanmadan etkilenmektedir (Fahmi ve ark., 2011). Bu da dünyada üzerinde tuzlu koşullardan etkilenen 900 milyon hektardan fazla araziye temsil etmektedir (Munns ve Tester, 2008). Yüksek tuz seviyeleri, ekili arazilerin %20'sini ve sulanan alanın yarısını kaplamaktadır (Sarwar ve ark., 2021). Tuzluluk, kuraklık, soğuk ve sıcak gibi abiyotik stresler, temel gıda ürünlerinin hayatta kalmasını, biyokütle üretimini ve verimini olumsuz yönde etkilemektedir. FAO'nun tahminlerine göre dünya topraklarının yüzde 6'sından fazlası tuzluluktan etkilenmektedir. Bu nedenle, tuzluluk stresi bitki ve ürün verimliliği üzerinde önemli bir kısıtlama gibi görünmektedir (Parihar ve ark., 2015).

Yaygın olarak bahçe teresi olarak bilinen *Lepidium sativum*, anavatanı Mısır ve Batı Asya olsa da şu anda tüm dünyada yetiştirilen hızlı büyüyen, yıllık bir bitkidir (Doke ve Guha, 2014). Dünyanın birçok yerinde *Lepidium sativum* fideleri keskin tadı nedeniyle salatalarda kullanılmaktadır (Wadhwa ve ark., 2012). Tohumu, yağı ve tozu birçok fonksiyonel içecek ve gıdada kullanılmakta ve önemli miktarda protein, yağ, mineral, lif ve fitokimyasal içermektedir (Singh ve Paswan 2017).

Bitki doku kültürü, bitki dokularının, organlarının ve bunların bileşenlerinin *in vitro* aseptik koşullar altında kültüre alındığı hem temel hem de uygulamalı çalışmalarda ve ticari uygulamada kullanılan bir yöntemdir (Thorpe, 2007). Bitki doku kültürü üretimi zor olan türlerin çoğaltılması, yok olma tehlikesi ile karşı karşıya kalınan türlerin korunması, hastalıklardan ve virüsten ari materyallerin elde edilmesi ve kısa süre içerisinde çok sayıda bitkinin üretilmesini amaçlamaktadır. Yapılan bu çalışmada, bahçe teresi bitkisinin *in vitro* koşullarda farklı konsantrasyonlarda hazırlanmış NaCl'nin 0 (kontrol), 50, 100, 150, 200, 250, 300 mM tuzluluk koşullarına karşı tepkisinin belirlenmesi amaçlanmıştır.

MATERYAL ve YÖNTEM

Araştırma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi bitki doku kültürü laboratuvarında yürütülmüştür. Deneme materyali olarak BT BU-TER bahçe teresi tohumları kullanılmıştır. Araştırma kapsamında temel besin ortamı olarak 4.4 g/l MS (Murashige ve Skoog, 1962), karbon kaynağı olarak 30 g/L sakkaroz, ortamın katılaştırması için 7 g/L agar ve NaCl' nin 0, 50, 100, 150, 200, 250, 300 mM dozları kullanılmıştır (Çizelge 1). Hazırlanan besin ortamları pH'ı, 5.8 olacak şekilde ayarlanarak, 121 °C sıcaklıkta, 1.2 atm basınçta 15 dakika süre ile otoklav ile sterilize edilmiştir.

Çizelge 1. Ortamların adlandırılması

Dozlar	NaCl (mM)
TRA (Kontrol)	0
TRB	50
TRC	100
TRD	150
TRE	200
TRF	250
TRG	300

Bahçe teresi tohumları steril kabin içerisinde %20'lik sodyum hipoklorit çözeltisinde 20 dk bekletilmiş ve 4-5 defa steril saf su ile yıkama işlemi yapılarak yüzey sterilizasyonu

gerçekleştirilmiştir. Sterilizasyon sonrası steril kabin içerisinde besin ortamlarının petrilere dökümü yapılmış, ortamlar soğuyup katılaşıncaya kadar bekletilmiştir. Sterilize edilen tohumları steril kabin içerisinde besin ortamına ekimi sağlanmıştır. Ekimi tamamlanan tohumlar $25 \pm 2^{\circ}\text{C}$ sıcaklık ve 3.000 lüks ışık altında 16 saat aydınlık 8 saat karanlık periyotta bekletilmiştir.

Deneme süresince tohumların çimlenme yüzdesi (%) ortalama çimlenme süresi (gün) (Kaya ve ark. 2006), gerçek su içeriği (%), gövde yaş ağırlığı (g), gövde kuru ağırlığı (g), kök yaş ağırlığı (g), kök kuru ağırlığı (g), (Keleş, 2019) tespit edilmiştir. Deneme dört tekerrürlü ve her tekerrürde 5 petri ve her petride 10 tohum olacak şekilde tesadüf parselleri deneme desenine göre kurulmuştur. Çalışmada elde edilen veriler SAS temeli üzerine kurulu JMP 8.1 istatistik paket programı kullanılmış, ortalamalar LSD testi ile karşılaştırılmıştır.

BULGULAR ve TARTIŞMA

Farklı konsantrasyonlarda hazırlanmış NaCl'nin bahçe teresi çeşidinde çimlenme yüzdesi (%) ve ortalama çimlenme süresi (gün) Çizelge 2'de verilmiştir. NaCl'ün değişik konsantrasyonlarda hazırlanmış besin ortamlarında çimlenme yüzdesi ve ortalama çimlenme süresi istatistiksel olarak önemli bulunmuştur. Çizelge 2'ye göre ortamlar içerisindeki NaCl konsantrasyonları arttıkça çimlenme yüzdesinin düştüğü gözle çarpmıştır. Çimlenme yüzdesi en fazla TRA (%74.00) ortamında, en düşük TRG (%36.20) ortamında gerçekleşmiştir. Ortalama çimlenme süresi en hızlı TRA (1.64 gün) ortamından elde edilmiştir.

Bayat ve ark. (2022), tuzluluğun ekmeklik buğday üzerine etkilerinin belirledikleri çalışmada çimlenme oranı %36.0-84.0 arasında değiştiği ve artan NaCl dozları çimlenme oranının düşmesine neden olduğunu bildirmişlerdir. Kiemde ve Kibar (2023), marulda tuzlu koşullarda farklı dozlarda putresin ve salisilik asit uygulamalarının çimlenme, bitki gelişimi, kalite özellikleri ve besin elementi içeriği üzerine etkilerini belirlemeyi

amaçlamışlardır. Çalışma sonucunda tuzluluğun marulda çimlenme, bitki gelişimi, kalite özellikleri ve besin elementi içeriğini olumsuz etkilediğine dikkat çekmişlerdir. Bu sonuçların literatürle uyumlu olduğu belirlenmiştir.

Çizelge 2. Değişik dozlarda hazırlanmış NaCl'ün çimlenme yüzdesi (%) ve ortalama çimlenme süresi (gün) üzerine etkisi

Ortamlar	Çimlenme Yüzdesi (%)	Ortalama Çimlenme Süresi (gün)

*P < 0.05, **P ≤ 0.01, ***P ≤ 0.001, Ö.D; Önemli Değil

Çizelge 3'te değişik dozlarda hazırlanmış NaCl'in bahçe teresi çeşidinde gövde yaş – kuru (g), kök yaş - kuru ağırlıkları (g) ve gerçek su içerikleri verilmiştir. Denemede gövde yaş – kuru (g), kök yaş ağırlıkları (g) ve gerçek su içerikleri (%) istatistiksel olarak önemli bulunmuştur. Çizelge 3'e göre gövde yaş ağırlığı en fazla istatistiksel olarak aynı grupta yer alan TRA (0.200 g) ve TRB (0.183 g) ortamlarından elde edilmiştir. Gövde kuru ağırlığı en fazla TRA (0.018 g) en az gövde kuru ağırlık TRG (0.005 g) ortamında olduğu saptanmıştır. Kök yaş ağırlığı incelendiğinde en fazla kök yaş ağırlığı TRA (0.042 g), en az kök yaş ağırlığı TRG (0.009 g) ortamlarında olduğu görülmüştür. Gerçek su içeriği

gövde yaş – kuru (g), kök yaş ağırlıklarında olduğu gibi en fazla su içeriğine TRA (%90.836) ortamında tespit edilmiştir.

Aktaş ve Kılıç (2013) soya filizi yetiştiriciliğinin tuz üzerine etkisini belirledikleri çalışmada, çimlenme sonrası 25 ve 50 mM dozlarında NaCl uygulamasının sürgün-kök uzunluğu ve sürgün-kök taze ağırlığı üzerine olumsuz etkide bulunduğunu bildirmişlerdir. Altuner ve ark. (2022) tuz stresinin *in vitro* koşullarda bazı arpa çeşitleri üzerine etkilerini belirlemeyi amaçladıkları çalışmada, tuz dozlarının artması ile birlikte kuru kök ağırlığının düştüğüne dikkat çekmişlerdir. Baktumur (2023), *in vitro* koşullarda değişik dozlarda (0, 50, 100, 150, 200, 250 mM) NaCl'nin kabak bitkisi üzerine etkilerini belirlemeyi amaçladıkları çalışmada, tuz miktarı arttıkça kabak bitkisinin gelişiminin azaldığını bildirmiştir.

Çizelge 3. Değişik dozlarda hazırlanmış NaCl'nin gövde ve kök yaş – kuru ağırlık (g) ve gerçek su içeriği (%) değerleri üzerine etkisi

Ortamlar	Gövde Yaş Ağırlık (g)	Gövde Kuru Ağırlık (g)	Kök Yaş Ağırlık (g)	Kök Kuru Ağırlık (g)	Gerçek Su İçeriği (%)

SONUÇ ve ÖNERİLER

In vitro koşullar altında değişik dozlarda hazırlanmış NaCl'in bahçe teresi bitkisinin gelişimi üzerine etkileri belirlenmiştir. Çalışmada çimlenme yüzdesi en yüksek TRA

(%74.00) ortamında, ortalama çimlenme süresi en hızlı TRA (1.64 g) ortamında belirlenmiştir. Gövde yaş – kuru (g), kök yaş ağırlığı (g) ve gerçek su içeriği kontrol TRA ortamından elde edilmiştir. Ayrıca denemede tuzluluk konsantrasyonunun artması bitkinin gelişimini olumsuz yönde etkilediği göze çarpmıştır. Sonuçlar dikkate alındığında tuzluluğun bitkinin fizyolojisi açısından etkisi oldukça fazladır. Bu kapsamda tuzluluğa karşı dayanıklı hatların oluşturulması oldukça önemlidir. Ayrıca farklı türlerde konsantrasyon miktarlarının da değiştirilerek çalışmaların yaygınlaştırılması gerekmektedir.

ABSTRACT

Background: Physical activity and exercise are increasingly used as an effective method in treatment of chronic mental illnesses. Physical activity and exercise are likely to have short-term benefits for mental and physical health as well as preventing the development of lifestyle-related chronic diseases. With the addition of physical activity to the treatment of patients, an increase in positive lifestyle changes and mental health levels can be observed in patients. There is increasing evidence that both muscle building and strengthening resistance training and aerobic exercise can improve symptoms of mental illness. **Aim:** In this review, it was aimed to examine the effect of physical activity on the recovery of individuals with mental illness. **Method:** A comprehensive review of studies evaluating the effect of physical activity on recovery was conducted. **Results:** In the meta-analysis studies, it was observed that the depressive symptoms of the patients decreased and the symptoms of patients with schizophrenia improved. It has been shown that moderate to high-intensity physical activity can lead to improvements in positive and negative symptoms in patients with schizophrenia. At the end of exercise program applied in the study of Yoon et al. (2016), self-esteem, interpersonal relationships, quality of life and global function in patients with schizophrenia improved. In the study of Lan et al (2022), it was found that after an exercise program applied somatic symptoms, anxiety, depression and social distress decreased, and levels of optimism and functionality increased. In another study, at the end of walking applied to patients with bipolar disorder, it was observed that depression, anxiety and stress levels of patients decreased. **Conclusion:** It can be said that regular physical activity and exercise programs are an effective method that reduces depression, anxiety, stress, social distress and illness symptoms, increases optimism, quality of life and functionality, and helps recovery in patients.

Keywords: Mental Illness, Physical Activity, Exercise, Recovery

INTRODUCTION

Chronic mental illnesses are diseases that cause impairments in individuals' emotions, thoughts and cognitive abilities, changes in personality and individual habits, and social and economic losses (Buldukoğlu et al., 2011; Gültekin, 2010; World Health Organization, 2022a). Mental illnesses cause disability in individuals (Lieberman, 2011), causing the person to disrupt the expected work, school, home, social roles and self-care functions and duties (Lök & Lök, 2016; Rosenbaum et al., 2014). Although the morbidity and mortality rates of individuals with chronic mental illness are higher than the general population, their life expectancy and physical activity levels are lower (Kaya Erginer & Partlak Günüşen, 2013; Rosenbaum et al., 2015; Vancampfort et al., 2017). The physical health of patients deteriorates due to disease-related causes such as drug side effects, neglect of physical symptoms, lack of compliance, lifestyle behaviors and environmental factors such as smoking, malnutrition, alcohol, cigarette and substance use, lack of physical activity and hygiene (Kaya Erginer & Partlak Günüşen, 2013). Individuals with chronic mental illness can often lead a sedentary life due to reasons such as alienation from themselves and constant sleepiness. This may cause individuals to become more self-centered and internalize the effects of the disease more. (Lök & Lök, 2016). In addition, due to sedentary life, patients with schizophrenia, bipolar mood disorder and major depressive disorder, which are among the common chronic mental illnesses (Fibbins et al., 2021), the rate of chronic diseases associated with sedentary behavior, such as obesity, diabetes and cardiovascular diseases, is also increasing (Richardson et al., 2005; Rosenbaum et al., 2015). Physical activity and exercise interventions are likely to have short-term benefits for mental and physical health, as well as preventing the development of lifestyle-related chronic diseases (Rosenbaum et al., 2015). Regular exercise reduces the risk of stress, depression, heart disease, hypertension, stroke, diabetes, various types of cancer and other chronic diseases, falls, hip and vertebral fractures; It is known to strengthen the immune

system, muscle and bone structure (Caner et al., 2020; World Health Organization, 2022b). In addition, physical activity can have positive effects on reducing anxiety, stress and depression, maintaining mental health, increasing well-being and quality of life, and establishing resilience (Caner et al., 2020; Lök & Lök, 2016; Mahindru et al., 2023; Sahin et al., 2018; Uzun et al., 2019). It has been reported that individuals with chronic mental illness who participate in physical activity programs feel better mental, are more compliant with medication and therapeutic interventions, their anxiety decreases, their physical self-perception strengthens, their social functionality increases, their daytime sleepiness decreases and their nighttime sleep becomes better quality (Lök & Lök, 2016). Therefore, it is important to encourage physical activity and regular exercise and add it to routine treatment in terms of both physical and mental health in individuals with chronic mental illness. Physical activity and exercise are increasingly used as an effective method in the treatment of chronic mental illnesses (Lök & Lök, 2016). By adding physical activity and exercise to the treatment of mental illnesses, patients can experience an increase in positive lifestyle changes and an improvement in their mental health levels (Richardson et al., 2005). While recovery from mental illness is defined as the elimination of all symptoms or complete recovery of functions in the traditional model (Çam & Yalçınır, 2018; Şenocak et al., 2019), in modern medicine it is defined as of the process of a deep, individual, unique change in the attitudes, values, feelings, goals, skills and roles of the person with residual disability, and it is defined as a way of living a satisfying, hopeful and meaningful life despite the limitations caused by the disease (Çam & Yalçınır, 2018). Accordingly, recovery shows that although the symptoms of the disease continue, the individual has learned to cope with the negative effects of the disease and treatment and the obstacles in order to achieve his basic goals regarding independent living (Corrigan, 2006; Çam & Yalçınır, 2018). The most effective method to help recovery of individuals with chronic mental illness is the implementation of psychosocial interventions in addition to

psychopharmacological strategies (Corrigan, 2006). As a psychosocial intervention, there is increasing evidence that both muscle building and strengthening resistance training and aerobic exercises can improve mental illness symptoms (McKeon et al., 2022). Therefore, In this review, it was aimed to examine the effect of physical activity on the recovery of individuals with mental illness (schizophrenia, depression, bipolar mood disorder).

MATERIALS and METHODS

A comprehensive review of studies evaluating the effect of physical activity on recovery was conducted in this review.

FINDINGS and DISCUSSION

It has been reported that regular physical activity can improve mental health in individuals with chronic mental illness (Richardson et al., 2005). In meta-analysis studies, it was observed that the depressive symptoms of patients decreased and the symptoms improved in patients with schizophrenia (Firth et al., 2015; Korman et al., 2020; Martland et al., 2023; Schuch et al., 2016). It has been shown that moderate to high-intensity physical activity can lead to improvements in both positive and negative symptoms in patients with schizophrenia (Fibbins et al., 2021). In the study of Lok et al. (2017), a physical activity program was applied to 30 patients with schizophrenia twice a week for 12 weeks, consisting of a five-minute warm-up, a 30-minute exercise containing 22 simple movements involving attention and coordination, and a five-minute cool-down. At the end of the intervention, it was determined that the patients' positive, negative and depressive symptoms decreased. In the study by Acil et al. (2008), an aerobic exercise program was applied to 15 patients with schizophrenia three days a week for 10 weeks. At the end of the intervention, it was found that the patients' psychiatric symptoms decreased and their quality of life increased. In the study of Shimado et al. (2019), after 12 weeks of 60 minutes of aerobic exercise twice a week applied to 16 patients with schizophrenia, there was an improvement in the patients' cognitive functionality, intrinsic motivation, psychiatric

symptoms and interpersonal relationships. In the study of Kwon and Kwag (2011), it was found to 25 patients with schizophrenia had a decrease in their body mass index, positive and negative symptoms at the end of an 8-week Tai Chi exercise program of 60 minutes twice a week. In the study of Ryu et al. (2020), an outdoor cycling exercise program consisting of 10 minutes of warm-up, 40 minutes of training and 10 minutes of cooling down was applied to 60 patients with schizophrenia for 16 weeks. At the end of the intervention, patients' psychiatric and depressive symptoms, state and trait anxiety decreased and, in general functionality and executive functions was found increased. Similarly, in the study by Yoon et al. (2016), there was an improvement in the self-esteem, interpersonal relationships, quality of life and general functionality of patients with schizophrenia at the end of a cycling exercise program applied outdoors for 3 months. In addition to existing treatments in patients with depression, physical activity has been shown to provide positive effects such as providing an antidepressant effect, reducing symptoms and relapses, duration of remission, neuroplasticity, cognitive functions, perceived social support, mood and quality of life (Uzun et al., 2019). In the study by Blumenthal et al. (2007), patients with major depression were assigned to the group of supervised exercise in a group environment, home-based exercise, antidepressant medication, or placebo medication for 16 weeks. At the end of the program applied to the patients in the exercise groups, 3 days a week for 16 weeks, consisting of 10 minutes of warm-up, 30 minutes of aerobic exercise and 5 minutes of cool-down, it was determined that exercise could be as effective as standard pharmacotherapy and the patients' depressive symptoms decreased (Blumenthal et al., 2007). In the study of Tasci et al. (2019), 32 patients with major depressive disorder were made to brisk walking for at least 30 minutes a day, at least 4 days a week for 12 weeks; At the end of the intervention, it was found that the patients' depression and anxiety symptoms decreased more than patients using antidepressants. Meta-analysis studies have shown that exercise for mild to moderate depression has a

comparable effect to antidepressant medication and psychotherapy, and that exercise for severe depression is a complementary therapy to traditional treatments (Knapen et al., 2015; Silveira et al., 2013). In the study conducted by Lan et al. (2022), it was found that the levels of physical symptoms, anxiety, depression and social distress decreased and the levels of optimism increased in individuals with chronic mental illness after an exercise program applied twice a week for approximately 50 minutes for a total of eight weeks. In another study, a 40-minute walking program applied to patients with bipolar disorder showed a decrease in their depression, anxiety and stress levels (Ng et al., 2007). In the study of Khoubaeva et al. (2022), a 12-week exercise program was applied to 21 patients with bipolar disorder; At the end of the intervention, it was determined that the patients' cardiorespiratory condition and mood improved.

CONCLUSION and RECOMMENDATIONS

It can be said that regular physical activity and structured exercise programs are an effective method that reduces depression, anxiety, stress, social distress and illness symptoms in individuals with mental illness, increases cognitive functions, self-esteem, interpersonal relationships, optimism, quality of life and functionality, and helps recovery. Accordingly, it is possible to say that regular physical activity and exercise programs have both physical and psychological benefits for individuals with chronic mental illness. In line with these results, it is recommended that individuals with chronic mental illnesses be encouraged to participate in physical activity and exercise and that physical activity and exercise programs be added to the routine treatment of patients. It is also recommended to plan and implement new studies examining the effects of physical activity and exercise programs to support the recovery of individuals with chronic mental illness.

ABSTRACT

Background: High-quality sleep is an important factor in sustaining health and promoting well-being. Sleep quality is defined as “the individual’s self-satisfaction with all aspects of the sleep experience”. Sleep disturbances are observed in approximately 80% of patients with schizophrenia. Patients generally report sleep latency, waking up frequently during sleep, changes in wakefulness/sleep periods, increased daytime sleepiness, decreased sleep efficiency, and poor sleep quality. In schizophrenia, sleep quality deteriorates especially due to depression symptoms and drug side effects, and this negatively affects functionality and quality of life. Improved sleep quality in patients with schizophrenia is associated with higher levels of physical activity. Physical activity and exercise are reported to help improve sleep quality in individuals with chronic mental illness. **Objective:** In this review, it was aimed to examine the effect of physical activity on sleep quality of patients with schizophrenia. **Method:** A comprehensive review of studies evaluating the effect of physical activity on sleep quality was conducted. **Results:** At the end of exercise program of a 12-week exercise program of 5 minutes, 10 minutes of stretching, 10 minutes of strengthening, 10 minutes of movement and 5 minutes of cooling down applied in the study of Korkmaz Aslan and Ekinçi (2022), in the quality of life and sleep of patients increased. In the study of Subotnik et al. (2023), an improvement in the sleep quality of patients was observed at the end of the web-based cognitive training and at least 150 minutes of moderate-intensity aerobic conditioning and strengthening exercise program applied at least 2 days a week for 24 weeks. In some studies, it has been found that physical activity and exercise programs increase sleep quality of patients. **Conclusion:** It can be said that physical activity and exercise programs are an effective and complementary method that improves the sleep quality of patients.

Keywords: Schizophrenia, Physical Activity, Exercise, Sleep Quality

INTRODUCTION

Physical activity and exercise are concepts that are increasingly important due to the inactivity that comes with the living conditions of today's world (Fariz, 2015). physical activity; It is defined as "all kinds of physical movements that require energy expenditure, produced by skeletal muscles, and can be done around work, home and garden, such as active recreation, sports, cycling and walking, as well as play, dancing, gardening, house cleaning and heavy shopping" (World Health Organization, 2022a). Exercise, on the other hand, is structured, planned and repetitive physical activities to protect, improve and develop physical health (Fariz, 2015; Mahindru et al., 2023). For adults aged 18-64, it is recommended to do muscle strengthening activities involving major muscle groups at least 150/300 minutes of moderate intensity or at least 75/150 minutes of high intensity, 2 or more times a week (World Health Organization, 2022a).

Physical activity and exercise are concepts that are closely related to the physical and mental health of individuals and can be applied as a treatment option in chronic mental illnesses (Lök & Lök, 2016). Schizophrenia, affecting approximately 24 million people in the world (World Health Organization, 2022b), is characterized by a set of symptoms such as delusions, hallucinations, disorganized speech or behavior, and impaired cognitive ability (Patel et al., 2014), and It is a chronic mental illness that negatively affecting affect, thought, perception, interpersonal relationships and behavior areas (Üçok, 2009; World Health Organization, 2022b). In schizophrenia, serious distress and impairment are often observed in personal, family, social, educational, occupational and other important areas of life (World Health Organization, 2022b). In addition to psychiatric symptoms, patients with schizophrenia often have comorbidities such as cardiovascular and metabolic disorders (Viljoen & Roos, 2020). Individuals diagnosed with schizophrenia have a higher risk of dying early and developing cardiovascular disease compared to the general population (Aguinaga-Ontoso et al., 2023; World Health Organization, 2022b). This

situation causes the life expectancy of patients to decrease by 15-20 years, increasing the death rates due to cardiovascular disease (Ringen et al., 2014). It has been determined that duration of illness, negative symptoms and body mass index are important risk factors for cardiovascular disease in patients with schizophrenia. (Kapıcı et al., 2023). It is known that obesity, dyslipidemia, smoking, presence of hypertension and diabetes, decreased functionality, sedentary lifestyle, and side effects of antipsychotic drugs used increase the risk of cardiovascular disease by causing metabolic abnormalities (MacKenzie et al., 2018; Mitchell et al., 2013; Vancampfort et al., 2017).

Patients with schizophrenia participate less in moderate and high intensity physical activity compared to the general population (Stubbs et al., 2016; Vancampfort et al., 2012). The presence of negative symptoms and cardio-metabolic comorbidity in patients, lack of knowledge about cardiovascular disease risk factors, side effects of antipsychotic medications, disbelief in health benefits, lower self-efficacy, other unhealthy lifestyle habits and social isolation reduce physical activity participation rates (Vancampfort et al., 2012). There is increasing evidence that physical activity and exercise are methods that help reduce the risk of cardiovascular disease in patients as much as drug therapy (Firth et al., 2015; Naci & Ioannidis, 2013; Vancampfort et al., 2017). In addition, it is reported that physical activity and exercise contribute to the improvement in depressive, positive, negative and psychiatric symptoms, cognitive functions, general functionality and quality of life in patients with schizophrenia (Acil et al., 2008; Fibbins et al., 2021; Firth et al., 2015; Ho et al., 2016; Lok et al., 2017; Ryu et al., 2020; Shimado et al., 2019).

Sleep is an important concept for the physical, social and mental health of individuals of all ages (Matricciani et al., 2018). Sleep quality greatly affects individuals' physical health, work efficiency and mental state (Zhao et al., 2023). A quality sleep contributes positively to many conditions such as cardiovascular disease, metabolic syndrome, mental health and dementia (Koohsari et al., 2023). Sleep quality is defined as "an individual's personal

satisfaction with all aspects of the sleep experience” (Nelson et al., 2022). High-quality sleep contributes to maintaining health and increasing well-being (Grandner & Fernandez, 2021). In addition, good sleep quality has positive effects such as feeling rested, normal reflexes and positive relationships (Nelson et al., 2022). It has been reported that poor sleep quality aggravates mental illness symptoms in patients, increases comorbid physical diseases (Lederman et al., 2019), causes fatigue, irritability, daytime dysfunction, and slowdown in reactions (Nelson et al., 2022). One of the most common complaints seen in most mental disorders is disruptions in the quantity and quality of sleep (Keskin & Tamam, 2018). Sleep disturbances, is another common problem in patients with schizophrenia. Sleep disorders are observed in approximately 80% of patients with schizophrenia (Anderson & Bradley, 2013; Klingaman et al., 2015; Ma et al., 2018). Patients generally report sleep latency, waking up frequently during sleep, changes in wakefulness/sleep periods, increased daytime sleepiness, decreased sleep efficiency, and poor sleep quality (Klingaman et al., 2015; Dule et al., 2020; Kiwan et al., 2020). It is stated that in schizophrenia, sleep quality is poor, independent of both depression symptoms and drug side effects and these factors, and this negatively affects daytime functionality and quality of life (Keskin & Tamam, 2018; Kiwan et al., 2020). In addition, while increased sleep quality is associated with higher physical activity levels in patients with schizophrenia (Costa et al., 2018); decreased physical activity is associated with high depressive symptoms and insomnia (Liu et al., 2023). It is stated that moderate-intensity physical activity positively affects sleep quality in patients with schizophrenia (Costa et al., 2018). In particular, it has been reported that moderate-intensity physical activity and exercise programs of at least 150 minutes per week are an effective, complementary and nonpharmacological treatment option to prevent, manage and improve poor sleep behavior in the general population (Lederman et al., 2019). Although systematic reviews indicate the improving effect of physical activity on sleep quality in adult individuals (Banno et al.,

2018; Wang & Boros, 2019), this effect has been studied very little in patients with schizophrenia (Korkmaz Aslan & Ekinci, 2022; Lalande et al., 2016; Leone et al., 2015; Subotnik et al., 2023). Therefore, In this review, it was aimed to examine the effect of physical activity on sleep quality of patients with schizophrenia.

MATERIALS and METHODS

A comprehensive review of studies evaluating the effect of physical activity on sleep quality was conducted in this review.

FINDINGS and DISCUSSION

There is little evidence in the literature examining the effects of physical activity and exercise programs on sleep quality in patients with schizophrenia (Korkmaz Aslan & Ekinci, 2022; Lalande et al., 2016; Leone et al., 2015; Subotnik et al., 2023). In the study of Leone et al. (2015), 8 patients with schizophrenia performed 75 minutes/session of strength training exercises for eight weeks. At the end of the intervention, there was an increase in the patients' sleep quality and body image; depressive symptoms decreased (Leone et al., 2015). In the study of Lalande et al. (2016), 8 patients with schizophrenia performed 75 minutes/session of strength training and cardiovascular fitness exercises for eight weeks. At the end of the intervention, there was an increase in the patients' sleep quality and waking state (Lalande et al., 2016). In the study of Korkmaz Aslan and Ekinci (2022), a 40-minute exercise program consisting of 5 minutes of warm-up, 10 minutes of stretching, 10 minutes of strengthening, 10 minutes of mobilization and 5 minutes of cooling down was applied to 30 patients with schizophrenia for 12 weeks. At the end of the intervention, it was found that there was an increase in the patients' quality of life and sleep quality (Korkmaz Aslan & Ekinci, 2022). In the study of Subotnik et al. (2023), a web-based cognitive training 4 days a week and at least 150 minutes of moderate-intensity aerobic conditioning and strengthening exercise program, as 2 days a week 45-minute group exercise and 2 days a week 30-minute home exercise was applied to 39 patients with

schizophrenia for 24 weeks. At the end of the intervention, sleep quality was observed to increase, similar to other studies (Subotnik et al., 2023).

CONCLUSION and RECOMMENDATIONS

Studies have proven that moderate-intensity physical activity and exercise programs are an effective method to improve sleep quality in the general population. When the literature was examined, it was revealed that there were a limited number of studies examining the effects of physical activity and exercise on the sleep quality of patients with schizophrenia. In line with these results, it can be said that moderate-intensity physical activity and exercise programs are an effective and complementary method that improves the sleep quality of patients with schizophrenia, similar to the general population. Therefore, it is recommended that patients with schizophrenia be encouraged to participate in physical activity and exercise, and that physical activity and exercise programs be added to the routine treatment of patients. Since there are few studies on the subject, it is recommended to plan and implement new studies examining the effects of physical activity and exercise programs on sleep quality in patients with schizophrenia.

ABSTRACT

The aim of this study is to present a model for estimating part production times in three-dimensional (3D) printer using data-based machine learning approach. Production time is a critical factor in ensuring that 3D printers are used effectively and efficiently. In this study, analysis of different parameters (material properties, geometry complexity, printer settings, etc.) affecting production time was made. Machine learning algorithms were used along with the analysis of existing datasets and the training process. The data collection process includes the information obtained during the production of experimental parts on 3D printers with various features. These data are correlated with actual production times as well as important parameters such as printer settings, material properties, printing geometry. The model is designed in such a way that it can process large-scale and complex data sets and provide high accuracy in predictions. Machine learning algorithms include widely used methods such as artificial neural networks and support vector machines. These algorithms are trained to estimate production times by analyzing the properties and relationships of datasets. In addition, in this study, the analysis and importance of the parameters affecting the production time are emphasized. In addition to material properties, the effects of factors such as geometry complexity, support strategy, layer thickness on the production time were investigated. This model provides 3D printer users with a valuable tool to predict and optimize print times.

Keywords: 3D printing, production time estimation, machine learning, artificial neural networks, support vector machines, parameter analysis

INTRODUCTION

The 3D printing technology, also known as Additive Manufacturing (AM), has transformed the realm of product design and production by permitting the construction of objects layer-by-layer, thereby facilitating the generation of intricate geometries and functional facets. In addition, the AM procedure promotes an eco-friendly approach by curbing material waste. Although it was initially utilised mainly for prototyping, AM is now widely acknowledged for end-product manufacturing. Different Additive Manufacturing methods, including Fused Filament Fabrication (FFF), Stereolithography (SLA), Selective Laser Sintering (SLS), Selective Laser Melting (SLM), and Laser Engineered Net Shaping (LENS), allow the production of operative components in multiple shapes and materials (Goh et al., 2021; Msallem et al., 2020; Shahrubudin et al., 2019). However, these techniques present challenges, such as inadequate bonding between materials, anisotropy, and fast cooling, requiring remedies. A thorough comprehension of the AM process factors in variables like material processability and part properties. Nonetheless, gaining a multidisciplinary understanding that encompasses manifold process parameters is a time-consuming process. Therefore, machine learning-based models play a vital role in optimizing the AM procedure, even when data is incomplete (Jin et al., 2020; Wang et al., 2020; Menon et al., 2019; Heymann & Schmitt, 2023). Quality control for AM components is of utmost importance in the industry. Parts made from advanced materials need to uphold high standards of quality and dependability. Porosity can have detrimental effects on mechanical performance, underlining the necessity of quality control. Machine learning identifies process deviations and impacts every aspect of additive manufacturing (Akhil et al., 2020). Its influence is projected to increase in the future. Machine learning functions as a subfield of artificial intelligence (Kuschmitz et al., 2021), allowing for learning and improvement based on data. With significant volumes of data being generated and shared in today's era, manual analysis of such massive amounts of data is unfeasible. Data analysis

methods have been developed and are utilized to identify patterns in data and obtain meaningful insights (Breitenbach et al., 2022; Raza et al., 2022). This analysis has the potential to improve predictive efficiency via supervised or unsupervised machine learning algorithms, including random forest, logistic regression, support vector machines, and clustering (Dhalaria et al., 2019). Machine learning comprises four distinct methodologies. Supervised Learning utilises labelled data to predict dependent variables via independent and dependent variables, in order to solve categorisation and prediction problems. This involves the implementation of algorithms such as linear regression, logistic regression, naive Bayes, and support vector machines (Hire IT People, 2023; Nam et al., 2020; Paraskevoudis et al., 2020). Conversely, Unsupervised Learning operates on uncertain, unlabelled data, with the goal of identifying underlying structures or patterns. Different fields demand specific machine learning methodologies, and choosing the suitable technique for a specific problem is vital. These approaches are critical for data analysis and knowledgeable decision-making. In 3D printers, the duration for prototyping production is still comparably high in contrast to conventional manufacturing. Hence, this poses pragmatic hindrances that necessitate attention. Some challenges arise due to disparities between the production time specified in the slicing software and the actual manufacturing time, which adversely affects production planning. As the number of parts surges, the rise in production time discrepancies may cause timing-related complications. Upon scrutinising the literature, no research evaluates 3D printer production times by associating them with slicing software.

This research project seeks to create a model using a data-driven machine learning technique to estimate production times for parts in a 3D printer. The research aims to provide a comprehensive understanding of the interplay between the parameters mentioned above to improve 3D printing. The study analyses significant factors such as material properties, geometric complexity, and printer settings, and incorporates machine learning

algorithms, including artificial neural networks and support vector machines. This model seeks to offer 3D printer users a useful resource in predicting and enhancing production times, thereby enabling greater efficiency and effectiveness in 3D printing technology.

MATERIALS and METHODS

The objective of this study is to anticipate the duration of production for parts with the use of a 3D printer. The evaluation was executed utilizing Cura software together with the Ender 3 S1 3D printer (Figure 1.a). Throughout the study, various amounts of parts were fabricated, and their production durations and weights were meticulously analyzed. To assess production times, two different time durations were recorded for each part: the production time estimated by Cura software and the actual measured production time. The variations between these two times were calculated to analyse the precision of the estimated time compared to the actual time. The Ender 3 S1 3D printer, which was used repeatedly throughout the study, was utilised to generate varying quantities of parts, each with different characteristics to assess the printer's performance and accuracy. The data acquired offers valuable insights for refining 3D printing times and enhancing printer settings. The ultimate goal of this study is to improve efficiency and precision in applying 3D printing technology by devising a procedure for gauging production times for parts manufactured using 3D printers. The placement of parts implemented using Cura software can be seen in Figure 1.b. Optimizing the placement using this software is a crucial step in enhancing the production process. Skillful placement can result in material and time savings.

Figure 1. a.) Ender 3 S1 3D printer b.) Cura software part placement layout

In this study, various regression models were employed to predict production times. Below are the regression models used in this study along with their key features. Linear Regression, This model is used to model the linear relationship between independent variables and the dependent variable. Linear regression is effective when data can be expressed with a linear equation. Ridge Regression, Ridge regression is similar to linear regression but adds L2 regularization to mitigate the risk of overfitting. The alpha parameter controls the strength of regularization. Lasso Regression, Lasso regression is also a type of linear regression but incorporates L1 regularization. Lasso can perform variable selection by driving some coefficients to zero. Decision Tree Regressor, A decision tree is a model that divides data into a series of decision nodes. Each leaf node is used to calculate predictions. Random Forest Regressor, Random forests are an ensemble of many decision trees. This ensemble approach reduces overfitting and provides more stable predictions. These regression models were used for data analysis and predicting production times. The performance of each model was evaluated using evaluation metrics such as the

R-squared (R^2) score. The results helped identify the best-performing regression model for predicting production times.

In this Figure 2, the estimated production times for parts in Cura software are presented for different scenarios: 1 piece: This part of the figure likely shows the estimated production time for a single part in Cura software. It demonstrates how the software calculates the time (marked with red ellipse) required to print a single piece (Figure 1.a). 14 pieces: This part of the figure is likely depicting the estimated production time (marked with red ellipse) for 14 identical pieces in Cura software. It shows how the software calculates the total production time when multiple identical parts are printed simultaneously (Figure 2.b). This can be useful for production planning and optimizing the use of the 3D printer. These estimations in Cura software are essential for managing time and resources effectively when using a 3D printer for manufacturing multiple parts.

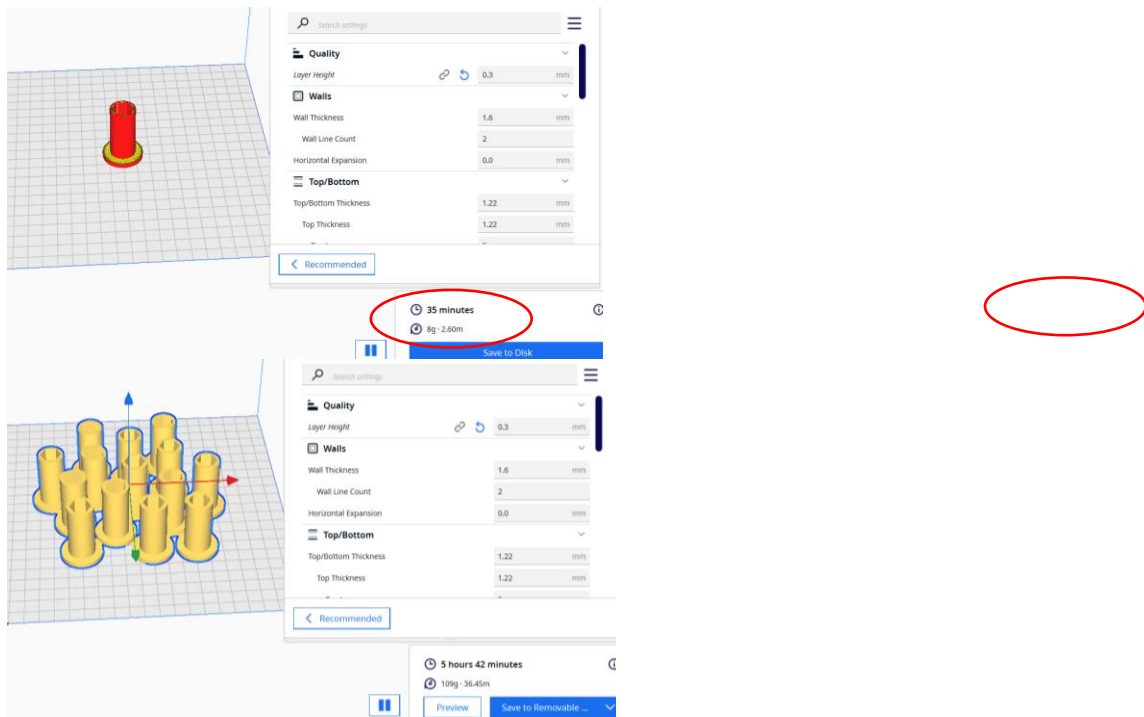

Figure 2. Production time estimation of parts in cura software a.) 1 piece b.) 14 pieces

In Figure 3, a comparison is made between the slicing software's predicted production times and the actual production times, based on the number of parts being produced. This figure likely displays a visual representation of how well the slicing software's time estimations align with the real-world production times for different quantities of parts. This kind of analysis is crucial for evaluating the accuracy of the software's predictions and optimizing the planning and scheduling of 3D printing operations.

Figure 3. Slicing software predictions vs. actual production times by number of parts

FINDINGS and DISCUSSION

Based on the results of our study, we evaluated the ability of Cura software to predict production times. The table below contains predicted and actual measured times for parts produced in different quantities. This data has helped us assess the performance of Cura software in predicting production times. The difference values indicate how much the estimated times deviate from the actual times. Positive differences indicate that Cura's predictions are shorter than the actual times, while negative differences indicate that the predictions are longer than the actual times. The comparison between predicted and actual

production times is critical for understanding the accuracy of the software's estimates. It allows us to determine whether the software tends to overestimate or underestimate production times and by how much. These findings are valuable for production planning, resource allocation, and optimizing the use of 3D printing technology. Additionally, it's essential to analyze the factors that may contribute to the differences between predicted and actual times. Factors such as part complexity, printer settings, and material properties can influence production times. Identifying these factors and their impact on estimation accuracy can lead to improvements in 3D printing processes and software algorithms. In conclusion, our study has provided insights into the performance of Cura software in predicting production times for 3D printing. These findings can contribute to more accurate planning and scheduling of 3D printing operations, ultimately enhancing the efficiency and effectiveness of this technology. Further research and analysis may help refine the estimation process and reduce the discrepancies between predicted and actual production times.

Figure 4 presents a regression analysis that examines the relationship between the estimated (predicted) production times and the actual production times based on the number of parts being produced. This analysis is important for assessing how well the estimation process aligns with real-world production times and whether there is a consistent pattern or trend in the discrepancies between estimated and actual times. The regression analysis may involve fitting a regression line or curve to the data points, allowing for a quantitative assessment of the relationship. Key findings from this analysis might include:

Regression Equation: The equation of the regression line or curve, which describes the mathematical relationship between estimated and actual times.

R-squared (R^2) Value: This statistical measure indicates how well the regression model explains the variance in the data. A higher R^2 value suggests a stronger relationship.

Residuals Analysis: Examination of the residuals (the differences between estimated and actual times) to determine whether they follow a specific pattern, such as being normally distributed or exhibiting heteroscedasticity.

Regression Coefficients: If a linear regression model is used, the coefficients associated with the independent variable (number of parts) will provide insights into the magnitude and direction of the impact of the number of parts on the differences between estimated and actual times.

The findings from this regression analysis will help in understanding whether the estimation process is reliable and whether there are systematic biases or errors in the predictions. This information is valuable for improving the accuracy of production time predictions in 3D printing and optimizing the use of this technology in various applications.

Figure 4. Regression of estimated and actual times by number of parts

The use of various regression models to predict production times has yielded important findings in this study. The Linear Regression model provided the following equation for predicting production times:

$$\text{True_Time} = 1.03 * \text{Cura Time} + 3.05$$

The R-squared (R^2) score, which measures the goodness of fit of the model to the data, was found to be 0.98. An R-squared score of 0.98 indicates that the model fits the data very well, suggesting a high degree of accuracy in predicting production times. This high R-squared score implies that the linear regression model explains much of the variance in the data. However, it's worth noting that the R-squared score alone does not tell the whole story. It's important to consider the actual differences between the estimated and actual production times to assess the model's performance fully. The negative R-squared score of -3.65 is unusual and indicates that the model may not be the best fit for the data. Negative R-squared scores suggest that the model does not fit the data well, and its predictions have low accuracy. These results may reflect the complexity of the data and the limitations of the model used for predicting production times. To achieve a higher R-squared score and better prediction capabilities, alternative regression methods or additional data could be considered. This study has addressed significant challenges in predicting production times and laid the groundwork for the development of improved prediction methods. Future research may aim to make these predictions more precise by incorporating more complex models and more data. Based on the results, several observations can be made regarding the ability of Cura software to predict production times. Cura software tends to underestimate production times, particularly when producing larger quantities of parts. This can make it challenging for users to plan production times effectively. Prediction errors increase as the number of parts increases, especially at quantities of 10 and 34 parts, indicating that larger production jobs may require more significant improvements in predictions. However, the differences between predictions and actual times are generally

acceptable. Ideally, closer alignment between predictions and actual times is preferred, but these differences can still be considered when users plan production times. In conclusion, Cura software may require some improvements in predicting production times, especially for larger quantities of parts. These prediction errors can make it challenging for users to plan effectively. In the future, collecting more data and further model development may be necessary to increase the accuracy of the software's predictions.

Figure 5 presents a visual representation of the predicted (estimated) production times and the actual production times based on the regression types used in the study. This figure is important for comparing the performance of different regression models in estimating production times. The figure may include data points or lines that represent the predicted production times generated by different regression models (e.g., Linear Regression, Ridge Regression, Lasso Regression, etc.) and the actual measured production times. By visually comparing the predicted and actual times for each regression type, you can assess which regression model provides the most accurate estimations.

Key observations and findings from Figure 5 might include:

Accuracy by Regression Type: It allows you to see which regression type tends to provide the closest estimations to the actual production times.

Variability: You can assess whether certain regression models consistently overestimate or underestimate production times.

Patterns: Any patterns or trends in the differences between predicted and actual times among different regression types.

This figure is valuable for selecting the most suitable regression model for estimating production times and understanding the strengths and limitations of each regression type in this context. It can also help in making informed decisions about which regression model to use in practical applications of production time prediction in 3D printing.

Figure 5. Predicted and actual production times by regression types

The table presents the results of different prediction models for varying quantities of parts, indicating the real measured production times and estimated times generated by various regression models, including Linear Regression, Ridge Regression, Lasso Regression, Decision Tree Regression, and Random Forest Regression. Notably, for all three quantity levels (5, 15, and 25 pieces), the Random Forest Regression model consistently demonstrates the closest approximation to the actual production times, with relatively small prediction errors compared to other models. These findings underscore the potential

effectiveness of Random Forest Regression for estimating production times in 3D printing processes, suggesting its suitability for practical applications in production planning and resource allocation.

Table 1. Results of estimation models

Number of Pieces	True time (min)	Linear Regression Estimated Time (min)	Ridge Regression Estimated Time (min)	Lasso Regression Estimated Time (min)	Decision Tree Regression Estimated Time (min)	Random Forest Regression Estimated Time (min)
5	132	128.97	129.07	128.99	110.0	101.34
15	338	336.13	335.98	336.09	270.0	217.69
25	545	543.29	542.88	543.17	720.0	554.69

CONCLUSION and RECOMMENDATIONS

The study employed a data-driven machine learning approach and extensive parameter analysis to comprehensively investigate the prediction modeling of part production times in a 3D printer. The results unveiled a notable trend wherein estimated production times generally increased with the quantity of parts, highlighting the significance of considering batch size in predictions. While Linear Regression, Ridge Regression, and Lasso Regression models exhibited similar trends, Decision Tree Regressor and Random Forest Regressor models displayed distinct outcomes, emphasizing the importance of tailored model selection. Importantly, the predictive performance of each model was intricately linked to the number of parts, underscoring the need for a judicious choice of regression model based on specific prediction needs and dataset attributes. In light of these findings, it is recommended that users adopt a thoughtful approach to model selection, consider batch size when making predictions, and explore further research and real-world validation to enhance the precision of production time predictions in 3D printing applications.

ÖZET

Grafen, önemli optik, termal, mekanik ve elektriksel özelliklerinden dolayı geleceğin elektroniği için en ilgi çekici malzemelerden biridir. Son yıllarda bilim insanları, grafen ve türevlerinin gerçek potansiyelini ortaya çıkarmak için yeni ve heyecan verici araştırmalara odaklandılar. Grafen üstün ve benzersiz özelliklerinden dolayı popüler bir malzemedir. Grafen kuantum noktaları (GQD'ler), grafen benzeri bir çerçeveden oluşan sıfır boyutlu (0D) karbon nanomalzemelerinin benzersiz bir kategorisidir. Kenar etkileri ve kuantum sınırlaması ile ilişkili dikkate değer elektronik ve fizikokimyasal özelliklerinden dolayı, yeni ortaya çıkan bazı uygulamalarda en çok çalışılan malzemelerden biridir. Bu çalışmanın amacı gadolinyumun (Gd) GQD bazlı diyotun elektriksel özellikleri üzerindeki etkisini araştırmaktır. Öncelikle Gd katkılı GQD'ler (GdNPs-GQD'ler) hidrotermal yöntemle sentezlendi ve ardından GdNPs-GQD'ler nanokompozit bazlı diyot yapısı oluşturuldu. Diyotun akım/gerilim özellikleri oda sıcaklığında $\pm 5V$ 'de araştırıldı. İdeallik faktörü (n), bariyer yüksekliği (Φ_B), arayüzey durum yoğunluğu (N_{ss}) ve seri direnç (R_s) değerleri, termiyonik emisyon (TE) teorisi ile I-V özelliklerinden hesaplandı. İdealite faktörü $n= 4,9$ olarak hesaplandı ve bariyer yüksekliği $\Phi_B =0,61$ eV olarak belirlendi. $\pm 5V$ 'de düzeltme oranı (RR) 14 olarak elde edildi. Deneysel inceleme, Gd ile katkılama sonrasında diyotun doğrultma davranışının omik davranışa dönüştüğünü gösterdi. Sonuç olarak, Gd tabanlı yapının geliştirilmiş performansı, verimli, hızlı, esnek ve yüksek performanslı elektronik cihazların geliştirilmesine katkıda bulunabilir. Bu alanda yapılacak ileri araştırmaların daha gelişmiş diyot yapılarının ve uygulamalarının geliştirilmesine yol açması beklenmektedir.

ABSTRACT

Graphene is one of the most intriguing materials for future electronics due to its important optical, thermal, mechanical and electrical properties. In recent years, scientists have focused on new and exciting research to unlock the true potential of graphene and its derivatives. Graphene is a popular material due to its superior and unique properties. Graphene quantum dots (GQDs) are a unique category of zero-dimensional (0D) carbon nanomaterials consisting of a graphene-like framework. Due to their remarkable electronic and physicochemical properties associated with edge effects and quantum confinement, they are one of the most studied materials in some emerging applications. The aim of this study is to investigate the effect of gadolinium (Gd) on the electrical properties of GQDs-based diode. Firstly, Gd doped GQDs (GdNPs-GQDs) were synthesized by a hydrothermal method and then the GdNPs-GQDs nanocomposite based diode structure was formed. The electrical properties of the diode were investigated by current-voltage (I-V) technique in the range from 1 kHz to 500 kHz at $\pm 5V$ at room temperature. The ideality factor (n), barrier height (Φ_B), interfacial state density (N_{ss}) and series resistance (R_s) values were calculated from the I-V characteristics by thermionic emission (TE) theory. The ideality factor n was calculated to be 4.9 and the barrier height Φ_B was determined to be 0.61 eV. The rectification ratio (RR) was obtained to be 14 at $\pm 5V$. The experimental investigation showed that the rectifying behavior of the diode changed to an ohmic behavior after the doping with Gd. In conclusion, the improved performance of the Gd-based structure can contribute to the development of efficient, fast, flexible and high performance electronic devices. It is expected that further research in this area will lead to the development of more advanced diode structures and applications.

GİRİŞ

Nadir toprak metalleri ile katkılanmış karbon bazlı malzemeler nanoteknolojinin en umut verici alanlarından biridir. Özellikle Gd içeren karbon bazlı malzemeler, floresan / manyetik rezonans görüntüleme (MRI) mükemmel özellikleri nedeniyle özellikle ilgi çekici olmuştur. Gd, periyodik tablonun 3-B grubunda nadir toprak elementler yani, lantanit serisinde yer alır. Diğer lantanitlere benzer şekilde metalik parlak, gri renktedir. Gümüşü beyaz bir metal olan Gd, nem veya atmosferik oksijen ile yavaşça reaksiyona girerek siyah bir kaplama oluşturur. Kristal yapısı oda sıcaklığında hekzagonaldir. Gadolinyumun metal formu, olağandışı süper iletken özelliğe sahiptir. Elektro pozitifliği yüksektir. Oda sıcaklığında ferromanyetik, bu sıcaklığın üstünde, çok güçlü bir paramanyetikdir. Gd bileşikleri netliği artırmak için manyetik rezonans görüntüleme (MRI), özellikle de kanserli hücrelerin tespit edilmesinde kullanılır. Ayrıca Gd, yüksek nötron yakalama tesir kesitine sahip kararlı elementtir. Bu özelliği nötron dedektörü için potansiyel uygulama alanı yapar. İçinde demir ve krom bulunan alaşımlara sadece %1 oranında Gd eklendiğinde bile yüksek sıcaklıklara ve oksitlenmeye karşı daha dayanıklı hâle gelirler.

Karbon, özellikle de grafen kuantum noktaları tabanlı elektronikler son zamanlarda ilgi çekici bir teknoloji haline geldi. Ayarlanabilir bant aralıkları, yüksek soğurma ve yüksek taşıyıcı mobiliteleri nedeniyle, karbon nanotüpleri (CNT'ler), grafen, fullerener ve GQD'ler gibi karbon allotropları, foto algılamada özellikle ilgi çekicidir. Karbon allotroplarından biri olan GQD'ler, olağanüstü fotostabilite, yüksek floresans kuantum verimi, düşük sitotoksisite, iyi biyouyumluluk ve suda mükemmel çözünürlük gibi mükemmel fiziksel özelliklere sahip sıfır boyutlu (0D), yarı-iletken nano malzemelerdir. Grafen kuantum noktalarının elektronik uygulamadaki yeri, geniş bir alana yayılan özellikleri ve potansiyeli nedeniyle oldukça önemlidir. Bu uygulamalar, daha verimli, hızlı, esnek ve gelişmiş performansa sahip elektronik cihazların geliştirilmesine katkıda

bulunabilir. Elektriksel ve optik özellikleri, grafen kuantum noktalarını elektronik cihazlar, sensörler, görüntüleme teknolojileri, güneş hücreleri, katalizörler ve biyomedikal uygulamalar gibi birçok alanda değerli yapar. Son zamanlarda bu yapılarla ilgili çok sayıda hem deneysel hem de teorik çalışmalar yoğunluk kazanmıştır.

MATERYAL ve METOD

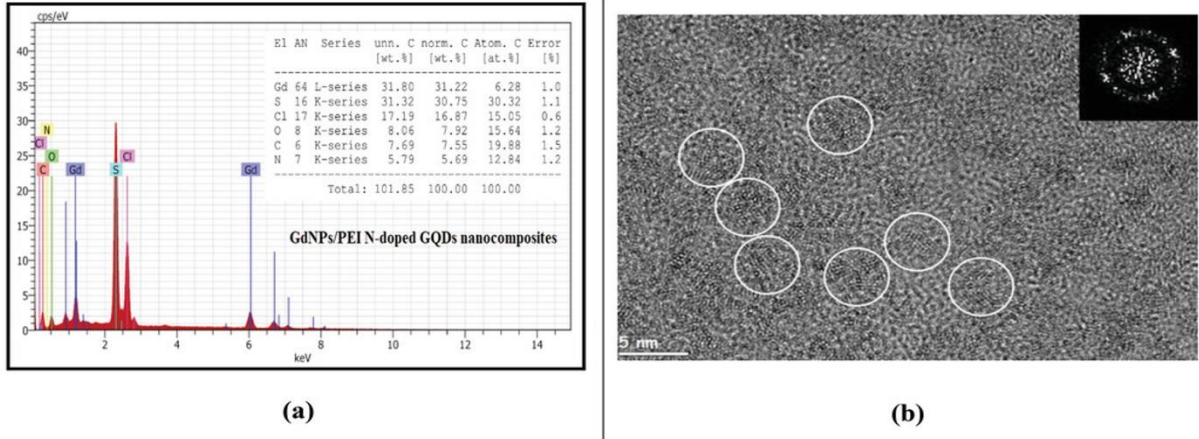

Deneysel çalışmamızda ilk olarak Gd katkılı grafen kuantum nokta nanokompozitlerin sentezi gerçekleştirildi ve ikinci kısımda ise diyot üretimi yapıldı. Gd katkılı yapının sentezlenmesinde, ilk olarak grafen kuantum noktalar başlangıç malzemesi olarak sitrik asit (CA) kullanılarak hidrotermal yöntemle başarıyla üretildi. Daha sonra Gadolinyum Nitrat Hekzahidrat ($Gd(NO_3)_3 \cdot 6H_2O$) kullanılarak Gd katkılı yapı elde edildi. GQD çözeltisi ve Gadolinyum Nitrat Hekzahidrat çözeltisi beherde 90 C'de 2 saat boyunca kaynatılarak bir araya getirildi. Sonra çözeltiyi süzerek, oluşan nanokompoziti ayırdık. Diyotu üretmek için p-tipi Si (100) yüzey yönelimli alttaş kullanıldı. Kimyasal olarak yüzey temizliğinden sonra yüksek saflıkta alüminyum (Al) metali (%99,999) 1×10^{-6} Torr basınçta tungsten filamandan levhanın tüm arka yüzeyine omik kontak için fiziksel buhar biriktirme ile oluşturuldu. Elde edilen Gd-GQDs nanokompozitleri daha sonra spin kaplama tekniği kullanılarak p-Si alttaşın cilalı yüzeyinde biriktirildi. Film kalınlığı yaklaşık 25 nm'dir. Son olarak, 1 mm çapında dairesel bir metal maske kullanılarak termal buharlaştırma yoluyla Gd-GQDs-p-Si üzerinde 128 nm kalınlığında Al dairesel kontaklar oluşturuldu. Diyotun yapısı **Şekil 1**'de şematik olarak gösterilmiştir.

Şekil 1. Diyot yapısı (Orhan et al, 2023)

BULGULAR ve TARTIŞMA

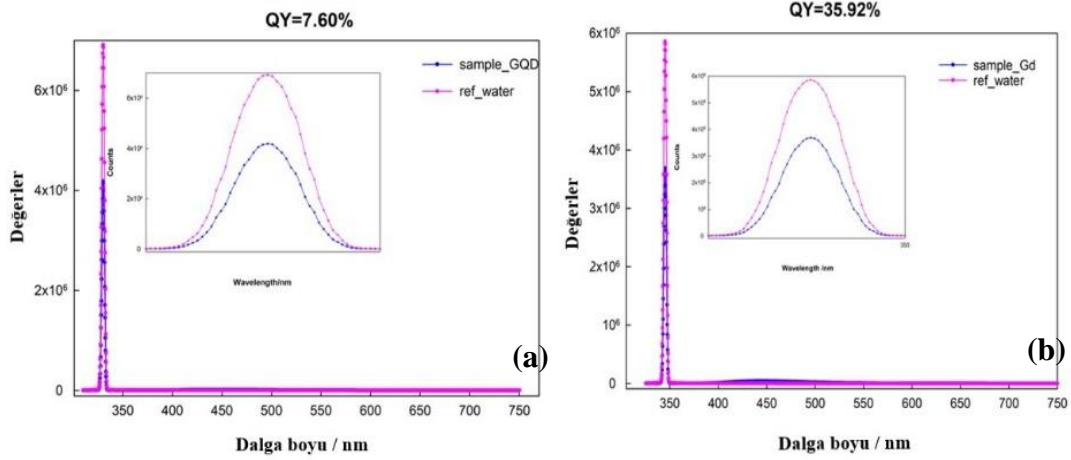

Enerji Dağılımlı X ışını spektroskopisi (EDX) ile taramalı elektron mikroskobu (SEM) ölçüm teknikleri kullanılarak çözeltide öngörülen elementlerin mevcut olduğunu doğruladı. EDX yöntemleri ile tespit edilen element miktarları **Şekil 2a'da** gösterilmiştir. Karbon, azot, oksijen ve gadolinyum, **Şekil 2a'daki** EDX spektrumundan görülebileceği gibi, numunelerin yüzeyinde tespit edilmiştir. EDX'in yalnızca yüzeydeki elementleri algıladığı anlamına gelir. Asla tam bir element analizi sağlamayacaktır. Bununla birlikte, EDX verileri numunede Gd varlığını doğrulamaktadır. Geçirimli elektron mikroskobu (TEM) için Gd-GQD çözeltisi sonifike edildi ve tek bir damlası, karbon film destekli bakır ızgaraya bırakıldı. Numune kurutulduktan sonra JEOL 2100F 200 kV elektron mikroskobu ile yüksek çözünürlüklü TEM (HR-TEM) analizi gerçekleştirildi. Hekzagonal yapı gözlemlendi ve çözeltideki Gd'nun ortalama parçacık boyutunun 5 nm olduğu belirlendi (Orhan et al, 2023) (**Şekil 2b.**)

Şekil 2. a) GdNPs-GQD'lerin nanokompozitlerinin EDX analizi; **b)** GdNPs-GQD'lerin nanokompozitlerinin HR-TEM analizi (Orhan et al, 2023)

GQD'ler, kuantum sınırlama (kuantum boyut etkisi) nedeniyle oluşan benzersiz floresans özelliklerine sahiptir. Kuantum noktada üç boyutta da sıkışan elektron enerjisini üst seviyelere çıkararak harcamadığı için kinetik enerjisi artmaya başlar ki bundan dolayı dalga boyu kısalır. Bunun sonucunda elektronun yaptığı ışımının rengi değişir ve bunula birlikte daha yüksek enerjiye sahip olduğu için yaptığı ışığa da daha şiddetli (daha parlak) olur. Bu çalışmada, GdNPs-GQD'lerin nanokompozitlerinin fotoluminesans (PL) performansını araştırmak için bir FS5 spektrofotometresi kullanılmıştır. Işık kaynağı olarak 150 W CW Xenon lamba kullanılır. Işık kaynağı numuneye çarptığında, bazı elektronlar daha yüksek enerji seviyelerine uyarılır. Bu elektronlar daha sonra temel enerji seviyelerine geri dönerken fazla enerjisinden ışığa yaparak kurtulur. Emilen foton sayısının yayılan foton sayısına oranı, bir molekülün veya malzemenin fotoluminesans kuantum verimi (PLQY) olarak tanımlanır. PLQY ve emisyon spektrumları sırasıyla **Şekil 3'te** gösterilmiştir. GQD'ler ve GdNPs-GQD'ler sırasıyla 330 ve 345 nm'de maksimum PL yoğunluğu sergiledi. Bunlar emisyon spektrumundaki iki zirveye karşılık gelir. Fotoluminesans piki, Gd içermeyen GQD'larda 330 nm'den Gd katkısı ile 345 nm'ye

kaymıştır. Gd katkılı GQDs'nin fotolüminesans kuantum verimi %35,92 olarak elde edilmiştir. Fotolüminesans kuantum verimindeki artış, Gd içermeyen GQDs örneğine (%7,60) kıyasla yaklaşık %470'tir.

Şekil 3. (a) Gd içermeyen ve **(b)** içeren GQD'lerin fotolüminesans özellikleri (Orhan et al, 2023)

Gd-GQD'lerin nanokompozit arayüzünün bazı elektriksel özelliklerini ve parametrelerini belirlemek için, TE teorisi için ileri $I-V$ ölçümleri yapıldı. Diyotun parametrelerini belirlemek için Denklem (1) kullanılmıştır.

$$I = I_0 \exp\left(\frac{q(V - IR_s)}{nkT}\right)$$

Burada I_0 ters doyma akımı, n idealite faktörü, R_s seri direnç, k Boltzmann sabiti, q elektrik yükü, T mutlak sıcaklık (Kelvin-K)'dir.

I_0 değeri; Denklem (2)'deki gibi yazılabilir,

$$I_0 = AA^* T^2 \exp\left(-\frac{q\Phi_B}{kT}\right)$$

burada Φ_b potansiyel engel yüksekliği, A^* etkin Richardson sabiti, A alandır. n değeri, Denklem (2)'den yarı log $\ln I-V$ grafiğinin eğiminden elde edilir.

$$n = \frac{q}{kT} \left(\frac{dV}{d(\ln I)} \right)$$

Şekil 4'te, GdNPs-GQDs nanokompozit diyotun I-V grafiğini göstermektedir. lnI-V grafiğinden doğrusal bölge üzerinden elde edilen n ve ϕ_B değerleri sırasıyla 4,9 ve 0,605 eV'dir. ± 5 V gerilimde düzeltme oranı (RR) 14 olarak bulunmuştur. Yapı iyi bir düzeltme göstermemektedir ancak yüksek olması istenen düşük RR'nin Gd ile katkılanmadan kaynaklandığı söylenebilir.

Şekil 4. I-V grafiği

Yapının hesaplanan bazı temel elektriksel parametreleri **Tablo 1.** de gösterilmektedir.

Tablo 1. Yapının elektriksel parametreleri (Orhan et al, 2023)

Parametre	Değer
n	4,9
I₀ (A)	$1,6 \times 10^{-6}$
ϕ_B (eV)	0,605
R_s (kΩ)	3,85
RR	14

SONUÇ ve ÖNERİLER

GdNPs-GQDs nanokompozit tabanlı diyotun I-V ölçümleri 300 K'de ± 5 V'da gerçekleştirildi. Gd katkısız ve katkılı GQD'lerin PLQY leri araştırıldı. GdNPs-GQD'lerin

mutlak PLQY'si %35,96 olarak bulunmuştur. Kuantum verimindeki yüksek artış, Gd içermeyen GQD örneğine (%7,60) kıyasla yaklaşık %470'tir. Bu durum Gd'nin varlığına bağlanmaktadır. Diyotun TE teorisi ile elde edilen Φ_B değeri 0,605 eV olarak bulunmuştur. Bununla birlikte, Gd katkılı GQDs diyotun RR'si $\pm 5 V'$ ta 14 olarak bulunmuştur (Orhan et al, 2023). Üretilen cihazda omik davranış gözlenmiştir. Yapının gözlenen düşük RR değeri, bariyer yüksekliği homojensizlikleri, yüzey/arayüz durumu veya tuzak seviyeleri dağılımları, katkılama atom konsantrasyonları ve seri direnç gibi çeşitli faktörlerden kaynaklanıyor olabilir. Sonuçlar, Gd katkılı karbon bazlı kompozit arayüzün yapının elektriksel özelliklerini nasıl etkilediğini göstermektedir. Bu da karbon elektroniği teknolojisini anlamak için bir temel oluşturmuştur. Diğer nadir toprak metallerinin bu yapılar üzerinde benzer etkilere sahip olup olmayacağını araştırılması gerekecektir. Bu alanda yapılacak daha fazla araştırmanın daha gelişmiş diyot yapılarının ve uygulamalarının geliştirilmesine yol açması beklenmektedir.

ÖZET

Son yıllarda, benzersiz yapısal özellikleri nedeniyle grafen kuantum noktalarına (GQD'ler) artan bir ilgi vardır. GQD'ler, diğer kuantum noktaları (QD'ler) gibi, sıfır boyutlu yarı iletken nanokristallerdir. QD'ler mikroelektronik alanında da popülerdir, ancak oldukça toksiktirler ve suda az çözünürler. Öte yandan, GQD'ler mükemmel biyoyoumluluk, düşük toksisite, daha yüksek suda çözünürlük, iyi elektriksel iletkenlik, kararlı fotoluminesansa sahiptir. Ek olarak, GQD'ler performansı artırmak ve optimize etmek için fonksiyonelleştirme ve katılanma yeteneğine sahiptir. Fonksiyonelleştirme, GQD'lerin yüzeyinin fonksiyonel gruplar veya moleküllerle modifikasyonunu içerir ve GQD'lerin çözünürlüğünü, stabilitesini ve biyoyoumluluğunu geliştirebilir. Flor (F), nitrojen (N), bor (B), fosfor (P) gibi heteroatom katkıları GQD'lerin bant aralığını değiştirebilir. GQD'lerin bu özellikleri, biyomedikal sensörler, fotodedektörler, gaz sensörleri, süper kapasitörler vb. gibi birçok uygulamada kullanılmasına yol açmıştır. Bu araştırmanın amacı, hidrotermal yöntemle sentezlenen işlevselleştirilmiş GQD'lerin dielektrik özelliklerini araştırmaktır. Bunun için GQD tabanlı Schottky diyot yapısı oluşturuldu. GQD tabanlı Schottky diyotun karmaşık dielektrik özellikleri empedans spektroskopisi (IS) yöntemi ile bulundu. Deney sonuçları, yapının negatif dielektrik özelliklerinin uygulanan gerilime ve güçlü bir şekilde frekansa bağlı olduğunu göstermiştir.

Anahtar Kelimeler: Kuantum Noktalar (QDs), Grafen Kuantum Noktalar (GQDs), Fonksiyonelleştirilmiş GQDs, Dielektrik karakteristik.

DIELECTRIC PROPERTY OF A DIODE BASED ON GRAPHENE QUANTUM DOTS

ABSTRACT

In recent decades, there has been a growing interest in graphene quantum dots (GQDs) due to their unique structural properties. QDs, like other quantum dots (QDs), are zero-dimensional semiconductor nanocrystals. QDs are also popular in microelectronics, but they are highly toxic and poorly soluble in water. On the other hand, GQDs have excellent biocompatibility, low toxicity, higher water solubility, good electrical conductivity, stable photoluminescence, high mechanical strength and elasticity. In addition, GQDs have the ability to be functionalized and doped to enhance and optimize performance. Functionalization involves the modification of the surface of GQDs with functional groups or molecules and can improve the solubility, stability and biocompatibility of GQDs. Heteroatom doping such as fluorine (F), nitrogen (N), boron (B), phosphorus (P) can change the band gap of GQDs. These properties of GQDs have led them to be used in many applications such as biomedical sensors, photodetectors, gas sensors, super-capacitors, etc. The aim of this research is to investigate the dielectric properties of the functionalized GQDs synthesized by a hydrothermal method. For this, GQDs-based Schottky diode structure was formed. The real and imaginary components of the complex dielectric constant ($\epsilon^* = \epsilon' - j\epsilon''$) and tangent loss ($\tan\delta$) of the GQDs-based Schottky diode were extracted by impedance spectroscopy (IS) in the wide frequency range from 1 kHz to 1 MHz and voltage range from -1V to +7V at room temperature. The experimental results have shown that the negative dielectric features of the structure are dependent on the applied voltage and are strongly frequency dependent.

Keywords: Quantum Dots (QDs), Graphene Quantum Dots (GQDs), Functionalized GQDs, Dielectric characteristics

GİRİŞ

Nanomalzemeler çeşitli boyutlarda bulunur: sıfır, bir, iki ve üç. Bu boyutlar kaç nano ölçekli boyuta sahip olduklarını gösterir; yani sıfır boyutlu (0D) nanomalzemelerdeki tüm boyutlar nanoölçek aralığındadır (Barati et al., 2022). Nano lifleri, nano tüpleri, nano çubukları ve nano telleri içeren tek boyutlu nano malzemelerde (1D) bir boyut, nano ölçeğin dışında yer alır. İki boyutlu nanomalzemelerde (2D) iki boyut nano ölçeğin dışındadır. 2D malzemeler plaka benzeri bir forma sahiptir ve grafen, nanofilmler, nano katmanlar ve nano tabakaları içerir. Herhangi bir boyutta nanoölçekle sınırlı olmayan malzemelere üç boyutlu nanomalzemeler (3D) adı verilir.

Kuantum nokta (QD), nanometre ölçeğinde boyutlara sahip sıfır boyutlu bir yarı iletken kristaldir (Sengupta et al., 2023). QD'ler metallere (örneğin Au), karbon bazlı malzemelerden (örneğin karbon noktaları ve grafen) veya yarı iletkenlerden (örneğin Se, Cd vb.) sentezlenebilir. Kuantum noktaları yüksek miktarda kendi kendine ışıldama özelliğine sahiptir. Belirli boyut aralığına sahip olup kuantum sınırlaması etkisi göstermektedirler. Bir elektronun uyarılması olayına bakıldığında zaman, daha küçük boyutlara sahip olan QD'ler daha yüksek enerji ve yoğunlukta ışık yayar (Nigam Joshi et al., 2016). Yalnız üretilen inorganik yapıdaki kuantum noktalarının toksitesi yüksek ve kimyasalların bağlanması zorlaştıran ve birçok uygulamada koloidal stabilite ile ilgili sorunlara neden olan kolloid yapıda olmaları gerçeğini içerir (Bacon et al., 2014). Karbon bazlı grafen kuantum noktaları (GQD) bu açıdan biyouyumlu olması, polar sıvılar içinde çözünürlüğü ve çevreye zarar vermeden üretililebilmeleri gibi özelliklerle öne çıkmaktadır. GQD'lerin optik ve fiziksel özellikleri de karbonik olmayan yarı iletkenlerden ve yalıtkan kuantum noktalarından farklıdır. Dikkat çekici bir şekilde, GQD'lerin benzersiz fotostabilite, yüksek çözünürlükleri ve yüksek kimyasal inertlikleri nedeniyle diğer kuantum nokta sınıflarından bu özellikleriyle ayrılırlar (Ghaffarkhah et al., 2022).

Grafen kuantum noktaları, karbon kuantum noktaları (CD'ler), karbon nanodotları (CND'ler) ve karbonize polimer noktaları (CPD'ler), sentetik süreçteki karbonizasyon, grafitizasyon ve polimerizasyondaki varyasyonlarına bağlı olarak farklı türde karbon noktalarıdır (Sengupta et al., 2023). GQD'lerin ve bu benzer yapıya sahip nanomateryallerin yapısal ve morfolojik farklılıkları, derinlemesine karakterizasyon teknikleri aracılığıyla dikkatle ele alınmalıdır (Zheng et al., 2015). GQD'ler, boyutu 20 nm'den küçük olan, tek veya birkaç katmandaki nanoskopik grafen parçaları olarak tanımlanabilen karbon bazlı malzemelerdir. Bunlar kuantum sınırlaması ve boyut etkisi sergileyen sıfır boyutlu (0 D) ışıldayan nanomalzemelerdir (Chung et al., 2021). GQD'lerin bant aralığı ve floresans özellikleri kuantum sınırlaması ve kenar etkilerinden kaynaklanmaktadır (Nesakumar et al., 2022). GQD'ler muazzam biyoyumluluğun yanı sıra fizikokimyasal, elektronik ve optik özelliklere de sahiptir. Bunlara ek olarak, yüksek şeffaflık ve geniş yüzey alanları sergileyen GQD'ler son zamanlarda enerji depolama malzemeleri olarak önerilmiştir (Biswal et al., 2022). GQD elektrotları geniş yüzey alanları ve iletkenlikleri nedeniyle kapasitörlere ve pillere de uygulanır. Yeni nesil yeşil nanomalzemeler olarak kabul edilen GQD'ler, her geçen gün daha fazla ilgi görmektedir. Grafen kuantum noktaları genellikle saf haliyle kullanılmaz çünkü saf haldeki GQD'lerin düşük kuantum verimi, düşük ürün verimi, düşük elektrik iletkenliği gibi bazı zorlukları vardır. Bu zorlukları aşmak için malzeme üzerinde fonksiyonelleştirme ve atom katkılama gibi yöntemler kullanılabilir. GQD'lerin fonksiyonelleştirme ile optik, fiziksel ve elektrokimyasal özelliklerini etkileyen, elektron veren/kabul eden, hidroksil (-OH), karboksil (-COOH), amin (-NH₂) grupları ve diğer biyomoleküller ile yüzey veya kenar modifikasyonudur (Kalkal et al., 2021). GQD'lerin yüzey modifikasyonu, gerekli fonksiyonel grupları içeren hammaddelerin eklenmesiyle sentezleri sırasında veya sentezden sonra istenen işlevselliklerin eklenmesi yoluyla gerçekleştirilebilir. GQD'lerin

kükürt (S), azot (N), bor (B) ve diğer elementler ile katkılanması elektriksel iletkenlik ve parlaklıkta bir artış sağlayabilir (Sengupta et al., 2023).

Malzemelerin dielektrik özellikleri yarı iletken teknolojisinde önemli bir yere sahiptir. Dielektrik malzemeler, bir elektrik alan uygulandığında altında o malzemenin yük veya enerji depolayabilme özelliğidir. Ayrıca tüm yüksek frekanslı devrelerin çalışması malzemelerin dielektrik özelliklerine bağlıdır ve yüksek frekanslı elektronik devreler uygun dielektrik malzemeler kullanılarak inşa edilir. Metal ile yarı iletken arasında yüksek dielektrik malzemelerin kullanılması hem metali yarı iletkenden yalıtır hem de aralarındaki yük aktarımını düzenler. Dielektrik sabiti normalde pozitifdir ancak son yıllarda yapılan çalışmalar, ϵ 'nin özellikle meta malzemelerde, negatif olabileceğini göstermiştir. Negatif dielektrik karakteristiğe sahip malzemeler enerji depolamada, transistörlerde, antenlerde, kablosuz iletişimde yaygın olarak kullanılmaktadır.

Bu çalışmada GQD'lerin özelliklerinin iyileştirilmesi ve üretilen GQD'lerin diyot haline getirilip dielektrik özelliklerinin araştırılması hedeflenmiştir. GQD'ler hidrotermal yöntemle üretilmiş ve p-tipi Silikon (Si) alttaş üzerine kaplanıp diyot haline getirilmiştir. Üretilen diyotun dielektrik özellikleri belli frekans değerleri için incelenmiştir.

MATERYAL ve YÖNTEM

Fonksiyonelleştirilmiş grafen kuantum noktaları hidrotermal yöntemle üretilmiştir. Başlangıç malzemesi olarak sitrik asit (CA) ve polietilenimin (PEI) kullanılmıştır. Hidrotermal reaksiyon otoklavın sulu ortamında gerçekleştirilmiştir. Fonksiyonelleştirilmiş GQD'lerin sentezinin ayrıntıları önceki çalışmalarımızda yer almaktadır (Berктаş et al., 2022, 2023).

Bu çalışmada alttaş olarak p-tipi Si (100) ve kontaklar için Alüminyum (Al) (%99,999 saflıkta) kullanılmıştır. Diyot yapısını oluşturmak için öncelikle alt kontak elde edilmiştir. Kontakı elde etmek için p-tipi Si alttaşın üzerine fiziksel buhar biriktirme tekniği (PVD) ile Al 128 nm kalınlığında biriktirilmiştir. Daha sonra oluşturulan GQD solüsyonu Şekil

1’de görülen döndürerek kaplama yöntemi kullanılarak p-tipi Si alttaş üzerine kaplanmıştır. Son olarak metal maske kullanılarak GQD/p Si yapısı üzerine tekrar PVD yöntemi ile kontaklar oluşturulmuştur. Şekil 2, oluşturulan diyot yapısının şematik çizimini göstermektedir.

Şekil 1. Döndürerek kaplama yöntemi

Şekil 2. Diyot yapısı

BULGULAR ve TARTIŞMA

Dielektrik, zayıf elektrik iletkenliğine sahip olan ve dielektrik polarizasyon olgusu nedeniyle elektrik yükünü depolayabilen bir malzeme olarak kabul edilir. Kompleks dielektrik (ϵ^*), dielektrik sabitinden (ϵ'), dielektrik kaybından (ϵ'') oluşur. Dielektrik sabitinin hesabı malzemenin ne kadar enerji depolayabildiğinin göstergesidir. Dielektrik kaybı ise malzeme içindeki taşıyıcı yüklerin uygulanan elektrik alan sonucunda polarize olmaları ve hareket halinde sürtünmeden dolayı açığa çıkan ısıdan dolayı oluşan enerji kaybıdır. ϵ' ve ϵ'' hesaplamaları malzemenin dielektrik özelliklerini belirler. Üretilen diyotun dielektrik özellikleri oda sıcaklığında analiz edilmiştir.

ϵ' ve ϵ'' değerleri dielektrik empedans spektroskopisinden çıkarıldı. Empedans spektroskopisi (IS), malzemelerin elektriksel ve dielektrik özelliklerini ve işlemlerini incelemek için en güvenilir ve önemli tekniktir. IS tekniği, bir sistemin sinüzoidal bir

bozulmaya karşı ac tepkisinin analiz edilmesine ve ardından empedansın ve ilgili parametrelerin frekansın bir fonksiyonu olarak hesaplanmasına dayanmaktadır.

ϵ' ve ϵ'' değerleri önceki çalışmamızda (Berktaş et al., 2023) ölçülen deneysel C-V ve G/□- V verilerinden Denklem 1 kullanılarak hesaplandı (Bunget & Popescu, 1984; Raju, 2017).

$$\epsilon^*(\omega) = \epsilon'(\omega) - j\epsilon''(\omega) = \frac{C}{C_o} - j \frac{G}{\omega C_o}$$

(1) burada C ve G diyotun ölçülen kapasitansı ve iletkenliğidir, $\omega(=2\pi f)$ açışal frekanstır ve $C_o(=\epsilon_o A/d_i)$ boş kapasitörün kapasitansıdır. C_o hesabında bulunan A diyot alanı ve d_i plakalar arasındaki mesafedir.

Şekil 3 ve Şekil 4'de gerilime bağlı dielektrik sabiti ve kaybı görülmektedir. Hem ϵ' hem de ϵ'' değerleri büyük ölçüde frekansa ve uygulanan gerilime bağlı olarak değişmektedir. 1 kHz frekansında negatif dielektrik özellik göstermektedir. Daha yüksek frekans değerleri olan 100 ve 1000 kHz'de ise pozitif karakteristik göstermektedir. Aynı zamanda negatif özellik gösterdiği düşük frekans değerinde dielektrik kaybının da yüksek olduğu görülmektedir. ϵ' ve ϵ'' 'nin bu davranışı, yüzey durumlarının/tuzaklarının varlığına, seri direncine (R_s) ve Maxwell-Wenger tipi polarizasyona atfedilmiştir.

Şekil 3. ϵ' -V karakteristiği

Şekil 4. ϵ'' -V karakteristiği

Tanjant kayıp faktörü ($\tan\delta$), malzemenin elektrik alanında depolanan enerjiye kıyasla dielektrik malzemede ısı olarak kaybolan enerji miktarını tanımlar. Başka bir deyişle, tanjant kaybı, bir malzemedan geçen elektrik sinyalinin malzeme boyunca iletilmek yerine ısı olarak emilme veya dağılma derecesini ölçer.

$\tan\delta$ hesabı, denklem 2 kullanılarak hesaplanır.

$$\tan \delta = \frac{\epsilon''}{\epsilon'} = \frac{G}{\omega C}$$

(2)

Şekil 5 gerileme bağlı $\tan\delta$ grafiğini göstermektedir. Tanjant kaybı 1 kHz'de en yüksek değeri olan 1500'e ulaşır. Yüksek frekans olan 100 ve 1000 kHz'de ise azalır. Frekans değeri arttıkça tanjant kayıp faktörünün azaldığı gözlemlenmiştir.

Şekil 5. $\tan \delta$ -V karakteristiği

SONUÇ ve ÖNERİLER

Bu çalışmada, fonksiyonelleştirilmiş GQD'ler hidrotermal yöntemle başarıyla üretilip, p-tipi Si kullanılarak diyot haline getirilmiştir. Daha önceki çalışmamızda (Berктаş et al., 2023) ölçülen C-V ve G/ω -V verileri kullanılarak dielektrik sabiti, dielektrik kaybı ve tanjant kayıp faktörü belli frekanslar için hesaplandı. Üretilen diyotun 1 kHz değerinde negatif dielektrik gösterdiği ölçülen diğer frekans değerleri için pozitif dielektrik özellik gösterdiği gözlemlenmiştir. Sonuçlar yapının dielektrik özelliklerinin gerilim ve frekansa bağımlı olduğunu göstermiştir. Negatif dielektrik malzemeler son yıllarda araştırılmaya başlanmış ve temel fiziksel özelliklerinin daha fazla perspektiften açıklığa kavuşturulması gerekmektedir. Tüm bu çabalar, gelişmiş fonksiyonel malzemelerin geliştirilmesini ve yeni elektronik cihazların yaratılmasını hızlandıracaktır.

ABSTRACT

“Iru” is a traditional condiment that is produced by the fermentation of African locust beans (*Parkia biglobosa*). It is a popular food condiment specifically in the West and Central African region. Its quality, safety and acceptability may be significantly improved through the use of starter cultures selected on the basis of multifunctional considerations which were the basis for this study. The traditional starter culture used was isolated from locally fermented iru. Raw *Parkia biglobosa* seed were processed by soaking, boiling and de-hulling and was fermented for 72 hours. Raw *P. biglobosa* seed and fermented sample quality indices such as pH, ash, fibre, moisture content, etc were measured. Two starter cultures were isolated and identified from iru procured from a local producer including *Aspergillus niger* and *Aspergillus oryzae* based on their morphological and microscopic characteristics. The proximate contents of the raw seed and fermented iru are as follows: ash (2.73% and 2.66%), moisture (9.24% and 51.37%), crude protein (26.64% and 26.64%), crude fat (37.85% and 37.83%), crude fibre (3.83% and 4.00%), carbohydrate (19.72% and 19.50%), nitrogen free extract (55.59% and 55.51%), calorific value (2201.01kj/100g and 2196.72kj/100g), tannin (0.594 mg/100g and 0.588mg/100g) and saponin (0.069mg/100g and 0.065mg/100g) respectively. The titratable acid and pH of the fermented and raw samples were 359.10mg/l, 361.80mg/l and 5.11, 5.59 respectively. In conclusion, this study revealed that the use of fungi for the fermentation of “iru” produced the same organoleptic and nutritional properties as those fermented using bacteria.

Keywords: Iru, Condiment, Fermentation, Fungi, Starter Culture

INTRODUCTION

Fermented foods are major sources of nutrition across Africa (Adekoya *et al.*, 2017). Traditional fermented food is an important part of the cultural heritage and diet that has been widely consumed since ancient times (Kavitakea *et al.*, 2017). The process of fermentation involves the breakdown of organic compounds into acids or alcohol through enzymatic action of microorganisms particularly yeasts, bacteria and molds under aerobic or anaerobic conditions (Chilton *et al.*, 2015). It has been shown that fermentation enhances the nutritional, health, organoleptic and preservative properties of food (Akpi *et al.*, 2020). As a technology that increases income sources, food availability, food diversity, reduces post-harvest losses and helps sustain food sovereignty, it plays an important role in developing economies.

Starter cultures or starters are individual or mixed formulations of selected strains of microorganisms with a particular physiological capacity to turn a substrate into a food product with specific characteristics when added at specified concentrations (Laranjo *et al.*, 2017). Adapted to the substrate, the typical starter facilitates improved control of the fermentation process and the predictability of its products. The choice of starter culture to use is dependent upon the substrate or raw material being fermented. Desirable properties of starter cultures include rapid acidification, predictable fermentation processes, desirable sensory characteristics (including taste, texture, aroma, and consistency), and the reduction of dangerous microbiota.

“Iru” is a traditional condiment which is being produced by fermentation of African Locust Bean (*Parkia biglobosa*) (Karamba *et al.*, 2022). The African locust beans plant (*Parkia biglobosa*) is a perennial deciduous tree of the Fabaceae family. Mostly found in Africa and also in the savannah and transitional zones of Nigeria. It is one of the accepted foods seasoning in Africa especially the Western and Central African region (Molinos *et al.*, 2016). “Iru” is a product of fermentation and cheap method of preservation. Small quantity of “Iru” is used in soup as source of protein, fat and flavor in West Africa (Quansah *et al.*, 2019; Abdullahi *et al.*, 2020). It serves as a tasty additive to soup and sauce due to its high protein content and can replace meat or fish (Jerry, 2016). The products are referred to as “Daddawa” in Hausa, “Iru” in Yoruba, “Ogiri” in Igbo, “Owo” in Urhobo and Itsekiri, “Okpiye” in Igala and Idoma Languages of Nigeria, Kinda in Sierra Leone, Afintin and Sonru in Benin Republic, and Natto in Japan (Karamba *et al.*, 2022).

Natural fermentations are usually undertaken by many microorganisms depending on the environment. Some microbes regularly contribute more to the transformation of the substrate

than others and are often associated with the fermentation of the particular food product. Such microorganisms could be used to develop starter cultures for controlled fermentation of the food products in order to maintain quality of the products (Michael, 2019). This study therefore seeks to develop starter culture for iru from resident fungi through solid state fermentation due to its potential to produce broad range of flavor, enzymatic activities, ability to increase the availability and bioavailability of certain nutrients than bacteria.

MATERIALS and METHODS

Sample Collection: Fermented Iru and dry *Parkia biglobosa* seeds were collected into sterile holders and transported immediately to the laboratory for analysis (Ayandele, 2015). The type of agar used for the microbiological analyses is Potato Dextrose Agar (PDA), a selective medium which was used for the isolation and maintenance of fungi. The medium was prepared according to the manufacturer's instructions.

Microbial Enumeration and Isolation: Ten grams (10 g) of commercial iru was homogenized with 90 ml sterile distilled water using orbital shaker at 250 rpm for 30 min. The resulting homogenate was plated by spreading 1 ml of it in sterile Petri dishes containing Potato Dextrose Agar (PDA), with the aid of sterile spreaders. The plates were incubated at 30°C for 3-4 days. The plates were examined for growth of visible colonies after incubation, visible colony were picked and sub-cultured repeatedly to obtain pure cultures. The isolates were maintained on PDA slants in the refrigerator for further use (Prajapati *et al.*, 2018).

Characterization and Identification of Isolates: The fungal morphology was studied macroscopically by observing the colony features (color, shape, size, hyphae), and microscopically using a compound microscope with a digital camera using a lactophenol cotton blue stained slide mounted with a small portion of the mycelium (Domsch *et al.*, 2020).

Inoculum Preparation: The selected starter(s) were cultivated on sterile PD agar. The culture plates were incubated at 30°C for 4 days. Pure colonies were introduced onto a fresh PDA slant (20 mL) using the determined optimal growth conditions and incubated at 30°C for 4 days. At the end of the incubation period, the slant was packed into the refrigerator for the fermentation process. Five mL of distilled water was used to wash each isolates which was used in combination as inoculum for the fermentation process.

Evaluation of Resident Fungi for Starter Culture Properties: Iru was prepared from the seeds of dried *Parkia biglobosa* (African locust bean) using traditional methods. After preparing the seeds (by removing coats, and through washing with clean water), it was

transferred into pots and covered completely with water and then boiled for 6 hours. The seeds were drained and dehulled, boiled again for another 6 hours to soften and probably reduce anti-nutrients in the seed. 100 g of the seeds was measured into a sample bottle and autoclaved. After autoclaving, the bottle was inoculated with the isolated fungi, sealed tightly and left for 4-5 days at ambient temperature (~32°C) for fermentation to take place. The resulting iru was taken for other analyses.

Chemical Analysis: The physicochemical and proximate composition of samples was carried out using the methods described by the Association of Analytical Chemist, AOAC (2022)

African Locust Beans (*Parkia biglobosa*)

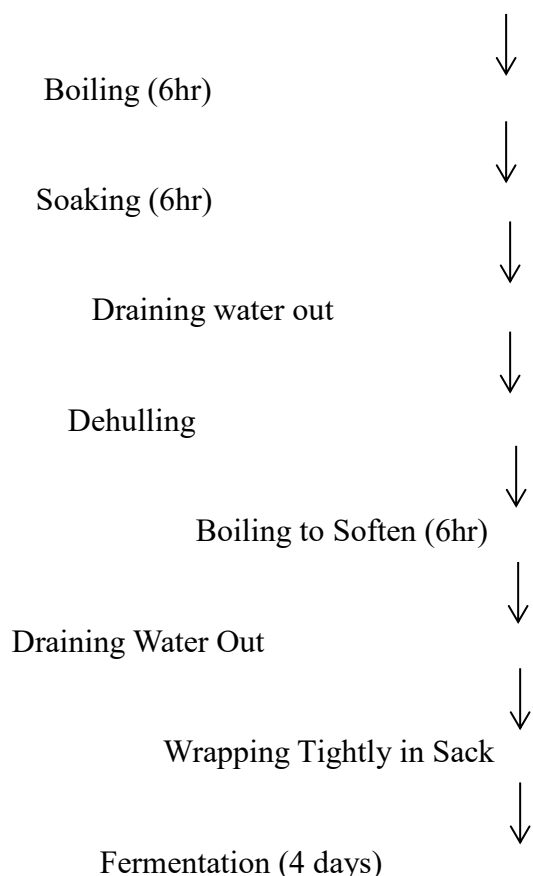

Figure 1: Flow Chart for Production of Fermented Locust Beans (Iru)

Source: (Osuntokun *et al.*, 2020).

Estimation of Tannins: 1.0 g of the sample was weighed and 10 ml of distilled water was added and mix with vortex mixer. This was incubated for 30 minutes at room temperature. This was centrifuge and 500 microliters of the supernatant was put inside test tube. To this was added 1.0 ml of Folin-C reagent and 0.5 ml of 17% sodium carbonate. 10.50 ml of distilled water was added to the reaction mixture and was incubated for 1hr at room temperature. The absorbance

was read at 760 nm. Blank Solution was prepared as well but distilled water was used in place of sample. For standard: 0-10ppm of Tannin acid was prepared and concentration varied to obtain a calibration curve. The absorbance of the Tannic acid standard solution was taken at 760nm as the sample. The amount of tannic acid in the samples was derived from the calibration curve.

Glycoside was calculated using the standard curve prepared (Nigussue *et al.*, 2021).

Estimation of Saponin: 1ml of methanolic extract (1mg/ml) was pipetted into a 50ml volumetric flask and 2ml of 5% FeCl₃ solution was added and made up to the mark with distilled water. This was then allowed to stand for 30 minutes for a blood red colour to develop. 0-10ppm saponins standard was prepared from saponins stock solution. The standard solutions were treated also with 2ml of 5% FeCl₃ solution as earlier described. The absorbance of the samples as well as standard saponin solutions was read after colour development using Ultra violet/Visible spectrophotometer at wavelength of 380nm. The saponin content in the samples was deduced from the standard curve plotted.

FINDINGS and DISCUSSION

Microbial Fermentation of the *Parkia biglobosa* Seed: Flavours/aroma was noticed during fermentation which can be attributed to the breaking down of some compounds and the formation of microbial metabolites and the texture was soft with a dark bean color. The results obtained were similar to the report of Ojewunmi *et al.* (2016).

Characterization and identification of the Isolates: The morphological properties of the isolates include the presence of conidia, dark brown to dirty green spore color, radiate conidia head, presence of globose vesicles and metulae, single walled to double walled stipe, etc. as presented in Table 1. The identities of the fungi involved in the fermentation process were found to be *Aspergillus niger* and *Aspergillus oryzae*. Similar organisms had been reported in earlier work by Amoa-Awua *et al.* (2005).

Table 1: Microscopic and Macroscopic Characteristics of Isolates

Characteristics	Isolate A	Isolate B
Colony color before Sporulation	White	Creamy
Color of Spore	Dark Brown	Dirty Green
Reverse View	Black	Pale Yellow
Days before Sporulation	2 Days	3 Days
Type of Spore	Conidia	Conidia
Conidia Head	Radiate	Radiate
Conidiophore	Hyaline and Smooth	Hyaline and Roughened
Stipe of Conidiophore	Single Walled	Double Walled
Conidia	Double Walled	Double Walled
Vesicle	Globose	Globose
Phialides	Borne on Vesicle	Borne on Metulae
Number of Rows	Uniseriate	Biseriate
Probable Organism	<i>Aspergillus niger</i>	<i>Aspergillus oryzae</i>

Physicochemical Composition of the Iru Samples: Results from Table 2 show the physicochemical composition of the different samples. The pH of iru produced with ferments of starter cultures was acidic, which is different from traditionally fermented iru. This result is similar to those reported by Madigan *et al.* (2006). The acidity may be due to the nature of the fungi used as starter culture with respect to pH requirements for optimum growth which has been shown to be acidic (Oladunmoye, 2007).

Table 2: Physicochemical Parameters

Samples	pH	TTA (mg/l)
<i>Parkia biglobosa</i> Seed	5.59	361.8
Fermented Iru	5.11	359.1

Data are mean of two replicates

Proximate Content of the Samples: Results from Table 3 show the proximate content of the different samples. The content of the ashes obtained was similar to those found by Agbobatinkpo *et al.* (2012) which were 2.6 to 3.2% as presented in Table 3. The loss in ash content could be due to the removal of the hull of *Parkia biglobosa* seed which may have contained significant amounts of minerals. Soaking of samples could also result in leaching of minerals (Igbabul *et al.*, 2014). Ash content may increase or decrease depends on the type of food sample or fermentation techniques after fermentation.

The moisture content of fermented iru was higher than the raw *Parkia biglobosa* seed as presented in Table 3. The high moisture content, however, shows that it will not keep well. The extreme increase in moisture content was due to processing techniques such as soaking in water and boiling. The moisture content of fermented iru in this study agreed favorably with 56.7% reported earlier by Odebunmi *et al.* (2010).

The protein content of the sample was the same as shown in Table 3. The protein levels obtained in this study were lower than those obtained for sonru and iru fermented with yanyanku and ikpiru additives, which average was 35% (Agbobatinkpo *et al.*, 2012). The variation of the protein contents may be due to the proteolytic activity of the fermenting strains (Mohammadou *et al.*, 2018) and also to the difference in the physicochemical constituent of African locust bean seeds according to the localities. Results demonstrated that fermented iru as well as unfermented *Parkia biglobosa* seed were rich in proteins (> 20%). Thus, iru could be a source of protein that could help poor population to meet their demand for this nutrient, particularly in developing countries.

The fat content of fermented iru was higher than the raw seed as presented in Table 3. According to Tope (2014), and Igbabul *et al.* (2014), the increase in fat content could be due to extensive breakdown of large fat molecule to simpler fatty acid units due to the high activity of lipolytic enzymes. The increase in fat content could also be fat from dead microflora or the fact that fermenting microflora does not use fat from these foods (substrate) as a source of energy. The fat content of fermented iru prepared is comparable to that reported by Guissou *et al.* (2020),

which was 40.47%. The calorie present in the fermented iru was lower than the raw seed. The carbohydrate content was lower in the fermented iru as presented in Table 3 and this may be attributed to the ability of the fermenting micro floral to hydrolyze and metabolize them as carbon source (substrate) in order to synthesize cell biomass (Oladunmoye, 2007). The carbohydrate contents of the samples were also in agreement with that reported by Guissou *et al.* (2020).

The fibre content of the fermented iru was higher than the raw seed as presented in Table 3. However, Adeyemi *et al.* (2012) suggested that increasing crude fibre interferes with other nutrients thereby, making such nutrients unavailable for use. The crude fibre contents of the samples in this study were lower than 4.4% reported by Omafuvbe *et al.* (2004). The nitrogen free extract of the raw seed was higher than the fermented iru and this may be attributed to the removal of the hull which might have facilitated the leaching of carbohydrate into the cooking water. The nitrogen free extract in this study was lower than 60.65% reported by Okoruwa (2017).

Antinutritive Estimation of the Samples: The tannin and saponin content of the sample was higher in the raw seed as presented in Table 4. Tannic acid and saponin content was lower in fermented iru to be of any nutritional disadvantage and this may be due to activities of microflora that breakdown tannin and saponin complex (Esenwah and Ikerebimeh, 2008). The tannin and saponin contents in this study were lower than 24.15 and 2.80mg/100g reported by Afolayan *et al.* (2017).

Table 3: Proximate Content

Test	<i>Parkia biglobosa</i> Seed	Fermented Iru
Ash Content (%)	2.73	2.66
Moisture Content (%)	9.24	51.37
Crude Protein (%)	26.64	26.64
Crude Fat (%)	37.83	37.85
Crude Fibre (%)	3.83	3.99
Nitrogen Free Extract (%)	55.59	55.51
Carbohydrate (%)	19.72	19.50
Calorific Value (kj/100g)	2201.01	2196.72

Table 4: Antinutritive Estimation

Test	Tannin (mg/100g)	Saponin (mg/100g)
<i>Parkia biglobosa</i> Seed	0.594	0.069
Fermented Iru	0.588	0.065

Data are mean of two replicates

CONCLUSION

From the study, the use of fungi as starter culture for the fermentation of iru has shown to have similar results as those fermented with the use of bacteria. With the increasing demand of fermented foods, it becomes necessary to ameliorate the productivity, food safety, and efficiency of the manufacturing processes, while dwindling production costs. Further research on innovative fermentation processes should include the consistent use of starter culture which could allow obtaining a stable and safe final product.

RECOMMENDATIONS

Currently, there's a great variety of fermented foods produced spontaneously. Still, with an adding body of knowledge regarding the microbial community involved in the fermentation processes and technological advancements regarding large-scale fermentations, there is a need to select proper microbial strains that can steer the fermentation process, select quality raw materials, and apply proper process control. Additional research is needed for the use of fungi for the development of starter culture in iru.

ABSTRACT

The R-RTR-RTR mechanisms combine rotational and translational motions and are rarely used in practical applications. The planar R-RTR-RTR mechanism includes a driver link with a rotational joint (R) and two dyads with the rotational (R), translational (T) and rotational (R) joints. Due to its rarity in application and complexity, only a few textbooks have addressed the analyses of position, velocity, and acceleration. Recently, artificial neural networks (ANNs) have found utility across various research domains, encompassing both inverse and forward kinematic analysis. However, the application of ANNs to position analysis in the planar R-RTR-RTR mechanism remains unexplored. This study aims to bridge this gap by introducing an ANN algorithm for the position analysis of the planar R-RTR-RTR mechanism. To achieve this, the Levenberg-Marquardt Backpropagation algorithm was chosen for its merits, including rapid convergence in training error and the unique combination of the Gauss-Newton training algorithm with the steepest descent method. To train the algorithm effectively, a meticulous selection of 50 datasets was undertaken, which were then randomly divided into sets for training, validation, and testing. Additionally, an extra set of 250 data sets was exclusively reserved to evaluate the performance of the trained algorithm. This study not only presents the results derived from training of the neural network algorithm but also outlines the outcomes of comprehensive testing. These results are subjected to thorough discussion and analysis, providing insights into the algorithm's effectiveness and potential implications.

Keywords: Planar R-RTR-RTR mechanism, Artificial neural networks, Position analysis, Levenberg-Marquardt Backpropagation algorithm

INTRODUCTION

The planar R-RTR-RTR mechanism comprises a driver link featuring a rotational joint and two dyads, each equipped with rotational, translational, and rotational joints. Due to its intricate structure and infrequent use in practical scenarios, research on this mechanism has been constrained. Notably, artificial neural network algorithms have found application in diverse research domains, including mechanism design. However, the application of neural network algorithms to the R-RTR-RTR mechanism has been notably absent, primarily due to the limited scope of its existing applications.

Kinematic position analysis of these mechanisms is extensively covered in various textbooks and lecture notes, such as Norton (2019), Waldron et al. (2016), and Uicker et al. (2017). These educational resources provide comprehensive explanations of both analytical and graphical solutions to the kinematic position analysis problem for these mechanisms. Furthermore, researchers have explored the application of artificial neural networks to the design of these mechanisms. For instance, Shah et al. (2011) conducted a study on a 2-degree-of-freedom robot, where they successfully utilized artificial neural networks to address both forward and inverse kinematic analysis challenges within the robotic manipulator. In another study by Shah et al. (2012), they extended the application of artificial neural networks to a 3-degree-of-freedom robotic manipulator, effectively solving both forward and inverse kinematic analysis problems through the use of neural network algorithms. Additionally, Zhang and Lei (2011) reported on the forward kinematic analysis of a 3-degree-of-freedom actuation redundant parallel robot. Their research explored various artificial neural network architectures, including multilayer perceptron, radial basis function, and support vector machine algorithms, demonstrating their utility in solving the forward kinematic mapping problem of this parallel manipulator.

Previously, position analysis of the slider-crank mechanism using artificial neural network algorithm is presented (Denizhan, 2023). In this article, Levenberg-Marquardt backpropagation algorithm is chosen because of its speed. In another study, two position synthesis of the four-bar mechanism is also introduced by using Levenberg-Marquardt Backpropagation algorithm (Denizhan, 2023). In this study, position analysis of the R-RTR-RTR mechanism is investigated by using Levenberg-Marquardt Backpropagation algorithm. The primary goal of this research is to demonstrate the utilization of a neural network algorithm for conducting kinematic position analysis on the R-RTR-RTR mechanism. The study presents and thoroughly discusses all obtained results.

1. Position Analysis of the Planar R-RTR-RTR Mechanism

As mentioned earlier, the kinematic position analysis of the mechanism is thoroughly covered in various textbooks and lectures notes. In this study, the position analysis of the mechanism within the range of 30 degrees to 60 degrees is investigated, as opposed to analyzing the full rotation capability of the R-RTR-RTR mechanism. This is due to the complex nature of obtaining solutions for the kinematic equations across a complete rotation. The study presents an analytical solution for the mechanism, with the initial dimensions of the planar R-RTR-RTR mechanism as follows: $|AB| = 0.15\text{m}$, $|AC| = 0.10\text{m}$, $|CD| = 0.15\text{m}$, $|DF| = 0.40\text{m}$ and $|AG| = 0.30\text{m}$. Joints A and C are fixed at specific coordinates: $x_A = y_A = x_C = 0$ and $y_C = 0.1\text{m}$. The analysis is conducted within the range of ϕ angles between 30 degrees and 60 degrees.

Figure 1. Planar R-RTR-RTR mechanism

The configuration of the planar R-RTR-RTR mechanism is depicted in Fig. 1. A revolute joint is present at Joint A , Joint B features both revolute and translational joints, Joint C has a revolute joint, and Joint D incorporates both revolute and translational joints. In Fig. 1, it can be observed that the lengths of Links $[AB]$ and $[AD]$ undergo changes during the motion of the mechanism. Joint A is affixed at the origin $(0,0)$, while Joint C is immobilized along the y -axis $(0, y_C)$. Points

G and F denote the endpoints of Links [AD] and [AB], respectively, with the lengths of [AG] and [AB] remaining constant.

Positions of Joints A and C remain constant during the motion of the mechanism. Position of Joint B can be found by using following equations:

$$x_B = |AB| \cos \phi \quad (1)$$

$$y_B = |AB| \sin \phi \quad (2)$$

where x_B and y_B are position of Joint C x and y axes respectively and the angle of ϕ is the angle Link [AB] relative to the horizontal axis. The parameter |AB| is the length of Link [AB]. Position of Joint D can be expressed by following equations:

$$(x_D - x_C)^2 + (y_D - y_C)^2 = |CD|^2 \quad (3)$$

$$m = \frac{(y_B - y_C)}{(x_B - x_C)} = \frac{(y_D - y_C)}{(x_D - x_C)} \quad (4)$$

where parameters x_C and y_C position of the Joint C and parameter x_D and y_D are position of Joint D x and y axes respectively and the parameter |CD| refers to the length of Link [CD]. The parameter m is the slope of the Link [CD]. According to the Fig. 1, the Points B , C , and D are on the same link; hence, all of them have the same slope.

The angles of Point B , Link [CD] have the same angle with horizontal x-axis and the parameters ϕ_2 and ϕ_3 represent to these angles respectively. Similarly, Point D and Link [AD] have the same angle with horizontal x-axis and the parameters ϕ_4 and ϕ_5 represent these angles respectively. The angles ϕ_2 , ϕ_3 , ϕ_4 and ϕ_5 can be expressed by following equations:

$$\phi_2 = \phi_3 = \arctan \frac{y_B - y_C}{x_B - x_C} \quad (5)$$

$$\phi_4 = \phi_5 = \arctan \frac{y_D}{x_D} + \pi \quad (6)$$

where the angles ϕ_2 , ϕ_3 , ϕ_4 and ϕ_5 correspond to angles of the Point B , Link [CD], Point D and Link [AD] respectively.

Points F and G represent end point of the Links [AB] and [AC]. The following equations express these points:

$$x_F = x_D + |DF| \cos \phi_3 \quad (7)$$

$$y_F = y_D + |DF| \sin \phi_3 \quad (8)$$

$$x_G = |AG| \cos \phi_5 \quad (9)$$

$$y_F = |AG| \sin \phi_5 \quad (10)$$

where x_F and y_F are x and y coordinates of the position of Point F respectively, x_G and y_G are x and y coordinates of the position of Point G respectively and the parameters $|DF|$ and $|AG|$ refer to the lengths of the Links $[DF]$ and $[AG]$ respectively.

Detailed solution of the analytical kinematic position analysis of the R-RTR-RTR mechanism is explained in various textbooks and lectures noted; hence, there is no need to solve these equations in this article.

As seen in equations above, there are a total of 12 unknown parameters. In fact, there are 10 unknown parameters because $\phi_2 = \phi_3$ and $\phi_4 = \phi_5$ but in this designed neural network algorithm, 12 parameters are assumed as unknown parameters. According to the equations above, all parameters can be determined by only giving driver link angle ϕ .

2. Position Analysis by Using Levenberg-Marquardt Backpropagation Algorithm

In this research, the Levenberg-Marquardt Backpropagation algorithm was specifically chosen due to its advantageous characteristics, which include its speed, the stable convergence of training errors, and its amalgamation of the Gauss-Newton training algorithm with the steepest descent method. The neural network architecture developed for this study comprises a single input and a total of 12 outputs. The input variable for this network is represented by the angle ϕ , corresponding to the driver link angle. As elucidated by the position analysis equations expounded in this article, the angle ϕ serves as the key determinant for all 12 unknown parameters, which encompass $x_B, y_B, x_D, y_D, x_F, y_F, x_G, y_G, \phi_2, \phi_3, \phi_4$ and ϕ_5 . All of these unknown parameters are output parameters in Levenberg-Marquardt Backpropagation neural network algorithm in this study.

Figure 2. Two-layer feedforward artificial neural network structure

Figure 2 displays the structure of a two-layer feedforward artificial neural network algorithm. As illustrated in Fig. 2, the hidden layer comprises 100 neurons, each equipped with a sigmoid activation function, while the output layer consists of 12 neurons utilizing a linear activation function. Within Fig. 2, the symbols w and b denote the weights and bias of the neural network algorithm, respectively.

For this study, a set of 50 data sets was designated for training, validation, and testing purposes. These 50 data sets were randomly divided, allocating 70% for training, 15% for validation, and another 15% for testing. Additionally, a supplementary test was conducted to assess the performance of the trained algorithm. In this case, a distinct set of 250 data sets was employed for the supplementary test, entirely separate from the original 50 data sets initially used for training.

3. Results

In this study, the Levenberg-Marquardt Backpropagation algorithm is employed for training, validation, testing, and additional testing using the MATLAB Neural Network Fitting App. The initial, stopped, and target values are determined by MATLAB in this study, although they can be manually adjusted for different analysis purposes.

Table 1. Training process of the Levenberg-Marquardt Backpropagation Algorithm

Unit	Initial Value	Stopped Value	Target Value
Epoch	0	7	1000
Elapsed Time	-	0:00:00	-
Performance	1.03	7.96e-14	0
Gradient	0.946	3.55e-08	1e-07
Mu	0.001	1e-10	1e+10
Validation	0	0	6

The training process of the Levenberg-Marquardt Backpropagation algorithm is detailed in Table 1. As indicated in Table 1, training was terminated at epoch 7 due to the attainment of the minimum gradient. The table demonstrates that the algorithm exhibited swift convergence, with the performance value nearly reaching its target value. Notably, the table reveals that no validation checks were incorporated into the training process, and the adaptive value (Mu) remained unchanged from its initially assigned value.

Table 2. Training results of the Levenberg-Marquardt Backpropagation Algorithm

	Observations	MSE	R
Training	34	0.0000	1.0000
Validation	8	0.0305	0.9842
Test	8	0.0321	0.9827
Additional Test	250	0.0116	0.9937

Table 2 displays the training results achieved by the Levenberg-Marquardt Backpropagation algorithm. In Table 2, the observation column represents the number of data sets, while MSE and R correspond to mean square error and regression, respectively. As per the data presented in Table 2, the training results can be characterized as impeccable, with an MSE value of 0 and an R value of 1. Both validation and test results exhibit a remarkable similarity, with mean square error values approaching zero and regression values nearing 1, as indicated in Table 2. Notably, Table 2 underscores that the additional test results surpass both the validation and test results, primarily due to the lower MSE value and an R value that is nearly equal to 1.

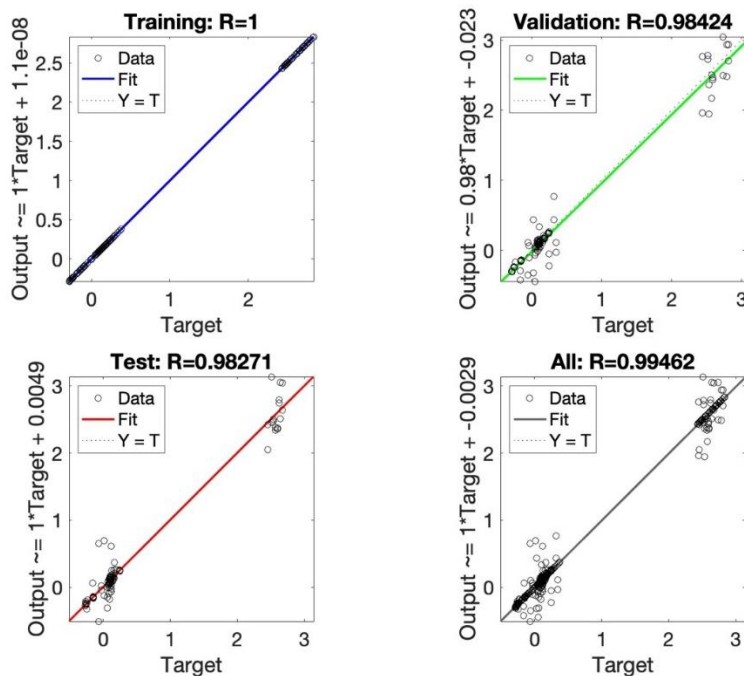

Figure 3. Levenberg-Marquardt Backpropagation algorithm training, validation, testing and overall regression plots

Regression plots for the training, validation, testing, and the entire dataset are depicted in Fig. 3. As observed in Fig. 3, the training dataset is impeccably fitted, exhibiting a regression value of 1. Conversely, the validation and testing plots in Fig. 3 indicate that the data is nearly perfectly fitted, although there are instances where certain data sets do not fit precisely. The final plot in Fig. 3 illustrates that the dataset is nearly perfectly fitted, as evidenced by its regression value of 0.99462.

Figure 4. Levenberg-Marquardt Backpropagation algorithm error histogram graph

The error histogram graph of the Levenberg-Marquardt algorithm is depicted in Fig. 4. According to Fig. 4, the zero error value is approximately -0.0324. As illustrated in Fig. 4, nearly all error values for the training dataset cluster around the zero error value. Only a few validation and test dataset entries exhibit differing error values, although they too remain close to the zero error value.

Figure 5. Levenberg-Marquardt Backpropagation algorithm the best validation graph

Figure 5 displays the best validation graph obtained through the Levenberg-Marquardt Backpropagation algorithm. As indicated in Fig. 5, the optimal validation performance, achieving a value of 0.03052, is observed at epoch 7. It is notable that, as illustrated in Fig. 5, the validation and test curves exhibit a tendency to remain

consistent and exhibit minimal changes after epoch 1. Conversely, the mean square error (MSE) during training experiences a dramatic decrease following epoch 1.

Figure 6. Levenberg-Marquardt Backpropagation algorithm fitting graph

Fitting curve graphs for the Levenberg-Marquardt Backpropagation algorithm are presented in Fig. 6. As depicted in Fig. 6, although certain data sets exhibit relatively larger errors, the majority of the data sets demonstrate nearly zero error. Therefore, Fig. 6 illustrates that the data sets are nearly perfectly fitted.

Figure 7. Levenberg-Marquardt Backpropagation algorithm additional test regression graph

In Fig. 7, a regression graph of additional test data sets is presented. It's worth noting that there is no training or validation involved in the additional test. As indicated in Fig. 7, the data exhibits nearly perfect fit, as evidenced by a regression value of 0.99374. Figure 7 underscores that nearly all data sets are well-fitted, and the performance of the training algorithm is almost flawless.

Figure 8. Levenberg-Marquardt Backpropagation algorithm additional test error histogram graph

Figure 8 displays an error histogram graph for the additional test conducted with the Levenberg-Marquardt Backpropagation algorithm. According to Fig. 8, the zero error value for the additional test of the trained algorithm is approximately -0.03139, which is nearly identical to the zero error value observed during the trained training phase. As depicted in Fig. 8, the majority of error values for the data sets also cluster around the zero error value.

Figure 9. Levenberg-Marquardt Backpropagation algorithm additional test fitting graph

Figure 9 presents the fitting curve graph of the Levenberg-Marquardt Backpropagation algorithm for the additional test. It is observed from Fig. 9 that the additional test data sets exhibit relatively larger errors, but the curve's trend closely aligns with the fitting curve of the algorithm during training. Both Figs. 6 and 9 indicate that there are no significant disparities between the fitting curve during algorithm training and the graph obtained from the additional test of the trained algorithm.

4. DISCUSSION

Improved training of neural network algorithms is facilitated by a larger quantity of data sets; nevertheless, the issue of overfitting arises. As previously mentioned, a total of 50 data sets were allocated for training, validation, and testing purposes. The utilization of a greater number of data sets can enhance training while simultaneously introducing the challenge of overfitting. Furthermore, for testing purposes of trained algorithms, a total of 500 data sets were employed in this study, but the option to incorporate additional data sets remains open. It's noteworthy

that overfitting is not a concern during additional testing, as these data sets are solely designated for testing purposes.

Various alternative neural network algorithms, such as Bayesian regularization or Scaled Conjugate Gradient Descent algorithms, exist. Different neural network algorithms can yield disparate performances. Hence, to assess the performance variations among these different algorithms, they can be applied to the same mechanism using identical data sets. This approach enables an understanding of the comparative performance of distinct algorithms within the same context.

5. CONCLUSION

In this study, the position analysis of the planar R-RTR-RTR mechanism is examined through the utilization of the Levenberg-Marquardt Backpropagation algorithm. Furthermore, an additional test is conducted to assess the performance of the trained algorithm. The results indicate that the data sets are impeccably fitted using the Levenberg-Marquardt Backpropagation algorithm. The outcomes of the additional test similarly reveal that the trained algorithm maintains consistency with the training results and proves to be effective.

**EFFECT OF PACKAGING IN REDUCTION OF POST-HARVEST LOSSES FOR
FRESH FRUITS AND VEGETABLES**

ABSTRACT

Parallel to the population growth, the demand for fruits and vegetables is also increasing. In recent years, while investigation on improvements in agricultural production has received great attention, studies on reducing post-harvest losses have received relatively less attention. Agricultural production does not end with the harvesting; it also includes various post-harvest activities, including processing, distribution and storage of the product. The shelf life of fresh fruits and vegetables is restricted from a few hours to a few weeks at ambient conditions. For this reason, some losses occur between the harvest and consumption of fruits and vegetables, and approximately one third of all fruits and vegetables produced worldwide cannot be consumed by humans. Moisture loss, bruising and following decay are the important types of spoilage responsible for the discarding of fresh fruits and vegetables. Many factors such as processing, storage and distribution conditions contribute to post-harvest losses in fresh fruits and vegetables. If these factors are properly controlled, post-harvest losses can be minimized. Among these, packaging is one of the most important factors to reduce post-harvest losses, along with extending the shelf life of fresh fruits and vegetables. Different packaging techniques for fruits and vegetables were employed to decrease the post-harvest losses and to increase the product quality and safety. Different traditional technologies have been used to preserve the quality and safety characteristics of fruits and vegetables, but they do not meet the requirement for shelf life extension. In recent years, novel packaging methods such as, gas and moisture control, antimicrobial and/or antioxidant packaging methods, smart labels, and edible films or coatings, have been developed to improve quality and prolong the shelf life of fresh fruits and vegetables.

Keywords: Fruits and Vegetables, Post-harvest Losses, Packaging.

INTRODUCTION

It is estimated that the world population will continue to increase and exceed 9 billion in 2050. This means that the world needs to produce more food, thus increasing the need for fresh fruits and vegetables. As stated by Food and Agriculture Organization of the United Nations (FAO), 910 million tonnes fruit and 1.2 billion tones vegetables were produced all around the world in 2021 (FAO, 2022). Agricultural production does not end with the harvesting; it also includes various post-harvest activities, including processing, distribution and storage of the product. During these processes, fresh products are lost both quantitatively and qualitatively. It is known that 20% to 50% of harvested product is lost on the way from producer to consumer (Shinde et al., 2018).

Fresh fruits and vegetables are living organisms and they continue their life processes after harvesting. These products carry out a series of metabolic pathways to obtain the energy necessary to sustain their life. For that reason, physiological and biochemical processes are performed throughout the post-harvest life (Yahia, 2018). The respiration and transpiration are the most important processes after harvesting. During respiration, oxygen is absorbed while carbon dioxide, water and heat are released by the plants. In transpiration, moisture is transported through the skin of product and water is lost from fruits and vegetables. The results of respiration and transpiration processes can be listed as ripening, fermentation, color changes, deterioration due to the disruption of the cellular structure and the growth of undesired microorganisms (DeELL et al., 2003). As a result of all these mechanisms, fresh fruits and vegetables are lost or wasted at different phases throughout the food chain. The stages can be listed as harvesting, handling, storage, processing, packaging, distribution and consumption (Kiaya, 2014). Fresh fruits and vegetables are lost at different rates throughout these stages. By improving post-harvest techniques such as packaging, it is possible to decrease post-harvest losses and improve the quality of fresh products.

Packaging is applied to protect the food from environmental factors. The key purpose of fruit and vegetable packaging is the protection of the products inside from physical, chemical or biological deterioration for the duration of storage, transportation and distribution (Smith et al., 2003). Different fresh fruits and vegetables require different types of packaging materials. The physical, anatomical and physiological structures of the products and their susceptibility to microbial decay should be taken into consideration when selecting packaging materials. Therefore, packaging necessities for fresh products may be listed as follows: (1) to avoid

microbial contamination and spoilage, (2) to avoid bruising and physical damage, (3) protection to moisture or weight loss, (4) providing aeration for respiration and gas exchange, (5) reduce the respiration rate, postpone ripening and extend storage time, (6) controlling the amount of ethylene in the package (Elik et al., 2019). It is essential to choose the most suitable packaging method and material for fresh fruits and vegetables. Appropriate packaging system should be used to minimize losses and maintain product quality. Traditional packaging methods played an important role in the early development of food distribution processes. However, these methods can no longer meet increasingly complex requirements effectively and adequately (Bodobodak & Rafiee, 2016). These days, consumers are looking for new packaging systems with improved functions to increase the quality and the shelf life of fresh fruits and vegetables.

Packaging of Fresh Fruits and Vegetables

Different packaging systems are available for the packaging of fresh fruits and vegetables. Many issues as the nature of the fresh product, the biodegradability and recyclability of the material and the product shelf life should be considered while choosing a packaging material. There are different packaging materials used for the fresh products such as sacks, wooden crates and boxes, pallet boxes, fibreboard boxes, plastic containers, flexible plastic films and shrink-film wraps. Today, with the progress in the food packaging machine industry, there are many packaging machines used for fresh fruits and vegetables. The most frequently applied packaging methods for fresh fruits and vegetables are flow pack packaging systems (horizontal or vertical flow), thermoform packaging, tray sealing and stretch film wrapping (PHP, 2018).

Innovative Packaging Systems

One of the most frequently used methods for preserving fresh fruits and vegetables is modified atmosphere packaging (MAP) system. The aim of MAP is to avoid undesired changes in the sensory properties and nutritional value of products and to prolong their shelf life. With MAP, undesired physiological, chemical, biochemical and physical modifications in foods are reduced, microbial growth is controlled and it prevents contamination of the product like other packaging techniques. It is based on the modification of normal composition of air surrounding the food inside the packaging. Oxygen, nitrogen and carbon dioxide are the main gasses applied in MAP (Floros & Matsos, 2005). The design of MAP systems is complex and different factors

such as temperature, gas composition, product characteristics and permeability of packaging material should be considered during MAP design (Belay et al., 2016).

Active packaging is one of the advanced methods applied to preserve or extend the shelf life of foods which also ensure the product quality, safety and integrity (Li et al., 2022). It is a packaging technique in which the condition of package is actively changed. Two different systems can be used which are active scavenging systems (absorbers) and active releasing systems (emitters). In active scavenging systems (absorbers), undesired compounds as moisture, carbon dioxide, ethylene etc. are removed from product or its atmosphere. On the other hand, some substances like antimicrobials, carbon dioxide, antioxidants or ethanol are added to the packaged product or into the headspace in active releasing systems (emitters) (Wyrwa & Barska, 2017; Yildirim et al., 2017). Absorbers and emitters may be in the form of sachet, label or film, depending on the physical condition of the active packaging systems (Bodbodak & Rafiee, 2016).

Smart (intelligent) packaging is a technique that follows the condition (temperature, pH, etc.) of packaged product or the surrounding atmosphere inside the package. This packaging system also provides this information to the user (Biji et al., 2015). The losses in fresh products in the supply chain can be reduced by using smart packaging systems. With this method, information about the product's quality, safety, shelf life and logistics efficiency may be sent to suppliers, which can be used to decrease the time products pass in the supply chain. This reduces the possibility of the product deterioration during transport and storage (Onwude et al., 2020).

In the past years, the improvement and usage of biodegradable packaging materials to increase the shelf life of fresh fruits and vegetables has attracted increasing attention. In biodegradable packaging, packaging materials which can decompose into natural elements by microorganisms are used instead of synthetic materials. Renewable raw materials are used to produce biodegradable packaging materials (Shaikh et al., 2021). The biodegradable polymers commonly applied for packaging of fresh fruit and vegetables are cellulose, starch, protein, chitosan, polylactic acid and polycaprolactone and lipids (Abdul Khalil et al., 2018).

Combining biodegradable packaging materials with other innovative packaging methods such as modified atmosphere and active packaging may increase the shelf life of fresh fruits and vegetables and also reduce the waste from packaging materials. Thus, combined system may be an optimal packaging method for fresh fruits and vegetables. Some of the examples of

advanced packaging techniques applied in recent years to extend the shelf life of fruits and vegetables are given in Table 1.

Table 1. Advanced packaging techniques applied for fresh fruits and vegetables

Fruit/vegetable type	Packaging technique	Storage conditions	Shelf life	Reference
Apple	Modified atmospheric packaging	2 °C	180 days	Mangaraj et al., 2023
Kiwifruit	Combination of active modified atmosphere packaging	4 °C and 50% RH	30 days	Öztürk & Ayhan, 2023
Mango	Chitosan and graphene oxide-based biodegradable bags	12.0 °C and 89% RH for 56 days	14 days increase in the marketable life of mangoes	Vilvert et al., 2022
Strawberry	Antioxidative Active Packaging Films	Room temperature	Extended shelf life to approximately 20 days	Xie et al., 2022
Cucumber	Active packaging (The poly (lactic acid) (PLA) membrane containing eugenol)	4 °C	Increased from 15 days to 21 days	Li et al., 2021

**SIVAS II. INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION
RESEARCH
15-17 SEPTEMBER - SIVAS / TÜRKİYE**

Table grape	Active packaging fortified with clove essential oil	13 °C and 75% RH	Increased from 6 days to 21 days	Luesuwan et al., 2021
Tomato	Modified atmosphere packaging	6 °C and 91% RH	Increased shelf life up to 21 days	Olveira-Bouzas et al., 2021
Bell peppers	Active packaging including encapsulated essential oils	8 °C and 90% RH	Increased shelf life up to 18 days	Buendía et al., 2020
Lemon	Coating and modified atmospheric packaging (MAP)	21 °C and 50% RH	Increased from 6 days to 18 days	Nasrin et al., 2020
Cherry tomato	Modified atmosphere packaging	5 °C and 80–85% RH	Extended postharvest life up to 25 days	Fagundes et al., 2015

CONCLUSION and RECOMMENDATIONS

Among food products, the products with the highest loss ratio are fresh fruits and vegetables. The increase in global demand for fresh fruits and vegetables also increases the need for novel and evolving techniques for preservation the quality and extending the shelf life of fruits and vegetables. Packaging has a significant role for reduction of post-harvest losses of fresh fruits and vegetables. Marketable quality and shelf life of fresh fruits and vegetables can be sustained for a long time by using advanced packaging systems. Although much is known about the advantages obtained from advanced packaging systems such as MAP to preserve fresh products, innovative improvements in packaging systems and complemented post-harvest techniques that will increase the shelf life and quality are still required to meet consumer expectations. In

addition, further studies are necessary to meet consumer perceptions of the impact of advanced packaging techniques on the quality of fruits and vegetables over time.

ÖZET

Grafenin sıfır boyutlu türevi olan grafen kuantum noktaları (GKN'lar), mükemmel elektriksel ve optik özellikleri ile son yıllarda araştırmacıların en çok ilgisini çeken nanomalzemelerden biridir. GKN'lar yüksek suda çözünürlük, düşük toksisite, iyi biyouyumluluk, kararlı floresan ve ayarlanabilir bant aralığı gibi önemli avantajlar sunarak sitotoksik olan ve düşük biyouyumluluk sergileyen geleneksel yarı iletken kuantum noktalarına (QD'ler) (örneğin CdSe, TiO, ZnS, CdTe, CdS) rakip olmaktadır. GKN'ler optoelektronik, enerji depolama, sensörler, biyo-görüntüleme gibi birçok uygulamada kullanılma potansiyeline sahiptir. Bu çalışmada, GKN'lar temelli bir yarı iletken diyot üretmeyi ve diyot parametrelerini belirlemeyi amaçladık. İlk olarak, GKN'lar hidrotermal yöntemle başarılı bir şekilde sentezlendi ve p-tipi silikon alttaş üzerine spin-kaplama yöntemiyle kaplandı. Doğrultucu ve omik kontaklar fiziksel buhar biriktirme tekniği (PVD) kullanılarak büyütülmüştür. Diyotun ana elektriksel parametreleri termiyonik emisyon (TE) teorisi kullanılarak oda sıcaklığında ve karanlıkta $\pm 5V$ voltaj aralığında akım-voltaj (I-V) ölçümlerinden hesaplanmıştır. Sonuçlar, GQD tabanlı hibrit elektronik teknolojisinin anlaşılması üzerinde bir etkiye sahiptir.

Anahtar Kelimeler: Grafen Kuantum Noktalar (GKN'lar), Schottky diyot, I-V karakteristikleri

**DETERMINATION OF DIODE PARAMETERS OF GRAPHENE QUANTUM DOT-
BASED SEMICONDUCTOR STRUCTURE**

ABSTRACT

Graphene quantum dots (GQDs), the zero dimensional derivative of graphene, are one of the nanomaterials that have attracted the most attention of researchers in recent years. GQDs exhibit excellent electrical and optical properties. Important properties of GQDs such as high water solubility, low toxicity, good biocompatibility, stable fluorescence and tunable bandgap make them competitors to semiconductor quantum dots (QDs) (e.g. ZnS, CdTe, CdSe, TiO) that exhibit cytotoxicity and low biocompatibility. GQDs have the potential to be used in many applications such as optoelectronics, energy storage, sensors, bio-imaging. In this study, we aimed to fabricate a semiconductor diode based on GQDs and to determine the diode parameters. Firstly, GQDs were successfully synthesized by hydrothermal method and coated on p-type silicon substrate by spin-coating method. The rectifier and ohmic contacts were grown using physical vapour deposition technique (PVD). In order to obtain the main electrical parameters of the diode, the diode parameters such as series resistance (R_s), ideality factor (n) and barrier height (ϕ_b) were calculated by using thermionic emission (TE) theory from current-voltage (I-V) measurements in the voltage range $\pm 5V$ at room temperature and in the dark. In addition, the R_s and the interfacial density of states (D_{it}) of the diode were calculated from capacitance-voltage (C-V) and conductance-voltage (G-V) measurements in the 1 kHz-2 MHz frequency range (-3V to +7V voltage range). The capacitance-voltage plot shows that the GQD-based structure exhibits negative capacitance behaviour at low frequencies. The results will have an impact on the understanding of GQD-based hybrid electronic technology.

GİRİŞ

Kuantum noktalar (QN'lar), optik ve elektronik özellikleri noktaların şekli ve boyutuna göre belirlenen benzersiz özelliklere sahip nanokristal yarı iletken malzemelerdir. Bu parçacıkların çapları yaklaşık 2-15 nm (10-75 atom) aralığında değişebilir. Parçacığın küçük boyutu ona yüksek bir yüzey-hacim oranı verir, dolayısıyla özellikleri bireysel moleküller ve yığın yarı iletkenler arasında çok önemli bir yere sahiptir (Ashoori, 1996; Banin et al., 1999; Yacobi, 2003). QD'lar periyodik tablonun III-V ve II-VI grup elemanlarından elde edilir (Huffaker et al., 1998). Neredeyse tüm yarı iletken ve metal bileşiklerinden QD'lar elde etmek mümkündür. Kuantum noktalarının boyutu değiştirilerek bant aralığı da değiştirilebilir. Kuantum kısıtlamasının etkisiyle kuantum noktalarının boyutunun değişmesi, yaptıkları ışımının rengini de değiştirir (Kathirgamanathan et al., 2015). Kuantum noktalarının görünür tüm frekanslarda yayılmasını ve hatta kızılötesi radyasyon yaymasını sağlamak, kontrol edilebilir bir süreçtir. Bu nedenle kuantum noktaları LED'ler, elektronikler, güneş panelleri, bilgisayar uygulamaları ve tıbbi görüntüleme süreçleri için büyük ilerlemeler vaat etmektedir (Huffaker et al., 1998; Lodahl et al., 2015; Eisaman et al., 2011; Senellart et al., 2017; Loss et al., 1997; Michalet et al., 2005).

İnorganik yarı iletken QN'lar son yirmi yılda ilgi çekici malzemeler olmasına karşın toksiteleri nedeniyle yeni malzeme arayışına gidilmiştir (Bacon et al. 2014). Bu anlamda grafen kuantum noktalar (GKN'lar) yarı iletken kuantum noktalara alternatif olacak yeni malzeme sınıfına girebilir ve toksite gibi problemleri daha iyi yönetebilir. Çeşitli solventlerde çözünebilirlik, iyi fotokimyasal stabilite, düşük toksisite, heteroatom katkılama ve kenarlara eklenebilecek fonksiyonel gruplar avantajlı özellikleri arasında yer almaktadır (Pan et al., 2010). GKN'ların boyutu yaklaşık 30 nm'den küçüktür ve birkaç atom kalınlığındadır. GKN'lar geniş çapları, yüksek yüzey alanları, konjuge π - π bağları, termal kararlılıkları nedeniyle üstün malzemelerdir (Kalkal et al. 2021). Tek veya birkaç tabaka grafen parçasından elde edilen GKN'lar aynı zamanda yarı iletkenlerdir. Sıfır boyutlu bir malzeme olarak GKN'lar, foto algılama (Kim et al., 2014; Mondal et al., 2021), ışık yayan diyot (Gu et al., 2021; Nag et al., 2018), fotovoltailer (Gupta et al., 2011), biyoalgılama (Zhao et al., 2013), biyogörüntüleme (Zhao et al., 2017) ve birçok benzer alanda kullanım potansiyelleri vardır (Sanati et al., 2020). GKN'ların heteroatomlarla katkılanması ise, elektronik cihazın performansı ve enerji dönüşümü/depolaması için özelliklerini iyileştirebilir (Yanyan et al., 2021). Azot katkılı GKN'lar (N katkılı GKN'lar), kimyasal, elektronik ve yapısal işlevselliklerini modüle etme ve

aynı zamanda enerji ve çevre uygulamalarında GKN'lerin üstün özelliklerini daha da geliştirme konusunda umut vaat etmektedir. Elektronik teknolojisinde oldukça önemli olan GKN tabanlı Schottky yapıları son birkaç yıldır araştırılmaya başlanmış ve düşük ileri gerilimlerde çalışabilen, çok hızlı anahtarlama yeteneğine sahip cihazların geliştirilmesi için çalışmalar yapılmaktadır. İşlevselleştirilmiş GKN'lar, özelliklerini geliştirmek için yaygın olarak kullanılmaktadır. GKN'lar karboksil, amid, nitro, aldehit, siyano ve izopropil grupları ile işlevselleştirilebilir. Bir amino grubu polimeri olan PEI ile işlevselleştirilmiş GKN'ların nanokompozitleri tıbbi ve biyolojik uygulamalar için sentezlendi (Karatay et al., 2021). PEI ile işlevselleştirilmiş N-katkılı GKN'ların yapısı, Schottky bağlantısının diyot ve arayüz özelliklerini değiştirilebilir.

Bu çalışmada, PEI/N/GKN'lar/p Si yapısının diyot parametreleri ve arayüz özellikleri, I-V hesaplamaları kullanarak incelenmiştir.

MATERYAL ve YÖNTEM

Diyot yapısını oluşturmak için öncelikle PEI/N/GKN'lar hidrotermal işleme başarıyla sentezlendi. PEI (Mw: 1800, H₂O içinde ağırlıkça %50) ve sitrik asit (CA), Sigma-Aldrich'ten satın alındı. PEI/N/GKN'ların sentezinin detayı önceki çalışmada detaylı bildirilmiştir (Karatay et al., 2021; Berktaş et al., 2022). CA ve PEI'nin hidrotermal reaksiyonuyla, PEI/N/GKN'lar otoklav sulu ortamda sentezlenmiştir (Karatay et al., 2021, Berktaş et al., 2022). PEI/N/GKN'ların karakterizasyonu bazı karakterizasyon yöntemleri kullanılarak gerçekleştirildi (Berktaş et al., 2022).

Bu çalışmada alttaş olarak p tipi Si (100) kullanılmış olup Schottky ve ohmik kontaklar için Alüminyum (Al) (%99,999 saflıkta) tercih edilmiştir. Öncelikle p-tipi Si (100) levha kimyasal temizleme prosedürleri uygulanarak temizlendi (Efil et al., 2020). Daha sonra omik kontaklar elde etmek için fiziksel buhar biriktirme tekniği (PVD) kullanılarak 124 nm kalınlığında Al (%99,999 saflıkta) biriktirildi. Kaplanan alttaş, Al'un alttaşın cilasız yüzeyine bağlanması için 500 ° C'de 10 dakika boyunca vakumda tavlandı. İkincisi, PEI/N/GKN çözeltisi p tipi Si levha üzerine spin kaplama yöntemi ile kaplandı. Son olarak GKN'lar/p Si yapısı üzerine PVD kullanılarak 1 mm çapında metal gölge maskesi kullanılarak 128 nm kalınlığındaki Al metal (%99,99) doğrultucu kontaklar biriktirildi. Tüm buharlaştırma işlemleri yaklaşık $2,7 \times 10^{-7}$ kPa'da gerçekleştirildi (Berktaş et al., 2022). Şekil 1, Al/PEI/N/GKN'lar/p Si yapısının şematik gösterimini göstermektedir.

Şekil 1. Al/PEI/N/GKN'lar/p Si yapısının şematik gösterimi

BULGULAR ve TARTIŞMA

Al/ PEI/N/GKN'lar/p Si yapısı, elektriksel özellikleri öğrenmek için TE teorisi kullanılarak araştırıldı. TE teorisine uyan diyotun ileri I–V karakteristikleri aşağıdaki ilişki ile açıklanabilir (Rhoderick et al., 1988; Reddy et al., 2019; Kaymak et al., 2018).

$$I = I_0 \exp\left(\frac{q(V-IR_s)}{nkT}\right) \quad (1)$$

burada n , IR_s , V , q , k , T ve I_0 değerleri sırasıyla ideallite faktörüdür, seri direnç R_s üzerindeki gerilim düşüşü, uygulanan gerilim, elektron yükü, Boltzmann sabiti, Kelvin cinsinden mutlak sıcaklık, ters doyma akımıdır. Schottky diyotunun ters doyma akımı şu şekilde yazılabilir:

$$I_0 = AA^*T^2 \exp\left(-\frac{q\Phi_b}{kT}\right) \quad (2)$$

burada k Boltzmann sabitidir, T Kelvin (K) cinsinden sıcaklıktır ve q elektron yüküdür ve Φ_b etkin bariyer yüksekliğidir. Ayrıca A aygıt alanıdır, A^* Richardson sabiti değeridir ve p Si için $32 \text{ A/cm}^2\text{K}^2$ olarak tanımlanır. Φ_b değeri 2. denklemden elde edilir. n , yarı logaritmik I-V grafiklerinin eğiminden hesaplanır (Rhoderick et al., 1988; Yerişkin et al., 2017):

$$n = \frac{q}{kT} \left(\frac{dV}{d(\ln I)} \right) \quad (3)$$

Al/ PEI/N/GKN'lar /p Si yapısının $\ln(I-V)$ ve I-V grafiği Şekil 2'de gösterilmektedir. Yapı, iyi bir doğrultma davranışı göstermiştir. Doğrultma oranı (RR) $\pm 5 \text{ V}$ 'de yaklaşık 28.10^3 olarak

elde edilmiştir. Şekil 1'de Al/PEI/N/GKN'lar/p-Si yapısının yarı logaritmik I-V grafiğinden görülebileceği gibi, Al/PEI/N/GKN'lar/p-Si yapısı düz beslem bölgesinde iyi bir lineer bölgeye sahiptir ve daha sonra R_s ve ara yüzey katmanının etkisiyle doğrusallıktan sapmıştır. Ayrıca, yapı iyi doğrultma özelliklerine sahiptir ($RR = I_{\text{doğru beslem}}/I_{\text{ters beslem}} = 2,8 \times 10^3$, $\pm 5V$ 'de) ve kaçak akım son derece düşüktür. Tüm bu sonuçlar hazırlanan Al/(PEI/N/GKN'lar)/p-Si'nin Schottky diyot davranışına sahip olduğunu göstermektedir (Berктаş et al., 2022).

Şekil 2. Al/ PEI/N/GKN'lar/p Si'un I-V ve ln(I)-V grafiği (Berктаş et al., 2022).

Al/ PEI/N/GKN'lar /p Si yapısı TE, yaklaşımı kullanılarak karakterize edildi. Tablo 1'de hesaplanan n , Φ_b ve R_s değerleri sunulmuştur. Φ_b değerleri 0,76 eV (TE teorisi) olarak bulundu. Ayrıca n değeri TE teorisine göre 3,71 civarında değerlendirilmektedir. Birden büyük n değerleri, bariyerin homojen olmamasına, arayüzey safsızlıklarına, seri dirence ve arayüzey durumlarından kaynaklanmaktadır [54-57].

Tablo 1. Al/ PEI/N/GKN'lar/p Si yapısının oda sıcaklığında elektriksel parametreleri (Berktaş et al., 2022).

Methods	n	Φ_b (eV)	R_s (Ω)
TE	3.71	0.76	-

SONUÇ ve ÖNERİLER

Bu çalışmada sensörler ve iletişim gibi yeni çalışma alanlarına kapı açabilecek GKN/p-tipi Si diyotun özelliklerini araştırdık. Hidrotermal yöntem kullanılarak PEI/N/GKN'lar CA ve PEI ile başarıyla sentezlendi. Al/PEI/N/GKN'lar/pSi yapısının I-V profili bu alanda yaygın olarak kullanılan TE yöntemi kullanılarak incelenmiştir. Elde edilen sonuçlar hazırlanan Al/(PEI/N/GKN'lar)/p-Si'nin Schottky diyot davranışına sahip olduğunu göstermektedir.

ÖZET

Bu çalışmada *Artemisia vulgaris* bitkisinden hidrodistilasyon metodu kullanılarak elde edilen uçucu yağının kontakt insektisidal aktivitesi *Sitophilus granarius* (Col: Dryophthoridae) ve *Tribolium castaneum* (Col: Tenebrionidae)'a karşı denenmiştir. Ayrıca *A. vulgaris* uçucu yağının bileşenleri GC-MS cihazı ile belirlenmiştir. Kontakt aktivite testlerinde uygulamalar topikal olarak böceğe mikroaplikatör ile %10 (v/v) dozunda 1 µl dozunda uygulanmıştır. Çalışmada pozitif kontrol olarak saf aseton, negatif kontrol olarak ise K-Obiol 25 EC kullanılmıştır. Uygulamadan 24, 48 ve 72 saat sonra ölü böcekler kaydedilmiştir. Çalışma sonucunda bitki uçucu yağının zamana ve uygulama yapılan böceğe bağlı olarak farklı aktivite sahip olduğu saptanmıştır. Uçucu yağ *Sitophilus granarius*'a karşı 24 saat sonra %85,6'lık bir ölüme neden olurken 72 saat sonunda bu oran %92,9 olarak belirlenmiştir. *Tribolium castaneum* için bitki uçucu yağı kayda değer bir aktivite göstermemiştir. GC-MS analizleri sonucunda *A. vulgaris* uçucu yağının ana uçucu yağ bileşeni beta-thujone (%27,153) olarak belirlenmiştir. Çalışma sonucunda elde edilen sonuçlar *A. vulgaris* uçucu yağının *S. granarius*'un mücadelesinde kullanılabilme potansiyelini ortaya koymaktadır.

CONTACT INSECTICIDAL ACTIVITY of *Artemisia vulgaris* (Asteraceae) ESSENTIAL OIL AGAINST TWO IMPORTANT STORED PRODUCT PESTS

ABSTRACT

In this study, the contact insecticidal activity of the essential oil obtained from *Artemisia vulgaris* (Asteraceae) using the hydrodistillation method was tested against *Sitophilus granarius* (Col: Dryophthoridae) and *Tribolium castaneum* (Col: Tenebrionidae). Furthermore, the constituents of *A. vulgaris* essential oil were identified through the utilization of gas chromatography-mass spectrometry (GC-MS). In contact activity tests, the essential oil was topically applied to the insect with a microapplicator at a dose of 1 µl at 10% (v/v). As a positive control, pure acetone was used, and as a negative control, K-Obiol 25 EC was used. Dead insects were recorded 24, 48, and 72 hours after the application. Based on the results of the study, it was determined that the activity of the plant's essential oil varies according to the time and insect treated. The essential oil caused 85.6% mortality after 24 hours and 92.9% mortality after 72 hours against *S. granarius*. The essential oil showed no significant activity against *T. castaneum*. As a result of GC-MS analyses, the main essential oil component of *A. vulgaris* essential oil was determined to be beta-thujone (27,153%). The results of the study show the potential of *A. vulgaris* essential oil for the control of *S. granarius*.

Keywords: *Sitophilus*, *Tribolium*, botanical, activity

GİRİŞ

Dünya nüfusu hızla artmakta ve bunun sonucu olarak artan güvenli gıda talebi, sınırlı kaynaklara sahip tarım sistemleri için büyük bir sorun teşkil etmektedir. Bu hızlı nüfus artışının devam etmesi durumunda dünya nüfusunun 2050 yılında 9.7 milyar olacağı ve oluşacak gıda ihtiyacının karşılanabilmesi için tarımsal üretimin yaklaşık %70 oranında artırılması gerektiği bildirilmektedir (United Nations, 2017; FAO, 2023). Bu nedenle, mevcut küresel tarımsal üretimin hasattan sofraya kadar biyotik ve abiyotik faktörlerden korunması gerekmektedir.

Tahıllar ve bakliyat dünyada en çok tüketilen ve en yaygın depolanan gıda ürünlerini oluşturmakta, dolayısıyla gıda güvensizliği sorunlarının çözümünde önemli bir yer tutmaktadır. Ancak üretilen tahılların %70'inden fazlası uygun olmayan geleneksel yapılarda depolanmaktadır (Mobolade et al., 2019). Gıda tahılları ve bakliyatın hasat sonrası kayıplarına neden olan çeşitli faktörler vardır ve böceklerin verdiği zarar en büyük tehdidi oluşturmaktadır. Hasat sonrası depolarda başta Lepidoptera, Coleoptera, Psocoptera, Blattodea ve Diptera takımında yer alan türler ve akarlar olmak üzere birçok etmen zarar oluşturmaktadır (Stejskal et al., 2019).

En büyük böcek takımı olan Coleoptera, çok çeşitli çevre koşullarında yaşayabilen başlıca ve önemli depolanmış ürün zararlılarını içermektedir. Depo zararlılarının beslenme davranışları ve seviyeleri değişiklik gösterir, bu nedenle bazıları birincil zararlılar olarak kabul edilirken diğerleri ikincil zararlılar olarak sınıflandırılır. *Sitophilus granarius* (L., 1758) (Coleoptera: Curculionidae) birincil zararlılardan biri olarak kabul edilirken *Tribolium castaneum* (Herbst) (Coleoptera: Tenebrionidae) ikincil zararlı olarak kabul edilmektedir. Bu zararlıların zararlı etkileri nedeniyle depolanmış ürünlerde kalitatif ve kantitatif kayıplar meydana gelmektedir. Potansiyel olarak tüm depolarda bulunabilen depolanmış ürün zararlılarının dünyadaki toplam tarımsal üretimin yaklaşık %10-30'u arasında bir kayba neden oldukları bildirilmiştir (Singh et al., 2009). Tahminlerdeki bu geniş varyasyon kısmen farklı coğrafi bölgeler, farklı iklim koşulları ve yetiştirilen başlıca ürünlerdeki farklılıklardan kaynaklanmaktadır. Ayrıca kayıpları doğru bir şekilde tahmin etmek için somut bir yöntem de bulunmamaktadır (Prusky, 2011).

Depolanmış ürün zararlılarını kontrol etmek için küresel olarak en yaygın kullanılan yaklaşım pestisitler ve özellikle de fumigasyondur (Mutungi et al., 2014). Tahıl, bakliyat, kuru meyve, fındık, kakao, kahve ve diğer işlenmiş gıda ürünleri de dahil olmak üzere depolanmış ürünlerin fumigantlar kullanılarak ilaçlanması yüzyılı aşkın bir süredir uygulanmaktadır. En önemli fumigantlardan biri olan metil bromürün yasaklanmasını takiben depo zararlılarına karşı dünya

genelinde en yaygın olarak kullanılan fumigant fosfin durumundadır. Ancak fosfinin bu derece sıklıkla kullanımı sonucunda fosfine karşı direnç, birçok zararlı böcek türünde sıklık, dağılım ve güç bakımından artmıştır ve bu durum, uygun alternatiflerin bulunmaması nedeniyle daha da kötüleşmiştir (Nayak et al., 2020). Günümüzde insan ve çevre sağlığının korunması amacıyla birçok pestisit kullanımı yasaklanmakta ve mevcut olanların kullanımı ise her geçen gün daha fazla sınırlanmaktadır. Öyle ki Avrupa Birliği “Green Deal the Biodiversity and Farm to Fork” stratejisi kapsamında 2030 hedeflerinde kimyasal pestisitlerin kullanımının %50 azaltılması ve hatta 2050 yılında kaldırılmasını hedeflenmektedir (Mora et al., 2023). Hem depolanmış ürünlerin doğrudan tüketilmesi hem de son yıllarda pestisit kullanımına ilişkin endişelerin artması, daha çevre dostu yaklaşımların geliştirilmesine yol açmıştır. Bu nedenle depolanmış ürün zararlıları ve kentsel zararlılara karşı yeni koruma yöntemlerinin, özellikle de botanik maddelerin ve toksik olmayan malzemelerin kullanımına yönelik büyük bir küresel araştırma ilgisi bulunmaktadır. Ancak istenilen biyolojik etkinliğin ve gıda güvenliğinin sağlanması için botanik insektisitlerin uygun şekilde formüle edilmesi ve hedef zararlılarda türe özgü bir şekilde ulaştırılması gerekmektedir (Stejskal et al., 2021).

Artemisia cinsi, kimyasal ve biyolojik çeşitliliğinin yanı sıra umut verici anti-sıtma ilacı artemisinin keşfi ve izolasyonu nedeniyle büyük ilgi konusu haline gelmiştir. *Artemisia vulgaris*, genellikle uçucu yağları ile bilinen *Artemisia* cinsinin önemli tıbbi bitki türlerinden biridir (Abiri et al., 2018). Pelin otu olarak da bilinen *A. vulgaris*'den elde edilen uçucu yağların fumigant, larvasit ve böcek öldürücü olarak biyolojik aktivite sergilediği bildirilmiştir (Gao et al., 2023; İlahi & Ullah, 2013; Wang et al., 2006; Mardiningsih et al., 2022; Sharifian et al., 2013).

Bu çalışma kapsamında Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü'nden temin edilen *A. vulgaris* bitkisinden elde edilen uçucu yağın *S. granarius* ve *T. castaneum* üzerine kontak insektisidal etkilerinin belirmesi amaçlanmıştır.

MATERYAL ve METOD

Bitkilerin temini

Artemisia vulgaris (Asteraceae) bitkisi Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü'nden temin edilmiştir. *Artemisia vulgaris* bitkisi çiçeklenme döneminde yetiştiriciliğinin yapıldığı alandan toplanmıştır. Toplanan bitkiler direkt güneş ışığı almayan ve hava sirkülasyonunun olduğu bir ortamda kurutulmuştur. Kurutulan bitkiler makas yardımı ile

küçük parçalara ayrılmış ve yağı çıkarılıncaya kadar hava almayan kavanozlarda saklanmışlardır.

Bitki uçucu yağlarının eldesi

Uçucu yağlar bitkinin kurutulmuş ve küçük parçalara ayrılmış toprak üstü kısımlarının (100g) Clevenger aparatında üç saat hidrodistilasyonu sonucunda elde edilmiştir. Clavenger apareyinin kondenser kısmı mikrohilller cihazına bağlanarak soğutma suyunun +4°C’de kalması sağlanmış, elde edilen yağın verimi v/w (mL yağ/100g bitki) olarak belirlenmiştir. İzole edilen uçucu yağ Na₂SO₄ üzerinde içerdiği sudan arındırılmış, insektisidal aktivite testlerinin yapılacağı ve uçucu yağ analizlerinin yapılacağı güne kadar saklanmak üzere amber renkli şişelere aktarılarak ve +4°C’de saklanmıştır.

Bitki uçucu yağ analizleri

Artemisia vulgaris uçucu yağının içerik analizleri İstanbul Altınbaş Üniversitesi, Eczacılık Fakültesi laboratuvarlarında EI modunda çalışan Agilent 5977 MSD GC-MS sistemi ile analiz edilmiştir. Enjektör ve MS transfer hattının sıcaklıkları 250°C’ye ayarlanmış, analizde split enjeksiyon modu kullanılmış; split oranı 1:50 olarak ayarlanmıştır. GC-MS analizlerinde Innowax FSC kolonu (60 m x 0.25 mm, 0.25 um film kalınlığı) ve taşıyıcı gaz olarak helyum (1 mL / dakika) kullanılmıştır. Fırın sıcaklığı 10 dakika boyunca 60°C’ye programlanmış ve 4°C/dk. hızında 220°C’ye yükseltilmiştir. Sıcaklık 10 dakika süreyle 220 °C’ de sabit tutulmuş ve sonra 1°C/dk. hızında 240°C’ye yükseltilmiştir. Kütle spektrumu, 70 eV’de 35-425 m/z kütle aralığı ile kaydedilmiştir. Ayrılan bileşiklerin bağıl yüzde miktarları MS kromatogramlarında yer alan piklerin integrasyonu ile hesaplanmıştır. Kütle spektrumu eşleştirmelerinde minimum benzerlik oranı %85 alınmıştır.

Böcek kültürlerinin temini

Çalışmada kullanılan *Tribolium castaneum* ve *Sitophilus granarius* kültürleri Zirai Mücadele Merkez Araştırma Enstitüsü Depolanmış Ürün Zararlıları laboratuvarından temin edilmiştir. *Tribolium castaneum* yumurtalarının eldesi için, 100 mesh’lik elekten elenmiş %70’i un ve %30’u kuru mayadan oluşan besin ortamı kullanılmıştır. Yaklaşık 500-750 adet ergin, içerisinde elenmiş un ve maya karışımı bulunan 1 lt’lik yumurtlatma kavanozuna bırakılmıştır. Yumurtlatma kavanozundan belirli aralıklarla eleme işlemi yapılarak elde edilen yumurtalar, içerisinde buğday kırması ve maya bulunan besin ortamına aktarılmış, *Sitophilus granarius* yumurtalarının eldesi için 1 lt’lik cam kavanozlara yaklaşık 300 g sağlam buğday tanesi konulmuş ve bu besinin üzerine 750-800 adet karışık cinsiyetli ergin birey bırakılmıştır.

Erginlerin buğdaya yumurta bırakması için belirli bir süre beklendikten sonra erginler uzaklaştırılmıştır. İstenilen yaşta erginin elde edilebilmesi için besin kavanozuna alınan yumurtalardan yaklaşık 3 hafta sonra günlük olarak ergin çıkış takibi yapılmış, ilk ergin çıkış tarihi kaydedilmiştir. Kavanozlar çalışma süresince 25 °C ve %60 orantılı nemdeki klimatize kültür odasında tutularak stok kültürlerin eldesi sağlanmıştır (Karakoç et al., 2006).

Kontakt insektisidal aktivite testleri

Artemisia vulgaris uçucu yağının kontak insektisidal etkilerini belirlemek amacıyla yürütülen çalışmalar Polatoğlu et al. (2015)'nin belirttiği gibi topikal uygulama ile yapılmıştır. Uçucu yağlar %10 konsantrasyonda mikro-aplikatör yardımıyla böceğin abdomeninin ventralinden uygulanmıştır. Kontrolde sadece aseton kullanılmış ve kontrol dahil tüm uygulamalarda her tekrerde 20 adet böcek kullanılmıştır. Pozitif kontrol olarak ticari bir preparat K-OBIOL® EC 25 (250 g/l Piperonyl Butoxide + 25 g/l Deltamethrin) tavsiye dozunda kullanılmıştır. Uygulama yapılan böcekler içerisinde 10 gr buğday bulunan 90 mm'lik plastik petri kutularına aktarılmış ve 25 ± 2°C'de inkübe edilmiştir. Sonuçlar üç gün boyunca 24 saatlik aralıklarla takip edilerek ölü birey sayıları kayıt altına alınmıştır.

İstatistiksel analizler

Elde edilen sonuçlar ilk önce % ölüm değerlerine çevrilmiş daha sonra arcsin transformasyonuna tabi tutulmuştur. Elde edilen veriler ile varyans analizi yapılmış ve buna ek olarak muameleler arasındaki farklılıklar Tukey çoklu karşılaştırma testiyle analiz edilmiştir. Tüm istatistiksel analizler MINITAB Release 20 (McKenzie & Goldman, 2005) paket programı yardımıyla yürütülmüştür.

BULGULAR

Tek doz kontakt etki denemeleri sonucunda *A. vulgaris* uçucu yağı *S. granarius*'a karşı denendiğinde 24 saat sonunda %85,6'lık bir ölüm oranına neden olmuştur (F=216,48; sd=2,14; P<0,05) (Tablo 1). Bu saat diliminde en yüksek aktivite pozitif kontrol grubunda %97,0'lik ölüm oranı ile saptanmıştır. Uçucu yağ ile pozitif ve negatif kontrol istatistiksel olarak farklı grupta yer almışlardır. Uçucu yağ 48 saat sonunda %92,9'luk bir kontakt insektisidal aktivite gösterirken pozitif kontrolde bu oran %100 olarak gerçekleşmiştir (F=241,23; sd=2,14; P<0,05). Yetmiş ikinci saat sonunda uçucu yağın kontakt aktivitesinde herhangi bir değişiklik olmamış ve 48. saatte olduğu gibi ölüm oranı %92,9'da sabit kalmıştır (F=241,23; sd=2,14; P<0,05).

Tablo 1. *Artemisia vulgaris* uçucu yağının *Sitophilus granarius* üzerindeki kontak insektisidal aktivitesi

	% Ölüm±StDev		
	24h	48h	72h
<i>A.vulgaris</i>	85,6±1,2b*	92,9±4,3b	92,9±4,3b
K-Obiol	97,0±2,7a	100,0±0,0a	100,0±0,0a
Kontrol	0,0±0,0c	0,0±0,0c	0,0±0,0c

*Aynı sütündeki ortalamaları takip eden farklı harfler, ortalamaların istatistiksel olarak önemli derecede farklı olduğunu gösterir (Anova P<0,05, Tukey test).

Bitki uçucu yağı *T. castaneum*'a karşı denendiğinde değerlendirme yapılan hiçbir zaman diliminde kayda değer bir aktivite göstermemiştir (Tablo 2). En yüksek ölüm oranı 72 saat sonunda %0,4 olarak saptanmıştır. Ancak pozitif kontrol grubu olarak denemede yer alan K-Obiol preparatı *T. castaneum* için 24.saat sonunda %92,3, 48. saat sonunda %97,6 ve son olarak 72. saat sonunda %100'lük beklenen bir aktivite göstermiştir.

Tablo 2. *Artemisia vulgaris* uçucu yağının *Tribolium castaneum* üzerindeki kontak insektisidal aktivitesi

	% Ölüm±StDev		
	24h	48h	72h
<i>A.vulgaris</i>	0,4±4,2b*	0,4±2,1b	0,4±2,1b

*Aynı sütündeki ortalamaları takip eden farklı harfler, ortalamaların istatistiksel olarak önemli derecede farklı olduğunu gösterir (Anova P<0,05, Tukey test).

Yapılan interaksiyon analizleri sonucunda muamele (uçucu yağ, aseton ve K-Obiol), böcek ve zamanın tek başına istatistiki olarak önemli bir etkiye sahip olduğunu ortaya koymuştur (Tablo 3). Ayrıca ikili interaksiyonun önemli olduğu sonucuna ulaşılmıştır. Ancak üçlü interaksiyon istatistiki olarak önemli bulunmamıştır.

Tablo 3. İki önemli depolanmış ürün zararlısına *Artemisia vulgaris* uçucu yağı uygulamaları için ANOVA parametreleri.

Uçucu yağ ile yapılan GC-MS analizleri sonucunda *Artemisia vulgaris* uçucu yağının ana bileşeni olarak β -thujone bileşeni %27,2 kaplama alanı ile saptanmıştır (Tablo 4). Ayrıca bitkinin uçucu yağ verimi 0,15 (v/w) olarak belirlenmiştir.

Tablo 4. *Artemisia vulgaris* bitkisinde elde edilen uçucu yağın GC-MS analizi sonucunda ana uçucu yağ bileşenleri

Bitki adı	Verim	Ana Bileşenler
<i>Artemisia vulgaris</i>	0,15 (v/w)	santolinatriene (%1,686); sabinene (%2,014); beta-myrcene (%2,391); 1,8-cineole (%1,271); p-cymene (%1,672); α -thujone (%3,406); β -thujone (%27,153); delta-3-carene (%5,416); terpinen-4-ol (%1,974); caryophyllene oxide (%1,633); spathulenol (%1,475); hexadecanoic acid (%2,815)

TARTIŞMA ve SONUÇ

Artemisia vulgaris uçucu yağının kimyasal kompozisyonu GC-MS analizleri sonucunda daha önce yapılan çalışmaların bulguları ile paralellik göstermiştir (Blagojević et al., 2006; Jerkovic et al., 2003; Judžentienė & Būdienė 2021). Ancak total uçucu yağ kompozisyonundaki ana bileşenlerin kapladıkları alan değişiklik göstermiştir. Bu durum pek tabii olarak beklenen bir durumdur, çünkü bitkinin kimyasal kompozisyonuna pek çok faktörün etki ettiği bilinmektedir. Bu faktörler bitkinin türü, toplama zamanı ve yetiştirme ekolojisine bağlı olarak farklılık göstermektedir. Daha önce yapılan bir çalışmada aynı bölgeden farklı zamanlarda toplanan *Tanacetum chiliophyllum* var. *chiliophyllum* bitkisinden elde edilen uçucu yağların biyolojik aktiviteleri ve uçucu yağ bileşenleri karşılaştırılmış ve hem aktivite yönüyle hem de uçucu yağ bileşenleri yönüyle farklılıklar olduğu ortaya konulmuştur (Polatoğlu et al., 2012).

Bu çalışmada *Artemisia vulgaris* uçucu yağı iki önemli depo zararlısın karşı değişen oranlarda kontakt toksisite göstermiştir. Bugüne kadar yapılan çalışmalarda *Artemisia* türlerine ait uçucu yağların (Liu et al., 2010; Negahban et al., 2006; Chu et al., 2010; Bachrouch et al., 2015; Liu et al., 2006; Gao et al., 2020; Luo et al., 2022; Chu et al., 2012; Huang et al., 2021; Liu et al., 2014; Zhang et al., 2019; Afshar et al., 2011) ve bu uçucu yağın bazı ana bileşenlerinin (Xie et al., 2020; Wróblewska-Kurdyk et al., 2019; Höld et al., 2001) insektisidal aktivitesi laboratuvar koşullarında araştırılmıştır. Kontakt aktivite sonuçlarına bakıldığında başta *A. vulgaris*'in *S. granarius*'a karşı önemli derecede aktivite gösterdiği belirlenmiştir. Buna karşın uçucu yağ *T. castaneum*'a karşı kayda değer bir etki göstermemiştir. İki farklı depo zararlısı böcek için elde edilen sonuçlar karşılaştırıldığında farklı türlerin ve aynı cinse ait bitki türlerine ait uçucu yağların etkilerinin farklı olduğu görülmektedir. Bu durum uçucu yağın kimyasal kompozisyonunda kaynaklanabileceği gibi farklı türdeki böceklerin fizyolojik ve biyokimyasal

farklılıklarından da olabileceği düşünülmektedir. Daha önce birçok araştırmacı tarafından yapılan çalışmada, aynı bitki uçucu yağı veya ekstraktının uygulandığı aynı cinse ait böcekler veya farklı türdeki böceklerin hassasiyetlerinin farklı olduğu ortaya konulmuştur (Guo et al., 2017; Liang et al., 2017; Nagehban et al., 2007; Shaaya et al., 1997). Kimani and Sum (1999), *Tanacetum cinerariifolium* (Trevir.)'un ucucu yağlarını *S. oryzae* ve *Tribolium castaneum* (Herbst) erginlerine karşı kontakt aktivitesi yönüyle denemişlerdir. Uçucu yağların etkinlikleri topikal uygulamalar ile belirlenmiş ve *S. oryzae*'nin *T. castaneum*'dan daha dayanıklı olduğunu bildirmişlerdir. Bir diğer çalışmada ise araştırmacılar buhar distilasyon yöntemi kullanarak küçük hindistan cevizi ağacı tohumlarından elde ettikleri uçucu yağların, depolanmış ürün zararlıları olan, *T. castaneum* ve *S. zeamais*'a karşı kontak, fumigant ve beslenmeyi durdurucu etkilerini araştırmışlardır. Kontak etki çalışmalarında *S. zeamais* erginlerinin, *T. castaneum* erginlerinden yaklaşık 10 kat daha hassas olduğu tespit edilmiştir. Ancak fumigant etki çalışmalarında *S. oryzae* erginlerinin *T. castaneum* erginlerinden sadece 1,7 kez daha hassas olduğu saptanmıştır (Huang et al., 1997). Bu sonuçlar yukarıda bahsedilen ve daha önce yürütülmüş iki çalışmanın sonuçları ile paralellik göstermektedir ve aktivitenin zararlıya, uygulama yapılan uçucu yağa, hangi biyolojik aktiviteye bakıldığına göre değişiklik gösterdiğini ortaya koymaktadır.

Sonuç olarak günümüz üretici ve tüketici eğilimlerine bakıldığında bitkisel kökenli uçucu yağların tarım sistemi içerisinde kullanımının ve öneminin her geçen gün artacağı görülmektedir. Türkiye üç floristik bölgenin kesişiminde yer alması, endemizm oranının yüksek olması nedeniyle önemli bir potansiyeli bünyesinde barındırmaktadır. Halen yeni endemik bitki türlerinin tespit edildiği Türkiye florasında biyolojik aktiviteleri yönüyle çalışılmamış birçok bitki bulunmaktadır. Bu bakımdan ülkemiz florasında doğal olarak yetişen veya ticari olarak üretilen bitkilerden elde edilen uçucu yağların kullanımının ve bu kullanımı destekler nitelikte formülasyonların geliştirilmesi, aktif moleküllerin belirlenmesi, semi-sentez olarak bu moleküllerin çoğaltılması ve bu uçucu yağların insektisidal etki mekanizmalarının ortaya konmasına yönelik çalışmaların yapılması önem arz etmektedir.

ÖZET

Sentetik pestisitler gerek yaygınlık gerekse de yoğunluk açısından tarımsal zararlılarla mücadelede en fazla kullanılan yöntem olmasına rağmen son yıllarda birçok sentetik pestisit kullanımını insan ve çevre sağlığına verdiği zarar nedeniyle yasaklanmıştır. Bu durumun bir sonucu olarak başta biopestisitler olmak üzere alternatif mücadele araçlarının tespitine yönelik çalışmalar hız kazanmıştır. Bu çalışmada insektisidal potansiyeli olan ve konvansiyel olarak yetiştiriciliği yapılabilecek *Anthemis tinctoria* (Asteraceae) ve *Anthemis austriaca* (Asteraceae) bitkilerin hidrodistilasyon yöntemi ile uçucu yağları elde edilmiş ve GC-MS cihazı kullanılarak uçucu yağ bileşenleri belirlenmiştir. Çalışma sonucunda *A. austriaca* bitkisinin yağ verimi 0,05 (v/w) olarak hesaplanırken *A. tinctoria* bitkisinin yağ verimi 0,038 (v/w) olarak belirlenmiştir. GC-MS analizleri sonucunda *A. tinctoria* uçucu yağının ana uçucu yağ bileşenleri hexadecanoic acid (%30,833), α -eudesmol (%5,768) ve Heptadecenal (%4,284) olarak belirlenmiştir. *Anthemis austriaca* bitkisinin ana bileşenleri ise hexadecanoic acid (%17, 239), Benzaldehyde (% 5,923), Caryophyllene oxide (%4,911), 2-pentadecanone (%4,957) ve Piperitone (%4,318) olarak belirlenmiştir. *Anthemis* türleri ile insektisidal aktiviteleri yönüyle yürütülen çok sayıda çalışma bulunmaktadır. Daha önce yürütülen çalışmalar *Anthemis* cinsine giren bitkilerin insektisidal aktivite potansiyelinin yüksek olduğunu ortaya koymaktadır.

Anahtar kelimeler: Uçucu yağ, GC-MS, insektisidal aktivite, botanikal

**CHEMICAL COMPOSITION AND POTENTIAL INSECTICIDAL ACTIVITY OF
ESSENTIAL OIL OF *Anthemis tinctoria* (Asteraceae) AND *Anthemis austriaca*
(Asteraceae)**

ABSTRACT

Although synthetic pesticides are the most widely used method in the control of agricultural pests in terms of both prevalence and intensity, the use of many synthetic pesticides has been banned in recent years due to the damage to human and environmental health. As a result of this situation, studies to determine alternative control tools, especially biopesticides, have gained momentum. In this study, the essential oils of *Anthemis tinctoria* (Asteraceae) and *Anthemis austriaca* (Asteraceae), which have insecticidal potential and can be cultivated conventionally, were obtained by hydrodistillation method and their essential oil components were determined using GC-MS. As a result of the study, the oil yield of *A. austriaca* plant was calculated as 0.05 (v/w), while the oil yield of *A. tinctoria* plant was determined as 0.038 (v/w). As a result of GC-MS analyses, the main essential oil components of *A. tinctoria* essential oil were determined as hexadecanoic acid (30.833%), α -eudesmol (5.768%) and Heptadecenal (4.284%). The main components of *A. austriaca* were hexadecanoic acid (17,239%), benzaldehyde (5,923%), caryophyllene oxide (4,911%), 2-pentadecanone (4,957%) and piperitone (4,318%). There are many studies carried out with *Anthemis* species in terms of insecticidal activity. Previous studies have revealed that the insecticidal activity potential of plants in the genus *Anthemis* is high.

Keywords: Essential oil, GC-MS, insecticidal activity, botanical

GİRİŞ

Anthemis cinsi Türkiye’de 51 tür ile temsil edilmekle birlikte yaklaşık tüm dünyada 210 türü olduğu bilinmektedir. *Anthemis* cinsi, papatya olarak bilinen *Chamaemelum* ile yakın akrabalığı olan aromatik özellikli çiçekli bir bitkidir. Bazı türleri köpek rezenesi veya mayıs otu olarak da adlandırılmaktadır. Akdeniz bölgesi ve güneybatı Asya'nın doğusundan İran'a kadar endojen özellik taşımaktadır (Güner et al., 2000; Ghafoor, 2010). *Anthemis* cinsi Avrupa, Batı, Güneybatı ve Orta Asya'nın yanı sıra Kuzey Afrika'da geniş bir dağılım göstermektedir (Fernandes, 1976). *Anthemis* cinsinin temel özelliği her iki çiçeğinin arasında çok küçük yapılı, pullu bir yapının olmasıdır (Birim et al., 1999; Ghafoor, 2010).

Anthemis cinsinin uçucu yağının kimyasal kompozisyonu ile ilgili çok sayıda çalışma yürütülmüştür (Javidnia et al., 2004; Uzel et al., 2004; Pavlović et al., 2006; Saroglou et al., 2006; Kivcak et al., 2007; Formisano et al., 2012). Yürütülen çalışmalar sonucunda: (-)-linalool, trans-caryophyllene, cis-chrysanthenyl acetate, spathulenol, trans-caryophyllene, eudesmol, cis-chrysanthenyl acetate, trans-caryophyllene, germacrene-d; germacrene-d, spathulenol, (-)-caryophyllene oxide, T-cadinol, p-cymene, chrysanthenone, trans-verbenol, (-)-caryophyllene oxide, 1,8-cineole, nopol, terpineol-4, trans-caryophyllene gibi uçucu yağ bileşenleri tespit edilmiştir (Saroglou et al., 2006).

Bu cinsin geleneksel kullanıma bakıldığı zaman çok farklı tedavi edici olarak kullanıldığı ve özellikle Akdeniz bölgesinde, antienflamatuar, antioksidan, antibakteriyel ve antispazmodik olarak tercih edildiği bilinmektedir (Bardaweel et al., 2014). Daha önce yürütülen çalışmalarda ise antimikrobiyal, sitotoksik (Dehghanizade et al., 2018), anti-inflamatori, hepatoprotektif ve antioksidan (Boukhary et al., 2019) aktivitesine yönelik çalışmalar yürütülmüştür.

Bu çalışmada ülkemizde doğal olarak yetişen ayrıca kısmi yetiştiriciliği yapılan *Anthemis tinctoria* ve *Anthemis austriaca*’dan elde edilen uçucu yağların kimyasal kompozisyonu belirlenmeye çalışılmıştır.

MATERYAL ve METOD

Bitkilerin temini

Anthemis tinctoria ve *Anthemis austriaca* (Asteraceae) bitkileri, Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü’n den temin edilmiştir. *Anthemis tinctoria* ve *A. austriaca* bitkileri çiçeklenme döneminde yetiştiriciliğinin yapıldığı alandan toplanmıştır. Toplanan bitkiler direkt güneş ışığı almayan ve hava sirkülasyonunun olduğu bir ortamda kurutulmuştur.

Kurutulan bitkiler makas yardımı ile küçük parçalara ayrılmış ve yağı çıkarılıncaya kadar hava almayan kavanozlarda saklanmışlardır.

Bitki uçucu yağlarının eldesi

Uçucu yağlar bitkinin kurutulmuş ve küçük parçalara ayrılmış toprak üstü kısımlarının (100g) Clevenger aparatında üç saat hidrodistilasyonu sonucunda elde edilmiştir. Clavenger apareyinin kondenser kısmı mikrohiller cihazına bağlanarak soğutma suyunun +4°C’de kalması sağlanmış, elde edilen yağın verimi v/w (mL yağ/100g bitki) olarak belirlenmiştir. İzole edilen uçucu yağ Na₂SO₄ üzerinde içerdiği sudan arındırılmış, insektisidal aktivite testlerinin yapılacağı ve uçucu yağ analizlerinin yapılacağı güne kadar saklanmak üzere amber renkli şişelere aktarılarak ve +4°C’de saklanmıştır.

Bitki uçucu yağ analizleri

Anthemis tinctoria ve *A. austriaca* uçucu yağlarının içerik analizleri İstanbul Altınbaş Üniversitesi, Eczacılık Fakültesi laboratuvarlarında EI modunda çalışan Agilent 5977 MSD GC-MS sistemi ile analiz edilmiştir. Enjektör ve MS transfer hattının sıcaklıkları 250°C’ye ayarlanmış, analizde split enjeksiyon modu kullanılmış; split oranı 1:50 olarak ayarlanmıştır. GC-MS analizlerinde Innowax FSC kolonu (60 m x 0.25 mm, 0.25 um film kalınlığı) ve taşıyıcı gaz olarak helyum (1 mL/dakika) kullanılmıştır. Fırın sıcaklığı 10 dakika boyunca 60°C’ye programlanmış ve 4°C/dk. hızında 220°C’ye yükseltilmiştir. Sıcaklık 10 dakika süreyle 220°C’de sabit tutulmuş ve sonra 1°C/dk. hızında 240°C’ye yükseltilmiştir. Kütle spektrumu, 70 eV’de 35-425 m/z kütle aralığı ile kaydedilmiştir. Ayrılan bileşiklerin bağıl yüzde miktarları MS kromatogramlarında yer alan piklerin integrasyonu ile hesaplanmıştır. Kütle spektrumu eşleştirmelerinde minimum benzerlik oranı %85 alınmıştır.

BULGULAR ve TARTIŞMA

Bu çalışmada kullanılan *Anthemis tinctoria* uçucu yağ bileşenlerine ait bilgiler aşağıda verilmiştir (Table 1). Bu itki uçucu yağında en yüksek oranda %30 kaplama ile hexadecanoic acid belirlenmiştir. Daha önce yürütülen bir çalışmada *Anthemis wiedemanniana*’dan elde edilen uçucu yağın bileşenleri araştırılmış ve %6,09 oranında hexadecanoic acid belirlenmiştir (Kivcak et al., 2007). Her ne kadar bizim bitkimizde tespit ettiğimiz bileşenin oranı ile bu bitkiden elde edilen bileşenin oranı farklılık göstermiştir. Bu durum biyotik ve abiyotik faktörlere bağlı olarak değişiklik gösterebilmektedir. Bu faktörler bitkinin türü, toplama zamanı ve yetiştirme ekolojisine bağlı olarak bitkinin kimyasal kompozisyonunda farklılığa neden olabilmektedir. Daha önce yapılan bir çalışmada aynı bölgeden farklı zamanlarda toplanan

Tanacetum chiliophyllum var. *chiliophyllum* bitkisinden elde edilen uçucu yağların biyolojik aktiviteleri ve uçucu yağ bileşenleri karşılaştırılmış ve hem aktivite yönüyle hem de uçucu yağ bileşenleri yönüyle farklılıklar olduğu ortaya konulmuştur (Polatoğlu et al., 2012). Daha önce hexadecanoic acid ile çok sayıda biyolojik aktivitesi yönüyle çalışma yürütülmüştür (Demiray et al., 2022; Abdullah 2019; Suqi et al., 2014). *Anthemis austriaca* uçucu yağın uçucu yağ bileşenleri Tablo 2’de verilmiştir. *Anthemis tinctoria*’da olduğu gibi en yüksek oranda bileşen % 17,2 kaplama ile hexadecanoic saptanmıştır. Yukarıda bahsedildiği gibi *Anthemis* cinsi ile ilgili çok sayıda çalışma yürütülmüştür. Ayrıca *Anthemis* cinsi esas olarak germacranolides, eudesmanolides, guaianolides ve flavonoidlere ait seskiterpen laktonların varlığı ile karakterize edilmektedir (Saroglou et al., 2010; Gonenc et al., 2011). *Anthemis* türlerinin bileşenlerinin anti-enflamatuar, hepatoprotektif ve antioksidan aktiviteler gösterdiği kanıtlanmıştır (Yang et al., 2012; Chadwick et al., 2013). *Anthemis* türleri Türk geleneksel tıbbında gastrointestinal rahatsızlıklar, hemoroid, dismenore ve mide ağrılarının tedavisinde halk hekimliğinde yaygın olarak kullanılmaktadır. Ayrıca hem vejetatif hem de kök kısımlarından elde edilen özler, tentürler ve merhemler Avrupa’da antibakteriyel antispazmodik olarak ve iltihaplı hastalıkların tedavisinde kullanılmaktadır (Bulatovic et al., 1997; Tuba et al., 2014).

Sonuç olarak mevcut tüketici eğilimleri değerlendirildiğinde bitkisel kökenli uçucu yağların giderek daha fazla talep edildiği görülmektedir. Bitki uçucu yağlarının tarımsal ürünlerin korunmasında kullanımına yönelik çalışmalar son 20 yılda hız kazanmış ve pek çok bitki türünden elde edilen uçucu yağların biyolojik aktivitelerine yönelik çok sayıda çalışma yapılmıştır. Türkiye, bitki genetik çeşitliliği bakımından Dünya'nın sayılı zengin

coğrafyalarının birinde yer almaktadır. İnan-Turan, Avrupa-Sibirya ve Akdeniz fitocoğrafik bölgeleri Anadolu coğrafyası üzerinde birleşmekte ve Türkiye bu üç floristik bölgenin kesişim noktasında bulunmaktadır. Tabii olarak bu durum ülkemizin bitkisel çeşitliliğini zenginleştirmektedir (Atik vd. 2010). Yukarıda yazılan bilgiler ışığında ülkemiz eşsiz bitki çeşitliliği ile önemli bir kaynağı bünyesinde barındırmaktadır. Özellikle önümüzdeki süreçte Türkiye florasında bulunan bitkilerden elde edilen uçucu yağların kimyasal karakterizasyonunun yapılması ve çok yönlü olarak biyolojik aktivitelerinin taranması önem arz etmektedir.

ABSTRACT

Airlines transport passengers, cargo and mail between a point of origin and a point of destination (flight route) and charge a fee for this service. Competition between airlines usually takes place on the route in question. This is because each route has its own characteristics and different customer profiles, and companies adapt their service offerings to the characteristics of the market in question. The simultaneous operation of more than one airline on the same route constitutes direct competition, but in some cases connecting options for the route in question become as important as direct flights. The aim of this study is to identify the factors that influence the ticket prices set by airlines on routes where indirect competition exists through the organisation of connecting flights on a particular route. In this context, a model has been developed by identifying alternative connecting points to direct routes departing from Turkey. Preliminary results show that indirect time, route detour factor and airline star have a positive effect on indirect ticket price. Also, difference route type has a negative on indirect price. Lastly, westbound flight has a negative on indirect price. Time detour and eastbound flight has no effect. The study is considered to be important in terms of revealing the factors that are effective in non-direct competition. It is expected that the research will be useful for stakeholders and decision makers in the sector.

Keywords: Detour Factor, Indirect competition, Airlines, Ticket Prices

INTRODUCTION

Air transport refers to the movement of passengers, cargo and mail between two points. Airlines providing this service charge users a fee for the service. The distance between two points where the transport service takes place is called the air transport market (Ciliberto and Tamer, 2009). These markets occur at different scales and are divided into airport-pair markets, city-pair markets, country-pair markets and regional markets. Since air transport markets are places where competition takes place, it is very important to adapt the product components (airline product) according to the market. Among the product components, price is the most important in this context. Competition in the market may be direct or indirect, depending on the characteristics of the airline (Reiss and Spiller, 1989). If two airlines operate in a market at the same time, there is direct competition. If one airline offers a direct flight to a route where another airline offers a connecting flight as an alternative, this is indirect competition. When setting ticket prices, airlines take into account many factors such as the number of airlines operating in the market, direct and indirect competitors, the profile of customers in the market and the airline's business model (Morrison and Winston, 1990; Piermartini and Fache Rousová, 2008). In line with this information, the aim of this study is to identify the factors that determine ticket prices for connecting flights. In the rest of the study, the methodology used in the research, findings and results will be presented.

MATERIALS and METHODS

The purpose of this study is to examine the effects of factors that are considered to be determinant on ticket prices on connecting flights offered by traditional airlines. In this context, 29 connecting flight routes offered as an alternative to the 6 direct flight routes offered by Turkish Airlines are analysed. After determining the flight routes and connecting options, the variables that are thought to affect ticket prices are determined and a model is created. Hypotheses were determined within the model and the effects on ticket prices were tested. Figure 1 shows a visualisation of direct and connecting flights.

Figure 1. Direct and Indirect Flights (gcmmap.com)

In Figure 1, the Istanbul-Bangkok route shows the route that THY offers direct flights. On the other hand, Etihad via Abu Dhabi, Emirates via Dubai, and Royal Jordan via Amman also offer connecting flights on the Istanbul-Bangkok route.

The model created within the scope of the research is as follows:

$$Indirect_Price_i = \beta_1 Indirect_Time_i + \beta_2 Difference_RouteType_i + \beta_3 RouteDetour_i + \beta_4 TimeDetour_i + \beta_5 DWest_i + \beta_6 DEast_i + \beta_7 AirlineStar_i$$

$Indirect_Price_i$ = Ticket price of connecting flight

$\beta_1 Indirect_Time_i$ = Duration of connecting flight

$\beta_2 Difference_RouteType_i$ = Time difference between a connecting flight and a direct flight

$\beta_3 RouteDetour_i$ = Detour factor value of the route in km

$\beta_4 TimeDetour_i$ = Detour factor value of the route in time

$\beta_5 DWest_i$ = Whether the flight is westbound (1 if westbound, 0 otherwise)

$\beta_6 DEast_i$ = Whether the flight is eastbound (1 if eastbound, 0 otherwise)

$\beta_7 AirlineStar_i$ = Service quality class of the airline offering the connecting flight

The data on connecting ticket prices, which are determined as the dependent variable in the model, were determined by selecting the same days and dates prospectively from sites such as skyscanner and google flights, which offer comparative ticket prices of more than one airline

company. For the selected flights, weekdays were selected rather than peak demand periods. In addition, campaign prices were excluded for ticket prices.

Among the independent variables determined within the scope of the study, the total duration of the connecting flights determined for indirect time was obtained from the timetables of the flights. For the Difference route type variable, the time difference between the direct flight and the connecting flight was created after the duration of both flights were obtained and subtracted from each other. The other independent variables used in the study are detour factor variables. This variable, which is calculated separately in terms of flight length and time used, is obtained by proportioning the direct flight and connecting flight to each other. For the route detour variable, the length of the direct flight and the length of the connecting flight are proportioned to each other. For the time detour variable, the ratio of the time taken for the direct flight and the connecting flight is calculated.

There are also 2 dummy variables among the independent variables. These are *DWest* and *DEast* variables, respectively. The values differ depending on whether the flight has an east-west or west-east extension. For example, if the flight is Istanbul-Bangkok, *DEast* takes the value of 1 and *DWest* takes the value of 0. The last independent variable used in the study is *AirlineStar*. This data obtained from the Skytrax website reflects the service quality of the airline and reflects the values obtained from the passenger surveys on an annual basis.

FINDINGS and DISCUSSION

This section presents the findings related to the determination of the factors affecting the ticket prices of connecting flights. In this context, firstly, descriptive statistics are given in Table 1.

Table 1. Descriptive Statistics

Variables	Minimum	Maximum	Mean	Std. Dev.
Indirect Price	10872,00	31965,00	19408,4483	5641,30753
Indirect Time	12,33	30,00	18,4883	4,74448
Difference Route Type	2,25	18,90	7,8090	4,22125
Route detour	,01	55,90	11,6834	12,27438
Time detour	1,20	2,70	1,7340	,37358
DEast	,00	1,00	,7931	,41225
DWest	,00	1,00	,2069	,41225

According to the information in Table 1, the minimum ticket price of connecting flights is 10872 TL, while the maximum ticket price is 31965 TL. The average connecting ticket price is

19408 TL. Looking at the duration of the connecting journey, it is seen that the minimum journey lasts 12.33 hours and the maximum duration is 30 hours. The average travel time is 18.48 hours. Looking at the time difference between the direct flight and the connecting flight, it is seen that the minimum difference is 2.25 hours and the maximum difference is approximately 19 hours. The average difference is approximately 7.8 hours. When detour factor values are examined, there are two components as route detour and time detour. While the minimum route detour value is 0.01, the maximum route detour value is 55.9. In time detour, the minimum value is 1.20 and the maximum value is 2.7. Dummy variables take values between 0 and 1. Following the descriptive statistics, Table 2 presents the results of the regression analysis.

Table 2. Regression Results

Total Population	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
(Constant)	-47685,01	21556,09		-2,212	,038
Indirect Time	4016,954	1035,096	,3378	3,881	,001
Difference Route Type	-5391,180	1940,149	-,4034	-2,779	,011
Route Detour	163,770	56,056	,356	2,922	,008
Time Detour	14194,262	11931,539	,940	1,190	,247
Dwest	-8111,094	2808,284	-,593	-2,888	,009
Airline Star	2681,295	993,384	,351	2,699	,013

F = 9,849; Sig. 0.000
Adjusted R2= 0,65

According to the regression results in Table 2, connecting flight duration has a significant and positive effect on ticket price. On the other hand, the difference between connecting flight and direct flight has a negative effect. Route detour factor also has a significant and positive effect on the connecting ticket price. However, no significant effect of time detour is found. While the westbound route has a decreasing effect on ticket prices, the eastbound route has no effect and therefore could not be included in the model. The reason for this effect may be the high competition on westbound flights. There is no such effect on eastbound flights. In future researches, re-evaluation can be made by increasing the number of routes. Finally, Airline Star has a significant and positive effect. In other words, the higher the service quality of the airline,

the higher the ticket price. It is natural for airline companies that develop their product components in the direction of comfort to reflect this to ticket prices.

CONCLUSION and RECOMMENDATIONS

This study aims to identify the factors that are likely to affect the price of connecting flights. Flights are analysed in the context of transoceanic flights. In future studies, it would be useful to include medium-haul flights to obtain comparable results. In addition, increasing the number of flight lines considered will provide more comprehensive results. On the other hand, by including the business models of airline operators in the model, the effect of the prices offered by different business models can also be seen. The study is considered important in terms of determining the factors operating in non-direct competition.

ÖZET

Koruyucu ailelik, devlet korumasındaki çocukların aile ortamında büyüdüğü bir sistemdir. Çocukların biyolojik ailesiyle bağı devam etmekte ve koruyucu aileler bunun farkında olarak koruyucu aile olmaktadır. Evlat edinmeden farkı ise, çocuğun soy bağı koruyucu aileye geçmemekte, çocuk biyolojik ailesini soy ismini kullanmaktadır. Türkiye’de aileler çoğunlukla biyolojik çocuğu olmadığı için ve çocuk sahibi olma isteğinin tatmin edilmesi amacı doğrultusunda koruyucu aile olmaktadır. Koruyucu aile sisteminde ebeveynler çocukla eşleştirilmeden önce uyum süreci kapsamında görüşürülmekte çocuğun uyum sağlamadığı durumlarda eşleşmeden vazgeçilmektedir. Kuruluş bakımında kalan çocuklar birçok nedenlerle biyolojik ailesinden alınmaktadır. Bu nedenlerden bazıları ekonomik nedenler, ebeveynlerden birisinin veya her ikisinin kaybı, ihmal ve istismar durumlarıdır. Biyolojik ebeveynlerinin yanında bakımı sağlanamayan çocukların koruyucu aile yanında bakımı çocuklar için önemlidir. Çocukların genel olarak biyolojik ailesindeki ebeveynlerinden birisiyle görüşmekte; biyolojik ailesiyle olan bağı önemsenmektedir. Özellikle 6 Şubat Kahramanmaraş depreminden sonra koruyucu ailelik konusu daha fazla popüler olmuştur. Teknolojik gelişmelere bağılı olarak yeni medyada ve iletişim ağında gelişmeler ve ilerlemeler meydana gelmiştir. Özellikle sosyal medya uygulamaları bu uygulamaların kullanımının artışı koruyucu aileliğe yönelik bilgi alışverişinin de artışını sağlamıştır. Facebook, instagram, Tiktok gibi uygulamalar moda, güzellik, makyaj, annelik, seyahat, dekorasyon, yemek, diyet gibi konularda paylaşımlar başta gelmektedir. Bu konu başlıklarındaki paylaşımlar takipçileri tarafından sanal bir mutluluk veya ekonomik çıkar doğrultusunda yapılmakta ve tüketilmektedir. Yeni medya teknolojileri bireylerin gündelik pratiklere dair beğenilerini şekillendirirken gerçekliği yeniden inşa etmekte ve birçok duyguyu deneyimlemeyi beklemektedir. Sanal gerçeklik uygulaması koruyucu ailelerin çocukla olan duygusal bağı kapsamına kullanılabilir. Örneğin koruyucu aile ve çocuk eşleşmesindeki uyum sürecinde sanal gerçeklik yoluyla nasıl davranılması gerektiği öğretilbilir veya biyolojik ailesiyle görüşme sağlayan çocuğun kökensel bağlarını koruma için sanal gerçeklik kullanılabilir.

Anahtar Kelimeler: Koruyucu aile, sanal gerçeklik, duygular, yeni medya

VIRTUAL REALITY AND EMOTIONS IN THE FOSTER FAMILY

ABSTRACT

Foster family is a system in which children under state protection grow up in a family environment. Children's bond with their biological family continues and foster families are aware of this and become a foster family. The difference from adoption is that the child's lineage does not pass to the foster family, the child uses the surname of the biological family. In Turkey, families become foster families mostly because they do not have biological children and in order to satisfy the desire to have children. In the foster family system, before the parents are matched with the child, they are interviewed within the scope of the adaptation process, and in cases where the child does not adapt, the pairing is abandoned. Children in institutional care are taken from their biological families for many reasons. Some of these reasons are economic reasons, loss of one or both parents, neglect and abuse. It is important for children to be cared for in foster families who cannot be cared for by their biological parents. The children generally meet with one of their parents in their biological family; His ties to his biological family are of paramount importance. Especially after the February 6 Kahramanmaraş earthquake, the subject of foster family became more popular. Depending on the technological developments, developments and advances have occurred in the new media and communication network. In particular, the increase in the use of social media applications has led to an increase in the exchange of information on foster care. Applications such as Facebook, Instagram, Tiktok are primarily shared on topics such as fashion, beauty, make-up, motherhood, travel, decoration, food, diet. The posts on these topics are made and consumed by their followers in line with a virtual happiness or economic benefit. While new media technologies shape individuals' tastes about daily practices, they rebuild reality and expect to experience many emotions. The virtual reality application can be used within the scope of the emotional bond of foster families with the child. For example, virtual reality can be taught how to behave in the adaptation process in foster family and child mating, or virtual reality can be used to protect the originary ties of the child who meets with his biological family.

Keywords: Foster family, virtual reality, emotions, new media

GİRİŞ

Çocuk geçmişten günümüze gelinceye dek toplumsal hayatın merkezinde yer almıştır. Biyolojik ailesinin sosyal, ekonomik ve psikolojik unsurlarından dolayı bakımı sağlanamayan çocuklar devlet koruması altına alınmaktadır. Çocuklar sosyo-ekonomik nedenlerle ihmale uğrama veya istismara maruz kalma, parçalanmış ailede yaşama, suç mağduru olma, suça sürüklenme gibi nedenlerle korunmaya muhtaç çocuk olup 5395 sayılı kanuna göre devlet koruması altına alınmaktadır. Ayrıca, dış göç nedeniyle ülkemize giriş yaparken veya ülkemizde iken ebeveyninin yanında kaybolan yabancı uyruklu refakatsiz çocukları da belirtmektedir.

Koruyucu ailelik, devlet korumasındaki bu çocukların aile ortamında büyüdüğü bir sistemdir. Sistemde çocukların biyolojik ailesiyle bağı devam etmekte ve koruyucu aile yanında bakım bir denetim mekanizması takibinde sağlanmaktadır. Türkiye toplumunda aileler çeşitli nedenlerle koruyucu aile olmak istemektedirler. Bu nedenlerin başında bireysel, ekonomik ve toplumsal etmenler gelmektedir.

Evliliği sürdürme, biyolojik çocuklara arkadaş bulma, biyolojik çocuğunun olmaması ve toplumsal kabul gibi unsurlar genel sebeplerdir. Koruyucu aileliğin güçlü ve zayıf yönleri bulunmaktadır. Güçlü yönlerinin aileye ve çocuğa katkıları olduğu gibi zayıf yönlerinin aileye ve çocuğa olumsuz yansımaları durumlarında önlem alınması gerekmektedir. Zayıf yönlerinin güçlendirilmesi için sanal gerçeklik uygulamaları yeni bir eğitim aracı olarak ele alınabilir.

Korunmaya Muhtaç Çocuk ve Koruyucu Ailelik

Korunmaya muhtaçlık durumu çocuğun ihmal ve istismara uğraması sonucunda oluşmaktadır. Koruma altına alınma çocuğun sosyal ve duygusal gelişimini etkileyen durumlardan olan ebeveynlerden birinin veya ikisinin kaybı, terk edilme, ihmal ve istismar edildiğinde meydana gelmektedir (Özbesler 2009: 3).

Koruyucu ailelik, devlet korumasındaki çocukların bir denetim mekanizmasının takibi altında olacak şekilde aile ortamında büyüdüğü bir sistemdir. Çocukların biyolojik ailesiyle bağı devam etmekte, soy bağı koruyucu aileye geçmemektedir.

Ruhsal, zihinsel, bedensel, ekonomik, duygusal ve ekonomik nedenlerden dolayı biyolojik aileler çocukların bakım ve gözetimini yerine getirememektedir. Böyle durumlarda çocukların biyolojik ailesinin durumu iyileşinceye kadar çocuklar ya kuruluştaki kalmakta ya da koruyucu ailenin yanında bakımı sağlanmaktadır. Kurum bakımının sağlıklı nesiller yetiştirmede yetersiz olması, korunmaya muhtaç çocuklara aile ortamını sağlayamaması koruyucu aileliğin önemini ortaya koymaktadır.

Koruyucu ailelik kimi zaman ailelerin çocuk sahibi olması için bir yol olabilmekte kimi zaman da kurum bakımındaki bir çocuğa aile ortamı sunarak onu mutlu etme amacını taşıyabilmektedir.

Koruyucu aile olmayı sağlayan ve kolaylaştırıcı unsurlar bakımın rolünü belirlemektedir. Ailelerin çocuğun gelişiminin kolaylaştırması ve ekonomik etmenleri oluşturan bireysel ve ailesel kaynaklar, biyolojik çocuğun olmaması gibi ailesel faktörler buna örnektir (C. Anjos et al., 2023). Yapılan bir başka araştırmaya göre aileler birey odaklı, çocuk merkezli ve ailevi sebeplerle koruyucu aile olmaktadır (E. Magalhães et al. 2022).

Türk toplumunda da benzer şekilde bireysel ve toplumsal nedenlerle koruyucu aile olunmaktadır. Toplumsal nedenler: Çocuğa aile ortamı sunma, bu bilinci sorumluluk olarak üstlenme gibi motivasyonları da kapsamaktadır. Bireysel nedenler: Evliliğin sürdürülme isteği, biyolojik çocuklarına arkadaş olması, çocuk sahibi olmaması, toplum tarafından kabul görülme ve çocuk hasretini giderme bu nedenlerdendir.

Koruyucu Ailelik Sisteminin Güçlü ve Zayıf Yönleri

Sistemin aileler ve çocuklar özelinde olumlu yönleri olduğu gibi olumsuz yönleri de bulunmaktadır. Yapılan bir araştırmaya göre koruyucu aileler sosyal çevresi tarafından takdir edilmenin yanı sıra koruyucu aileliğin rolüne yönelik kararsızlıklar da bulunmaktadır (C. Anjos et al., 2023).

Koruyucu aile sistemi çocuğun aile yanında sosyal ve fiziksel gelişim sürecinin sağlıklı bir şekilde tamamlanmasını sağlamaktadır. Romanya'da yapılan bir araştırmaya göre, koruyucu aile yanında büyüyen 4.5 yaşındaki bir çocuk kuruluş bakımında büyüyen çocuğa oranla daha yüksek IQ puanına sahiptir (akt. Erdal 2014:180). Buna göre bir çocuğun aile ortamında büyümesi zekâsı üzerinde de etkili olduğu ifade edilebilir.

Koruyucu aile yanında kalan çocukların deneyimlerini ele alan bir çalışmaya göre, koruyucu aileden memnun kalmakta ve onları gerçek bir aile olarak kabul etmektedirler. Koruyucu ailede kendi ailelerine oranla daha iyi hissetmektedirler. Diğer çocukların varlığını olumlu karşılamakta ve kendi ailelerinden sadakatle ve affetme duygusuyla yaklaşmaktadırlar (F. Van Holen, et al., 2020).

Zayıf yönleri ise kurumsal, sosyo-ekonomik ve psikolojik olarak gruplandırılabilir. Örneğin, biyolojik aile görüşmelerinde ailenin ve çocukların yaşadığı sorunlar, miras bırakamama, uyum süreci toplumsal ve duygusal sorunlardandır. Koruyucu ailelik toplumda yanlış anlaşılabilir. Bu durumda süreç olumsuz etkilenebilmektedir (Akbulut 2011:100-101).

Bu yüzden korunmaya muhtaç çocuğun bakımını kaliteli bir şekilde sağlayabilecek aileyi seçmek, bakımı yapan aileyi denetlemek koruyucu aile bakımının en önemli unsurudur.

Bir araştırmaya göre koruyucu aile sisteminin çocuklar üzerinde olumsuz etkileri vardır. Koruyucu ailelerde yaşayan çocukların kliniğe giden ve koruyucu ailede kalmayan diğer çocuklara kıyasla travma yaşamakta, riskli ve problemlili cinsel davranışlar sergilemekte, daha fazla hizmet aciliyeti yaşadığı görülmektedir (S.L. Stewart et al., 2023). Sisteme ilişkin güçlüklerin giderilmesi kurumlara bağlı olduğu kadar bireylerin uyum sağlaması de önem arz etmektedir. Koruyucu aile sisteminin en temel süreci aile çocuk eşleşmesidir.

Koruyucu Ailelikte Duygular

Koruyucu aile sisteminde çoğunlukla duyuların ön plana çıkmasına rağmen profesyonel olarak işlemesi gereken bir uygulamadır. Fakat Türkiye’de aileler koruyucu aile sisteme evlat edinme gibi bakmakta ve çocuğun biyolojik aileye döndürülme ihtimaline karşı sıklıkla endişe içerisinde. Bu sorunu bertaraf edebilmek adına çocuğun ve ailenin zayıf yönleri güçlendirilmelidir. Hochschild’in (2001:83) ifade ettiği gibi, aileler çocuklarının mutsuzluğuna karşı umutsuzca duygusallık beslemektedir. Koruyucu aileler çocuklarına karşı büyük bir duygusallık yaşamaktadır. Bu noktada sanal gerçeklik uygulaması yaşanabilecek sorunlara profesyonel yaklaşmayı öğretme adına önem arz etmektedir.

Sanal Gerçeklik ve Koruyucu Ailelik

Koruyucu ailelik sistemi yeni medyada son zamanlarda sıklıkla yer almaktadır. 6 Şubat depreminden sonra sisteme olan ilgi artmış; pek çok aile depremzede çocuklara koruyucu aile olmak istemiştir. Sistemin biranda popüler bir hal alması kontrolünü, denetimi riskini beraberinde getirmiştir. Bu bakımı yapabilecek ailelerin belirlenmesi, takip edilmesi, çocuğun yerleştirilmesi uzun süreç gerektirmektedir. Aileler seçildikten sonra ise çocuklarla uyumu önemli bir kritik aşamadır. Bu kritik aşamada sanal gerçeklik uygulaması yeni bir eğitim aracı olarak ele alınabilir. Sanal gerçeklik, başa takılan cihazda üç boyutlu simüle edilen stereoskopik görüşte konumlanmıştır. Kullanıcı simüle edilmiş ortamlarda gezinebilir ve elektronik giysi, elektronik eldiven, bilgisayar tarafından hareketlerinin izlendiği maddelerle etkileşime geçebilir (Brey, 2008).

VR pek çok alanda kullanılmaktadır; tıp, eğitim, psikoterapi, sanat bunların başında gelmektedir. Tıpta, örneğin sanal ameliyatlar için eğitim ve öğretimde, tıbbi prosedürlerde, anatomik yapıların simülasyonunda kullanılmaktadır. Psikoterapide, hastanın anksiyeteye sebep olan unsur ile yüzleşmesini sağlayarak anksiyete bozukluğuyla başa çıkmada kullanılmaktadır. Eğitimde, sanal dünyalar inşa edilerek öğrenme ve öğretme tabanlı keşifte kullanılmaktadır. Sanatta, yeni sanat şekilleri yaratmak için ve daha fazla üç boyutlu, hareketli var olan sanat deneyimini sağlamak için kullanılmaktadır.

Sağlıkta bakıcı tedarikinde kullanılmaktadır. Demans hastaları için, bakım elemanı eğitimi doğrultusunda kullanılmaktadır (Yamakawa, Sung, Tungpunkom, 2020). Eğitimde, sosyal bilişi geliştirmek ve sonuçları toplum temelli değerlendirmek için kullanılmaktadır. Örneğin, fiziksel engelli bireyler için VR iş görüşmesi eğitimi konulu bir çalışmada, VR tabanlı platformların mesleki erişimi mümkün olmayan bireyler için olanak tanıdığı görülmektedir (Smith ve ark. 2014). Çocuklara VR eğitimiyle yaya güvenliği eğitiminin öğrenme yöntemlerinde birtakım avantajlar kazandırılmaktadır. VR teknolojisi çocuklara ilgi çekici, etkili, sürükleyici ve güvenli etkileşim sunmaktadır. Ayrıca VR riskli yaya davranışlarının tespiti noktasında, oluşabilecek davranışlarının düzeltilmesini sağlamaktadır (Feng& Yang, 2020).

SONUÇ

Sanal gerçeklik uygulaması koruyucu ailelerin çocukla ilk karşılaşmada, bakım sürecinde, okulla, çevresiyle iletişimine olan uyumunda, biyolojik aile görüşmelerinde yardımcı olabilir. Uygulamaya yüklenecek programda ailenin çocuğa karşı nasıl yaklaşım sergileyeceği

anlatılabilir. Örneğin koruyucu aile ve çocuk eşleşmesindeki uyum sürecinde sanal gerçeklik yoluyla nasıl davranılması gerektiği öğretilir veya biyolojik ailesiyle görüşme sağlayan çocuğun kökensele bağlarını koruması için sanal gerçeklik kullanılabilir. Sanal gerçeklik uygulamasında aileler çocukla ilk eşleşme ve uyum sürecini, yaşanabilecek mevcut riskleri buradan izleyerek adeta staj yapabilecektir. Sanal gerçeklik uygulamasına sistemin psiko-sosyal yönüyle ilgili sosyologlar, psikologlar ve mühendislerinin iş birliğiyle gerçekleştirilebilecektir.

ABSTRACT

Several studies have investigated the performance of crump weirs through experiments with paying much attention on the accurate prediction of discharge coefficient. Thus, the main objective of this study is to employ artificial intelligence (AI) techniques to predict and analyse discharge coefficient (C_d) of crump weir models. Hence, the precision and use of seven data-driven models including Bayesian neural network (BNN), multiple linear regression (MLR), multi-layer perceptron neural network (MLPNN), genetic algorithm (GA), support vector machine (SVM), Radial Basis Function (RBF) and curve fitting neural network (CFNN) were examined for estimating of the C_d . To achieve this, experiments were conducted on eighteen crump weir models of different apex angles 80° , 90° , 100° , 110° , 120° and 130° . The upstream angles of the weir models were set in decreasing order of 85° , 70° , 55° , 40° , 25° and 10° . While the downstream angles were increased as 15° , 20° , 25° , 30° , 35° and 40° respectively. 360 laboratory test results were used, 70% for training, 15% for testing and 15% for validation. And statistical parameters of coefficient of determination (R^2), root-mean-square error (RMSE), mean absolute error (MAE), were employed as the criteria for the comparison of the models' performance. Results showed good agreements between the observed and estimated values using the AI-based models. However, among these models, the CFNN managed to estimate the C_d of the weir with the highest precision and accuracy than the rest of the models with (RMSE= 0.1635×10^{-4} , $R^2=0.9981$). Also, it was found that the most efficient crump was weir model 17 for having the least C_d of 1.14914 and least percentage error of 12.97412, which has been optimized using GA with C_d value of 1.14815.

Keywords: Crump Weir, Discharge Coefficient, Channel, Experiments, Artificial Intelligence

1. INTRODUCTION

The Crump section *flat-vee* weir is favored by hydrometrics because of the accuracy and range of flow measurement it exhibited. It is comparatively insensitive to submerged conditions and ease of determination of flow curves for any width, and its coefficient of discharges remain through undrown condition. However, this type of weir is disliked by fishermen because it can present a barrier to migration of fish (Rickard *et.al.*2003). As such it becomes necessary to investigate the behavior of the flow over the crump weir. In this way, few studies have been devoted to evaluating the flow over crump weirs, for example, Bos,1989 was the first to study the flow characteristics of trapezoidal profile weirs systematically. He conducted a series of experiments on these types of weirs with both upstream and downstream side slopes. The discharge coefficient was determined for free flow conditions using different discharge values. (Daneshfaraz et al. 2019). Similarly, Khalifa & Umar, 2018 conducted experiments on crump weir models of different apex angles, they demonstrated that increase in the apex angle resulted in decrease in discharge coefficient. Hence, controlling the amount of discharge over different hydraulic structures was always a field of interest for researchers, with a view of decreasing sedimentation in reservoirs (Zahabi et al. 2018).

2. THEORETICAL BACKGROUND

2.1 Governing Equations

The discharge was estimated using the equation governing the modelling of flow over crump weir by determining the upstream flow head (h). Point gauge was used to measure the, h, above the crump weir (Arora, 2005). Thus, for modular flow over the crump weir, when the weir operates undrowned, the modular discharge is expressed as follows:

$$Q_m = C_d \sqrt{g} \cdot b H_o^{\frac{3}{2}} \quad (1)$$

C_d and H_o can be determined using Equations (2) and (3) respectively

$$C_d = 1.163 \left(1 - \frac{0.0003}{h} \right)^{1.5} \quad (2)$$

$$H_o = y_o + \frac{V_o^2}{2g} \quad (3)$$

Where, Q_m = Discharge for modular flow (m^3/s), C_d = Modular discharge coefficient, g = gravity (m^2/s), b = Breath of weir (m), H_o = Total head upstream of the weir crest (m), y_o = upstream water level (m), $\frac{V_o^2}{2g}$ = upstream velocity head (m).

However, dimensionless reduction factor is introduced to correct the non-modular flow as given by Equation (4):

$$f = Q/Q_m \quad (4)$$

Where, Q = Discharge for non-modular flow (m³/s)

2.2 Artificial Neural Networks

Artificial neural network (ANN) is a nonlinear mathematical model that is able to simulate arbitrarily complex nonlinear processes, which relate inputs and outputs of any system. In many complex mathematical problems that lead to solving complex nonlinear equations, multilayer perceptron networks are common types of ANN widely used by researchers (Parsaie 2016; Moazamnia et al. 2019).

2.3 Support Vector Machines

Support vector machines operate based on data mining algorithms and are like other artificial intelligent methods. It was used in different fields of hydrology (e.g., Nadiri et al. 2017) and Hydraulics (e.g., Sadeghfam et al. 2019). Support vector machines are an efficient learning system based on the theory of optimization that uses the inductive principle of minimization of structural errors and lead to a general optimal response.

2.4 Multi-layer Perceptron Neural Network (MLPNN)

MLPNN is a computational method which tries to propose a mapping between input space (input layer) and optimal space (output layer) by understanding the inherent relationships among data with the help of learning process and using simple processors called neurons (Heidari *et al.*, 2016). The high speed of processing and flexibility in the face of unwanted errors are the features of this model. Its main advantage is its high speed and optimal precision in the prediction of complex variables with linear and non-linear mapping.

Mohammad Zounemat *et al.*, 2019 have examined the precision and use of six data driven models including BNN, MLR, MLPNN, GEP, LSSVM and CHAID for estimation of discharge passing triangular Arced labyrinth weir. MLPNN managed to estimate the discharge passing the weir with the highest precision (RMSE = 0.00385, R² = 0.999).

Reza Norouzi *et al.*, 2019 have investigated the performance of MLP, RBF and SVM in predicting the discharge coefficient (Cd) of lybrinth weirs. The performance of the MLP model was excellent with RMSE and R² of 0.019 and 0.985 respectively.

In the studies of Zounemat *et al.*, 2019, they applied various hybrid meta-heuristic MLPNN and ANFIS for predicting flow parameters of piano key weir flow.

3. METHODOLOGY

3.1 Fabrication of the Experimental Models

The experimental work was conducted on eighteen crump weir models of different apex angles of 80° , 90° , 100° , 110° , 120° and 130° . Accordingly, the upstream angles of the models were decreased to have the following values 85° , 70° , 55° , 40° , 25° and 10° , and to as well increasing the downstream angles as 15° , 20° , 25° , 30° , 35° and 40° respectively, which will sum up to give 180° as the total angles in a triangle as shown in Figure 1. Plywood of 22 mm thickness was used in fabricating the main body of the crump weirs.

Figure 1: The schematic view of crump weir model 1 of apex angle 80° , upstream angle and slope, 85° and 0:1, downstream angle and slope, 15° and 4:1 respectively.

Table 1.0: Geometric Factors of Crump Weir Models

Model	Upstream Slope	Downstream Slope	Model width 'b' (cm)	Crest Height 'P' (cm)	Apex Angle (degree)	Upstream Angle(degree)	Downstream Angle(degree)
1	0.1:1	4:1	30	15	80	85	15
2	0.4:1	3:1	30	15	90	70	20
3	0.7:1	2:1	30	15	100	55	25
4	1:1	2:1	30	15	110	40	30
5	2:1	1:1	30	15	120	25	35
6	6:1	1:1	30	15	130	10	40

3.2 Experimental Procedure:

The crump weirs were installed in the flume with the help of sealants to prevent leakage, which has to be levelled. One vernier were located downstream the weir and the other upstream. The verniers were zeroed with the bed of the channel.

Seventy-two models were fabricated for which the angles were varied, 80° , 90° , 100° , 110° , 120° , and 130°

Experiment were then be ran for each model and various heads and their corresponding discharges were recorded; The procedure has five (5) runs. Each run has a different flow rate and a set of four (4) y_o and y_l depths; two sets for modular flow condition and the other two sets for non-modular flow condition. The initial flow rate were set. Then, y_o and y_l depths were recorded for the following conditions: Modular flow: without stop block (gate). Modular flow: one full stop block (gate) (y_l should be the only depth that changes). Non-modular flow: Add a half of one stop block (gate). (y_l and y_o depth that change). Non-modular flow: Add one quarter of a stop block (gate). The flow rate were increased at constant interval.

Heights (P=10cm, 15cm, 20cm) were used as a crump weir models. For each type of crump three types of surface roughness were used. The first one were a smooth PVC , the second one is coated with a uniform sand $D_{50} = 0.72$ mm (D_{50} =is the sieve diameter in which 50% of material are finer), while the third is covered by gravel of $D_{50} = 3.6$ mm . Eighteen models were used to conduct the experimental study. In each run the selected model were inserted along the width of the flume. Then the pump started at desired flow rate and after the flow stability were achieved the water surface level upstream and above the weir model were measured using point gauge. For each type of the crump weir a series of tests under different flow rates were conducted. The pump were activated and the discharge were adjusted using a control valve and the reading of the point gauge were recorded to give the head above crump weir required for the calculation of estimated discharge; At the beginning of each run the control valve were adjusted to alter the head; For each head recorded, the actual discharge were measured by direct method using the weighing arrangement provided at the tail end of the flume. The previous steps were repeated for each of the five runs of experiments to be conducted for each model. A total of 360 runs were conducted.

3.3 Determination of Observed Discharge (Q_o)

The observed discharge, Q_o , was measured experimentally using the gravimetric method. Throughout the experiment, 100kg of water were collected by means of the weighing balance (see plate II) attached to the flume and stopwatch was used to obtain the time taken to collect the 100kg for onward determination of discharge.

Volume, $V = \text{mass}/\text{density}$

Observed discharge, $Q_o = \text{Volume} / \text{average time}$

$$\text{Average time} = \frac{(t_1 + t_2)}{2} \quad (5)$$

3.4 Determination of Estimated Discharge (Q_e)

The discharge equation for the crump weir was used to compute the estimated discharge using the flow heads.

Point gauge will be used to measure the flow head (h) above the crump weir (Arora, 2005).

$$Q_m = C_d \sqrt{g} \cdot b H_o^{\frac{3}{2}} \quad (1)$$

$$C_d = 1.163 \left(1 - \frac{0.0003}{h} \right)^{1.5} \quad (2)$$

$$H = y + \frac{v^2}{2g} \quad (3)$$

3.6 Derivation of Discharge Coefficient

In order to validate the suitability of the theoretical equations, the maximum of the absolute value of the deviation of the data from the model was obtained as:

$$\text{MaxErr} = \max(\text{abs}(C_{do} - C_{de})) \quad (7)$$

Where, C_{do} = Experimental Discharge Coefficient = Q_o / Q_e

C_{de} = Estimated Discharge Coefficient

$$Cd = (D_{50}, P, h, Q, \theta) \quad (8)$$

Thus, by dimensional analysis and using the approach of Buckingham's π -theorem, Equation (8) becomes:

$$Cd = f \left(\frac{D_{50}}{P} \theta, \frac{h}{P} \right) \quad (9)$$

It follows that Equation (9) can be expressed as Equation (10) based on dimensional homogeneity:

$$C_d = k_1 \left[\frac{D_{50} \theta}{P} \right]^a + k_2 \left[\frac{h}{P} \right]^b \quad (10)$$

Where, K_1 , K_2 , a , and b are parameters to be estimated by regression analysis.

4.0 RESULTS and DISCUSSION

4.1 Computation of Discharge Coefficients (C_d)

Tables 2 show the values of C_d obtained from Equations 1 and 2 respectively. The head measurements were obtained by means of the point gauge.

4.2 Discussion of Result:

Predicting the Cd of crump weir using ANN

Results of evaluating the precision of the data-driven models in the estimation of Cd of crump weirs in the training and testing sets are presented in Tables 5 and 6 respectively. Comparison of the values provided in Table 6 shows that CFNN managed to estimate discharge passing the weir with the highest accuracy (RMSE= 0.1635×10^{-6} MAE= 0.4713×10^{-3} $R^2 = 0.9981$). Also, CFNN was followed by MLPNN, BNN, GA, MLR, RBF and SVM.

Table 7 shows the sensitivity analysis of Coefficient of discharge, Cd. The sensitivity analysis was carried, in order to evaluate the significance of input variables on the Coefficient of discharge. The sensitivity analysis was performed using the ANN model due to the high value of correlation coefficient and minimum error it produced.

Consequently, the parameter ($\frac{h}{p}$) was found to be the most effective parameter with $R = 0.9971$, $MSE = 3.8513 \times 10^{-4}$ on the prediction of Cd. While the function ($\frac{D_{50}^{\theta}}{p}$) was found to be the least effective parameter on the prediction of Cd.

Figure 8: ANN verification of Cd from Model Equation

Table 5. Results of evaluating the performance of data driven models in the training phase.

Models	MSE $\times(10^{-6})$	MAE $\times(10^{-3})$	R^2
MLP	8.1825	0.9874	0.9234
BNN	7.9003	0.8452	0.9192
RBF	2897.6	1.7652	0.8400
SVM	4232.7	2.6745	0.7300

Table 6. Results of evaluating the performance of all the applied models in the testing phase.

Models	MSE $\times(10^{-6})$	MAE $\times(10^{-3})$	R ²
CFNN	0.1635	0.4713	0.9981
MLP	1.8738	0.6704	0.9821
BNN	3.4682	0.7461	0.9669
GA	3.9641	0.8452	0.9573
MLR	2611.7	1.4233	0.8700
RBF	2672.6	1.5712	0.8600
SVM	3288.7	2.1005	0.7900

Finally, the precision of the models in estimating the discharge passing the weir was evaluated using the root-mean square error (RMSE), mean absolute percentage error (MAE), R² (coefficient of determination). The best values of these criteria were 0, 0, and 1 respectively.

$$RMSE = \sqrt{\frac{1}{n} \sum_{j=1}^n (y_j - \hat{y}_j)^2} \quad (12)$$

$$MAE = \frac{1}{n} \sum_{j=1}^n |y_j - \hat{y}_j| \quad (13)$$

$$\hat{R}^2 = 1 - \frac{\sum_{i=1}^n (Y_i - \hat{Y}_i)^2}{\sum_{i=1}^n (Y_i - \bar{Y})^2} = 1 - \frac{\frac{1}{n} \sum_{i=1}^n (Y_i - \hat{Y}_i)^2}{\frac{1}{n} \sum_{i=1}^n (Y_i - \bar{Y})^2} \quad (14)$$

In Eqs. (12)–(14), y is the actual Cd, \hat{y} is their saverage, n is the number of estimations.

Figure 9: Relation of Cd and h/p using (MLR) model

Figure 10: Relation of Cd predicted and Actual value using (MLR) model

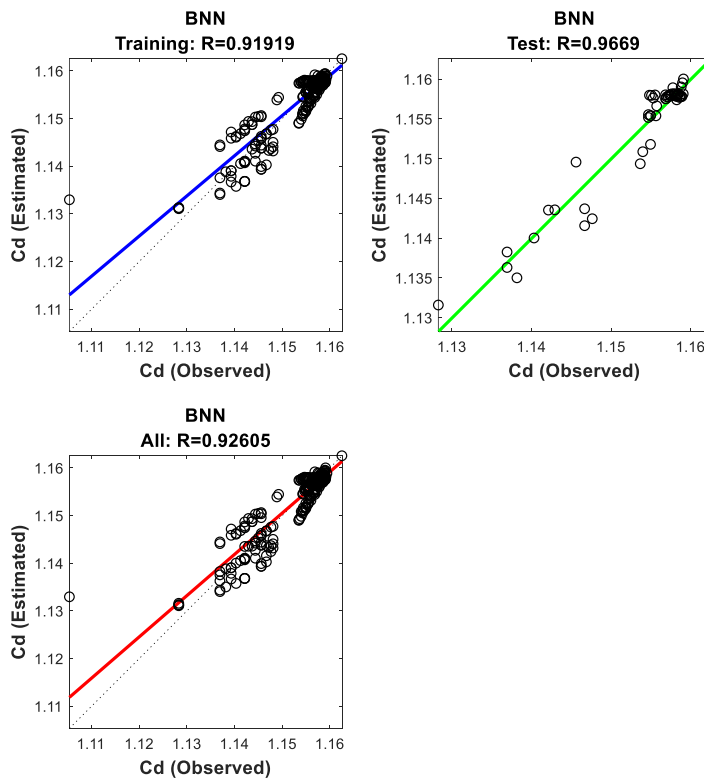

Figure 14: Distribution diagram of the observational-computational values in training and testing stages of Bayesian Neural Network (BNN) Model varification of Cd.

Thus, the parameters K_1 , K_2 , a and b in Equation (10) were determined through regression analysis and Curve Fitting Neural Network as expressed by Equation (15) as follows:

$$Cd = 0.5785 \left[\frac{D_{50}\theta}{P} \right]^{6.593 \times 10^{-5}} + 0.58 \left[\frac{h}{P} \right]^{0.006761} \quad (15)$$

The model equation has $R^2 = 0.9981$.

Table 7. Sensitivity analysis of Cd's for input parameters with ANN model.

Function	Training		Testing	
	MSE $\times(10^{-4})$	R^2	MSE $\times(10^{-4})$	R^2
$Cd = \left[\frac{D_{50}\theta}{P} \right]$	7.5421	0.9782	7.6801	0.9884
$Cd = \left[\frac{h}{P} \right]$	3.7313	0.9841	3.8513	0.9971
$Cd = \left(\frac{D_{50}}{P} \theta, \frac{h}{P} \right)$	0.1534	0.9883	0.1635	0.9981

Table 7 shows the sensitivity analysis of Coefficient of discharge, Cd. The sensitivity analysis was carried, in order to evaluate the significance of input variables on the Coefficient of discharge. The sensitivity analysis was performed using the ANN model due to the high value of correlation coefficient and minimum error it produced.

Consequently, the parameter $\left(\frac{h}{P} \right)$ was found to be the most effective parameter with $R = 0.9971$, $MSE = 3.8513 \times 10^{-4}$ on the prediction of Cd. While the function $\left(\frac{D_{50}\theta}{P} \right)$ was found to be the least effective parameter on the prediction of Cd.

Figure 16: Relation of predicted Cd and observed Cd using (MLP) model

5.0 CONCLUSION

By using the equations which has been discussed in the literature, the raw data was calculated and processed using ANN.

Based on the results of the investigation, the following conclusions are reached: .

1. The effect of increase of surface roughness on h values will be more on small heights of the crump weir than large ones.
2. C_d decreases from model 1 to model 18 with model 17 having the least C_d close to unity and least percentage error making model 17 to be more efficient.
3. The Mathematical Model equation generated using CFNN performed better than other models such as MLP, BNN, GA, MLR, RBF and SVM with $RMSE= 0.1635 \times 10^{-6}$
 $MAE=0.4713 \times 10^{-3}$ $R^2 =0.9981$
4. The model was optimised using GA and the predicted C_d value was 1.14815 as best fitted value.

5.1 RECOMMENDATIONS

The recommendations below are some of the improvements that can be carried out for further study:

1. Depth of weir and width of channel in variable value are suggested to get the best flow rate for hydraulic structure of crump weir design.
2. Calibration device for better data collection suggested using a volume meter to get the flow rate over a crump weir.
3. Similar study should be carried out using stones and cement models instead of wooden models.

ÖZET

Bu çalışmanın amacı sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşlerinin belirlenmesidir. Araştırmada, nitel araştırma modeli temel alınarak tasarlanmış durum çalışması kullanılmıştır. Araştırmanın çalışma grubu kolay ulaşılabilir örnekleme yöntemi ile belirlenmiş ve İç Anadolu bölgesindeki bir ilde görev yapan 15 sınıf öğretmenine ulaşılmıştır. Verilerin toplanmasında araştırmacı tarafından geliştirilen yarı yapılandırılmış görüşme formu kullanılmış ve sınıf öğretmenleri ile doğrudan görüşmeler yapılmıştır. İçerik analizi kullanılarak görüşmeler sonucunda elde edilen veriler analiz edilmiştir. Araştırma sonucunda sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşleri “bilgi”, “öğrenciye sağladığı faydalar”, “öğretmene sağladığı faydalar”, “kolay yönleri” ve “zor yönleri” şeklinde beş farklı temada ve 35 farklı kategoride toplandığı tespit edilmiştir. STEM etkinliklerinin ilkokullarda uygulanabilmesi için müfredatta düzenlemeler yapılması ve hizmet içi ve lisansüstü eğitimlerle daha çok sınıf öğretmenine ulaşarak STEM eğitimi yaygınlaştırılabilmesi önerilmiştir.

Anahtar Kelimeler: STEM, ilkokul, sınıf öğretmeni

PRIMARY SCHOOL TEACHERS' OPINIONS ABOUT STEM EDUCATION

ABSTRACT

The aim of this study is to determine the views of primary school teachers on STEM education model. In the study, a case study designed based on qualitative research model was used. The study group of the research was determined by convenience sampling method and 15 primary school teachers working in a province in the Central Anatolia region were reached. A semi-structured interview form developed by the researcher was used to collect the data and direct interviews were conducted with the primary school teachers. The data obtained from the interviews were analysed using content analysis. As a result of the research, it was determined that the opinions of primary school teachers about the STEM education model were collected in five different themes and 35 different categories as "knowledge", "benefits to students", "benefits to teachers", "easy aspects" and "difficult aspects". In order to implement STEM activities in primary schools, it is suggested that arrangements should be made in the curriculum and STEM education can be made widespread by reaching more primary school teachers through in-service and postgraduate trainings.

Keywords: STEM, primary school, primary school teachers

GİRİŞ

Hızla gelişen teknoloji hayatımızın her noktasını etkilediği gibi içinde bulunduğumuz yüzyılda toplumsal işgücü ve mesleklere yönelim de etkilenmeye başlamıştır. Teknolojinin hızlı gelişimi mühendislik uygulamalarının önemi daha da artmıştır. Buna bağlı olarak eğitim süreçleri ve müfredat programlarında da bu önem paralelinde değişimler meydana gelmiştir. Bu değişimlerden birisi de STEM (Science, Technology, Engineering and Mathematics) eğitimi olmuştur. Amerika Birleşik Devletleri'nde ortaya çıkan bu modelde matematik, teknoloji ve mühendisliğin ilk, orta, lise ve yükseköğretimde disiplinler arası derslerde öğretilmesini amaçlamaktadır. STEM, matematik bilim, mühendislik teknoloji alanlarının verildiği ve günlük yaşamla bağlantı kurularak 21. yüzyıl becerileriyle desteklendiği bir eğitimidir (Yıldırım ve Altun, 2014; Yıldırım, 2016). Günümüzde STEM eğitimi birçok ülke tarafından müfredat programlarına entegre olarak uygulanmaktadır. Ülkelerin bu eğitimi vermelerinin birçok önemli gerekçeleri bulunmaktadır. Disiplinler arası çalışmaya yer vermesi, öğrenilen bilgilerin günlük hayat problemlerine karşılık gelmesi, 21. yüzyıl meslekleri için gerekli bilgi ve becerileri içinde barındırması gibi gerekçeler STEM eğitiminin müfredat programlarına entegre edilmesini ve uygulanmasını gerekli kılmıştır. Öğrenci merkezli olması ve günlük hayat problemlerini içermesi STEM eğitiminin temelini ilerlemeci eğitim felsefesinden aldığı söylenebilir (Selvi ve Yıldırım, 2017).

STEM eğitimi küreselleşen dünyada girişimciliğe katkı sağlarken meslek, sosyal çevre ve okul arasında bağlantılar kurmayı da kolaylaştırır. Bu eğitim modelinde ekonomik ve teknolojik gelişmeleri yakından takip eden, yaratıcı ve girişimci liderler yetiştirmek hedeflenir (Akgündüz vd., 2015). Ülkemizde de son yıllarda adını sıkça duyduğumuz STEM eğitimi eğitim müfredatlarıyla öngörülen becerilerin kazanılması, eleştirel bakış açısının geliştirilmesi yaratıcılığın, girişimciliğin ve yenilikçiliğin ön plana alınması, meslekler arası iletişimin sağlanması ve yeni mesleklere uyum sağlama becerisinin kazandırılmasında etkili olabilmektedir (Millî Eğitim Bakanlığı [MEB], 2015). Bu eğitim modelinin gelişimi ve uygulanmasına yönelik ülkemizde son yıllarda yapılmış birçok çalışma bulunmakta, STEM eğitimi farkındalıkları, STEM eğitimi öğrenci görüşleri, STEM eğitimi öğretmen görüşleri STEM eğitimi uygulamalardaki etkileri gibi çalışmalar bunlardan bazılarıdır. Şahin, Ayar ve Adıgüzel (2014), STEM içerikli okul dışı etkinliklerin öğrenciler üzerinde oluşturduğu etkiyi incelemeye çalışmışlardır. Okul dışı etkinliklerinin, öğrencilerin birbirlerinden öğrenerek iş birliği içinde çalışmalarını, becerilerini artırdıklarını ilgililerinin STEM alanlarına doğru yöneldiği gibi olumlu sonuçlara ulaştıklarını belirtmişlerdir. Yamak, Bulut ve Dündar (2014), STEM' in

beşinci sınıf öğrencilerinin fen bilimlerine ve bilimsel süreç becerilerine etkisini belirlemek amacıyla bir çalışma tasarlamışlardır. STEM'in fen dersine karşı olumlu tutum geliştirmesine yönelik etkisinin olduğunu ortaya koymuşlardır. Bazı araştırmalar ise STEM'in okul başarısına etkisine yönelik olarak yapılmıştır. Öner vd. (2014) yaptıkları çalışmada okulların bağlı oldukları eğitim merkezlerine göre akademik başarılarını değerlendirmişlerdir. STEM okullarının farklı bölgelerdeki matematik ders başarılarında anlamlı bir farklılık göstermemişlerdir. Bu çalışmaların dışında öğretmenlerin STEM uygulamalarına yönelik görüş ve farkındalıklarının araştırıldığı çalışmalar da literatürde bulunmaktadır. Çınar vd., (2016) STEM eğitiminin öğretmen adaylarının disiplinler arası eğitim anlayışına etkisini araştırmışlardır. Çalışma sonucunda öğretmen adaylarının STEM eğitimin disiplinler arası yaklaşımda faydalı buldukları ve sınıf etkinliklerinde yer vermek istedikleri görüşünü ortaya çıkarmıştır. Akgündüz ve arkadaşları (2015) ise hazırlamış oldukları STEM Türkiye Raporunda STEM' in amacına ulaşması için fen bilimleri ya da matematik öğretmenlerinin gerekli bilgi, donanım, beceriye sahip olmaları gerektiğini belirtmişlerdir.

Öğretmenlerin STEM eğitim modelini uygulamaya koymadan önce bu eğitim modeline yönelik yeterliliklerinin geliştirilmeleri gerekliliği önemli görülmektedir. Özellikle ilkököl dönemi çocukların deneyimleyerek öğrendiği, somut nesnelerin daha çok işe koşulduğu, yaratıcılık becerilerinin en üst seviyede olduğu öğrencilerle çalışan ve kalıcı öğrenmelerin temelini atan sınıf öğretmenlerinin STEM modelinden ne kadar haberdar olduğunun belirlenmesi araştırmacılarca önemli görülmüştür. Bu bağlamda sınıf öğretmenlerinin STEM modeline yönelik görüşlerinin belirlenmesi gerekliliği ortaya çıkmış ve araştırmacılar sınıf öğretmenleri ile bu eğitim modeli odağında görüşme yapmayı tasarlamışlardır. Elde edilen bulguların öğretmenlerin STEM hakkındaki görüşlerini yansıtması, sınıf içi uygulamalarda bu eğitime yer verme nedenlerini ve STEM eğitiminin ilkökullarda da uygulanması noktasındaki görüşlerinin alana katkı sağlayacağı düşünülmektedir. Bu bağlamda, araştırmanın amacı sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşlerinin belirlenmesidir.

YÖNTEM

Araştırma Deseni

Bu araştırmada nitel araştırma modellerinden olan durum çalışması (case study) kullanılmıştır. 'Nasıl' ve 'niçin' sorularını baz alındığı, durum çalışması araştırmacının kontrolünde olmadığı bir olay ya da olgunun detaylı incelenmesine imkan vermektedir (Yıldırım ve Şimşek, 2016). Yin'e göre durum çalışması; "güncel bir olguyu kendi yaşam çerçevesi (içeriği) içinde çalışan, bulunduğu içerik arasındaki sınırların kesin hatlarıyla belirgin olmadığı ve birden fazla kanıt

veya bilgi kaynağının yeterli olduğu durumlarda kullanılan, görgül bir araştırma yöntemi” “olarak tanımlanmıştır (Akt: Yıldırım ve Şimşek, 2016). Durum çalışmaları var olan durumu açıklayan, değişimi ve gelişimi etkileyen, etkenler arasındaki ilişkiyi derinlemesine inceleyen ve süreç içerisinde bu gelişimi gösteren bir yaklaşımdır (Best ve Kahn, 2017). Bu çalışmada da STEM eğitim modeli bir durum olarak tanımlanarak sınıf öğretmenlerinin görüşleri doğrultusunda derinlemesine incelenmiştir.

Çalışma Grubu

Araştırmanın çalışma grubu kolay ulaşılabılır örnekleme yöntemi ile belirlenmiş ve İç Anadolu bölgesindeki bir ilde görev yapan 15 sınıf öğretmenine ulaşılmıştır. Bu sınıf öğretmenlerinden 9’u kadın, 6’sı ise erkektir. 11’i daha önce STEM’le ilgili eğitim almamışken, 4’ü ise daha önce eğitim aldıkları görüşünü bildirmişlerdir.

Veri Toplama Aracı

Verilerin toplanmasında araştırmacı tarafından geliştirilen yarı yapılandırılmış görüşme formu kullanılmış ve sınıf öğretmenleri ile doğrudan görüşmeler yapılmıştır. Görüşme tekniğinde konuya derinlemesine, detaylı ve çok boyutlu nitel veriler elde edilir (Glesne, 2014). Yarı yapılandırılmış görüşme tekniğinde ise belirlenen konu doğrultusunda önceden hazırlanan sorulara ve bunlara verilen cevaplara göre yeniden sorular sorma imkânını veren bir görüşmedir (Yıldırım ve Şimşek, 2016). Görüşme formu geliştirilirken alan yazın taraması yapılmış, konu alanında uzman bir akademisyenin görüşlerine başvurulmuştur. Hazırlanan yarı yapılandırılmış görüşme formundaki soruların netliği, anlaşılabilirliği ve içeriği değerlendirilmiş ve uzman onayından sonra form güncellenmiş ve son halini almıştır. Ayrıca çalışma grubuna dahil olmayan bir sınıf öğretmeni ile yarı yapılandırılmış ön görüşme yapılarak forma ait soruların geçerliliği test edilmiştir.

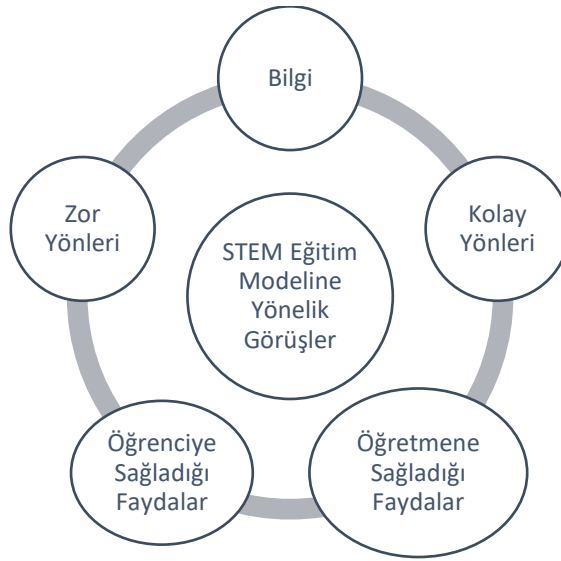

Verilerin Analizi

Öğretmeler ile yapılan doğrudan görüşmeler sonucunda araştırmanın amacı doğrultusunda nitel verilere ulaşılmıştır. İçerik analizi kullanılarak görüşmeler sonucunda elde edilen veriler analiz edilmiştir. Elde edilen veriler dört aşamada analiz edilmiştir. Bunlar; verilerin kodlanması, temaların ya da kategorilerin bulunması, kodların ve temaların düzenlenmesi, bulguların tanımlanması ve yorumlanması şeklindedir (Yıldırım ve Şimşek, 2016). Elde edilen veriler yazılı olarak “Word” ortamına aktarılmış, araştırmacılar tarafından tek tek okunmuş ve verilerden kodlar oluşturulmuştur. Bu kodlardan kategoriler ve kategorilerden temalara ulaşılmıştır. Bulguların daha rahat anlamlandırması için tablo ve şekillerle okuyucuya sunulmuş ve doğrudan alıntılar ile bulgular desteklenmiştir. Bireylerin isimleri saklı tutulmuş

ve sınıf öğretmenlerine kodlar verilerek bilimsel etiğe dikkat edilmiştir. Bu kodlar Ö1, Ö2, Ö3, Ö4, ...Ö20 olarak tablolarda sunulmuştur.

BULGULAR

Sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşleri “Bilgi”, “Öğrenciye Sağladığı Faydalar”, “Öğretmene Sağladığı Faydalar”, “Kolay Yönleri” ve “Zor Yönleri” şeklinde beş farklı temada toplanmıştır. Sınıf öğretmenlerinin bu görüşlerine ilişkin beş temada 35 farklı kategori oluşturulmuştur.

Şekil 1. Sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşleri

Sınıf öğretmenlerinin STEM eğitim modelinin “Bilgi” temasına ilişkin görüşlerine ait oluşturulan kategoriler Tablo 1’de sunulmuştur.

Tablo 1. STEM eğitim modelinin bilgi temasına ilişkin görüşler

Kategori	Katılımcılar	f
Disiplinler Arası Yaklaşım	Ö1,Ö2,Ö8,Ö10,Ö11,Ö15	7
Matematik ve Fen Eğitimi	Ö1,Ö2,Ö8,Ö10,Ö11,Ö15	6

Teknoloji ve Mühendislik Eğitimi	Ö2,Ö8	2
Yenilikçi Öğrenme	Ö4	1
Toplam		32

Tablo 1’de görüldüğü üzere sınıf öğretmenlerinin görüşleri doğrultusunda STEM eğitim modelinin “Bilgi” temasında 8 farklı kategori oluşturulmuştur. Bu bulguları desteklemek amacıyla sınıf öğretmenlerinden bazılarının görüşleri aşağıda sunulmuştur:

Ö10:” *Bilim, matematik, teknoloji ve mühendisliğin eğitim öğretime katılması ve bunların birbiriyle bütünleştirilerek öğretime uygulanmasıdır.*”

Ö15:”*Güncel bir eğitim modelidir. Örneğin matematik fizik derslerinin günlük hayatla ilişkilendirilmesidir.*”

Ö6:” *Eleştirel yaratıcıyı düşünmeyi geliştirmesi sorunlara çözüm bulmasını sağlar.*”

Ö7:”*Yaratıcı düşünme, eleştirel bakış açısı, buluş yapma, gelecek için beş zihin becerilerini geliştirir.*”

Ö3:”*Akademik kavramların gerçek problemlerle birleştirildiği öğrenmeye yönelik yaklaşımdır.*”

Ö5:”*Öğrencilerin üretim ve buluş yapma alanında yaratıcı düşünme, eleştirel düşünme, problem çözme yeteneklerini geliştirmeyi amaçlayan eğitimdir. İş dünyasına kolay alışmayı sağlar.*”

Ö4:”*Ezberden uzak, araştırma ve sorgulamaya dayalı yenilikçi bir eğitim modelidir.*”

Ö8:”*Fen teknoloji, mühendislik, matematiğin herhangi bir alanda ilişkilendirilmesidir.*”

Sınıf öğretmenlerinin STEM eğitim modelinin “Öğrencilere Sağladığı Faydalar” temasına ilişkin görüşlerine ait oluşturulan kategoriler Tablo 2’de sunulmuştur.

Tablo 2. STEM eğitim modelinin öğrencilere sağladığı faydalar

Kategoriler	Katılımcılar	f
Eleştirel Düşünme Becerisi	Ö2,Ö3,Ö4,Ö6,Ö8,Ö9,Ö10,Ö11	8
Yaparak Yaşayarak Öğrenme	Ö1,Ö5,Ö8,Ö11,Ö13,Ö14,Ö15	7
Kalıcı Öğrenme	Ö1,Ö7,Ö8,Ö9,Ö10,Ö12,Ö15	7
Yaratıcı Çözüm	Ö2,Ö3,Ö4,Ö5,Ö6,Ö10,Ö14	7
İşbirlikçi Öğrenme	Ö2,Ö3,Ö4,Ö7,Ö9	5
Tasarım Becerisi	Ö2,Ö5,Ö8,Ö9	4
Problem Çözme Becerisi	Ö3,Ö4,Ö5,Ö8,Ö9	4
Teknolojiyi Etkin Kullanma	Ö2,Ö11	2
Toplam		44

Tablo 2’de görüldüğü üzere sınıf öğretmenlerinin görüşleri doğrultusunda STEM eğitiminin uygulanmasının “Öğrencilere Sağladığı Faydalar” temasında 8 farklı kategori oluşturulmuştur. Bu bulguları desteklemek amacıyla sınıf öğretmenlerinden bazılarının görüşleri aşağıda sunulmuştur:

Ö2: “İşbirlikçi öğrenme, hayat boyu öğrenme, yaratıcılık, eleştirel düşünme, problem durumunun farkına varma, çözüm üretme, model tasarlama teknolojiyi etkin kullanma gibi faydalar sağlar.”

Ö1: “Öğrencilerin yaparak yaşayarak öğrenmelerine fırsat sağladığı için kalıcı öğrenme artar.”

Ö8: “Fen, matematik okuryazarlık oranını artırır. İş birliği yoluyla akranlarla yapılan çalışmada öğrenme kalıcılığı yüksek olur.”

Ö14: “Öğrencilerin donanımlı, yaratıcı düşünme becerilerinin geliştiği, hayatında öğrendiği bilgileri nasıl kullanacağı hakkında bilgi sahibi olmasını sağlar.”

Ö5: “Yaratıcı düşünme, buluş yapma problem çözme yetenekleri gelişir.”

Ö11: “Öğrencilerin günlük hayat problemlerinin farkına varmasını sağlar. Eleştirel düşünme becerisi kazandırır. Okuryazarlık becerilerine katkı sağlar.”

Sınıf öğretmenlerinin STEM eğitim modelinin “Öğretmene Sağladığı Faydalar” temasına ilişkin görüşlerine ait oluşturulan kategoriler Tablo 3’de sunulmuştur.

Tablo 3. STEM eğitim modelinin öğretmenlere sağladığı faydalar

Kategoriler	Katılımcılar	f
Bilgi Aktarımında Kolaylık	Ö7,Ö8,Ö9,Ö10,Ö11,Ö12,Ö14	7
Etkili Öğretim Kolaylığı	Ö2,Ö4,Ö6,Ö7,Ö8,Ö9,Ö10	7
Rehber Olma	Ö1,Ö3,Ö13,Ö15	4
Öğretmenin Mesleki Doyumu	Ö3,Ö5,Ö13,Ö15	4
Üst Düzey Bilişsel Beceriler	Ö6,Ö9	2
Zamanı Etkili Kullanma	Ö9	1
Toplam		25

Tablo 3’de görüldüğü üzere sınıf öğretmenlerinin görüşleri doğrultusunda STEM eğitiminin uygulanmasının “Öğretmenlere Sağladığı Faydalar” temasında 6 farklı kategori oluşturulmuştur. Bu bulguları desteklemek amacıyla sınıf öğretmenlerinden bazılarının görüşleri aşağıda sunulmuştur:

Ö11:''Öğrencilerin düşünme becerilerinin geliştirilmesi diğer derslerin öğretilmesinde öğretmene kolaylık sağlar.''

Ö9:''Zaman yönetimi konusunda öğretmene kolaylık sağlar.''

Ö10:''Eğitim ,öğretim ortamını zenginleştirir tek düzelikten ve sıkıcılıktan kurtarır öğretmenin daha verimli olmasını sağlar.''

Ö15:''Öğrencilerin keşfederek ve anlamlı öğrenmeler sağlaması öğretilmesinde mesleki doyumun oluşmasında oldukça önemlidir. Öğrenci keşfederek öğrenir öğretilmesinde yol gösterendir.''

Ö13:'' Öğrencinin aktifliği ,öğretmenin ders verimliliğine katkı sağlar.''

Ö6:''Öğrencinin düşünme becerisinin artması ,öğretmenin yeni konulara geçişini hızlandırır ve daha çok konu anlatır.''

Ö7:''Kolaylık sağlar, başarı oranını artırır. Öğrenilecek çalışmalarda akılda kalıcılık artar öğretmene katkı sağlar.''

Sınıf öğretmenlerinin STEM eğitim modelinin “Kolay Yönleri” temasına ilişkin görüşlerine ait oluşturulan kategoriler Tablo 4’de sunulmuştur.

Tablo 4. STEM eğitim modelinin kolay yönleri

Kategoriler	Katılımcılar	f
İlgi Çekici Olması	Ö4,Ö5,Ö8,Ö9,Ö10	5
Aktif Katılımı Sağlaması	Ö6,Ö9,Ö10,Ö12,Ö13	5
Kalıcı Öğrenme Etkisi	Ö3,Ö13,Ö15	3
Eleştirel Düşünme	Ö14,Ö15	2
Kavram Öğretiminde Kolaylık	Ö3,Ö11	2
İşbirlikçi Öğrenmeyi Sağlama	Ö2,Ö4	2
Görsel Destek İmkani	Ö1,Ö7	2
Hatalarından Öğrenmeyi Sağlama	Ö2	1
Toplam		22

Tablo 4’de görüldüğü üzere sınıf öğretmenlerinin görüşleri doğrultusunda STEM eğitim etkinliklerinin uygulanmasının “Kolay Yönleri” temasına 8 farklı kategori oluşturulmuştur. Bu bulguları desteklemek amacıyla sınıf öğretmenlerinden bazılarının görüşleri aşağıda sunulmuştur:

Ö10: "Eğlenceli bir eğitim ortamı yaratması öğrenciyi motive etmeyi sağlar bu da süreci kolaylaştırır Merak ve ilgiyi canlı tutar. Gerçek dünya problemleri, keşfetme arzusu eğitim öğretim ortamı için oldukça olumlu ve kolaylaştırıcı bir yol sunar."

Ö12: "Yaparak, yaşayarak aktif öğrenme sağlaması kolay yönlerindedir."

Ö13: "Gerçek dünyayla bağlantı kuran bir uygulama olduğu için öğrenmenin daha kalıcı olmasını sağlar ve öğrenciyi aktif kılarak başarıyı artırır."

Ö15: "Öğrencileri keşfetmeye yönlendirmek ve eleştirel düşünme becerileri kazandırmak, öğrencilerde öz bilincin gelişmesini sağlar ve bu durumda öğrenci kendi kentine öğrenmeyi öğrenir."

Ö9: "Eğlencelidir, bireyi merkeze alır birçok farklı alanı barındırdığından ilgi çeker ve katılımı artırır."

Ö4: "İlgi çekici olması, grup çalışmasına uygun olması."

Ö7: "Malzeme ile çalışma imkânı sağladığı için, görsel destek sağlar öğrenme zenginleşir."

Ö2: "İşbirlikli öğrenme ve grupla çalışma yapıldığı için iletişim becerisi kazandırır. Aynı zamanda hata yapmayı öğrenir. Hatalarından ders çıkararak yeni öğrenmeler sağlar."

Sınıf öğretmenlerinin STEM eğitim modelinin "Zor Yönleri" temasına ilişkin görüşlerine ait oluşturulan kategoriler Tablo 5'de sunulmuştur.

Tablo 5. STEM eğitim modelinin zor yönleri

Kategoriler	Katılımcılar	f
Zaman Sıkıntısı	Ö1,Ö2,Ö3,Ö4,Ö5,Ö6,Ö10,Ö11,Ö12	9
Maddi İmkanların Azlığı	Ö1,Ö4,Ö9,Ö11,Ö14,Ö15	6
Kalabalık Sınıf Ortamı	Ö1,Ö2,Ö7,Ö9,Ö10	5
Materyal Eksikliği	Ö3,Ö7,Ö9,Ö12	4
Müfredat Yoğunluğu	Ö3,Ö6,Ö13,Ö15	4
Bilgi Eksikliği	Ö8	1
Toplam		29

Tablo 5'de görüldüğü üzere sınıf öğretmenlerinin görüşleri doğrultusunda STEM eğitim etkinliklerinin uygulanmasının "Zor Yönleri" temasında 6 farklı kategori oluşturulmuştur. Bu

bulguları desteklemek amacıyla sınıf öğretmenlerinden bazılarının görüşleri aşağıda sunulmuştur:

Ö1:” Zaman ve maddi açıdan uygulanması zor, kalabalık sınıflarda uygulamak da zor olabilir.”

Ö9:” Zaman problemi oluşabilir, öğretmenlerin bunları önceden tasarlamasını gerektirir bu da öğretmeni yorabilir alternatif ölçme araçlarını kullanmayı gerektirebilir.”

Ö15:” Sosyo-ekonomik nedenler süreci zorlaştırabilir. Ayrıca bizim eğitim sistemimiz gibi sınava yönelik eğitim sistemlerinde birtakım sıkıntılar yaşanabileceğini düşünüyorum.”

Ö7:” Sınıf ortamının kalabalık olması ve bu etkinlikleri yaparken gereksiz gürültülerin oluşacağı ve öğrencilerin malzeme birleştirme süreçlerinde zorlanacaklardır.”

Ö12:”Uygulamada materyal eksiklikleri olma durumu ile karşılaşılacağı ve uygulama da zaman sıkıntı olacağını düşünüyorum.”

Ö13:”Her ders için uygulama imkânı olmayabilir. Her bölge ve il için tek bir eğitim öğretim çerçevesinde ortak bir ürün çıkmayabilir.”

Ö8:” Öğretmenlerin ve öğrencilerin bu eğitim hakkında yeterince bilgi sahibi olmamaları .”

SONUÇ ve TARTIŞMA

Bu araştırmada sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşleri belirlenmiştir. Araştırma sonucunda sınıf öğretmenlerinin STEM eğitim modeline yönelik görüşleri “bilgi”, “öğrenciye sağladığı faydalar”, “öğretmene sağladığı faydalar”, “kolay yönleri” ve “zor yönleri” şeklinde beş farklı temada ve 35 farklı kategoride toplandığı tespit edilmiştir.

Araştırmada sınıf öğretmenlerinin bilgi temasına ilişkin, STEM eğitimi hakkında tam bir tanım yapmadıkları görülmüş ve farklı görüşler belirtmişlerdir. Sınıf öğretmenleri bu modeli duyduğunu ancak ayrıntılı bilgiye sahip olmadığını, fen, matematik, teknoloji ile ilgili bir eğitim olduğunu, bu modelin ezberden uzak araştırmaya sorgulamaya dayalı olduğunu, eleştirel bir bakış açısı olan bir eğitim, ürün tasarlama ve yaratıcılık kavramlarını ön plana çıkaran ifadeler sunmuşlardır. Ramli ve Subahan (2017) yaptıkları araştırmada öğretmenlerin bu modeli fen, teknoloji, mühendislik ve matematik şeklinde tanımlama yaptıklarını keşfetmişlerdir. Öğretmenlerin tam bir tanımlamada bulunamaması veya farklı tanımlamalara

yönelmesi, sınıf öğretmenlerinin bu konuda yeterli bir eğitim almamış olmalarından kaynaklanmış olabilir. Araştırmaya katılan on beş sınıf öğretmeninden 11'i daha önce eğitim almadığını belirtmişlerdir. STEM eğitimi ile ilgili yapılan araştırmalar incelendiğinde, Belek (2018) öğretmen adaylarının büyük bir kısmının STEM eğitimini ilk kez duydukları sonucuna ulaşırlarken bu model hakkında öğretmen adaylarının akıllarına topluluk, kuruluş, mühendislik uygulamaları ve fen ile ilgili projeler geldiğini belirtmişlerdir. Özdemir ve Cappellaro (2020) ise sınıf öğretmenlerinin STEM hakkında yeterli bilgiye sahip olmadıklarını, sadece isim olarak duyduklarını tespit etmişlerdir. Sınıf öğretmenlerinin bu durumunu STEM eğitimine yönelik daha önceden eğitim almamış olmalarına bağlamıştır.

Öğrenciye sağladığı faydalar temasına ilişkin sınıf öğretmenleri STEM eğitim etkinliklerinin eğitim öğretime uygulanmasında kalıcı öğrenme, işbirlikçi öğrenme, problem çözme becerisi, tasarım yapabilme ve teknolojiyi etkin kullanma becerisi sağladığını ifade etmişlerdir. Sınıf öğretmenleri bu etkinliklerin 21. yüzyıl becerilerini geliştirmesinde yararlı olabileceğini belirtmişlerdir. Şahin, Ayar ve Adıgüzel (2014) STEM ile ilgili uygulamaların öğrencileri işbirlikçi öğrenmeye, birlikte araştırma yapmaya yönlendirdiğini ve 21. yüzyıl becerilerinin gelişimine katkı sağladığını tespit etmişlerdir. Sarı ve Katrancı (2020) da yaptıkları çalışmada STEM etkinliklerinin öğrencilerin derse yönelik ilgi ve motivasyonlarını olumlu yönde etkilediği, ayrıca öğrencilerde düşünme becerisini artırdığı, birlikte çalışma alışkanlığını ve el becerilerini geliştirdiği sonuçlarına ulaşmışlardır.

Öğrenciye sağladığı faydalar temasına ilişkin sınıf öğretmenleri STEM eğitim etkinliklerinin eğitim öğretim ortamında uygulanmasının bilgi aktarımında kolaylık, etkili zaman yönetimi kolaylığı getirmesi, öğretim kolaylığı sağlaması, üstbilişsel becerileri harekete geçirmesi ve mesleki olarak doyuma ulaştırması olarak ifade etmişlerdir. Özdemir ve Cappellaro (2020) çalışmasında sınıf öğretmenlerinin STEM etkinliklerinin öğretmene sağlayacağı ayrıcalıkları büyük oranda kişisel ve mesleki ilerlemeye katkı sağladığı vurgusunu yaparken aynı zamanda bu modelin verimli öğretim ortamı ve eğlenceli eğitim ortamı sağlamasının önemli bir kazanç olduğundan bahsetmektedirler. Yapılan araştırmada bu çalışmanın sonucunu destekler niteliktedir.

Kolay yönleri temasına ilişkin sınıf öğretmenleri eğitim öğretim ortamında STEM eğitimi etkinliklerinin uygulanmasının ilgi çekici olması, görsel destek sağlaması, yaparak yaşayarak öğrenmeye katkı sağlaması, kalıcı öğrenmeye destek, kavram öğretiminde etkili olması olarak ifade etmişlerdir. Öğretmenler STEM'in kolay yönlerinin olduğunu ve bazı engellerin ortadan kaldırılırsa sınıf ortamında kullanabileceklerini belirtmişlerdir. İmir (2019) ve Süldür'de (2019)

yaptıkları çalışmalarda STEM temelli etkinliklerin sınıf öğretmenlerinin geneli tarafından derslerinde uygulamak istediklerini tespit etmişlerdir.

Kolay yönleri temasına ilişkin sınıf öğretmenleri STEM eğitim etkinliklerinin eğitim öğretim ortamlarında uygulanmasında zamanın kısıtlılığı ve buna karşın müfredatın yoğun olması, materyal eksikliği ve maddi yetersizliklerin olması, eğitim hakkında bilgi yetersizliği ve sınıfların kalabalık olması yönünde fikir belirtmişlerdir. Müfredata ve ders kitaplarına entegre edilecek STEM etkinlikleri bu konuda sınıf öğretmenlerinin işini kolaylaştırabilecektir. Bazı çalışmalarda STEM eğitim modelini uygulamada hiçbir engeli olmadığını düşünen öğretmenler de bulunmaktadır (Özdemir ve Cappellaro, 2020; Siew, Amir ve Chong, 2015).

Öneriler

Elde edilen bulgular doğrultusunda aşağıdaki öneriler sıralanabilir:

- 1- STEM eğitimi etkinliklerinin ilkokullarda uygulanabilmesi için müfredatta düzenlemeler yapılabilir. Hazır etkinlikler şeklinde ders kitaplarında yer alması sağlanabilir. Dolayısıyla sınıf öğretmenlerinin bu modele ilişkin kaygıları giderilebilir.
- 2- STEM eğitiminin uygulanabilmesi için maddi yetersizlikler giderilmesine yönelik okul – yönetim – veli işbirliği artırılabilir. Böylece daha uygun öğrenme ortamları sağlanabilir.
- 3- Hizmet içi eğitimlerle ve lisansüstü eğitimlerle daha çok sınıf öğretmenine ulaşılmaktadır. Böylece STEM eğitimine yönelik etkinlikler ilkokullarda da yaygınlaştırılabilir.

ABSTRACT

Determination of soil moisture constants is a very important issue for soil-plant-water relations. The van Genuchten (1980)-Mualem (VGM) model is a commonly used equation to estimate soil moisture constants. In this study, the moisture constants (field capacity and wilting point) of the soils were estimated by VGM in semi-arid climate conditions, where agricultural production is common, and the estimation accuracy was evaluated. The soil belonging to the study was taken from the Isparta region. VGM equation parameters were determined within the ROSETTA program. The root means square error (RMSE) value obtained as a result of the field capacity estimation of the soils was $0.125\text{cm}^3\text{ cm}^{-3}$, while the Lin's concordance correlation coefficient (LCCC) values were determined as 0.529. When the estimation performance of the wilting point was evaluated with the VGM model, the mean square error (MSE) was $0.006\text{ cm}^3\text{ cm}^{-3}$, while the ratio of performance to deviation (RPD) value was 0.98. Model prediction interval (PI) was determined as $0.115\text{-}0.738\text{ cm}^3\text{ cm}^{-3}$ for field capacity at 90% confidence interval and $0.01\text{-}0.401\text{ cm}^3\text{ cm}^{-3}$ for wilting point. According to the LCCC and RPD values, the accuracy of the model was evaluated as poor. In cases where the textural fractions of the soils are 50% or more, the error rate is generally high in the estimations obtained. It has been evaluated that the model generally predicts with higher success in medium textural groups.

Keywords: Field capacity, wilting point, pedotransfer function, pF

INTRODUCTION

The water scarcity risk draws attention in society and can be related with global climate changes, poor soil use and management, and the waste of water from rivers and aquifers (UN-Water, 2019). Soil is an indispensable reservoir of water, which is important for plant production and other terrestrial ecosystem functions. Furthermore, soil water content is an important parameter that directly affects the uptake of nutrients by plants and their availability and distribution over the soil profile. The water content is also a limiting parameter of several soil functions such as aeration, temperature, infiltration, and surface runoff (Priori et al., 2021).

Some mechanical properties of the soil such as plasticity, consistency and swelling-shrinkage are also dependent on its water content and, therefore, its determination is a basic requirement in soil, hydrology, and engineering studies that evaluate soil use and management. In this context, the soil water retention curve (SWRC) is an important property that reflects soil texture and structure features revealing its porosity, pore size distribution, integral energy, and water adsorbing level (Topp et al., 2008; Jaiswal et al., 2020). Due to it, SWRC is an interesting tool to be used for assessing soil compaction since several of these structure features changes with the compaction process. At low levels of pressure head (positive values), matrix suction is particularly dependent on capillarity and pore size distribution and therefore is strongly influenced by soil structure. On the other hand, since the water retention at higher suctions is governed by the adsorption mechanism, it is more affected by texture and specific surface area of the soil particles rather than their own arrangement (Karahana et al., 2014).

Measuring SWRC in large scales is time-consuming and often requires large costs. Thus, the use of simulation models in the analysis of the soil water retention is an inexpensive and feasible method. In this regard, computer models based on pedotransfer functions (PTFs) have been upgraded to predict soil water movement (Anlauf et al., 2012). Although a more complete ecological-modelling requires specific information associated with regions, climate, plants, and geology (Weynants et al., 2009), the majority of PTFs applied in the past decades to simulate the soil water status is solely dependent on textural contents. There are 2 approaches in PTFS regarding water retention in soil, point and parametric. For the estimation of soil water content under various pressure loads, the creation of separate models specific to each pressure load is a point approach (Rawls and Brakensiek, 1989). Determining the estimation coefficients in the models is parametric approaches (Rajkalet et al., 2004). Some of the most commonly used equations for this purpose are those proposed by Brooks and Corey (1964), Campbell (1974) and Van Genuchten et al. (1980). According to Alaboz et al. (2021), the van Genuchten's

(1980) equation (VG) parameters were successfully estimated by ROSETTA-PTF-program within the scope of determining some key soil water contents in Isparta-Turkey.

In this study, it is aimed to evaluate how successful the VG equation is in estimating the field capacity and wilting point of the soils. The study of this equation in semi-humid ecological conditions with different soil properties reveals the original aspect of the study.

MATERIAL and METHODS

Study area and soil sampling

The study area is within the borders of Bozanönü village and Kuleönü town in the Central District of Isparta province in the Western Mediterranean Region. The area is located in the north of the city center, between the coordinates N: 285161-290007, E: 4192095-4197260 (UTM-m, WGS 1984, Zone 36N) (Figure 1). The average elevation of 923 meters above sea level is identified and according to Corine (2018), the land use and cover classification of the entire study area (1371.88 ha) is classified as agricultural land where grain and fodder crops are extensively found in the area.

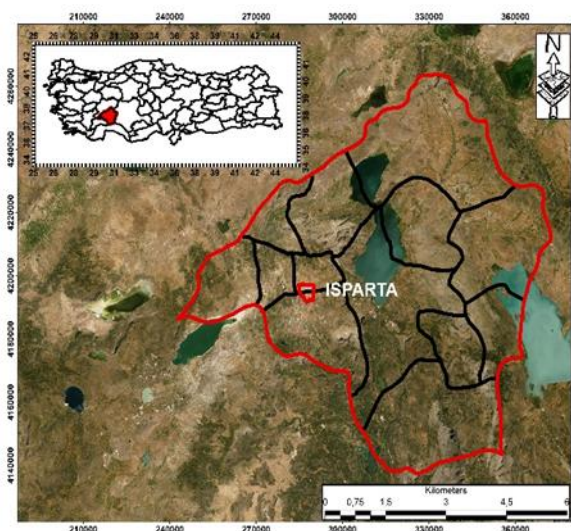

Figure 1. Soil sampling patter and location maps of the study area

The climate over the study area can be described as sub-humid and according to a long-term meteorological data set (1974-2017), the mean annual precipitation and temperature of the research area are 467 mm and 12.3 °C, respectively. Soil temperature and moisture regimes are *Mesic* and *Xeric* (in sub group level *Dry Xeric*), respectively based on the Newhall simulation model (Van Wambeke, 2000).

A random soil sampling was carried out over the study area by taking into account the land use. Soil samples were taken from 0-30 cm depth from a total of 104 sampling points in the area. Disturbed and undisturbed soil samples were taken from 104 points. Undisturbed soil samples were taken by means of steel cylinders with a volume of 100 cm³. The analysis of pH and EC of the soils were measured in 1:1 samples (soil: water suspension) (U.S. Salinity Lab. Staff, 1954). The organic matter content was measured by the Walkley-Black method, and the equivalent lime content was determined volumetrically with a calcimeter. Texture was determined according to the Hydrometer method (Soil Survey Staff, 1992; Burt, 2014).

The soil water contents were measured with undisturbed core samples in pressure plate apparatus at 33 kPa, here defined as field capacity (θ_{FC}), and at 1,500 kPa, here defined as permanent wilting point (θ_{PWP}). The bulk density (ρ_b) was evaluated according to the undisturbed sampling method (Klute, 1986; Burt, 2014).

Model prediction and evaluation

The van Genuchten's (1980) (VGM) parameters that describe both water retention and unsaturated hydraulic conductivity functions.

The VGM equations to describe the SWRC is given as follows:

$$\Theta = \frac{\theta - \theta_r}{\theta_s - \theta_r} = \left[\frac{1}{1 + (\alpha h)^n} \right]^m \quad \text{Eq. (1)}$$

in which θ is the volumetric soil water content (m³ m⁻³) as a function of the soil water pressure head (h), considered positive for unsaturated conditions, Θ is the effective saturation, θ_r and θ_s are respectively the residual and saturated water content (m³ m⁻³), α (m⁻¹), λ , n and m ($m = 1 - 1/n$) are empirical curve shape parameters. Retention Curve (RETC) program-Rosetta neural network was used in the evaluation of the moisture characteristic parameters.

The mean absolute error (MAE), root mean square error (RMSE), mean absolute percent error (MAPE), Lin's concordance correlation coefficient (LCCC) and ratio of performance to deviation (RPD) parameters, were used to assess the effectiveness of models (Eq. 2, 3, 4, 5). According to Shrestha and Solomatine's (2006) method, the 90% prediction interval (PI) was determined.

$$MAE = \frac{1}{n} \sum_{i=1}^n |Z_i - Z| \quad (2)$$

$$RMSE = \sqrt{\frac{\sum (Z_i - Z)^2}{n}} \quad (3)$$

$$MAPE = \frac{1}{n} \sum_{i=1}^n \left| \frac{Z_i - Z}{Z} \right| * 100 \quad (4)$$

$$LCCC = \frac{2S_{xy}}{S_x^2 + S_y^2 + (x_m - y_m)^2} \quad (5)$$

$$RPD = \frac{SD}{RMSE} \quad (6)$$

In equation Z_i : predicted value, Z : observed value, n : number of observations; n : number of observed value, x_i and y_i are the measured and predicted soil properties; x_m and y_m are the means of for x_i and y_i ; and S_x^2 and S_y^2 are the corresponding variances, SD is the ratio standard deviation and $RMSE$ is the root mean square error.

Descriptive statistics of soil properties were obtained in the R program. It was used "Tidyverse, modeldata" packages in R for the PI calculation. "DescTools and ML metrics" packages were used for LCCC. Thereby, R software and ggplot2 package (library) were used to create the Violin plot graphics of the obtained results.

RESULTS and DISCUSSION

Soil properties

The results of the descriptive statistical analysis of the examined physico-chemical properties of the soils in the study are shown in Table 1. The contents of clay, silt, and sand of the soils varied between 5.59-63.00%, 11.15-70.41%, and 9.00-78.40%, respectively. About 51% of the soils of the study area, where the medium and heavy texture is dominant, are present in clay (C) or in the clay loam (CL) texture classes. The texture class distributions of the soils are given in Figure 2. Approximately 3% of the soil samples were classified as coarse (LS), 67% as medium (SL, L, SiL, Si, CL, SCL, SiCL), and 34% as heavy (SiC, C) textured. Organic matter contents are at low-good levels (0.89-2.68%) according to Hazelton and Murph, (2016). The salt content of soils with a slightly alkaline reaction was determined to be low (0.25-0.74 dS cm⁻¹). The bulk density of the soils ranged from a minimum of 1.14 g cm⁻³ to a maximum of 1.89 g cm⁻³.

Table 1. Descriptive statistics of soil properties

	Minimum	Maximum	Mean	Std. Deviation	Skewness	Kurtosis
Clay-%	5.59	63.00	33.56	12.02	0.22	-0.78
Silt-%	11.15	70.41	32.37	13.52	0.65	0.52
Sand-%	9.00	78.40	34.06	15.25	1.55	0.50
OM-%	0.89	2.68	1.54	0.30	0.65	-0.47
pH	7.68	8.25	8.01	0.22	0.52	0.55
EC dS cm ⁻¹	0.25	0.74	0.45	0.23	1.25	0.85
ρ_b g cm ⁻³	1.14	1.89	1.28	0.25	0.98	-0.098
θ_{FC} cm ³ cm ⁻³	0.11	0.55	0.33	0.11	0.50	-0.78
θ_{PWP} cm ³ cm ⁻³	0.06	0.39	0.20	0.09	0.44	-0.76

ρ_b : bulk density, ρ_p : solid-particle density, θ_s : saturated water content, θ_{FC} : soil water content at field capacity, θ_{PWP} : soil water content at permanent wilting point

Figure 2. Textural class triangle
 Sa:Sand, Cl:Clay, LO:Loamy, Si:Silt

The results of θ_s , θ_{FC} and θ_{PWP} of the soils varied between 0.39-0.63 cm³ cm⁻³, 0.11-0.55 m³ m⁻³, 0.06-0.039 cm³ cm⁻³, respectively. The features farthest from the normal distribution were determined as sand, EC. The distribution of ρ_b was near-normal left-skewed, while other properties showed a right-skewed distribution. The positive skewness coefficient in organic matter (OM) contents is an indicator of right skewness. This is a result of the high number of samples with low OM content. Gucdemir (2006) stated that 65% of the soils in the Lakes region, which are close to the study area, have low OM content (0-2%). These low values may be associated with poor vegetation and increased oxidation with cultivation, typically in arid and

semi-arid regions. While the field capacity of the soil was 0.11-0.55 cm³ cm⁻³, the wilting point varied between 0.06-0.39 cm³ cm⁻³.

Evaluation of the Model

The descriptive statistics of the equation parameters obtained from the Rosetta program are given in Table 2. Sand, silt, clay and bulk density contents of the soils were used in the Rosetta algorithm. In the Van Genuchten model, the inverse of the α parameter is known as the air intake value. It is expressed as the matric potential of the water, which is the beginning of the drainage, where the air begins to enter the large pores in the soil. n and m are shape parameters and are values obtained to minimize the difference between the estimated volumetric water content and the measured water content value at a given soil water pressure. n is a dimensionless parameter related to the curve shape. For the coefficient m , it is determined using the equation $m=1-1/n$ stated by Mualem (1976) (van Genuchten and Nielsen, 1985, van Genuchten et al. 1991). As the soil water potential increases, the amount of remaining water in the soil approaches zero and after a point the water retention curve starts to bend and continues to be stable. The resulting inflection point corresponds to the remaining water content (θ_r) (Abdulwahhab, 2020). According to Alaboz et al. (2021) stated that the estimations of moisture content in saturation (θ_s) and residual water content (θ_r), which are among the parameters of the van Genuchten model, show results close to reality, with the n coefficient estimated by the Rosetta program varying between 1.383-4.374 and the m coefficient between 0.277-0.771. Again, many researchers reported that the estimations of α and n are generally imprecise and vary depending on soil characteristics (Barros et al., 2013; Medeiros et al., 2014).

Table 2. Descriptive statistics of parameters obtained by ROSETTA

	Mean	St.Dev	Minimum	Maximum	Skewness	Kurtosis
θ_s	0.51	0.06	0.36	0.63	-0.01	-0.79

θ_s :saturated moisture content, θ_r :residual moisture content, α , n , m : equation parameters

The results of θ_{FC} and θ_{PWP} calculated based on VGM parameters and the Violin box-plot graphic of observed values are given in Figures 3 and 4. Violin chart is one of the most effective methods for visualizing the distribution and probability density of data because it clearly reflects the range towards which the data is distributed and where there is imbalance.

Figure 3. Distribution of field capacity values with Violin box-plot

Figure 4. Distribution of permanent wilting point values with Violin box-plot

The distribution of observed and predicted values for field capacity and wilting point are given in Figures 5 and 6. Model prediction interval (PI) was determined as 0.115-0.738 $\text{cm}^3 \text{ cm}^{-3}$ for field capacity at 90% confidence interval and 0.01-0.401 $\text{cm}^3 \text{ cm}^{-3}$ for wilting point. The predicted values generally showed accumulation in the 3rd quarter for the field capacity. The third quarter represents the region between the median and maximum. For the wilting point,

the predicted values clustered between the first quartile and the median. The first quartile is the part between the median and the minimum.

Figure 5. Distribution of observed and predicted values for field capacity

Figure 6. Distribution of observed and predicted values for wilting point

Evaluation parameters of model accuracy are given in Table 3. LCCC = 1 for perfect agreement, $LCCC > 0.9$ for excellent, $0.8 < LCCC < 0.9$ for good, $0.65 < LCCC < 0.8$ for moderate, and $LCCC \leq 0.65$ for poor agreement (Rossel et al. 2016). Rossel et al. (2006) classified as a $RPD > 2.5$ for excellent, $2.0 < RPD < 2.5$ for very good, $1.8 < RPD < 2.0$ for good, $1.4 < RPD < 1.8$

for fair, $RPD < 1.4$ for poor. According to Lewis (1982)'s MAPE classification, the estimations obtained by VGM are considered "acceptable" (20-50%). The accuracy of the model is evaluated as "poor" according to LCCC and RPD values. In the PWP estimation, RMSE, MAE, MAPE values were determined at lower levels. One reason why the lower error level is determined compared to FC is that PWC is determined at lower levels. The examples that deviated the most in the data set used in field capacity and wilting point estimation are given in Figure 7, 8. When the textural fractions of the points specified in Figures 7 and 8 were examined, it was determined that the clay content was higher than 50% for the field capacity and the sand content was higher than 50% for the wilting point.

Table 3. Model evaluation parameters

	RMSE	MAE	MAPE- %	MSE	LCCC	RPD
θ_{FC}	0.125	0.103	35.90	0.015	0.529	0.82
θ_{PWP}	0.078	0.063	31.45	0.006	0.541	0.98

Figure 7. Residual values for field capacity

Figure 8. Residual value for wilting point

CONCLUSION

In this study, the soil water contents at field capacity and permanent wilting point of Isparta-Turkey region, which is under semi-arid climate, were examined by means of VGM. When the obtained model accuracy parameters were compared, it was evaluated as an “acceptable” model according to the MAPE value. However, the excess residues resulting from samples with high deviations due to differences in textural fractions were evaluated as a "poor" relationship in LCCC and RPD values. In the study, it was observed that the contents of textural fractions were generally higher than 50% in deviant samples. In general, it has been evaluated that more effective estimations are made in medium texture group soils. Therefore, it is thought that more effective results will emerge if the textural groups are evaluated separately in future studies.

ABSTRACT

In this study, we aimed to investigate the antitumor properties of aminomethyl derivatives synthesized from bis-1,2,4-triazole compounds in MCF-7 human breast cancer cells. Since aminomethyl derivatives containing bis-triazole ring as the main functional groups are biologically active compounds, the idea of synthesizing aminomethyl derivatives over 1,2,4-triazoles was born. Therefore, it is expected that the compounds obtained in this way will also be biologically active. The study was carried out at four different concentrations (0.1 μ M, 1 μ M, 10 μ M and 100 μ M). We found that the test compounds L1, L3, L4, L5 at all concentrations significantly ($P < 0.001$) destroyed cancer cells and decreased the percent viability compared to the control. The 1,2,4-triazoles compounds that showed anti-tumor properties in vitro in this study will pave the way for more comprehensive studies in the future. These properties will support the literature in potential antitumor drugs or new drug development.

Keywords: Aminomethyl Derivatives, Antitumor, Cancer, MCF-7

INTRODUCTION

Although there has been a significant increase in the number of compounds with biologically active effects in recent years, the use of most of them has been limited due to the difficulty of administration, high risk of toxicity, emergence of drug resistance, the observation of undesirable side effects, pharmacokinetic deficiency or inadequacy in activity. This situation forces today's science to continuously develop new agents. Many compounds used as drugs today contain five-membered heterocyclic ring structures, especially thiadiazole, triazole and oxadiazole. These rings have various isomers according to the position of heteroatoms. However, the most biologically active of these isomers are 1,2,4-triazole, 1,3,4-thiadiazole and 1,3,4-oxadiazole derivatives. The synthesis of five-membered heterocyclic compounds has become increasingly important in recent years due to their various application areas, one of the most important of which is undoubtedly the field of chemotherapy (Chavez & Parrish, 2009; Turan et al., 2001). Such five-membered ring-containing compounds have a wide spectrum of biological activities such as antibacterial, antifungal, anti-HIV, antitumor, antiviral, antidepressant, anti-inflammatory, anti-tuberculosis, diuretic, analgesic, diuretic, diuretic, and analgesic, especially anticancer activity.

It is known that free radicals play a role in the development of many cardiovascular, rheumatic, auto-immune and neurological diseases as a result of our organism being exposed to high levels of oxidative stress (Maccarrone & Ullrich., 2004). Our organism tries to protect itself from these harmful effects with the help of many enzymatic and non-enzymatic chemicals. However, industrial developments, urban life and environmental pollution factors in today's conditions make these protection weapons of the organism inadequate and in many cases it is necessary to use supplementary antioxidant substances from outside (Kelly, 1998).

In this study, we aimed to investigate the biological effects of some bis-1,2,4-triazole derivatives according to the positions of the side groups on the structure and to add them to the literature. We think that the antitumor properties of bis-1,2,4-triazole-containing aminomethyl derivatives used in the study in MCF-7 human breast cancer cells will be guiding preliminary studies for the acquisition of new candidate compounds and will provide new study areas for academicians in this discipline.

MATERIALS and METHODS

The aminomethyl derivatives containing bis-1,2,4- triazole ring and their IUPAC nomenclature are as follows.

5,5'-bütan-1,4-diilbis(4-allil-2,4-dihidro-3H-1,2,4-triazol-3-tiyon (The starting material of compounds with formation reactions)	
L1	5,5'-bütan-1,4-diilbis[4-allil-2-({4-[3-(triflorometil)fenil]piperazin-1-il }metil)-2,4-dihidro-3H-1,2,4-triazol-3-tiyon
L2	5,5'-bütan-1,4-diilbis{2-[(4-benzilpiperazin-1-il)metil]-4-allil-2,4-dihidro-3H-1,2,4-triazol-3-tiyon
L3	5,5'-bütan-1,4-diilbis[4-allil-2-(pirolidin-1-ilmetil)-2,4-dihidro-3H-1,2,4-triazol-3-tiyon
L4	5,5'-bütan-1,4-diilbis{4-allil-2-[(dipropilamino)metil]-2,4-dihidro-3H-1,2,4-triazol-3-tiyon
L5	5,5'-bütan-1,4-diilbis{4-allil-2-[(4-metilpiperidin-1-il)metil]-2,4-dihidro-3H-1,2,4-triazol-3-tiyon

MCF-7 Thawing, Cultivation in Flasks, Feeding and Division

Frozen MCF-7 (human breast cancer cells) from the cell culture bank (ATCC, USA) were thawed at room temperature and transferred into 75 ml flasks. DC5 (25 ml) was added to the flask and the flasks were placed in a Nuair brand 5% CO₂ - 95% O₂ incubator (Playmouth, MN, USA). The condition of the cells was checked daily using a Soif inverted microscope (Soif Optical Inc., China) and at the end of the third day, DC5 in the flasks was removed and replaced with fresh DC5. This procedure was repeated continuously at three-day intervals. The cells continued to increase in number and began to form layers on top of each other, completely covering the bottom of the flask. At the end of the 15th day, the medium in the flasks was removed and replaced with 3 ml trypsin and placed in the incubator. The flasks were gently shaken every 2-3 minutes to allow the cells to detach from the adherent surface.

After all cells were detached from the surface of the flasks, 12 ml DC5 was added to the flasks and the cells were homogeneously dispersed in the solution by careful trituration (separation of the suspension by drawing the suspension into a pipette and emptying it). Cells were counted using a hemocytometer. Each flask was filled with a cell suspension of 5×10^6 cells, DC5 was added (total volume 25 ml) and all flasks were placed in an incubator. Cells were seeded, fed and experiments were performed in a sterile class II laminair flow (Biolaf, Ankara) (Offeing & Martelli, 1997; Ferrari et al., 1999).

Determination of Cell Number and Substance Doses to be Used

MCF-7 breast cancer cells were removed by adding trypsin to the flasks and the cell suspension was centrifuged at 2000 rpm for 5 min. The trypsin-medium mixture in the tubes was removed and DC5 was added instead and the cells were trituated to form a single cell suspension. Cells

were counted using a hemocytometer and the cell count was adjusted to 1×10^6 /ml cells for MCF-7 cell experiments. In this way, the doses were decided to be 0.1 μ M, 1 μ M, 10 μ M and 100 μ M (Kumamoto et al., 1990).

One ml of the cell suspension was transferred to test tubes and the test agents were added at concentrations of 0.1 μ M, 1 μ M, 10 μ M and 100 μ M. The same amount of saline was added to the negative control tubes and the same amount of DMSO was added to the vehicle tubes and the tubes were placed in the incubator. The amount of DMSO in the cell suspensions was not more than 1%. After 24 hours, the tubes were removed from the incubator, triturated and the cell suspension was mixed with 0.4% trypan blue at a ratio of 1:1 (v/v) and 100 randomly selected cells were counted on a hemocytometer. Cell viability rate was expressed as percentage (Esefsi, 2004).

FINDINGS and DISCUSSION

Measurement of Antitumor Properties in Vitro

The findings obtained from the treatment of MCF-7 (human breast cancer) cells with the test substances were presented in the form of a tabular figure showing the comparison of the groups with the control group throughout the treatment in each of the parameters. Live cell results of MCF-7 cells treated with the substances are given in table 1.

Table 1. Percentage viability of MCF-7 cells treated with compounds according to dose

% Cell Viability (MCF-7)	Groups							--P--
	Control	Solvent control	L1	L2	L3	L4	L5

According to the results obtained above, we determined that all of our test substances destroyed cancerous cells in a statistically significant way compared to the control. Although the L2 test substance had a good effect compared to the control, it was determined that our L1, L3, L4, L5 test substances showed good anti-carcinogenic effects.

In this study, the antitumor activity of some bis 1,2,4 triazole derivative compounds applied to MCF-7 cells in vitro was found to have different effects compared to the control group. According to the results we obtained, we determined that all of our test substances destroyed cancerous cells in a statistically significant way compared to the control. Considering the parameters measured in this study and the number of dead cells during the experiment, it can be said that our L1, L3, L4, L5 test substance showed antitumor activity. The L2 test compound, on the other hand, did not kill much living cancer cells and gave results close to the control.

The study was carried out at four different concentrations (0.1 μ M, 1 μ M, 10 μ M and 100 μ M). At all concentrations, L1, L3, L4, L5 test compounds significantly ($P < 0.001$) destroyed cancer cells and decreased the percent viability compared to the control.

In the study, L4 compound decreased MCF-7 cancer cell viability the most at a concentration of 0.1 μ M. We found that L4 compound destroyed cancer cells and decreased the percent viability ($P < 0.001$) compared to the control. In addition, it can be said that L5, L3, L1 substances also have significant anticancer properties compared to the control. At 1 μ M concentration, L5 compound showed the lowest percentage MCF-7 cancer cell viability. Statistically, we found that it destroyed cancer cells in the most significant way and decreased the percentage viability ($P < 0.001$) compared to the control. In addition, L4, L3, L1 substances were also significantly anticancer ($P < 0.001$) compared to the control. At 10 μ M concentration, the lowest percentage MCF-7 cancer cell viability of L3, L4, L5 substances was detected. We observed that they destroyed cancer cells in the most statistically significant way and significantly ($P < 0.001$) decreased the percent viability compared to the control. In addition, L1 was also found to be significantly anticancer ($P < 0.001$) compared to the control. At 100 μ M concentration, L1, L3, L4, L5 substances had the lowest percentage of MCF-7 cancer cell viability. We observed that they destroyed cancer cells in the most statistically significant way and significantly ($P < 0.001$) decreased the percent viability compared to the control.

At this concentration, L2 compound was found to have anticancer properties significantly ($P < 0.001$) compared to the control. It came to the forefront at this concentration that the anticancer properties of L2 increased with increasing concentration. It was observed that L2 compound was closest to the control and decreased cell viability compared to the control, even if not as much as other substances. According to the data obtained, it can be said that increasing concentrations of compounds also increase their capacity to destroy cancerous cells.

In the literature, there are studies showing the antitumor effect of 1,2,4 triazole ring derivatives supporting our results. It is known that such heterocyclic compounds with 4,5-dihydro-1H-

1,2,4-triazol-5-one ring show antitumor and antioxidant properties as well as biological activity studies (ikizler et al.,1989; Yüksek et al., 1997; Yüksek et al., 2006; İkizler et al., 1998). The used 2-(4-(2-(2-(dimethylamino)ethyl)-4H-1,2,4-triazol-3) pyridine derivatives are said to have shown in vitro cytotoxic effect against five cancer cell types (MKN-45, H460, HT-29, A549 and U87MG) as well as normal cells (WI-38) with good results. It was also observed that almost all of the compounds exhibited superior activity with better selectivity in MKN-45, H460 and HT-29 cells (Qin, 2014).

In a study investigating the cytotoxic effects in HCT-116, U-87-MG and MCF-7 human cancer cells, triazole derivative compounds were reported to be potent anti-cancer agents using MTT method, one of the enzymatic test methods commonly used in the evaluation of cytotoxicity. The researchers reported that compounds containing 1,2,4-triazole pyridine ring were evaluated as antiproliferative and potent anti-cancer agents as a result of their in vitro activities (Xiao-Meng, 2013).

In another study, the anticancer activity of 6,7,8,9-tetrahydro-5H-[1, 2, 4]-triazol[1,5,-a]-azepin-2-yl)benzyl] indole compound against human tumor cells was evaluated and its effects against cancer cells were determined (Mujagic et al., 1983). It was also reported that 2,3-dihydrobenzo[b][1,4]dioxin-6-yl)-4-phenyl-4H-1,2,4-triazole compound has significant anti-tumor activity against HEPG2 cancer cells (Hou et al., 2011).

In a study, the antitumor activity of a series of 3-(2,4-dichloro-5-fluorophenyl)-6-(substituted phenyl)-1,2,4-triazole [3,4-b]-1,3,4-thiadiazine compounds synthesized was investigated. It was reported that the compound exhibited good results in vitro inhibiting the growth and proliferation of cancer cells against a panel of sixty cancer types (Bhat et al., 2009).

Some of the 4-arylmethylenamine-4H-1,2,4-triazoles have been found to have remarkable anti-cancer activities against human cancer cells (Bekircan et al., 2006).

CONCLUSION and RECOMMENDATIONS

The anticancer drug sector in the fields of medicine and pharmacy is making progress every day. It is possible to say that 1,2,4- triazole compounds, which we believe that many new biological profiles will be added and will be the subject of further research in the ambitious future in the field of health sciences, will take their place on the shelves as drugs for the treatment of many diseases and current scientific studies will be important for the future development of these compound derivatives.

ABSTRACT

Melatonin is a hormone synthesized and released primarily from the pineal gland, ovary, lens and bone marrow cells of mammals, as well as bile and the gastrointestinal tract. Many factors influence the synthesis and release of melatonin, but the most important factor is light. After dark in the evening, melatonin secretion starts to increase, reaches its highest point at night, and decreases in the morning with the increase in daylight. It is reported that melatonin concentrations in the blood and in cells at night are several times higher than during the day. Nutritional factors also affect melatonin production. The effect of diet is linked to certain vitamins and minerals that act as cofactors and activators in melatonin synthesis. Melatonin plays a role in the regulation of circadian rhythm and organismal functions by transferring information about the photoperiod to the body's physiology. The association of melatonin secretion with the light/dark cycle suggests this hormone as an endogenous synchronizer. Melatonin can easily enter cells due to its high lipid solubility compared to water. Therefore, its effects are not only membrane-directed. Its partial solubilization in aqueous media also contributes to its intracellular effects. Recent studies have shown that melatonin is found in high concentrations in the nucleus and that there are specific binding sites for melatonin. According to these findings, it is suggested that the effects of melatonin may be related to molecular events in the nucleus similar to thyroid and steroid hormones. Melatonin, a potent antioxidant and immunomodulatory agent with the ability to prevent cell death under oxidative stress conditions, is a physiologically effective agent in the mechanism of many diseases.

Keywords: Biosynthesis, Circadian rhythm, Melatonin, Physiology

INTRODUCTION

Melatonin Biosynthesis and Sources

Melatonin is a hormone synthesized and released from the pineal gland, ovary, lens and bone marrow cells, as well as from the bile and gastrointestinal tract of mammals (Üstündağ et al., 2020). Tryptophan, a protein amino acid, is a precursor in the synthesis of melatonin and is taken up from plasma by the pineal gland. Tryptophan is an essential amino acid that must be obtained from food (Atasoy & Erbaş, 2017). Tryptophan is hydroxylated to 5-hydroxytryptophan by tryptophan hydroxylase. Tryptophan hydroxylase enzyme is the first enzyme of the serotonin production pathway and has a rate-limiting role. Vitamin B6 acts as a coenzyme in this reaction. The resulting 5-hydroxytryptophan is a naturally occurring intermediate metabolite. 5-hydroxytryptophan can easily cross the blood-brain barrier. 5-hydroxytryptophan is converted to serotonin by losing its carboxyl group through the enzyme L-amino acid decarboxylase. Serotonin cannot cross the blood-brain barrier. Serotonin is then acetylated to N-acetylserotonin by the enzyme N-acetyltransferase (NAT) (Figure 1). N-acetylserotonin is converted to melatonin by hydroxyindole-O-methyl-transferase (Atasoy, 2019). Melatonin is synthesized and secreted by the pineal gland under normal light or dark conditions at night. It is produced from L-tryptophan, an amino acid precursor, in one step of several enzyme-based reactions. There are many factors that affect the synthesis and release of melatonin, but the most important factor is light (Atasoy, 2019). Melatonin is synthesized and secreted by the pineal gland under normal light or dark conditions at night. It is produced from L- tryptophan, an amino acid precursor, in one step of several enzyme-based reactions. There are many factors that affect the synthesis and release of melatonin, but the most important factor is light (Atasoy, 2019). After dark in the evening, melatonin secretion begins to increase, reaches its highest point at night, and decreases with the increase of daylight in the morning. It is stated that the concentrations of melatonin in the blood and cells at night are 3-10 times higher than during the day (Atasoy, 2019). Nutritional factors also affect melatonin production. The effect of diet is linked to certain vitamins and minerals that act as cofactors and activators in melatonin synthesis. Therefore, deficiencies in certain nutrients can restrict the synthesis of endogenous melatonin. Although melatonin is found in many food sources, the content of melatonin varies greatly according to the foods.

Figure 1. Neural, hormonal and enzymatic control of melatonin synthesis in the pineal

SCN: Suprachiasmatic nucleus, PVN: Paraventricular nucleus, MFB: Median forebrain bundle, SCG: superior cervical ganglion, NAT: N-Acetyl transferase enzyme, HIOMT: Hydroxy indole O-methyl transferase enzyme.

The richest sources of exogenous dietary melatonin are products such as eggs, fish, some fungi, barley, oats, germinated seeds, nuts, and medicinal plants (Meng et al., 2017). To prevent melatonin deficiency, it should be taken externally as a food supplement or with food. In general, food supplements contain between 1 and 5 mg of melatonin concentration. The use of renewable nutrient sources for microorganism growth, such as fruit by-products (pomace) rich in amino acids, will contribute to the reduction of waste, partially reducing greenhouse gas emissions into the atmosphere. It is stated that the production of 100% natural and environmentally friendly melatonin through the use of a biotechnological approach may be a good alternative to chemically synthesized melatonin (Juhnevica-Radenkova et al., 2020). All animals, plants and humans in nature are the product of a balance (Macit & Köse, 2015). Studies show that the seeds, roots, leaves and fruits of plants are good sources of melatonin. The change in melatonin level varies according to the plant variety, climatic conditions, horticultural practices, processing and storage conditions (Juhnevica-Radenkova et al., 2020). Melatonin levels in plants such as radish plant, white mulberry leaf, wheat germ, asian rice, jujube plant, raspberry plant, linden leaf and aloe vera were 485; 1510; 124.7; 1006; 256; 387; 410 and 516 ng/g have been reported (Çalışkan et al., 2017). Hypericum perforatum flowers, tanacetum parthenium (blossoms), piper In medicinal plants such as nigrum fruits, the melatonin level was

4490, respectively; 1920-2450; it has been reported as 1092.7ng/g dry matter (Meng et al., 2017). Various foods that are sources of melatonin, such as cherries, strawberries, kiwis, apples, grapes, bananas, pineapple, dark green vegetables, and Japanese vegetables, have been reported to contribute to the maintenance of health by contributing to improvements in melatonin levels in humans. These fruits contain less melatonin than edible seeds. Melatonin level is average in pineapple; 302 ± 27 pg/g in bananas; 8.9 ± 0.3 pg/g in oranges; 150 ± 4 pg/g were detected. It was determined that serum melatonin level increased two hours after consuming these fruits (Sae-Teaw et al., 2013). Melatonin levels in tomato and strawberry cultivars were 4.11 ng/g-114.52 ng/g (fresh weight), respectively; 1.38 ng/g 11.26 ng/g (fresh weight). In addition, melatonin was seen as a new bioactive compound in tomatoes and strawberries (Stürtz et al., 2011). As melatonin level is different in different fruits, it is also different in different varieties of the same fruit. This difference has been explained by including several hypotheses such as fruit growth status, location, environmental stress and analytical method (Feng et al., 2014). 699 ± 75 in six different tropical fruits (mango, papaya, pineapple, banana, orange and makmao); 241 ± 15 ; 302 ± 47 ; 8.9 ± 0.6 and 150 ± 6 pg/g melatonin were detected (Johns et al., 2013).

FINDINGS and DISCUSSION

Melatonin bioavailability

Bioavailability is the level of absorption of any nutrient in the body and usable in the cell. This level depends on the structure and concentration of the nutrient, the composition of the carrier food, the digestion time of this food, the health status of the person and the interaction of the nutrients in the consumed food (Özge & Sedef, 2011). It has been reported that when melatonin-rich foods are consumed, the concentration of melatonin in the blood and 6 sulfateoxymelatonin, the metabolite of melatonin in urea, are quite high. Melatonin is metabolized very rapidly. The half-life in humans ranges from 10-60 minutes after exogenous administration. In a study, the effect of pineapple, orange and banana on serum melatonin concentration and antioxidant capacity was investigated. In blood samples taken from twelve healthy individuals before and after consuming these fruits, it was found that plasma melatonin was 32 to 48 pg/mL after 60 minutes, 145–151 pg/mL after 131 minutes, and less than 50 pg/mL, which dropped rapidly after 180 minutes detected. It has been reported that there is a positive correlation between antioxidant capacity and serum melatonin concentration (Sae-Teaw et al., 2013). In the study, it was stated that the serum melatonin concentration increased

in rats consuming walnuts and that the increased melatonin level in the blood was correlated with the increased antioxidant capacity (Reiter et al., 2005). The dosage of melatonin use depends on the desired effect. target replacement if therapy is oral melatonin ingestion 0.1; It is in the range of 0.5 mg, with a plasma concentration of 100; 500 pg/ml. Melatonin-induced sleep disorders are usually treated with 1.0 to 5.0 mg of oral melatonin (Amaral & Cipolla-Neto, 2018). The bioavailability of melatonin in plant- based foods affects the daytime level and can of course be explained by the health benefits of diets rich in vegetables, fruits and grain products. It has been found that the bioavailability of melatonin from beer is directly proportional to the dose of melatonin from nutritional supplements. Moreover, melatonin found in beer has been reported to contribute to the total antioxidant activity of human serum and can protect the human body from general oxidative stress (Juhnevcica-Radenkova et al., 2020). Dietary melatonin intake, other bioactive Acting in synergy with phytochemicals (polyphenols), it helps to maximize the health-promoting effects of medicinal plants and healthy foods in humans. As there is no difference between endogenous and exogenously acquired melatonin, it is very difficult to assess the dietary contribution in humans (Salehi et al., 2019).

Physiological effects of melatonin- (SCN neurons and circadian effects on rhythm)

Melatonin plays a role in the regulation of the circadian rhythm and the functions of the organism by transferring the information about the photoperiod to the physiology of the body. The association of melatonin secretion with the light/dark cycle suggests this hormone as an endogenous synchronizer (Arendt & Skene, 2005; Schulz & Steimer, 2009). As with many biochemical, physiological and behavioral variables in humans, plasma melatonin levels show regular fluctuations within a 24-hour period. This is circadian rhythm in the hypothalamus suprachiasmatic. It is controlled by the central pacemakers in the nucleus and the main regulator of the rhythm is the light/dark cycle in the external environment. Pineal functions are acutely suppressed when exposed to light at night (Liebmann et al., 1997). Endogenous melatonin Its relationship with cortisol secretion is also important in its role as a synchronizer. When melatonin receptors in the adrenal gland are stimulated at physiological doses, it suppresses ACTH-mediated cortisol formation (Campino et al., 2008). The relationship between melatonin and cortisol is important in terms of the effects of both hormones on the immune system. Melatonin and cortisol levels act in opposite directions. Cortisol is low in the evening at bedtime, whereas melatonin peaks a few hours after cortisol fully falls. This is important in

terms of disruption of the normal secretion pattern, deterioration of health or the risk of cancer. Researchers have reported that low melatonin and high cortisol levels can cause various diseases. So the balance between these two hormones is important for good health. In determining this, while the melatonin-cortisol index provides information about immune functions, it has also been used as a marker to determine conditions related to depression, heart disease, osteoporosis, and weight gain (Millet et al., 1999; Guardiola-Lemaitre, 2007). Some findings regarding the relationship between melatonin and cortisol: low melatonin and high cortisol levels (Guardiola-Lemaitre, 2007).

-Melatonin level is lower in patients with depression compared to patients without depression, cortisol levels were found to be higher in the evening hours (bedtime) in patients with depression.

-High cortisol and low melatonin lead to bone loss. In order for melatonin to show its positive effects on bone, estradiol levels must also be sufficient.

-People exposed to light at night have low melatonin levels and a higher risk of breast cancer.

Breast cancer risk is also associated with cortisol, and high cortisol during the day and in the evening increases the risk of breast cancer. In addition, it has been reported that melatonin levels are low in endometrial, prostate, lung, gastric and colon cancers, whereas melatonin may be protective against cancer with its antioxidant effects (Reiter et al., 2009). Change in secretion with light application: While early studies reported that only bright light (daylight) suppresses melatonin levels in humans, recent findings suggest that artificial light (lighting system in the dark period) has a similar effect. In subjects with '0' light perception in the blind, melatonin secretion is freely distributed within 24 hours (Reiter, 2002). While artificial light produced at night acutely suppresses the synthesis and secretion of melatonin, the light applied with the onset of dusk causes a shift in the plasma melatonin concentration peak observed between 02.00 and 04.00 at night, whereas light application in the morning before dawn causes this concentration peak to appear early. Exposure to light in the morning and evening hours causes phase contraction (Claustrat et al., 1998).

CONCLUSION and RECOMMENDATIONS

Change of rhythm with exogenous melatonin administration

The use of melatonin in Jet Lag When melatonin is given in the evening or in the evening, the change in the profile of plasma melatonin is defined as "phase advance" (the shift of sleep

between 23.00/07.00 in the 24-hour sleep/wake cycle to 20.00/04.00). On the other hand, if melatonin is given in the morning hours, the melatonin profile change that occurs is "phase delay" (a forward shift in the 24-hour sleep/wake cycle and shift of sleep from 20.00 to 04.00 to 23.00/07.00) (Claustrat et al., 1998). The circadian circadian of melatonin It is recommended to be used on trips that skip the time zone by taking advantage of its rhythm- regulating effect (especially in pilots and other aircraft attendants). To this end; In the journey to the east, 5 mg melatonin is administered 3 days before leaving that region at the hours corresponding to the bedtime at the destination for preconditioning purposes, the same application is made on the day of departure and the application is continued for 2 days after arrival. For westbound travel, only post-flight is recommended (Lino et al., 1993). Age-related changes in melatonin levels: There is no evidence of melatonin synthesis in the fetus in humans, but no activity was found in the fetus in the study conducted in sheep. Melatonin can be passed from mother to fetus and through milk to the newborn and therefore circadian this is how rhythm is formed. Melatonin concentration varies with age, secretion is very low in newborns, increases shortly after birth, peaks between 1-3 years of age and then decreases again. After that secretion It becomes circadian during puberty and adolescence. After the twenties, the rate of synthesis and secretion of melatonin decreases, reaching the lowest levels in the 60s (Waldhauser et al., 1984). The following pharmacological and neurochemical agents alter the plasma levels of melatonin by stimulating or inhibiting pineal functions (Penev & Zee, 1997).

ABSTRACT

The increase in carbon emissions due to global warming is a significant threat. The resequstration of carbon into the soil, which also influences global warming, has recently caught the attention of researchers. Soil losses and accordingly soil organic matter losses have become one of the most important environmental problems of this century. Climate change, along with it, poses significant risks to ecosystem sustainability and food security for many countries around the world. In addition, it is considered that the pine forests where the study is conducted, as well as other forested regions worldwide, play a significant role in the storage of soil organic carbon. The organic matter cycle in forest ecosystem contributes to the accumulation and long-term storage of organic carbon in the soil. The loss of organic carbon can contribute to an increase in soil erosion, a decrease in vegetation cover and the acceleration of the desertification process. In this study, the carbon sequestration potential of surface soils in the pine forests located in the Engiz district of Samsun province, as well as their relationships with certain soil properties, have been assessed. It has been determined that the organic carbon content of the soils ranges from 0.32% to 14.47%. In these data, the carbon sequestration potential in forest soils has been determined to range from 7.60 to 73.72 C ha⁻¹. As a result of the research, it has been concluded that forest soils with low organic carbon content, where organic matter and organic carbon decomposition is difficult, have high carbon sequestration potential.

Keywords: Carbon Sequestration Potential, Desertification, Pine Forest

1. INTRODUCTION

In these days the reduction of climate change with the retention of soil carbon and the conservation of biodiversity has been a high priority in scientific research, by states and nongovernmental organizations. The most important resource affecting soil quality and sustainability is soil organic carbon. Soil and plants are the most important organic carbon scavengers for the terrestrial ecosystem (Janzen, 2004). Forests currently store approximately 800 million tones of organic carbon in trees and soils (Sohngen, B., & Mendelsohn, R., 2003) Forest are one of the most important carbon pools where CO² is stored. However, the amount of carbon sequestered in forest soils can be very variable. In addition, various forestry practices (clearing, tillage, fertilization, etc.) can positively or negatively affect the amount of carbon bound in the soil (Tolunay and Çömez, 2007). Stocks of organic carbon held in the soil for long periods under favourable conditions, changes in land use, tillage techniques, erosion and different cultural methods (Yılmaz and Dengiz, 2021) The most effective way to recover carbon released into the atmosphere is too bind it back to the organic structure in the soil. With the decomposition of organic matter, carbon-containing greenhouse gases are released into the atmosphere and the persistence of this situation shows that its effects contribute to global warming (IPCC, 2014). In general terms, SOC (Soil Organic Carbon) consists of humic substances and soil organic matter. Humic substances are substances with a stable structure that are unique to each soil and do not change significantly over the period of soil use.

Organic materials, whether of plant or animal origin, are energy sources for microorganisms present in the soil. Microorganisms decompose all or some of the carbohydrates, protein, and other organic compounds in the structure of organic matter, as a result of a series of enzymatic reactions in order to obtain their energy. As a result, plants benefit from all elements and compounds in organic matter (Brady and Weil 2008). Soil organic carbon (SOC) is the main factor affecting soil quality and function, playing an important role in increasing soil aggregation and promoting the formation of aggregate structure. Organic carbon can be physically preserved in aggregates by adsorption on the mineral clay surface (Xue et al. 2019). Soil organic carbon contains humic substances and unstable soil organic matter. Humic substances are specific to each soil and do not change significantly over decades of soil use. Activated carbon, which is a fraction of organic matter that microorganisms living in the soil quickly use as a source of carbon and energy, is an indicator for soils (Saygın et al., 2023).

Maintaining and restoring soil quality is a fundamental task for soil-based management frameworks such as Common Agricultural Policies and policies such as the soil degradation

neutrality scheme proposed by the UNCCD (UNCCD, 2013). Soil organic carbon (SOC) is considered one of the most important and universal indicators for assessing soil quality and land degradation (Bünemann et al., 2018; UNCCD, 2013; Lorenz et al., 2019). Soil loss and SOC (Soil Organic Carbon) loss is one of the main environmental challenges of this century and together with climate change, poses serious risk to ecosystem sustainability and food security in many world regions (Cherlet et al., 2018). In the European context, the high rates of soil erosion, high risk of land degradation and very high vulnerability to desertification that characterize several areas of the Mediterranean region are the result of a combination of climatic factors, geomorphological characteristics, soil type and land cover/management (Panagos et al. 2015; Zeng et al., 2021; Mirzabaev et al., 2019; Stolte et al., 2016; Russo et al., 2019).

In this current study, in order to assess the carbon sequestration potential of surface soils in the pine forests located in the Engiz district of Samsun province as well as their relationships with certain soil properties was aimed.

2. MATERIAL and METHOD

2.1. Material

The study area is located within the borders of Engiz district (746646 East, 4583037 North and 257713 East, 4580544 North UTM-m, Zone 37) in Samsun providence (Figure 1).

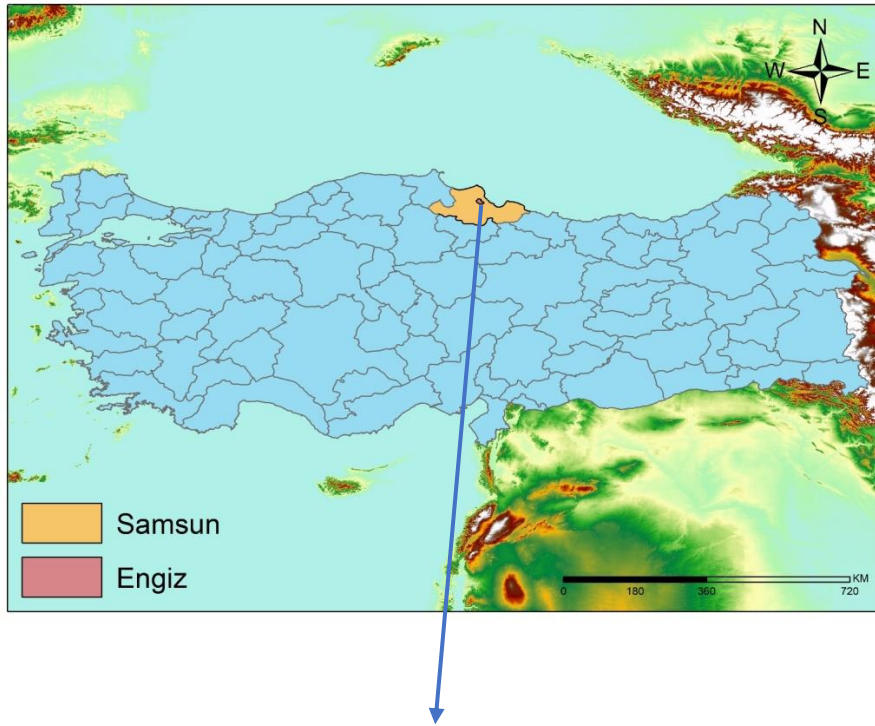

Figure 1. Location map of the study area

Samsun province generally has a temperate climate type. However, the climate shows different characteristics in the coastline and inland areas. On the coastline, the Black Sea climate is characterized by hot summers and mild and rainy winters. The average annual temperature varies between 13 - 15 °C according to the data obtained from the meteorological stations of Atakum and Bafra districts located in the coastal areas. The lowest perennial average temperature was measured in March with 7.5 °C. The highest temperature was 23.6 °C in August. Considering Atakum and Bafra data, the annual rainfall varies between 700 and 800 on average. In the study, long-term average precipitation and temperature data from Atakum (1962 - 2016) and Bafra (1963 - 2016) meteorological stations were used (Table 1).

Table 1. Long term meteorological data of the study area (1962 – 2016)

Monthly	Stations			
	Atakum		Bafra	
	Rainfall	Temperature	Rainfall	Temperature
January	64,9	7,1	78,2	5,8
February	53,3	7,1	56,2	6,2
March	61,5	8,1	56,5	7,5
April	58,7	11,4	52,3	11,1
May	51,5	15,7	42,8	15,5
June	48,1	20,4	41,6	20,2
July	33,1	23,3	27,6	22,9
Agust	40,8	23,6	41,1	22,8
September	51,5	20,1	54,2	19,3

Yearly	710,0	14,6	717,5	13,8

According to Corine 2018 land use- land cover classification (Figure 2), broad-leaved forest accounted for 83% (37923,02 ha), agriculture and natural vegetation %7 (3590,61 ha), mixed forest %3 (1528,89 ha), mixed plant pattern %2 (1335,07 ha), fruit trees and fruit plantations %1 (670,82 ha), coniferous forest %0,1 (239,57 ha), pasture %0,1 (74,20 ha).

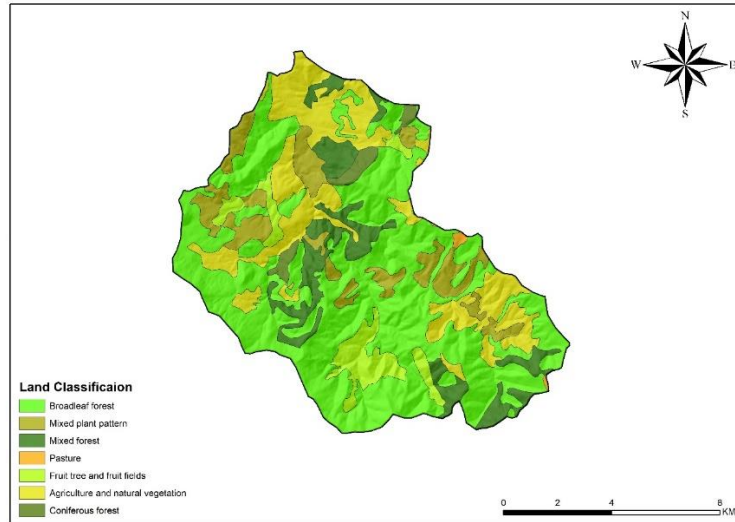

Figure 2. Corine land classification map

2.2. METHOD

2.2.1. Soil Sampling and Analysis

Total 73 disturbed and undisturbed soil samples were taken to represent 0-20 cm depth at the sampling points. After preparing soil samples in laboratory, the physical and chemical analysis methods of the properties examined in the soils are given below.

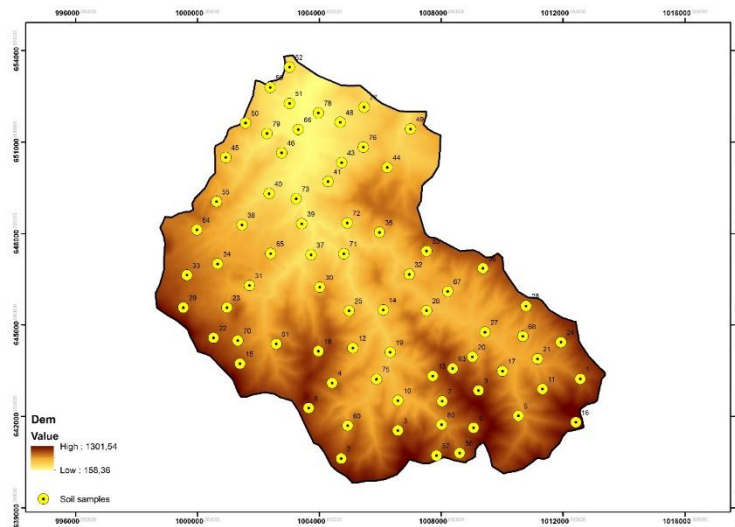

Figure 3. Soil sampling pattern in the study area

This study was carried out in Isparta University of Applied Sciences, Faculty of Agriculture, Department of Soil Science and Plant Nutrition Laboratory. Soil samples were passed through

a 2 mm sieve and used in the research experiment. The pH and EC values of the materials used in the study were determined in 1:5 soil-water suspensions according to Soil Survey Staff (1992), and US Salinity Laboratory Staff (1954). The organic carbon content was determined by the modified Walkley-Black method, and the Equivalent CaCO₃ % was determined by the Scheibler calcimeter (Burt 2014). As a result of mechanical analysis, hydrometer method was used for sand, silt, and clay % distributions (Burt 2014). For the wet aggregate stability analysis, the wet sieving method (with single sieve diameter) recommended by Kemper and Rosenau (1986).

2.2.2. Calculating Soil Carbon Sequestration Potentials

The carbon sequestration potentials of the soils were determined according to Equation 1. (Angers et al., 2011; Cao et al., 2016).

$$C_{SP} = S_{def} \times \gamma \times D \times (1 - d_{2-mm}/100) \times 10^{-1} \quad (\text{Eq.1})$$

Where γ is the bulk density (g cm^{-3}), D is the soil depth (cm) and d_{2-mm} (%) is the >2 mm coarse fraction of the soil, C_{SP} : The carbon sequestration potential (C_{SP} , t C ha⁻¹), S_{def} : remaining deficit to saturation, $S_{def} = C_{sat} - a \cdot \text{TOC}$, where a is the ratio of soil organic carbon (<20 μm) in total SOC, C_{sat} : the saturated soil organic carbon (C_{sat} , %) associated with < 20 μm

2.2.3. Statistical Analysis

Spearman correlation matrices were used to evaluate the relationships of soil properties. In addition, descriptive statistics and correlations of soil properties were carried out using the IBM SPSS Statistics 23 package program. R software and ggplot2 package (library) were used to create the Violin plot graphics of the obtained values.

3. RESULTS and DISCUSSION

Ten physical and chemical properties of 73 soil samples collected from the study area were analyzed and descriptive statistic were calculated. These properties were determined as organic matter, CaCO₃, EC, pH, aggregate stability, organic carbon, clay, silt, sand and bulk density. Descriptive statistics of 10 physico-chemical soil properties of 73 samples taken from the study area are given in Table 2. The soils of the study area were generally unsaline in terms of salinity between 0.01-0.62 dS/m values and soil reaction was determined as acid - slightly alkaline between 4.34 - 7.59 values. The calcium content of the study area was determined to be between 1.61% and 4.07% and the average was 3.04%.The texture classes of the soils according to sand silt and clay contents vary greatly within the area as loamy (30.13%), sandy

loam (28.76%), clay loam (15.06%), sandy clay loam (13.69%), clayey (6.90%) and silty loam (2.73%). The bulk density of the soils varies between 0.86 gr/cm³ - 1.60 gr/cm³ with an average of 1.16 gr/cm³. The aggregate stability of the soils of the study area varied between 29.55% and 84.74% and the average was determined as 58.33. (Dinel et al., 1991) stated that high aggregate stability in soils prevents soil erosion and desertification, which is one of the main factors in soil degradation.

Table 2. Descriptive statistics of soil properties

Parameters	Mean	S.D	%COF*	Variance	MV	HV	Ske.**	Kur.
Sand (%)	49.66	13.60	27.38	185.04	13.71	77.15	0.11	-0.303

EC (dS/m ⁻¹)	0.16	131.40	82125.0	17266.8	0.01	0.62	2.00	4.50
CaCO ₃ (%)	3.04	0.56	18.42	0.23	1.61	4.07	-0.45	0.73

S.D.: Standard Deviation, COF: Coefficient of variation, MV: Minimum Value, HV: Highest Value, Ske.: Skewness, Kur: Kurtosis, OM: Organic Matter, BD: Bulk Density, AS: Aggregate Stability, OC: Organic Carbon
*Coefficient of Variability: < 15 = Low Variability, 15-35 = Medium Variability, >35 = High Variability
**Skewness: < | \mp 0,5 | = Normal Distribution, 0,5- 1,0 = Character transformation is applied to the data set. CC > 1,0 \rightarrow Logarithm transformation is applied.

Organic matter content, which is one of the soil parameters known as an important indicator for desertification as well as aggregate stability in the soil, movement of water in the soil, protection of nutrient cycles and erosion control, varies between 0.5 and 24.95%, with an average of 10.64% (Grili et al., 2021). However, the organic carbon content of the study area varied between 0.31% and 14.47% with an average of 6.17%. This is due to the fact that the study area is pine forests where organic matter and organic carbon are difficult to decompose and disappear. Yılmaz and Dengiz (2021) reported that among different land uses, the highest soil organic carbon (SOC) stock was in forested areas (53.356 ton ha⁻¹) and the lowest SOC stock was in agricultural lands (34.048 ton ha⁻¹). Soil organic matter is an important desertification parameter because it contains soil organic carbon and soil organic carbon is an important indicator for desertification and erosion.

The graph showing the linear relationship between sand content of soils and soil organic carbon is given in Figure 4.

Figure 4. The relation between sand content and CSP

The R^2 value was obtained as %68. It was observed that the amount of soil organic carbon increased with decreasing sand content. Studies have shown that fine textures are more effective in C storage potential and coarse textured soils have a negative relation (Angers et al., 2011). The graph showing the linear relationship between clay content of soils and soil organic carbon is given in Figure 5.

Figure 5. The relation between clay content and CSP

The R^2 value was obtained as %66. It was observed that the amount of soil organic carbon increased with the increase in clay content. Studies have shown that the C storage potential of soils is positively correlated with the clay content in the $<20 \mu\text{m}$ fractions. It is thought that storage may occur by forming complexes, especially with clay (Angers et al., 2011; Cao et al., 2016). The relation between soil organic carbon and CSP is presented in the graph in Figure 6. The R^2 value was obtained as %23.

Figure 6. The relation between organic carbon and CSP

The CSP content spatial map for the region is provided in Figure 7. The CSP content of the region was obtained using Equation 1. The highest value within the region was found to %73,61. The lowest value within the region was found to 7,62. The distribution of CSP ratio is observed to be high. However, lower values have been encountered in the eastern, northeastern, west eastern and central regions.

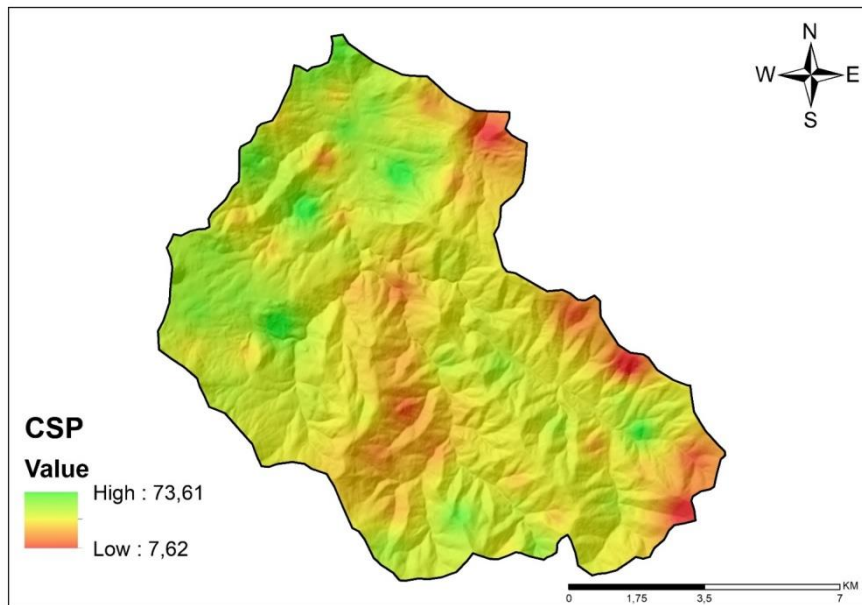

Figure 7. CSP spatial distribution map

Relationships of soil texture, clay mineralogy, mineral-organic matter affect the life of C in soil (Paustian et al., 2019). Cao et al. (2016) determined that the carbon sequestration potential is affected by the soil physicochemical properties, climate and land, and the most important feature associated with the carbon sequestration potential is the soil humic substance concentration. Desertification, decline in quality of soil and vegetation and spread of desert-

like environments, is a biophysical process driven by socio-economic and political factors. Important biophysical effects involve deterioration of aggregates and soil structure, soil erosion by water and wind, decline in topsoil depth and a reduction in available water capacity, salinization, nutrient depletion, and reduction in the soil C pool. Desertification control can enhance soil quality and improve SOC pool (Lal, R., 2003).

4. CONCLUSION

In the present study, the carbon sequestration potentials of soils in pine forest area were examined and their relations with some other soil properties were revealed. As a result of the study, it has been determined that the carbon sequestration potential of the soils is higher due to the organic matter contents and heavy texture in the pine forest soils. The C sequestration potentials of the soils showed a positive correlation with the fine fraction (<20 μ m) and a negative correlation with the coarse fraction (sand). As a result, it was concluded that the protection of pine forests against desertification will help to increase the amount of SOC in the area and improve soil quality.

Acknowledgements

Throughout the study, our respects express to the TEMA Foundation, notably Hikmet ÖZTÜRK and Merve ŞEN, who supplied material and spiritual resources through the Turan Demiraslan Scholarship (MSc Graduate) Program and did not spare their support, and we thank them with our warmest wishes.

ABSTRACT

Plants have been extensively utilized for their medicinal and nutritional properties since ancient times. Their significance lies in the presence of secondary metabolites. Plant secondary metabolites are organic compounds produced by plants that are not directly involved in the plant's primary metabolic processes such as growth, development, and reproduction. The secondary metabolites often have roles in ecological interactions, defence mechanisms, and signalling within plants. Herein, quantification of bioactive compounds of *Thymus leucostomus* var. *leucostomus* flowers extract was measured by LC-MS/MS analysis. Shikimic acid (0.26 mg/g extract), naringenin (0.074), caffeic acid (0.060), salicylic acid (0.034) were determined as major products. Antioxidant activity of methanol extract of flowers of *Thymus leucostomus* var. *Leucostomus* was executed, and this plant revealed the excellent DPPH, ABTS and FRAP activities with the values of 10.29 ± 0.3 (IC₅₀, µg/mL), 9.12 ± 0.2 (IC₅₀, µg/mL), 3.51 ± 0.02 (µ mol TE/mg extract) respectively in comparison to the BHT (DPPH: 11.13, ABTS: 8.04, and FRAP: 6.14). The antioxidant activity is either due to the main compounds contained in the extract or because of the synergistic effect of the compounds.

Keywords: Natural products, quantitative analysis, antioxidant activity, *Ebenus haussknechtii*.

INTRODUCTION

The plants have been employed for medicine and food purposes for years. The importance of these plants is due to the bioactive compound contents. Moreover, plants play a significant role for drug development process (Aksit et al., 2014; Topçu et al., 1999; Türkmen et al., 2014).

Plants comprise both primary and secondary metabolites, which are important compounds included in various biological processes and interactions with their environment (Cragg & Newman, 2005; Khodja et al., 2023). Primary metabolites are essential compounds that play a fundamental role in the plant's growth, development, and basic metabolic processes (Zaoui et al., 2022). The carbohydrates, proteins, lipids, and nucleic acids are considered as primary metabolites. These compounds are necessary for energy production, cell structure, and the regulation of biochemical pathways. However, secondary metabolites serve various ecological and adaptive functions. Alkaloids, flavonoids, terpenoids, and phenolic compounds are the class of secondary metabolites. The functions of secondary metabolites are to protect plants against enemy and to adapt to the environment. In addition, secondary metabolites exhibit important biological activities making them valuable in medicine (Valentao et al., 2001).

More than 50% of the medicines used nowadays consist of natural products and their derivatives. 80% of people in developing countries rely on traditional medicine for primary healthcare. Additionally, approximately 85% of traditional medicine involves the use of plant extracts (Newman & Cragg, 2007). Phenolic compounds are secondary metabolites and arise biogenetically from the shikimate-phenylpropanoids-flavonoid pathways. Plants need phenolic compounds for growth, reproduction, resistance to pathogens, and overall resistance to biotic and abiotic stresses (Erenler et al., 2023; Yaman et al., 2022).

Secondary metabolites have antioxidant effects and radical scavenging activities (Sakrani et al., 2022). Enzymatic and auto-oxidation of lipids are reactions that lead to the degradation of foods and negatively affect the colour, odor, taste and nutritional value of foods. For this reason, antioxidants are used for foods to prevent radical reactions. Still, widely used synthetic antioxidants such as butylated hydroxy anisole (BHA) and butylated hydroxytoluene (BHT) have some toxic effects, so their usage has been limited. Therefore, there has been a trend towards the use of natural antioxidants instead of synthetic antioxidants. Hence, research on the use of antioxidants in both the food and pharmaceutical industries has accelerated (Saidi et al., 2022).

In this study, quantitative analysis of phenolic compounds of *Thymus leucostomus*. var. *leucostomus* by LC-MS/MS was carried out and antioxidant activity was evaluated.

MATERIALS and METHODS

Plant material

Thymus leucostomus. var. *Leucostomus* Hausskn. et Velen. was collected from Bingol and identified by Dr. Lutfi Behcet, a voucher specimen was deposited in the herbarium of Bingol University (No: 20831).

Quantitative analysis of phenolic compounds

Quantitative analysis of phenolic compounds of *Thymus leucostomus*. var. *leucostomus* Hausskn. et Velen. flowers extract was determined by LC-MS/MS analysis. After dissolving of plant extract (50 mg) in methanol (1.0 mL), hexane was added, centrifugated. The hexane layer was removed, and the methanol solution (100 µL) was diluted by addition of deionized water (450 µL) and methanol (450 µL). After filtration (0.22 µm filter), the solution was injected to the instrument. The flow was adjusted as 0.4 mL/min. Formic acid (0.1%) in water A, formic acid (0.1%) in methanol B were used for mobile phase. The gradient program was adapted as 20% for 1-5 min, 40% for 5-15 min, 80% for 16-25 min, and 3% for 26-30 min for B mobile phase (Atalar et al., 2023).

Antioxidant activity

DPPH activity of methanol extract was determined. Different concentrations (5.0, 10, 25 ppm) of extract and standards were taken in different test tubes. The methanol was added to reach the volume to 100 µL. DPPH solution (5 mL, 0.1 mM) was added to the test tubes and stirred. The test tubes were kept at 25°C for 20 minutes. The absorbance measurement was carried out at 517 nm against methanol blank. The radical scavenging activity was expressed as IC₅₀ (Elmastas et al., 2004). ABTS radical cation scavenging activity test and FRAP assay were carried out according to the literatures (Demirtas et al., 2013; Elmastaş et al., 2015).

FINDINGS and DISCUSSION

Thymus leucostomus. var. *leucostomus* flowers was extracted with methanol and quantitative analysis of phenolic compounds was carried out by LC-MS/MS analysis (Table 1). Moreover, antioxidant activity of methanol extract was executed using the DPPH, ABTS and FRAP assays (Table 2). Shikimic acid, naringenin, caffeic acid, and salicylic acid were presented as major products (Figure).

Shikimic acid (3,4,5-trihydroxy-1-cyclohexene-1-carboxylic acid) is first isolated from *Illicium anisatum* flowers. Shikimic acid play an important role in the synthesis of natural compounds in plants and microorganisms due to the shikimic acid pathway. Many microorganisms can convert quinic acid to shikimic acid (Bochkov et al., 2012). Caffeic acid is an important natural

compound synthesized by all plants. This compounds and its derivatives have a broad spectrum of biological activities (Espíndola et al., 2019).

Table 1. Quantitative analysis of phenolic in *Thymus leucostomus*. var. *leucostomus* (mg/g extract)

Compound	RT	quantity
Shikimic acid	1.2654	0.257
Protocatechuic acid	5.4826	0.005
Chlorogenic acid	7.3728	0.007
Hydroxybenzaldehyde	7.7280	0.003
Caffeic Acid	7.7809	0.060
Vanillin	8.4197	0.005
o-coumaric acid	9.2680	0.005
Salicylic Acid	9.4877	0.034
Trans-ferulic acid	10.1740	0.022
Scutellarin	11.2575	0.020
Hesperidin	11.8041	0.019
Isoquercitrin	11.9065	0.001
Quercetin	14.4676	0.006
Naringenin	14.9234	0.074
Luteolin	17.9513	0.006

Since plants synthesize fascinating compounds, they inspire synthetic chemists to synthesize related compounds. Hence, synthesizing natural compounds and their derivatives gains excellent interest in drug discovery. Antioxidants, containing phenolic compounds such as flavonoids, and phenolic acids have many biological activities due to their antioxidant effects (Benguedouar et al., 2022).

Herein, the methanol extract of *Thymus leucostomus*. var. *leucostomus* flowers exhibited the good DPPH, ABTS and FRAP antioxidant activities with the values of 10.29 ± 0.3 (IC₅₀, µg/mL), 9.12 ± 0.2 (IC₅₀, µg/mL), 3.51 ± 0.02 (µ mol TE/mg extract) respectively in comparison to the BHT (DPPH: 11.13, ABTS: 8.04, and FRAP: 6.14). The antioxidant activity is either due to the main compounds contained in the extract or owing to the synergistic effect. The essential oils of this plant was studied and carvacrol, p-cymene, thymol; alpha-terpinyl acetate, and borneol were determined as major compounds (Tümen et al., 1997). Another essential oils study on *Thymus leucostomus* var. *gypsaceus* and *T. pubescens* var. *cratericola*

was carried out. Thymol and borneol was detected as major product in *Thymus leucostomus* var. *gypsaceus*. In addition, carvacrol, β -cymene and thymol were determined as chief products in *T. pubescens* var. *cratericola* (Baser et al., 1999).

CONCLUSION and RECOMMENDATIONS

Since the plants contain the bioactive compounds displaying significant biological activities, the determination of the responsible compounds is essential for drug development process. Shikimic acid, naringenin, caffeic acid, and salicylic acid were the major compounds of corresponding plants. Hence, this plant could be a valuable source for these compounds. The activity of this plant could be due to the major compounds or synthetic effect of combination of these compounds. The bioactive compounds of *Thymus leucostomus*. var. *leucostomus* flowers extract should be isolated and biological activity of each isolated compounds should be presented.

ABSTRACT

Plants are the main source of drugs due to their significant bioactive compound contents. The development in spectroscopy has helped the plant to become the focus of the sciences. So, the isolation and identification of bioactive compounds from plants have accelerated by means of spectroscopy. The diversity of the phytochemicals contained in the plants and the lesser side effects are very important in the prevention and treatment of cancer. Moreover, natural compounds have also inspired synthetic chemists to synthesize related compounds. In this study, *Consolida orientalis* (Gay) Schrödinger was collected in June 2022 in Artova-Taspınar village, Tokat-Turkey. Quantitative analysis of phenolic compounds by LC-MS/MS of *C. orientalis* leaves was carried out. In addition, cytotoxic effect of methanol extract was evaluated with MTT assay. In quantitative analysis, vanillic acid (8.72 mg/g extract), caffeic acid (7.85 mg/g extract), and protocatechuic acid (7.1 mg/g extract) were determined as major products. The methanol extract of *C. orientalis* revealed the good cytotoxic effect against Caco-2 cell lines (% Cell viability, 26.9 ± 0.6 , 1.0 $\mu\text{g/mL}$). Therefore, the components contained in *C. orientalis* may be potential material for cancer drugs.

Keywords: *Consolida orientalis*, LC-MS/MS, MTT assay, phytochemistry

INTRODUCTION

Plants have long been used in medicine and food due to the richness of bioactive chemicals they contain. Natural products play a significant role in the drug discovery development with their wide range of biological effects (Awuchi, 2019). Many bioactive chemicals were extracted and identified from plants after the discovery of spectroscopy and chromatography in the nineteenth century. Furthermore, synthetic chemists have created a large number of chemicals inspired by natural molecules (Ahmad et al., 2020).

Phytochemicals are bioactive substances that exist as secondary metabolites in plants and have health benefits when ingested as nutrients (Visweswari et al., 2013). There are various classes such as alkaloids, phytosterols, polyphenols, terpenoids and organosulfures. Phenolic compounds (polyphenols), carotenoids, tannins, saponins, coumarins, tocopherols, isothiocyanates, sulfites, sulforaphanes, alkaloids, phytosterols, phytoestrogens, and indoles are the most well-known phytochemical substances (Abbas et al., 2017). These chemicals are utilized to treat a variety of ailments nowadays, owing to their high antioxidant activity. It also has antiviral, antifungal, antibacterial, antithrombotic, antiatherogenic, antiulcer properties and the ability to block transcription factors that initiate and sustain tumor formation by increasing detoxifying enzymes. Phytochemical substances have been proven in studies to have anticarcinogenic activity, minimize complications in cancer treatment, and protect against the negative effects of standard chemotherapeutic medicines (Arora et al., 2019).

Consolida orientalis (Gay), also known as "morçişek" in Turkey, is distinguished by laciniae linear leaves, an intense violet flower, and follicular fruit. It can reach heights of up to 100 cm and prefer cool locations despite their average length of 20-74 cm (Gumusok & Hurkul, 2021). *C. ambigua* seeds contain the diterpenoid alkaloids ajacin and ajakonin, whereas *C. regalis* leaves have the anthocyanin delphinidin. It has been reported that *C. rugulosa* has antimicrobial, *C. regalis* has antioxidant, *C. ambigua* has antifungal, and *C. rigida* has anthelmintic biological activities (Venkateswarlu et al., 1995; Yin et al., 2020).

Research has found that plants belonging to the *Consolida* sp. have limited cytotoxicity studies to treat cancer. Therefore, this study is to indicate the phenolic content of *C. orientalis* and its cytotoxic activity against Caco-2 cell line.

MATERIALS and METHODS

Plant material

C. orientalis was collected in June 2022 in Artova-Taspınar village, Tokat, Türkiye at 40°07'46.6"N 36°19'12.4"E. The botanical identification of the plant was carried out by Dr. Murat Unal at the Department of Biology, Van Yuzuncu Yil University where a voucher specimen was deposited in the Herbarium (No: VANF 20295).

Extraction

C. orientalis leaves (5.0 g) were extracted with methanol (100 mL) for 24 hours at room temperature. The solvent was evaporated at reduced pressure after filtration (Whatman 1 filter paper) to produce the extract (Erenler et al., 2017).

LC-MS/MS Analysis

The phenolics were quantified by LC-MS/MS (Agilent Technologies 1260 Infinity II, 6460 Triple Quad Mass spectrometer). The column Poroshell 120 SB-C18 (3.0 100 mm, I.D., 2.7 μm) was employed. The extract (50 mg) was weighed and diluted in methanol (1.0 mL) in Eppendorf (2.0 mL). Hexane was added to this solution and centrifuged for 10 minutes at 9000 rpm. 100 μL of the methanol phase was taken and diluted with 450 μL of water and 450 μL of methanol. This solution was then filtered (0.22 μm filter) and injected into the device. The injection volume was set to 5.12 μL, with a flow rate of 0.40 mL/min. Water A contains formic acid (0.1%) and ammonium formate (5.0 mM). The gradient program was set at 25% for the first 1-3 minutes, 50% for the next 4-12 minutes, 90% for the next 13-21 minutes, and 3% for the last 22-25 minutes. The temperature in the column was 40°C. The capillary voltage was 4000 V, the nebulization gas (N₂) flow rate was 11 L/min, the pressure was 15 psi, and the gas temperature was 300 °C (Erenler et al., 2023).

MTT assay for cytotoxicity

MTT [3-(4,5-dimethyl-thiazol-2-yl)-2,5-diphenyl tetrazolium bromide] assay was used to test cytotoxicity in mouse fibroblast cell lines (L929) and human colon cancer (Caco-2) cell lines. The cells (10 × 10³ cells/mL) were seeded in 96-well plates and incubated for 24 hours before the extract (0.125, 0.25, 0.5, and 1 μg/mL) was given to the cells and incubated for another 24 hours. After the DMEM (L-glutamine, 10% FBS, 1% antibiotic) medium was removed from the well plates, MTT (50 μg/mL, 1 mg/mL) was added to the wells and incubated (2.5 h) at 37°C. MTT solution was then withdrawn from the wells, and MTT solvent (isopropanol) was added. The percentage of viable cells was calculated using an ELISA plate reader set to 570 nm (Karan et

al., 2022). The cell vitality of the control group was taken as 100%, and the cell viability of each group was calculated using the provided formula:

$$\text{Cell viability \%} = [A_x/A_y] \times 100$$

A_x: is the sample of optical density. A_y: is the control

Statistical analysis

GraphPad Prism (8.0.1), One-way ANOVA with Tukey's multiple comparison test was used for statistical analysis of the extract's cytotoxic activity.

FINDINGS and DISCUSSION

Quantitative analysis of phenolic compounds in *C. orientalis* obtained by LC-MS/MS analysis. In quantitative analysis, vanillic acid (8.72 mg/g extract), caffeic acid (7.85 mg/g extract), and protocatechuic acid (7.1 mg/g extract) were determined as major products (Table 1).

Table 1. Phenolics of *C. orientalis*

Compounds	Retention time (RT)	mg/g extract
Gallic acid	3.260	0.167
Protocatechuic acid	5.514	7.085
Chlorogenic acid	7.388	3.302
Hydroxybenzaldehyde	7.705	0.143
Vanillic acid	7.805	8.72
Caffeic Acid	7.859	7.85
Syringic acid	8.390	3.77
Vanillin	8.639	0.104
o-coumaric acid	9.401	4.898
Salicylic Acid	9.707	3.396
Polydatine	10.124	0.092
Trans-ferulic acid	10.072	2.324
Sinapic acid	10.353	2.361
p-coumaric acid	11.419	0.642
Protocatehuic ethyl ester	11.621	0.320
Hesperidin	11.679	0.646
Isoquercitrin	11.711	0.701
Quercetin-3-xyloside	12.504	0.412
Kaempferol-3-glucoside	13.013	0.914
Quercetin	14.762	1.406
Naringenin	14.763	2.312

The quantification of secondary metabolites in plants is critical in the drug development process. Many phenolics have anticancer effects and suppress tumor formation. Tea's epigallocatechin-3-gallate, for example, induces apoptosis in chronic lymphocytic leukemia B cells, which are resistant to apoptosis (Cornwall et al., 2016). It has been determined that

phenolic compounds in apple, especially flavonoids such as quercetin, have good cytotoxicity against Caco-2 colon cancer cell line (Niestroy et al., 2011).

Various ionization methods are used for LC-MS characterization of phenolics. Recently, these compounds can be identified by electrospray ionization (ESI) in positive or negative MS mode to provide additional structural information (Fang et al., 2002). Reverse phase high performance liquid chromatography (RP-HPLC) was used in a study on the identification of phenolic compounds of *C.orientalis*. Chlorogenic acid, caffeic acid, coumaric acid and sinapic acid were detected as the main phenolic compounds (Ozden et al., 1995). Environmental conditions in the region where plants grow, external factors such as agricultural factors, and internal factors such as genetic factors are very effective on the chemical content of plants (Li et al., 2020).

Vanillic acid (V.A), a flavoring ingredient, is a benzoic acid derivative with numerous biological activities including anti-inflammatory, antioxidant, and neuroprotective properties. VA, on the other hand, has shown anticancer promise in colon cancer by targeting the mTOR/Ras pathway (Kaur et al., 2021). According to a flow cytometry study, vanillic acid strongly triggered G1 phase arrest and inhibited the proliferation of human colon cancer HCT116 and Caco-2 cells. Protocatechuic acid (PCA) is found in almost all edible plants utilized in folk medicine. It is also found in bran and grain brown rice (*Oryza sativa* and *Allium cepa* L.) and is a highly prevalent component in human diet. PCA is a dihydroxybenzoic acid, which is a type of phenolic acid that functions as an antioxidant, antiviral, antiulcer, anticancer, and antiaging agent. It is also well-known for triggering caspase-mediated apoptotic activity and increasing cytotoxicity in numerous cancer cell lines (Khan et al., 2015). Caffeic acid (CA) is a hydroxycinnamic acid chemical molecule. CA is a phenolic chemical that is created by all plant species and is found in foods like coffee, wine, and tea, as well as popular medications like propolis. This phenolic acid and its derivatives are anticarcinogenic, anti-inflammatory, and antioxidant. It has been determined that CA plays a protective role against breast, cervical and colorectal cancer types (Mirzaei et al., 2021).

Apart from the main components, the presence of significant phenolics such as o-coumaric acid, syringic acid, salicylic acid and naringenin has also been detected in *C. orientalis*. It is thought that the main substances in the phenolic component content of the plant have a serious importance as well as the synergistic effect of other components (Tungmunnithum et al., 2018). Cancer is a fatal disease, and substantial scientific research has been conducted in the discovery and development of anticancer medications (Greenwell & Rahman, 2015). In this study, the cytotoxic effect of extract was investigated using L929 and Caco-2 by MTT assay. The

methanol extract *C. orientalis* revealed the good cytotoxic effect against Caco-2 cell lines (% Cell viability, 26.9). The effectiveness of the extract increased in this cell line due to the increase in concentration. The extract exhibited 53.2% cell viability in the L929 cell line, which is a mouse normal fibroblast cell line (Figure 1).

Figure 1. Cytotoxic effects of extract of *C.orientalis* (% Viability)

CONCLUSION and RECOMMENDATIONS

The phytochemistry of *C. orientalis* leaves was investigated and determined that could be a suitable pharmaceutical agent for CaCo-2 due to its bioactive component content. In the future stages of the study, the activities of *C. orientalis* extract against various cell lines such as breast, brain, lung, bone and prostate cancer can be examined. In addition, by isolating the main components, activities such as anticancer, antioxidant, antimicrobial and antiviral can be investigated to protect human health.

Thanks and Information Note

The author thanks Prof. Dr. Ramazan Erenler for his scientific helps and for providing laboratory facilities.

ABSTRACT

Zirconia (ZrO₂) is a high-tech ceramic with high hardness, wear resistance, and fracture strength. Due to its high hardness and brittle character, ZrO₂ cannot be produced in complex shapes using conventional methods. Therefore, 3D additive manufacturing methods are used to produce complex-shaped ceramic parts. In this study, it was aimed to examine the densification, elastic modulus, and especially the flexural strength according to the fracture type by producing the ZrO₂ rectangular prism-shaped bars in a 3D ceramic printer based on stereolithography (SLA) technology. Firstly, the ZrO₂ samples were cleaned from the uncured slurry. Then, the binder burn-out was carried out under nitrogen to remove the polymers in the structure. High-temperature sintering (1450°C) was used for densification and removal of large voids formed by removing polymers from the structure. After the production, the densities of the samples were measured and the elastic modulus was measured by an impulse excitation technique. The relative density (for Archimedes and volumetrically), elastic modulus, and hardness values of the ZrO₂ samples were found as 98.9%, 98.6%, 188 GPa, and 1475 HV, respectively. It was also found that some samples were delaminated during the 3-point bending test and this affected the strength values. It was observed that the fracture strength, which was 755 MPa in properly fractured samples, decreased to 225 MPa in delaminated samples.

INTRODUCTION

Zirconia (ZrO_2) is an advanced engineering ceramic with high hardness, wear resistance, high toughness, high biocompatibility, good chemical, and thermal resistance (Jiaxiao, Xie, and Zhu 2023; Zhao et al. 2023). However, ZrO_2 is a brittle material so, it is almost impossible to produce complex-shaped products via traditional methods (Xing et al. 2017). 3D printing ceramics that cannot be produced by traditional methods. It especially provides high-precision production of ceramic parts containing internal holes, pores, and sharp corners (Shuai et al. 2020; Zeng et al. 2022). Digital light processing (DLP), stereolithography (SLA), fused deposition modeling (FDM), selective laser sintering (SLS), selective laser melting (SLM), two-photon polymerization (TPP), inkjet printing (IJP) and direct ink writing (DIW) are used in additive manufacturing processes of ceramics (Fu et al. 2019). Among these methods, SLA enables more precise production of 3D ceramic parts compared to other methods (Song et al. 2018). The SLA method enables the production of ceramic parts with high precision, smooth surfaces, and thin layers. Furthermore, defects due to internal stresses can be avoided in this process (Wu et al. 2018). In the SLA process, a colloidal mixture containing photopolymerizable additives (ceramic powders, monomers/oligomers, photoinitiators, dispersants, solvents, and plasticizers) is cured with a light source of a certain wavelength. In this process, the light scans on the liquid surface are realized point by point and the part to be produced is printed in thin layers (Chen et al. 2019; Chugunov, Adams, and Akhatov 2020).

When the literature studies were examined, it was seen that there were studies in which ZrO_2 parts were produced using a three-dimensional ceramic printer. Xing et al. produced zirconia bars (3x4x80 mm) using an SLA-based three-dimensional ceramic printer. The density, surface quality, dimensional accuracy, bending strength, fracture toughness, and hardness of the produced ZrO_2 rods were investigated. As a result of the study, high surface quality and dimensional accuracy were obtained. In addition, as a result of mechanical tests, density, flexural strength, fracture toughness, and hardness values were determined as 99.3%, 1154 ± 182 MPa, 6.37 ± 0.25 MPa.m^{1/2}, 13.90 ± 0.62 GPa, respectively (Xing et al. 2017). Gao et al. fabricated square and hexagonal honeycomb-shaped bars on a DLP-based three-dimensional printer. In addition, the effects of different geometric parameters (surface layer thickness, cell height, cell wall thickness, cell size) on flexural strength were evaluated. As a consequence of the 3-point bending test, it was observed that the bars in square honeycomb shape exhibited better properties and the geometric parameters affected the bending resistance (Gao et al. 2020). Fu et al. studied the effect of variable laser power (160 mV, 260 mV, 360 mV, and 460 mV) on

dimensional accuracy and mechanical properties (density, hardness, fracture toughness, flexural strength). Relative density, hardness, fracture toughness, and flexural strength of the produced samples were determined as 97%, 13.1 GPa, 5.62 MPa.m^{1/2}, and 1044 MPa, respectively. Moreover, it was observed that these properties were not significantly influenced by the laser power changes. For dimensional accuracy, the optimum laser power was determined to be 360 mV (Fu et al. 2019).

In this study, the mechanical properties of rectangular prism-shaped ZrO₂ bars produced by using a 3D ceramic printer were investigated. Especially, the variation of the flexural strength according to the fracture type was studied.

MATERIALS and METHODS

In this study, an SLA-based 3D ceramic printer (3DCERAM, France) and 3 mol yttria stabilized ZrO₂ ceramic slurry (3DCERAM, France) were used. Post-sintering shrinkage ratios were considered to ensure that the specimen dimensions conform to ASTM C1161 test standards (45 mm length, 4 mm width, and 3 mm thickness). Shrinkage for ZrO₂ bars were obtained from the supplier. Figure 1 shows the ceramic 3D printer used in this study and the printing process.

Figure 1. 3D ceramic printer and the printing process

The green samples were cleaned from uncured slurry using a special liquid solvent. The cleaned samples were subjected to binder burn-out under nitrogen gas to remove the polymers in the structure. After binder burn-out, voids were formed in the structure due to the removal of polymers. Sintering was performed at 1450°C to eliminate these voids and to provide densification. The sintering cycles used for ZrO₂ slurry are given in Figure 2.

Figure 2. Sintering cycle of ZrO₂ slurry

The densities of the sintered samples were measured by both volumetrically and Archimedes method. The elastic modulus was measured by an impulse excitation technique, while the Vickers hardness test was used for hardness. The flexural strength was determined by a 3-point bending test (ASTM C1161).

FINDINGS and DISCUSSION

Density values of the samples after printing, binder burn-out, and sintering were measured and compared. Densities after printing and binder burn-out were measured volumetrically, while after sintering they were measured both volumetrically and by the Archimedes method. The green density of ZrO₂ bars after printing is approximately 56%. The green density value decreased to 54% after binder burn-out in the nitrogen atmosphere. The reason for this is the voids formed by the removal of polymers in the structure during the binder burn-out process. Sintering was performed to eliminate these voids and to ensure densification. Figure 3 presents the variation of density values measured from 17 different samples after sintering. After sintering, average density values (Archimedes and volumetrically) were 98.9% and 98.6%, respectively.

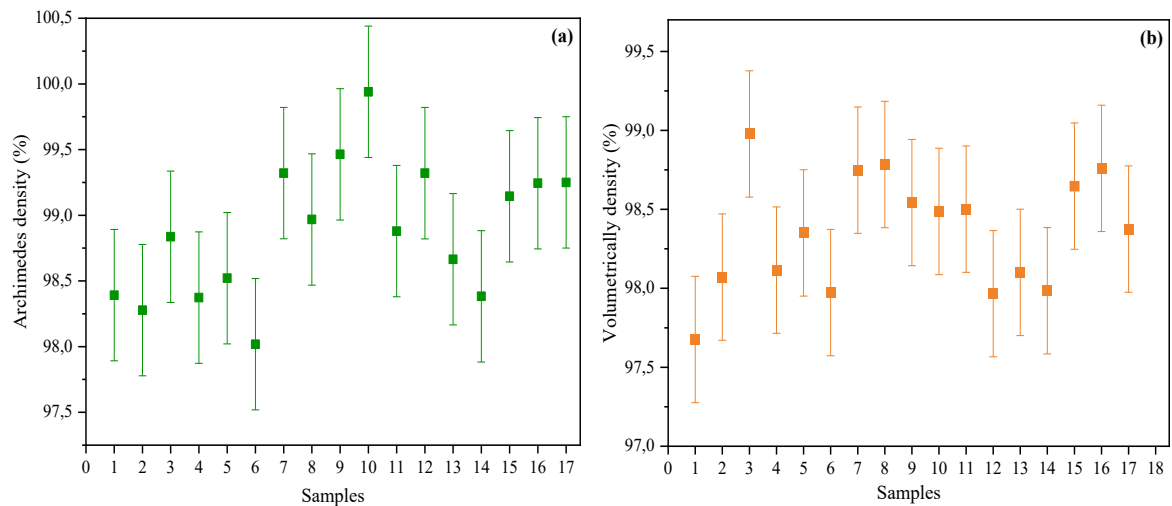

Figure 3. Archimedes (a) and volumetrically (b) density results of ZrO_2 bars.

Vickers hardness and elastic modulus measurement results of the samples are given in Figures 4(a) and 4(b), respectively. Five different measurements were made during each test, and the average values were taken as hardness and elastic modulus values. Hardness tests were carried out for 10 s under a 2 kg load and the average hardness value was found as 1475 HV. From the elastic modulus results in Figure 4b, the average elastic modulus value was 188 GPa for ZrO_2 bars.

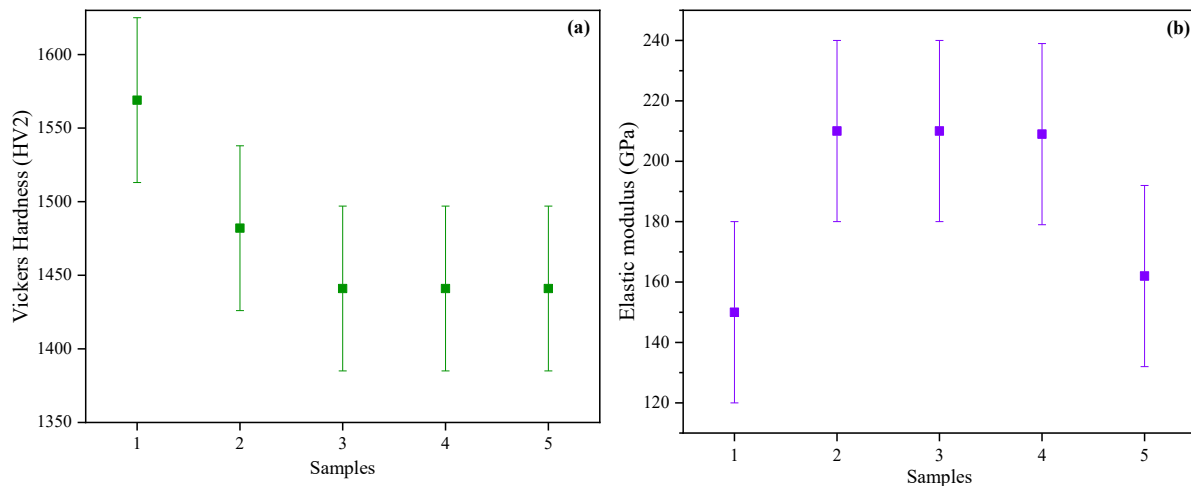

Figure 4. Vickers hardness (a) and elastic modulus (b) values of ZrO_2 bars samples

A 3-point bending tests were performed to determine the flexural strength using a 50 kN load cell at a 0.5 mm/min loading rate. In addition, the 3-point bending tests were performed for seventeen different samples and the average value was taken as the flexural strength. The samples exhibited brittle fracture behavior due to their hard and brittle structure. Some samples were seen to be delaminated. This delamination directly affected the flexural strength. When the graph in Figure 5 is analyzed, it is seen that the highest flexural strength is 1168 MPa. This

value decreased significantly in delaminated samples. The average flexural strength of the properly fractured samples was 755 MPa. However, it was observed that this value decreased up to 225 MPa in delaminated samples. Consequently, it was observed that the fracture type directly affected the flexural strength and that the flexural strength decreased in delaminated samples.

Figure 5. Variation of flexural strength of ZrO_2 bar samples according to fracture type.

Figures 6(a) and (b) illustrate the properly fractured and delaminated specimens during the 3-point bending test. It is seen from the figures that all ceramic samples exhibited brittle fracture behavior due to the nature of the ceramic materials. The delamination during the 3-point bending test is due to the production technique. Since a layer-by-layer production was performed, the voids formed after debinding caused delamination between the layers. This delamination caused a significant decrease in the flexural strength.

Figure 6. Properly fractured (a) and delaminated (b) samples.

CONCLUSION and RECOMMENDATIONS

In the present work, the ZrO₂ rectangular bars were produced using an SLA-based 3D ceramic printer. The densification, hardness, elastic modulus and especially the effect of fracture type on the flexural strength of the produced samples were investigated. As a result of the tests, the average density (Archimedes and volumetrically) values of the samples were 98.9% and 98.6%. The average Vickers hardness and elastic modulus values were 1475 HV and 188 GPa, respectively. Also, the flexural strength was found to be affected by the type of fracture. While the flexural strength of the properly fractured samples was 755 MPa, this value decreased to 225 MPa in delaminated samples.

ÖZET

Ofis sandalyesi ergonomisi, çalışma ortamında sağlıklı ve güvenli bir oturma pozisyonu sağlamayı amaçlayan bir konsepttir. Uzun saatler bilgisayar başında veya masa başında çalışan kişiler için önemlidir. Sandalyenin dönebilmesi ve tekerleri üzerinde hareket edebilmesi özelliğiyle çalışma alanına erişim sağlanır. Döner maşalı tekerlere sahip olan çalışma sandalyelerinin tekerlek sisteminin dayanıklılığı için 110 kg bir insanın günde 8 saat çalışması esasına dayanarak deney düzeneği tasarlanmıştır. Bu deney düzeneği 1890 x 1000 mm alüminyum karkas üzerine montaj edilmiş bir tabla üzerine kurulmuştur. Alüminyum kolonların arası desteklenmiştir. Çift araba sistemi kurulmuştur. Sandalye tutucu ayarlanabilir olarak tasarlanmış ve farklı tipteki koltuklar için denebilmektedir. Deney düzeneğindeki vidalı mil ve araba mekanizması motor ile tahrik edilmektedir. Dayanıklılık deneyleri 110 kg altında, dakikada 6 devir yapacak hızda, 1 metre boyunca gidiş-dönüş şeklinde lineer hareket yaparak 36000 çevrim yaparak çalışmaktadır. Bu sistem bir motor sürücü ile kontrol edilmektedir. Gidiş ve dönüşlerdeki bildirimler bir konum şalteri ile alınmıştır. Dakikadaki 6 devirlik süre aralığı içerisinde kronometre ile ölçülerek motor sürücüsü üzerinden ayarlanmıştır. Tüm bu şartlar TS EN 1335-3 standardının göstergeleri doğrultusunda sağlanmıştır. Deney düzeneği bu çalışma şartlarına uygun mukavemet ve ergonomi de tasarlanmıştır. Kavramsal tasarımının ardından bilgisayar destekli tasarımı tamamlanmış olan bu test düzeneyi daha sonrasında TS EN ISO/IEC 17025 standartı ile akredite olmuş kalite laboratuvarına teslim edilmiştir.

**EXPERIMENT SET DESIGN AND MANUFACTURING FOR DETERMINING THE
DURABILITY OF SWIVEL CHAIR**

ABSTRACT

Office chair ergonomics is a concept aiming to provide a healthy and safe sitting position in a working environment. It is important for people who work at the computer or desk for long hours. The ability of the chair to swivel and move on its wheels allows for access to the workspace. A testing setup has been designed for the durability of the wheel system of working chairs with swivel casters, based on the principle of an 110 kg person working 8 hours a day. This experimental setup was built on a table mounted on an aluminum carcass of 1890 x 1000 mm. Supported between aluminum columns. A double car system was installed. The chair holder is designed as adjustable and can be tested for different types of seats. The screw shaft and car mechanism in the experimental setup are driven by a stepper motor. Durable performance tests are conducted by performing linear motion in a back-and-forth manner over a distance of 1 meter, at a speed of 6 revolutions per minute, and under a load of 110 kg. The system operates by completing 36,000 cycles. This system is controlled by the Arduino open-source software program. The experimental setup was designed in accordance with these working conditions in terms of strength and ergonomics.

GİRİŞ

Ergonomi, insanların çalışma ortamlarını, iş süreçlerini ve ekipmanlarını daha verimli, güvenli ve rahat hale getirmek için tasarımın ve çalışma koşullarının incelendiği bir disiplindir. Ergonomi, insan fizyolojisi, psikoloji ve iş yapma becerileri ile ilgilenir ve bu ayrıntıları kullanarak iş yerlerini daha etkili hale getirir. Elbette ofis mobilyalarının ergonomisi çalışma ortamının verimliliği, çalışanların sağlığı ve rahatlık açısından son derece önemlidir. Ofis mobilyalarının ergonomisi, çalışanların konforunu ve verimliliğini artırır. Bu nedenle, bir iş yerinin mobilyalarının ergonomik özelliklerine dikkat etmek önemlidir. Ofis sandalyelerinin ergonomisi, ofis çalışanlarının rahatlığını, genişliği ve kapsamını genişletmek amacıyla tasarlanan özel özellikleri içeren bir konsepttir. Ergonomi, başka bir tanımla; insanın konforu, güvenlik ve etkinlik açısından en iyi şekilde kullanılabilen araç, makine ve donanım hakkında gerekli tüm bilgileri içeren bir bilim dalı olarak da üretilebilir (Özkul, 2000). Kısacası ergonomi, endüstriyel iş ortamındaki tüm kişilerin arasından ortaya çıkabilen organik ve psikososyal streslerle başa çıkmak ve insan-makine-çevre uyumunu belirlemek amacıyla, insanların anatomik özelliklerini, antropometrik özelliklerini, göz önünde bulunduran çok disiplinli bir araştırma ve geliştirme alanıdır (Yetiz, 2009).

İşte ofis sandalyelerinin ergonomisi hakkında üzerine konuşulabilecek bir takım etmenler aşağıdaki gibidir:

1.Ofis Sandalyeleri:

- Sandalyenin sırtının dayanıklılığı, bel doğal eğrilerini desteklemeli ve ayarlanabilir olmalıdır.
- Sandalyenin ayarlanabilir olması ve kişilerin ayaklarının yere düzgünce basmasını sağlaması gerekir.
- Kol dayamaları, kullanıcıların kollarını taşımasını sağlaması ve masalara göre uygun bir şekilde ayarlanabilir olması gerekir.

3.Ofis Mobilyalarının Ayarlanabilir Olması:

- Ofis mobilyaları, farklı vücut tiplerine uyum sağlaması için ayarlanabilir olmalıdır. Bu, farklı kullanıcıların aynı mobilyalarını kullanabilmesini sağlar.

4.Sırt Desteği:

- Ergonomik ofis sandalyeleri, öğrencinin bel ve sırt bölgesini doğru şekilde destekleyecek bir sırtına dayanağına sahiptir. Bu sırtın dayanıklılığı, bel doğal eğrilerinin desteklenmesi ve ayarlanabilir olması gerekir.

5.Kol Dayamaları:

- Ergonomik sandalyeler, kol dayamaları veya kol destekleri ile bir bütündür. Bu, kullanıcıların kollarını dinlendirebilecekleri ve klavyeyi kullanarak doğru pozisyonlarını koruyabilecekleri anlamına gelir.

6.Yükseklik Ayarı:

- Ofis sandalyeleri yükseklik ayarına sahip olmalıdır. Bu, kullanıcının sandalyenin yüksekliğini kişisel tercihlerine ve çalışma masasının ölçülerine göre ayarlamasına yardımcı olur.

7.Koltuk Derinliği Ayarı:

- Ergonomik sandalyeler, kullanıcıların ayarlarının oturabileceği bir koltuk derinliği ayarı sunmalıdır. Bu, kullanıcının belinin korunmasına yardımcı olur.

8.Ergonomik Tasarım:

- Ergonomik sandalyeler, kişinin vücut yapısına uygun şekilde tasarlanır. Bunun sonucunda kullanıcılar omurga sağlığına zarar vermeden uzun süreli oturmayı sürdürürler.

9.Kişisel çözülebilirlik:

- İyi bir ergonomik ofis sandalyesi, kullanıcıların tercihlerine göre ayarlanabilir olmalıdır. Bu, çalışanın konfor seviyelerine uygun bir oturma deneyimi yaşamasını sağlar.

10.Ayak ve Tekerlekler:

- Ofis sandalyeleri genellikle beş tekerlekli tabana sahiptir, bu da kolayca hareket etmesini sağlar.
- Ayaklar, çocuğun ağırlığını dengeli bir şekilde taşıyabilecek kadar sağlam olmalıdır.

Ofis mobilyalarının ergonomisi, çalışanların konforunu ve sistemlerini artırma verimliliğini ve konforu artırır. Bu nedenle, bir iş yerinin mobilyalarının ergonomik özelliklerine dikkat etmek önemlidir. İnsan gücüne ihtiyaç duyulan her alanda ergonomi, insan/makine ilişkilerinde önemli bir tasarım problemi olarak karşımıza çıkmaktadır. Ofis ortamında, sabit bir masa etrafında hareketli sandalye ile çalışma, çalışanın hem uygun mobilitesini arttırarak çalışma performansı arttıracak, hem de uygun çalışma pozisyonu sağlanması konusunda çalışana büyük rahatlık sağlayacaktır.

Yorulma ömrü, makinelerin veya makine elemanlarının uzun vadeli dayanıklılığı ve güvenilirliği açısından kritik bir faktördür. Bu süreç, malzemenin tekrarlayan gerilme veya

zorlamalara maruz kaldığı durumlarda meydana gelir. Önce zayıf bir noktada yorulma başlar. Ardından bu noktada bir çatlak oluşur ve derinleşen çatlak gerilme mukavemeti sınırını geçerek aniden kırılır (Tirit, 2022). İşte bu kırılmalar sonucu oluşacak olumsuz olaylar karşısında işyerlerinde bu tür sandalyelere yatırım yapmak, çalışanın kapasitesini artırmak ve iş sağlığı ve güvenliğini artırmak olumlu bir etki yaratabilir. Ancak diğer bütün insan/makine arayüzlerinde olduğu gibi ofis ekipmanlarının da belirli standartları sağlamaları gerekmektedir. Çalışma koltuğu mobilitesiden sorumlu koltuk tekerleri de TS EN 1335-3 standartları gereği, belirlenen çalışma ömrünü sağlamak zorundadır.

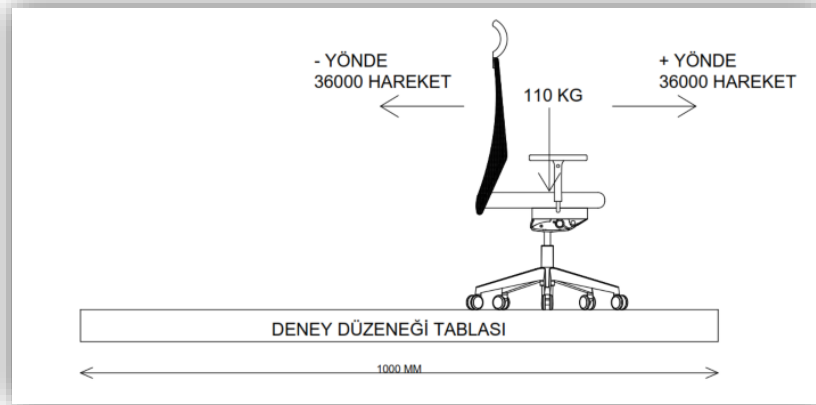

TS EN 1335-3 standardı, ofis ortamında kullanılacak hareketli bir çalışma koltuğun döner maşalı tekerleklerinin ve sandalye tabanının, iş kazasına meydan vermeden uygun görülen bir çalışma ömrüne sahip olup olmadığının bir ölçütü olarak ortaya konmuştur. Bu bakımdan bu çalışma, ülkemizde çalışma koltuğu üreten firmalara, uluslararası standartlara uygun bir test cihazı tasarımı ve üretimi konusunda bir örnek teşkil etmeyi amaç edinmiştir.

MATERYAL ve YÖNTEM

Çalışma kapsamında, öncelikle TS EN 1335-3 standardı ve bu standardın atıf yaptığı diğer standartlar taranarak, standardın olgunlaşma sürecinde dikkat çekilen noktalar araştırılmıştır. TS EN 1335-3 standardı gereği yapılacak testte, test numunesi koltuğun yeterli şartları sağladığının göstergesi;

- 110 kg'lık test kütlesi ile yüklendikten sonra,
- 1000±250mm'lik çizgisel yörünge boyunca,
- 1 dakikada 6 çevrim yapacak şekilde,
- 36000 çevrim sonunda herhangi bir hasar belirtisi göstermemesidir (Avrupa Standardizasyonu Komitesi (CEN), 2012).

Alternatif olarak sandalyenin dönme eksenini masanın dönme eksenine çıkaracak şekilde bir deney zemini olan döner bir masa üzerine yerleştirilen sandalye, 110 kg yüklenerek dönme için serbest bırakılmalıdır. Masa dakikada 6 döngü yapacak hızda 0 ile 180 derece arasında döndürülerek darkl bir test cihazında tasarlanabilir (Avrupa Standardizasyonu Komitesi (CEN), 2013).

Literatür de, daha önce yapılmış ve test düzeneği tasarım ve imalatı üzerine yapılmış bilimsel çalışmalar araştırılarak, bu alanda dikkat edilmesi gereken hususlar tespit edilmiştir. Literatür çalışmasının ardından, ilgili standart gereğince gerekli çalışma uzayına sahip test cihazının kavramsal tasarımı yapılmıştır. Bu tasarım sürecinde piyasada bulunabilecek standart parçalarla birlikte, kullanılacak muhtemel özel parçaların imalat resimleri hazırlanarak imal edilmiş ve test cihazının montajı tamamlanmıştır. Test cihazının kavramsal tasarımının tamamlanmasının ardından 3 boyutlu tasarım aşamasına geçilmiştir. Bu aşamada tasarlanan test cihazı için mümkün olduğunca piyasada kolay bulunacak olan malzemeler tercih edilmiştir. Kavramsal tasarım sürecinde deney düzeneği için vidalı mil somun bağlantısı tercih edilmiştir.

Şekil 2. Bilyalı vidalı mil mekanizması (ERDÖL, 2014)

Şekil 3. Deney düzeneği 3 boyutlu tasarım görseli

45x45 mm ölçülerindeki alüminyum profiller bağlantı elemanları vasıtası ile birbirine bağlanarak bir karkas taban oluşturulmuştur. Bu karkasın yer ile bağlantısı dört köşeden ayarlanabilir bingö ayaklar vasıtasıyla sağlanmıştır. Hazırlanmış olan karkas üzerine 4mm kalınlığında bir sac levha bağlanarak test düzeneği zemini oluşturulmuştur. Bu sac bağlı karkas sistemi ayarlı bingö ayaklar vasıtası ile teraziye alınmıştır. Bu terazileme işleminde kumpas ve su terazisi kullanılmıştır.

Şekil 4. Deney düzeneği karkas sistemi 3 boyutlu tasarım görseli

45x90mm ölçülerindeki iki adet alüminyum profil kolon profilleri olarak karkasa dik bir şekilde imal edilmiştir. Bu kolonlar arası en üst noktadan 90x90 alüminyum profil vasıtası ile birbirine bağlanmıştır. Deney düzeneğinde kullanılacak olan vidalı mil için yataklar 90x90 profil üzerine bağlanmıştır. Motor ile mil bağlantısı, redüktör kullanılmadığından dolayı doğrudan imal edilen kaplin ile sağlanmıştır.

Şekil 5. Deney düzeneği motor bağlantısı 3 boyutlu tasarım görseli ve orijinal görüntüsü

Motorun sabit bir şekilde durabilmesi için slotlu bir motor tablası, kolon görevi gören 45x90 alüminyum profil üzerine bağlanmıştır. Test düzeneği üzerinde çift araba sistemi kurulmuştur. Bu araba sistemlerinden yukarıda olan üzerine montajlanmış tekerler vasıtası ile alüminyum profilin kanalları üzerinde hareket etmektedir. Aşağıdaki araba sistemi ise doğrudan üstteki sistemle akuple olarak bir lama üzerinde hareket etmektedir. İki sistem birbirine lazerde kesilmiş bir parça ile birbirine bağlanmıştır.

Araba sistemi ile sandalye arasındaki bağlantı kısmı yine slotlu bir şekilde tasarlanmış imal edilmiş ve montajlanmıştır. Ayarlanabilir olmasındaki amaç, sandalyelerdeki amortisör görevi gören konum koruyucuların konumlarının sandalye çeşitlerine göre değişiklik göstermesidir. Bu konum koruyucuların iç mil ve kovanlarındaki çap değişikliğide göz ardı edilmemiş ve bağlantı lazerleride slotlu olarak imal edilmiştir.

Şekil 6. Deney düzeneği araba sistemi ve koltuk bağlantı aparatı şeması

Motor bir motor sürücüsü vasıtası ile tahrik edilmiştir. Bu sürücü üzerinden TS EN 1335-3 standardının sunmuş olduğu dakikadaki 6 devirlik motor hızı kronometre yardımıyla ayarlanmıştır. Deney düzeneğinin her bir metre sonraki geri dönüş bildirimini konum şalterleri vasıtası ile sağlanmıştır.

Şekil 7. TS EN 1335-3 standardınca imal edilmiş deney düzeneği görseli

Şekil 8. Deney test numunesi görseli

BULGULAR ve TARTIŞMA

Çalışmanın ilk aşamasında kavramsal tasarım ortaya çıkarken yalnızca alt kısımdaki araba sistemi ile ileri geri hareket mekanizması düşünülmüştür. Bu sistemde 3 boyutlu tasarımın ardından montaj parçalarının teknik resimleri çıkarılmış ve imal edilmiştir. Sonrasında Ar-Ge atölyede montajlanma sürecinin ardından bir problem olduğu ortaya çıkmıştır. Mil üzerinde hareket eden somun mekanizması ile alt araba sistemi arasında hem montaj sacı üzerinde aksel bir eğilme hem de vidalı milde bir eğilme olduğu ortaya çıkmıştır. Bu eğilmelerin ortadan kaldırılması adına üst araba sistemi kurulma kararı alınmıştır. Dört adet tekerden oluşan ve bir saca bağlı olan parça somun mekanizmasına kaynaklı olarak bağlanmıştır. Tekerler 90x90 alüminyum kayıt üzerine yerleştirilmiş ve tekerlerin kanallar üzerinde ilerlemesi sağlanmıştır. Bu sayede hem vidalı mildeki hemde montaj sacı üzerindeki aksel eğilme ortadan kaldırılmıştır.

Şekil 9. TS EN 1335-3 standardınca tasarlanmış deney düzeneğinin 3 boyutlu tasarım görseli

Deney düzeneği karşılaşılan problemlerden bir tanesi de tabandaki sacın kalınlığı olmuştur. Sac taban ilk olarak 2 mm kalınlığında tasarlanmış ve montajlanmıştır. Montajlandıktan sonra sandalye üzerine TS EN 1335-3 standardı gereğince 110 kg ağırlık yüklenmiştir. Bu yükleme sonucunda tabandaki sacda eğilmeler ve oluklaşmalar görülmüştür. Sonrasında bu sac levha 4 mm kalınlığındaki bir sac levha ile değiştirilerek bu problem ortadan kaldırılmıştır. Mukavemet şartlarını sağlaması adına sac levha üzerine havşalar açılıp alüminyum karkas üzerine havşa başlı vidalar vasıtası ile sabitlenmiştir. İmalatı tamamlanmış deney düzeneği için bir takım değişiklikler yapılabilir. Örneğin iki kolon arasındaki 90x90 alüminyum kayıt daha

aşağılara indirilip tek bir araba sistemi kullanılabilir. Ray-araba bağlanıp daha basit düzeyli bir test cihazı oluşturulabilir.

Şekil 10. İmal ve montajı yapılmış deney düzeneğinin farklı yapıdaki tasarım görseli

SONUÇ ve ÖNERİLER

Sonuç olarak, deney düzeneği önce bilgisayar ortamında tasarlanmış ve sonrasında fabrikanın Ar-Ge atölyesinde imal edilmiştir. Sonrasında TS EN ISO/IEC 17025 ile akredite olmuş laboratuvarında kullanılması adına kalite birimine teslim edilmiştir. Bu standart, numune alma kapsamında, deney ve/veya kalibrasyon hizmeti veren bir laboratuvarın yeterliliğinin sağlanması için sağlanması gereken genel şartları içermektedir. Bu standart, l aboratuvar tarafından ayrılabilen standart olan ve standart olmayan metotlarla yapılan deney ve kalibrasyonu da kapsamaktadır (Avrupa Standardizasyonu Komitesi (CEN), 2010).

Muhtemel tasarım ve imalat g ncellemelerinin sonucunda ortaya  ıkmıř olan  alıřmanın, ilgili standarda uygun bir test cihazı, bu alanda  retim yapan yerli  reticilerin kendi test cihazlarını  retmeleri konusunda bir yol haritası olmuřtur. Ortaya koyulan bu deney d zeneđi vasıtası ile  eřitli tedarik i firmalardan alınan farklı  ap ve  zelliklerdeki tekerlerin test edilerek tedarik ileri geri bildirim sađlanması i in ve kullanıcıların iř, okul ve  alıřma ortamı gibi farklı alanlardaki  alıřma sađlıđı ile alakalı olarak iř kazası ge irmemesi konusunda bir adım atılmıřtır.

Teřekk rler

 alıřmaya olan katkılarından dolayı Selim Dođan, Burak Tařkın ve Rıdvan  elik'e teřekk r ederim.

ABSTRACT

Using an electrolyte solution of low-concentration 5 mM Cd (NO₂)₃·4H₂O as a Cd source, an electrochemical deposition method was employed to produce a thin film of CdO at an applied potential of -0.7 V and a temperature of 70 °C. Subsequently, a layer of pentacene organic semiconductor compound, approximately 100 nm thick, was deposited onto the CdO surface using the PVD method, resulting in the synthesis of a Pentacene/CdO nanocomposite heterojunction. The electrical analysis of heterojunction was carried out at a dark condition and under light intensities of 20-100 mW/cm² with an applied potential of ±2 V. The basic diode parameters of the heterojunction were investigated with thermionic emission theory. Accordingly, the diode ideality factor (n) values at dark and light intensity of 20, 40, 60, 80 and 100 mW/cm² are 12.06, 11.04, 9.79, 12.75, 10.11 and 10.95, respectively. The barrier height (ϕ_b) values are 0.211, 0.202, 0.212, 0.204, 0.209 and 0.207, respectively. It is seen that the n and ϕ_b values are not a function of the light and the values exhibit fluctuating behavior against the light. This can be explained by the rearrangement of molecular structures under light. Photocurrent (I_{ph}), photoresponsivity (R_{ph}) and specific detectivity (D*) parameters of the heterojunction at 2 V were investigated at 20, 40, 60, 80 and 100 mW/cm² light intensity. I_{ph} values are 7.77x10⁻⁴, 1.50x10⁻⁴, 3.47x10⁻⁴, 1.10x10⁻⁴, 2.85x10⁻⁴ A respectively. R_{ph} values are 6.03x10⁻², 5.84x10⁻³, 8.97x10⁻³, 2.14x10⁻³, 4.43x10⁻³ A/W respectively. D* values are 1.95x10⁹, 1.88x10⁸, 2.89x10⁸, 6.89x10⁷, 1.43x10⁸ Jones, respectively. The highest parameters were observed at 20 mW/cm² light intensity. This light intensity is the value at which the photogenerated electron-hole pairs and the generated signal reach the maximum level. It has been seen that the successfully produced Pentacene/CdO nanocomposite heterojunction offers an alternative to the field of optoelectronic application.

Keywords: CdO, Pentacene, Electrical parameters, Light sensitivity, Nanocomposite heterojunction.

INTRODUCTION

The demands of ever-evolving optoelectronic technology have piqued the attention of academia and business in producing more efficient and alternative transparent metal oxide semiconductor materials. Researchers have been developing various materials and designs to push the limits of metal-semiconductor contacts, which are used in many applications in the electronics industry, including solar cells, light-emitting diodes, photodetectors, phototransistors, liquid crystal displays, gas sensors, and photocatalytic converters (Tao et al., 2020; Wu et al., 2022). Cadmium oxide (CdO) is an n-type II-VI group metal oxide semiconductor with direct band gaps ranging from 2.2 to 2.6 eV (Lewis & Paine, 2000). Because of its electrical, optical, and magnetic capabilities, as well as its chemical stability, CdO appears promising. Low cost and simplicity of manufacturing, massive carrier concentration, excellent mobility, and possibly vast optical response range all contribute to the possibility for extensive use and exploration (Unal, Kurt, Aktas, & Kabaer, 2022). CdO thin films can be produced by many different methods (Chandiramouli & Jeyaprakash, 2013). These methods are Vapour phase techniques (Dakhel & Henari, 2003; Lamb & Irvine, 2009; Subramanyam, Radha Krishna, Uthanna, Srinivasulu Naidu, & Jayarama Reddy, 1997; Zhang, Chen, Zhang, Ma, & Yang, 2010), Solution phase techniques (Akyuz, Kose, Ketenci, Bilgin, & Atay, 2011; Dhawale, More, Lathe, Rajpure, & Lokhande, 2008; Salunkhe & Lokhande, 2008). The electrochemical deposition method, which is one of the solution phase methods, is a significant deposition method that is easy, inexpensive, and does not require a high vapor pressure or a vacuum atmosphere (Aktas, Unal, Kurt, & Kabaer, 2022; Aktaş & Ünal, 2022; Fatih et al., 2022; Fatih et al.; Kurt, Aktas, Ünal, & Kabaer, 2022). In this study, a nanocomposite heterojunction was produced with CdO using pentacene organic semiconductor and it was aimed to provide an alternative to both optical and electrical fields.

MATERIALS and METHODS

CdO thin film was produced by electrochemical deposition method. Using an electrolyte solution of low-concentration 5 mM $\text{Cd}(\text{NO}_2)_3 \cdot 4\text{H}_2\text{O}$ as a Cd source, an electrochemical deposition method was employed to produce a thin film of CdO at an applied potential of -0.7 V and a temperature of 70 °C. Subsequently, a layer of pentacene organic semiconductor compound, approximately 100 nm thick, was deposited onto the CdO surface using the physical vapor deposition method, resulting in the synthesis of a Pentacene/CdO nanocomposite heterojunction.

FINDINGS and DISCUSSION

At an applied potential of 2 V, the electrical analysis of the Pentacene/CdO nanocomposite heterojunction was tested under both dark and five various light intensities. The I-V measurement of the Pentacene/CdO nanocomposite heterojunction is shown in Figure 1. Under light, the electrical conductivity of the Pentacene/CdO nanocomposite heterojunction varies. Under light, the production of new electron-hole pairs has resulted in an increase in electrical conductivity, which is seen in both forward and reverse bias circumstances. The I-V curve displays linear behavior under forward bias up to 0.3 V, beyond which it begins to exhibit series resistance effects. The series resistance effect has caused a reduction in current.

Figure 1. I-V analysis of pentacene/CdO nanocomposite heterojunction

The diode parameters of the Pentacene/CdO nanocomposite heterojunction can be determined using the thermionic emission theory (Unal, 2023; Zurnacı et al., 2021). Figure 2 presents the variation of the diode ideality factor (n) values of the Pentacene/CdO nanocomposite heterojunction in the dark and under different light intensities. In the dark and at light intensities of 20, 40, 60, 80, and 100 mW/cm², the n values are 12.06, 11.04, 9.79, 12.75, 10.11, and 10.95, respectively. The highest n value was observed at a light intensity of 60 mW/cm², while the lowest n value was observed at 40 mW/cm² light intensity. The n values deviate from the ideal value of 1 both in the dark and under different light intensities, as is common in the literature, as observed in examples such as MnPc/GC (Aktas et al., 2023), TiO:NiO composite thin structures (Burhan, Fatih, & Mümin Mehmet, 2023), and Si/TiO₂ (Unal, Kurt, & Durdu, 2022).

Figure 2. Change of n values of pentacene/CdO nanocomposite heterojunction depending on light intensity

The fluctuation of the barrier height (ϕ_b) values of the Pentacene/CdO nanocomposite heterojunction in the dark and under varied light intensities is depicted in Figure 3. The ϕ_b values are 0.211, 0.202, 0.212, 0.204, 0.209, and 0.207 eV in the dark and at light intensities of 20, 40, 60, 80, and 100 mW/cm², respectively. The maximum ϕ_b value was found in darkness, while the lowest ϕ_b value was found at a light intensity of 60 mW/cm². It is clear that the ϕ_b values are not affected by the intensity of the light; rather, they are connected to the rearrangement of the molecules in the layers under illumination. Furthermore, there is an inverse connection between n and ϕ_b values, with a bigger ϕ_b value approaching the ideality of the diode.

Figure 3. Change of ϕ_b values of pentacene/CdO nanocomposite heterojunction depending on light intensity

Photocurrent ($I_{ph}=I_{ill}-I_{dark}$), photoresponsivity ($R_{ph}=I_{ph}/P_{inc}\cdot A$) and specific detectivity ($D^*=R\cdot A^{1/2}/(2qI_{dark})^{1/2}$) parameters of the heterojunction at 2 V were investigated at 20, 40, 60,

80 and 100 mW/cm² light intensity. The fluctuation of I_{ph} values of the Pentacene/CdO nanocomposite heterojunction as a function of light intensity is depicted in Figure 4. The relative I_{ph} values are 7.77x10⁻⁴, 1.50x10⁻⁴, 3.47x10⁻⁴, 1.10x10⁻⁴ and 2.85x10⁻⁴ A. The maximum I_{ph} value was found at a light intensity of 20 mW/cm², while the lowest I_{ph} value was found at an intensity of 80 mW/cm². The greatest light intensity at which I_{ph} is reached denotes the maximal photogenerated charge.

Figure 4. Change of I_{ph} values of pentacene/CdO nanocomposite heterojunction depending on light intensity

The fluctuation of R_{ph} values of the Pentacene/CdO nanocomposite heterojunction as a function of light intensity is shown in Figure 5. R_{ph} values are 6.03x10⁻², 5.84x10⁻³, 8.97x10⁻³, 2.14x10⁻³, 4.43x10⁻³ A/W respectively. The maximum R_{ph} value was found at a light intensity of 20 mW/cm², while the lowest R_{ph} value was found at an intensity of 80 mW/cm². R_{ph} values drop as light intensity rises. This is explained by the reduction in radial diffusion of light as light intensity increases.

Figure 5. Change of R_{ph} values of pentacene/CdO nanocomposite heterojunction depending on light intensity

Figure 6 depicts the variation of D^* values of the Pentacene/CdO nanocomposite heterojunction as a function of light intensity. D^* values are 1.95×10^9 , 1.88×10^8 , 2.89×10^8 , 6.89×10^7 , 1.43×10^8 Jones, respectively. Similar to the I_{ph} and R_{ph} values, the highest D^* value was observed at a light intensity of 20 mW/cm^2 , while the lowest D^* value was observed at 80 mW/cm^2 light intensity.

Figure 6. Change of D^* values of pentacene/CdO nanocomposite heterojunction depending on light intensity

CONCLUSION and RECOMMENDATIONS

Using hybrid techniques, a pentacene/CdO nanocomposite heterojunction was effectively created. The electrical study findings in the dark and at varied light intensities revealed that the heterojunction was light sensitive, with a maximum efficiency at 20 mW/cm^2 light intensity. As a result, the heterojunction we created provides a new option in the optoelectronic application area.

ABSTRACT

The ZnO compound was grown on ITO-coated glass using an electrochemical method, while the Pentacene organic compound was deposited on the ZnO thin film using physical vapor deposition. Copper (Cu) ohmic contacts were deposited on the layers. The aim of this study was to create a junction with previously uncombined layers and provide an alternative to diode technology. The basic current-voltage (I-V) characterization of the Pentacene/ZnO diode was conducted at $\pm 2V$ applied potential, under room conditions, and in a dark environment. The diode parameters (Ideality factor (n), barrier height (ϕ_b), reverse saturation current (I_0), series resistance (R_s)) of the Pentacene/ZnO diode were determined using thermionic emission theory (TE) and Cheung & Cheung functions (C&CF). In TE, the linear portion of the I-V curve was used to determine the parameters, while in C&CF, the region where the linear portion of the I-V curve begins to deviate, indicating the onset of series resistance effect, was used. Additionally, C&CF employed two different functions to determine the parameters. For the Pentacene/ZnO diode, the values of n , ϕ_b , and I_0 determined from TE were 2.02, 0.46 eV, and 7.7×10^{-4} A, respectively. The values of n and ϕ_b determined from C&CF were 1.85 and 0.45 eV, respectively. While ϕ_b and n values are close, they differ, attributed to the utilization of different regions of the I-V curve by the two methods. However, in both methods, the n values deviate from the ideal diode value of 1. Interface states, contaminants formed during the experiment, measurements conducted in atmospheric conditions, and unwanted oxide layers may contribute to this deviation. The C&CF-determined R_s values for the Pentacene/ZnO diode range from 132 to 135 Ω . These R_s values, calculated using C&CF, are relatively low according to the literature and are close to each other, indicating low calculation error.

Keywords: ZnO, Pentacene, Junction, Diode parameters, I-V characterization

INTRODUCTION

Diodes are essential parts of contemporary electronics and the foundation of innumerable electronic circuits and systems. Zinc oxide (ZnO) stands out as a versatile and promising choice among the wide range of materials utilized for diode applications. This metal oxide, which is made up of atoms of zinc and oxygen, has a special combination of electrical and material characteristics that make it a desirable option for diode technology. The amazing electrical properties of ZnO make it desirable for diode applications. ZnO is a wide-bandgap semiconductor that displays excellent rectification behavior and has a direct bandgap energy of about 3.37 eV (Djurišić & Leung, 2006); this makes it a good choice for diode configurations (Arya et al., 2012). Its promise in diode technology is aided by its high breakdown voltage, low leakage current, and quick switching capabilities (Fortunato et al., 2005), which provide superior performance in systems where dependability and efficiency are critical. ZnO-based diodes are used in many different fields and businesses. ZnO diodes have the potential to improve the efficiency and power density of electronic devices (Özgür et al., 2005) in the field of power electronics. They are useful parts in power conversion systems, such as inverters, rectifiers, and voltage regulators because to their capacity to function at high temperatures and handle high voltages (Kurt, Aktas, Ünal, & Kabaer, 2022). Additionally, ZnO diodes are developing significantly in the optoelectronics sector (Choi, Kang, Hwang, & Park, 2009). They enable the creation of effective and high-performance optoelectronic devices due to their compatibility with LEDs and photodetectors (Ghosh et al., 2016). Solid-state lighting, optical communication, and image technologies are just a few of the fields that this combination has the potential to change. Despite the enormous potential of ZnO diodes, problems with material quality, interface engineering, and contact qualities still exist and require further study (Kennedy et al., 2016). High-quality diode materials are being produced thanks to improvements in ZnO growing methods such molecular beam epitaxy (MBE), physical vapor deposition (PVD) (Jimenez-Cadena, Comini, Ferroni, Vomiero, & Sberveglieri, 2010) electrochemical deposition (ED) (Aktas, Unal, Kurt, & Kabaer, 2022) and chemical vapor deposition (CVD) (Ju et al., 2007). Additionally, improvements in ZnO diode performance characteristics are being made possible by advancements in device design and fabrication. Pentacene, an organic semiconductor, is a very challenging compound, especially in the field of optoelectronic applications. It attracts a lot of attention due to its easy coating and high mobility. Its chemical formula is $C_{22}H_{14}$ and it shows p-type conductivity (Hamura, 2019). This

research sought to develop a junction with hitherto uncombined layers and to offer a substitute for diode technology.

MATERIALS and METHODS

Before the experimental process began, the ITO-coated glass was cleaned with soapy water, acetone, and propanol, and dried with nitrogen gas. Subsequently, the ZnO compound was grown on the ITO-coated glass using an electrochemical deposition method. The electrolyte solution was prepared by mixing 5 mM ZnCl₂ (20 mL) with 250 mM LiCl (10 mL) to obtain a total of 30 mL, and the Autolab PGSTAT128N system was used. Pt plate was used as the counter electrode, Ag/AgCl reference electrode as the reference electrode, and glass/ITO as the working electrode. The reaction temperature was maintained at 60 °C, and the applied voltage was set to -0.9 V. The deposition was carried out for 1 hour (Aktaş & Ünal, 2022; Kurt et al., 2022). The pentacene organic compound was then grown on the ZnO compound using the Vaksis (PVD-MT/2M2T) system. Copper ohmic contacts were subsequently placed on the layers for electrical analysis. Electrical analysis was performed using the SCIENCETECH Solar Simulator AAA system. Figure 1 provides a schematic representation of the device fabrication process.

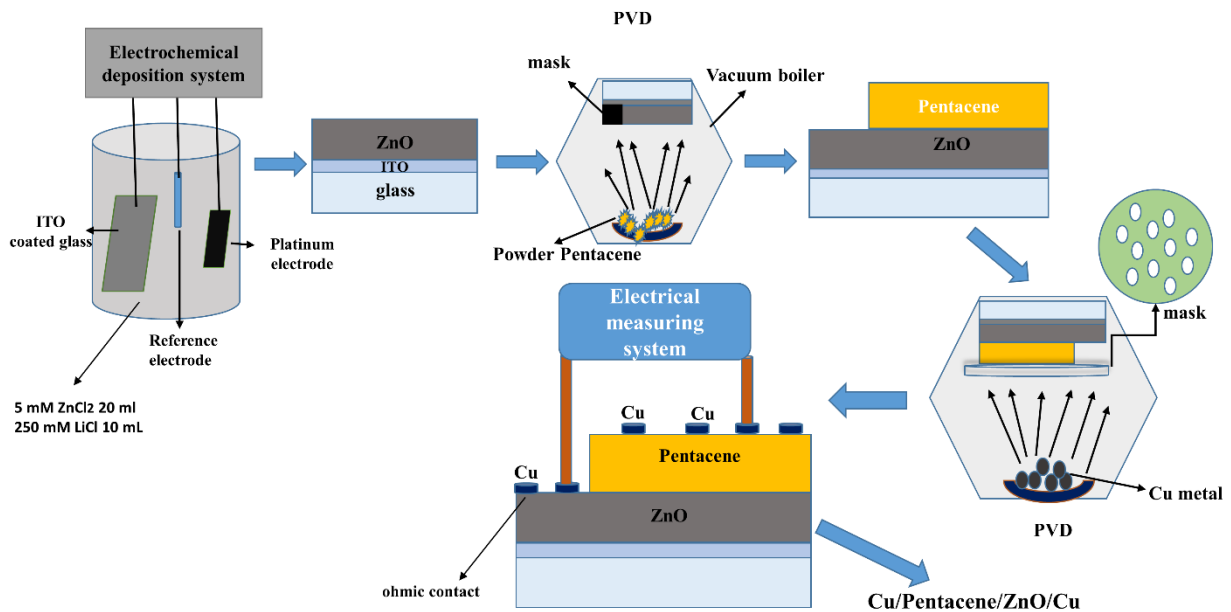

Figure 1. Schematic representation of the production of pentacene/ZnO diode

FINDINGS and DISCUSSION

The electrical analysis of the Pentacene/ZnO diode was conducted at a ± 2 V applied potential, under room conditions, and in a dark environment. Figure 2 illustrates the semi-logarithmic I-V characteristics of the Pentacene/ZnO diode. Particularly, an asymmetry is observed in the

low voltage region, and this asymmetry diminishes as we move towards higher voltage regions. At 0.1 V, the rectification factor of the device is found to be 8.9, whereas at 2 V, this value has decreased to 1.5. The increase in current under reverse bias, accompanied by the accumulation of charge between the layers with increasing voltage, has led to the decrease in the rectification factor (Saron, Hashim, Naderi, & Allam, 2013; Xu, Zhang, He, Wang, & Xie, 2011). Additionally, the low mobility has contributed to the small value of this factor.

Figure 2. Semi-logarithmic I-V characteristic of the pentacene/ZnO diode

The classic technique determines the link between current and voltage using thermionic emission theory (TE), as shown in equation 1. (Al-Ta'ii, Periasamy, & Amin, 2016; Aldemir, Kökce, & Özdemir, 2017; Aydoğan, İncekara, & Türüt, 2010; Rhoderick, 1982; Zurnacı et al., 2021).

$$I = AA^*T^2 \exp\left(-\frac{q\phi_b}{kT}\right) \left[\exp\left(\frac{q(V-IR_s)}{kT}\right) - 1\right] \quad (1)$$

Here A is the active diode area, A* is the richardson constant, q is the charge of the electron, ϕ_b is the effective barrier height, k is the boltzman constant, T is the temperature in kelvins, V is the applied potential, Rs is the series resistance. Equality 1 when $V-IR_s \gg 3kT$

$$I = I_0 \exp\left(\frac{qV}{nkT}\right) \quad (2)$$

It takes the form and I_0 is determined by the following formula

$$I_0 = AA^*T^2 \exp\left(-\frac{q\phi_b}{kT}\right) \quad (3)$$

If we take the logarithm of both sides of the equation and differentiate it with respect to V, we get

$$n = \frac{q}{kT} \frac{dV}{d(\ln(I))} \quad (4)$$

n diode ideality factor is found. The ideality factor n is derived by calculating the slope of the linear section of the graph of ln(I) shown versus V in the low voltage region together with other constants. The reverse saturation current is found at the point when the linear section of the graph of ln(I) plotted against V crosses ln(I). In the classic technique, the diode ideality factor and barrier height are determined.

In the Cheung and Cheung method, diode ideality factor, barrier height and series resistance values are determined by using Cheung and Cheung functions (C&CF) (Cheung & Cheung, 1986). Cheung and Cheung functions are given in Equation 5-6-7.

$$\frac{dV}{d\ln(I)} = IR_s + \frac{nkT}{q} \quad (5)$$

$$H(I) = V - \frac{nkT}{q} \ln\left(\frac{I}{AA^*T^2}\right) \quad (6)$$

$$H(I) = IR_s + n\phi_b \quad (7)$$

In the above equations, the graph of $\frac{dV}{d\ln(I)}$ and H(I) against I is drawn using the values in the high voltage region in the ln(I)-V graph. The slope of the graph drawn between $\frac{dV}{d\ln(I)}$ against I is calculated as Rs, and the ideality factor n is calculated from the value where the curve crosses the y-axis using other constants. ϕ_b is determined by using the n value from the point where the curve intersects the y-axis in the graph drawn of H(I) against I. The slope of this curve gives the value Rs.

The values of n, ϕ_b , and I_0 calculated from TE for the Pentacene/ZnO diode were 2.02, 0.46 eV, and 7.7×10^{-4} A, respectively. The calculated values of n and ϕ_b from C&CF were 1.85 and 0.45 eV, respectively. While the ϕ_b and n values are similar, they differ due to the two approaches using distinct portions of the I-V curve. However, the n values in both approaches depart from the ideal diode value of 1. This difference may be caused by interface states, pollutants generated during the experiment, measurements taken under air conditions, and undesired oxide layers. The Rs values measured by C&CF for the Pentacene/ZnO diode vary from 132 to 135 Ω .

CONCLUSION and RECOMMENDATIONS

Pentacene/ZnO diode was successfully produced using hybrid methods. The electrical analysis of the produced diode was examined in the dark at ± 2 V application potential. Diode parameters of the device were determined using different methods and the parameters were compared. As a result of these comparisons, it was seen that the values found were close to each other. This is an indication that the analyzes give healthy results.

ÖZET

Bu çalışma, Elâzığ ilinin bitkisel üretim açısından mevcut durumunun belirlenmesi amacıyla yürütülmüştür. Çalışmada bitkisel üretim kapsamında yer alan tarla ve bahçe bitkilerinin ekim-dikim alanları, üretim ve verim değerleri ortaya çıkarılmıştır. Elâzığ ilinin sahip olduğu 9 281 000 dekar yüzölçümünün 1 908 176 dekarlık kısmında tarım yapılabildiği bu da mevcut tüm alanın sadece %20.6'lık kısmına tekabül ettiği görülmektedir. Elâzığ ilinde beş yıllık ortalamaya göre toplam tarım arazi varlığının %75.3'ünde tarla bitkileri ve %3.9'unda bahçe bitkileri yetiştiriciliği yapıldığı, %21'lik alanın ise nadasa bırakıldığı görülmektedir. Elâzığ ilinin tarla tarımı açısından oldukça gelişmiş olduğu görülmektedir. Elâzığ ilinde tahıllardan en çok arpa; baklagillerden kuru nohut; endüstri bitkilerinden şeker pancarı; yem bitkilerinden ise fiğ yetiştirilmektedir. Sebzelerden en çok domates; meyvelerden ise en çok kaysı yetiştiriciliği yapılmaktadır. İlde aynı zamanda süs bitkileri ve örtü altı sebzeçiliği de yapılmaktadır.

Anahtar kelimeler: Bitkisel üretim, Tarla bitkileri, Bahçe bitkileri, Süs bitkileri ve örtü altı sebzeçiliği, Elâzığ

EVALUATION OF ELAZIG PROVINCE IN TERMS OF CROP PRODUCTION

ABSTRACT

This study was carried out to determine the current situation of Elazig province in terms of plant production. In the study, planting-planting areas, production and yield values of field and horticultural crops within the scope of plant production were revealed. It is seen that 1 908 176 decare of the 9 281 000 decare area of Elazig province can be cultivated, which corresponds to only 20.6% of the entire existing area. According to the five-year average in Elazig, 75.3% of the total agricultural land assets are cultivated for field crops and 3.9% for horticultural crops, while 21% of the land is left fallow. It is seen that the province of Elazig is quite developed in terms of field agriculture. In Elazig, mostly barley from cereals, dry chickpea from legumes, sugar beet from industrial plants and vetch from forage plants are grown. Tomatoes are grown mostly from vegetables and apricots are grown from fruits. Ornamental plants and greenhouse vegetables are also grown in Elazig.

Keywords: Crop production, Field crops, Horticultural crops, Ornamental plants and greenhouse vegetable growing, Elazig

1. GİRİŞ

Elâzığ kent merkezinin geçmişi yeni olmakla birlikte yerleşim olarak bölgenin tarihi oldukça eskidir. Bu nedenle Elâzığ'ın tarihinin, devamı durumunda olduğu Harput, yazılı kaynaklara göre MÖ 2000 yılına dayanan 4000 yıllık tarihiyle, Elâzığ'ın ilk yerleşim bölgesidir. Harput'un yerleşime elverişli olmayışı, tabiat şartlarının zorluğu nedeniyle Elâzığ, 1834 yılında, bugünkü yerinde kurulmuştur. Elâzığ, sosyal ve ekonomik hayatında tarımın önemli bir yeri vardır. Sanayi ve hizmet sektörlerindeki gelişmelere rağmen tarım, ana sektör olma özelliğini sürdürmektedir. Elâzığ ilinde dik, çok dik ve sarp eğimli araziler önemli yer işgal eder. Bu arazilerin doğal bitki örtüsü olarak ilk başta seyrek mera örtüsü gelmektedir. Orman arazisi olarak nitelendirilen araziler kereste ve diğer orman ürünleri istihsaline elverişli ağaçların sık veya seyrek olarak bulunduğu alanlardır. Elâzığ'da yetiştirilen ürünler çok çeşitlilik gösterir. Kuru tarım alanlarında tahıllar başta gelmektedir. Buğday, Arpa, Mercimek ve yazlık buğdaylar başlıcalarıdır. Son yıllarda birçok yüksek yer ve düz ovalarda sulama yapıldığından kuru tarımda yetiştirilen tahıllar yerini sulu tarımda yetiştirilen sanayi bitkilerine terk etmiştir. Pamuk ve şekerpancarı bunların başlıcalarıdır. Yine son yıllarda özellikle Keban ve Baskil ilçelerinde kayısıçılık çok büyük önem taşımaktadır. Bununla beraber Uluova pamuk ve şeker pancarlarının yanında sebze üretiminde önemini korumaktadır. Kavun, karpuz ve diğer sebzeler iç tüketimi karşılama durumundadır. Meyvecilik alanında son yıllarda kiraz, kayısı, elma gibi meyveler ile bağcılık yöre halkının vazgeçilmez uğraşısıdır. Tarım yapılan parsellerin gerek miras yolu ile parçalanması gerekse ilin topografik yapısından kaynaklanan çok parçalı ve küçük araziler sorunların başında gelmektedir. Nüfusu büyük oranda tarım ve hayvancılık ile uğraşan Elâzığ ilinin, bitkisel üretim açısından mevcut durumunun ortaya çıkarılması bu çalışmanın amacını teşkil etmektedir.

2. ELAZIĞ İLİNİN GENEL ÖZELLİKLERİ

Elâzığ ili Türkiye topraklarının %0.12'sini meydana getiren il sahası, 40° 21' ile 38° 30' doğu boylamları, 38° 17' ile 39° 11' kuzey enlemleri arasında kalmaktadır. Bu çerçeve içinde şekil olarak kabaca bir dikdörtgene benzeyen Elâzığ ili topraklarının D-B doğrultusundaki uzunluğu yaklaşık 150 km K-G yönündeki genişliği ise yaklaşık 65 km. civarındadır. Coğrafi konumu itibariyle Elâzığ doğudan Bingöl, kuzeyden Keban Baraj Gölü aracılığıyla Tunceli, batı ve güneybatıdan Karakaya Baraj Gölü vasıtasıyla Malatya, güneyden ise Diyarbakır illerinin arazileri çevrelemektedir. İl sınırları içindeki en önemli akarsu Fırat ve kollarıdır. 86 km² yüzölçümü olan Hazar Gölü, il merkezine 30 km mesafededir. Ayrıca Elâzığ, Keban,

Karakaya, Kralkızı ve Özlüce gibi önemli baraj gölleri ile çevrilidir. Elâzığ ili Doğu Anadolu Bölgesinin güneybatısında, Yukarı Fırat Bölümünde yer almaktadır. Yüzölçümü 8 455 km²'si kara, 826 km²'si baraj ve doğal göl alanları olmak üzere toplam 9 281 km²'dir. Denizden yüksekliği 1 067 m olan Elâzığ, yeryüzü şekilleri açısından topraklarını dağlık alanlar, platolar ve ovalar oluşturmaktadır. Geçmişte karasal iklimin hüküm sürdüğü Elâzığ, yapılan ve yapılmakta olan barajların etkisi ile ılıman bir iklime geçiş yapmıştır. Elâzığ ilinin son beş yıldaki (2018-2022) bitkisel üretim alanlarına ait veriler Çizelge 1'de verilmiştir.

Çizelge 1. Elâzığ İlinin Son 5 Yıla Göre Tarım Alanı (Anonim, 2023)

Tarım Alanı	2018	2019	2020	2021	2022	Ort.	%
Toplam Alan	1 865 821	1 851 212	1 867 405	1 908 176	1 825 059	1 863 535	100
Meyveler	278 300	279 395	287 440	290 987	300 955	287 415	15.42
Nadas Alanı	452 814	405 769	391 656	398 301	325 035	394 715	21.18
Sebze Alanı	69 088	71 614	73 850	73 721	74 109	72 476.4	3.89
Süs Bitkileri	121	154.5	152	152	152	146.3	0.0079
Tahıllar ve Diğer Bitkisel Ürünler	1 065 498	1 094 279	1 114 307	1 145 015	1 124 808	1 108 781	59.5

Çizelge 1'de görüldüğü üzere, Elâzığ ilinin son beş yıldaki tarım alanlarında çok fazla bir değişiklik olmadığı, ilin sahip olduğu 9 281 000 dekar toplam yüzölçümünün 1 908 176 dekarlık kısmında tarım yapılabildiği bu da mevcut tüm alanın sadece %20.6'lık kısmına tekabül ettiği görülmektedir. 2018 yılında %20.1 olan üretim alanlarının, 2021 yılında %20.56'ya kadar çıktığı, 2022 yılı itibariyle %19.7 olduğu görülmektedir. Elâzığ ilinde beş yıllık ortalamaya göre toplam tarım arazi varlığının %75.3'ünde tarla bitkileri ve %3.9'unda bahçe bitkileri yetiştiriciliği yapıldığı, %21'lik alanın ise nadasa bırakıldığı görülmektedir. Ülkemizdeki toplam üretim alanı açısından bakıldığında; işlenen alanların %68'lik kısmında tarla tarımı, %19'luk kısmında ise bağ ve bahçe tarımı yapıldığı, %14'lük alanın ise nadasa bırakıldığı (Anonim, 2021) göz önünde bulundurulduğunda, Elâzığ ilinin bahçe tarımı konusunda geride kaldığı, nadasa bırakılan alanın fazla olduğu ancak tarla tarımı açısından ise oldukça ileride olduğu görülmektedir.

3. TARLA BİTKİLERİ

3.1. Tahıllar

Elâzığ ilinin son beş yıllık tahıl yetiştiriciliğine ilişkin ekim alanı (da), üretim miktarları (ton) ve verimleri (kg/da) yukarıda verilmiştir.

Çizelge 2'ye baktığımızda, Elâzığ ilinin son beş yıllık tahıl yetiştiriciliğine göre, %50 ile en çok arpa yetiştiriciliğinin yapıldığı, onu %49 ile buğday, %0.11 ile yulaf ve %0.05 ile tiritikale yetiştiriciliğinin takip ettiği izlenmektedir.

Çizelge 2. Elâzığ İli Tahıl Yetiştiriciliğine Ait Veriler 2018-2022 (Anonim, 2023)

Tahıllar	Yıl	Ekilen Alan (da)	Hasat Edilen Alan (da)	Üretim Miktarı (ton)	Verim (kg/da)	%

		Toplam Ekilen Alan (da)			9 126 232	100	

Son beş yılın verilerine göre, ilde en çok yetiştirilen tahıllardan durum buğdayının üretim miktarının ortalama 4 568 ton ve veriminin 279 kg/da, durum buğdayı hariç diğer buğdayların üretim miktarı ortalama 107 065 ton ve veriminin 249 kg/da; arpanın (biralık) üretim miktarının ortalama 665 ton, veriminin 270 kg/da ve arpanın (diğer) üretim miktarının ortalama 118 799 ton ve veriminin ise 259 kg/da; yulafın üretim miktarının ortalama 277 ton ve veriminin 272

kg/da; tiriticalenin üretim miktarının ortalama 153 ton ve veriminin 316 kg/da, olduğu görülmektedir.

3.2. Baklagiller

Elâzığ ilinin son beş yıllık baklagil yetiştiriciliğine ilişkin ekim alanı (da), hasat alanı, üretim miktarları (ton) ve verimleri (kg/da) Çizelge 3'te verilmiştir.

Çizelge 3. Elâzığ İli Baklagil Yetiştiriciliğine Ait Veriler 2018-2022 (Anonim, 2023)

Baklagiller	Yıl	Ekilen Alan (da)	Hasat Edilen Alan (da)	Üretim Miktarı (ton)	Verim (kg/da)	%
Fasulye, Kuru	2018	6 012	5 952	962	162	20

	2022	9 283	9 283	1 192	128	
Ortalama		8 351	8 347	929	110.8	
Toplam Ekilen Alan (da)					33 436	100

Çizelge 3'te görüldüğü üzere, Elâzığ ilinin son beş yıllık baklagil yetiştiriciliğine ait ortalamalara baktığımızda, en çok kuru nohut yetiştiriciliğinin yapıldığı ve bu oranın baklagiller içerisindeki oranının %55 olduğu görülmektedir. Onu kırmızı mercimek %25 ile takip ederken kuru fasulye yetiştiriciliği %20 ile onları izlemektedir. Son beş yılın verilerine göre, ilde en çok yetiştirilen baklagillerden kuru nohudun üretim miktarının ortalama 1 589 ton ve veriminin 85 kg/da, kuru fasulyenin üretim miktarının ortalama 11 674 ton ve veriminin ise 178 kg/da ve kırmızı mercimek üretim miktarının ortalama 929 ton ve veriminin 111 kg/da olduğu görülmektedir.

3.3. Endüstri Bitkileri

Elâzığ ilinin son beş yıllık endüstri bitkilerinin yetiştiriciliğine ilişkin ekim alanı (da), üretim miktarları (ton) ve verimleri (kg/da) Çizelge 4'te verilmiştir.

Çizelge 4. Elâzığ İli Endüstri Bitkileri Yetiştiriciliğine Ait Veriler 2018-2022 (Anonim, 2023)

Çizelge 4'te görüldüğü üzere, Elâzığ ilinin son beş yıllık endüstri bitkilerinin yetiştiriciliğine ait ortalamalara baktığımızda, en çok şeker pancarı yetiştiriciliğinin yapıldığı ve bu oranın endüstri bitkileri içerisindeki oranının %86 olduğu görülmektedir. Şeker pancarını %9.8 ile aspir, %1.8 ile patates, %1.6 ile susam ve %0.4 ile lavanta yetiştiriciliğinin takip ettiği izlenmektedir. Son beş yılın verilerine göre; ilde en çok yetiştirilen endüstri bitkilerinden şeker pancarının üretim miktarının ortalama 151 238 ton, veriminin 5 481 kg/da; aspirin üretim miktarının ortalama 438 ton, veriminin 140 kg/da olduğu; patates üretim miktarının ortalama 994 ton, veriminin 1 742 kg/da; susamın üretim miktarının ortalama 25 ton, veriminin 49 kg/da; lavanta üretim miktarının ortalama 13 ton, veriminin 12 kg/da olduğu görülmektedir.

3.4. Yem Bitkileri

Elâzığ ilinin son beş yıllık yem bitkilerinin yetiştiriciliğine ilişkin ekim alanı (da), üretim miktarları (ton) ve verimleri (kg/da) Çizelge 5'te verilmiştir. Çizelge 5'te görüldüğü üzere Elâzığ ilinin son beş yıllık yem bitkilerinin yetiştiriciliğine ait ortalamalara göre, en çok yeşil

ot amacıyla yaygın fiğ yetiştiriciliğinin yapıldığı ve bu oranın yem bitkileri içerisindeki oranının %44 olduğu görülmektedir. Onu mürdümük yeşil ot %18, yonca %14, silajlık mısır %11, yemlik bezelye %8, Macar fiğ ise %2, korunga %0.9, mürdümük %0.8, burçak %0.5, tohumluk yaygın fiğ %0.5 ve sorgum %0.1 ile yetiştiriciliği izlenmektedir.

Çizelge 5. Elâzığ İli Yem Bitkileri Yetiştiriciliğine Ait Veriler 2018-2022 (Anonim, 2023)

Son beş yılın verilerine göre; ilde en çok yetiştirilen yem bitkilerinden yeşil ot amaçlı yaygın fiğ üretim miktarının ortalama 76 902 ton ve veriminin 1 135 kg/da; Macar fiğde üretim miktarının ortalama 4 576 ton ve veriminin 1 187 kg/da; yaygın fiğ tohumunda üretim miktarının ortalama 78 ton, veriminin de 99 kg/da olduğu; mürdümük üretim miktarının ortalama 13 337 ton, veriminin 492 kg/da, yonca yeşil ot üretim miktarının ortalama 77 794 ton, veriminin 3 622 kg/da; silajlık mısırın üretim miktarının ortalama 83 863 ton, veriminin 4 880 kg/da; yemlik bezelye üretim miktarının ortalama 27 634 ton, veriminin 2 178 kg/da; korunga üretim miktarının ortalama 1 160 ton, veriminin 817 kg/da; mürdümük tohum üretim miktarının ortalama 92 ton, veriminin 68 kg/da; burçağın yeşil ot üretim miktarının ortalama 537 ton, veriminin 596 kg/da; sorgum yeşil ot üretim miktarının ortalama 501 ton ve veriminin de 3 390 kg/da olduğu görülmektedir.

4. BAHÇE BİTKİLERİ

4.1. Sebzeler

Elâzığ ilinin son beş yıllık sebze yetiştiriciliğine ilişkin ekim alanı (da) ve üretim miktarları (ton) Çizelge 6'da verilmiştir.

Çizelge 6'da görüldüğü üzere, Elâzığ ilinin son beş yıllık sebze yetiştiriciliğine ait ürün çeşitliliği 34 olup yüzdelik paya göre ilk on ürün şu şekilde sıralanmaktadır: En çok domates (sofralık) yetiştiriciliğinin yapıldığı ve bu oranın sebzeler içerisindeki oranının %3.73 olduğu görülmektedir. Onu %2.36 ile kavun; %2.35 ile biber (dolmalık); %1.7 ile salçalık domates; %1.41 ile karpuz; %1.34 ile sofralık hıyar; %1.29 ile taze fasulye; %1.14 kuru soğan ve %0.8

ile salçalık kapyra biber ve %0.7 ile patlıcan yetiştiriciliğinin takip ettiği izlenmektedir. Lahana, marul, ıspanak, maydanoz, roka, tere, nane, balkabağı, sarımsak, barbunya, pırasa, turp, havuç, acur, bamya, kabak gibi sebzelerin yetiştiriciliğinin ise çok az düzeyde olduğu görülmektedir.

Son beş yılın verilerine göre; ilde en çok yetiştirilen sebzelerden domatesin (sofralık) ekim alanının ortalama 13 530 da, üretim miktarının ortalama 49 789 ton; kavun ekim alanının ortalama 8 545 da, üretim miktarının ortalama 17 779 ton; dolmalık biber ekim alanının ortalama 8 521 da, üretim miktarının ortalama 16 862 ton; salçalık domatesin ekim alanının ortalama 6 153 da, üretim miktarının ortalama 25 786 ton; karpuz ekim alanının ortalama 5 129 da, üretim miktarının ortalama 19 534 ton; sofralık hıyar ekim alanının ortalama 4 874 da, üretim miktarının ortalama 24 204 ton; taze fasulye ekim alanlarının 4 684 da, üretim miktarlarının ortalama 4 415 ton; kuru soğan ekim alanının ortalama 4 152 da, üretim miktarının ortalama 5 875 ton; salçalık kapyra biber ekim alanının ortalama 3 065 da, üretim miktarının ortalama 8 921 ton ve patlıcan ekim alanının ortalama 13 530 da, üretim miktarının ortalama 49 789 ton olduğu görülmektedir. Bu ürünlerle diğer yetiştirilen lahana, marul, ıspanak, maydanoz, roka, tere, nane, balkabağı, sarımsak, barbunya, pırasa, turp, havuç, acur, bamya, kabak gibi sebzelerin ekim alanının ortalama (da) ve üretim miktarının ortalaması (ton) Çizelge 6'da yer almaktadır.

4.2. Meyveler

Elâzığ ilinin son beş yıllık meyve yetiştiriciliğine ilişkin dikim alanı (da), üretim miktarları (ton) ve ağaç başına verim (kg) Çizelge 7’de verilmiştir. Çizelge 7’de görüldüğü üzere, Elâzığ ilinin son beş yıllık meyve yetiştiriciliğine ait ortalamalara göre, en çok kayısı yetiştiriciliğinin yapıldığı ve bu oranın meyveler içerisindeki oranının %7 olduğu görülmektedir. Onu %4.5 ile çekirdekli sofr üzümü; %3.1 ile şarap üzümü; %1.2 ile badem, %1 ile ceviz; %0.5 kiraz; %0.4 ile armut; elma (golden) ve diğer elmalar %0.4; %0.3 ile çilek yetiştiriciliğinin takip ettiği izlenmektedir. Şeftali, içde, incir, ayva, zerdali, vişne, nektarin, erik, kızılıcık, Antep fıstığı, nar, dut, Trabzon hurması ve kapari gibi meyvelerin yetiştiriciliğinin ise çok az düzeyde olduğu görülmektedir.

Çizelge 7. Elâzığ İlinin Meyve Yetiştiriciliğine Ait Verileri 2018-2022 (Anonim, 2023)

Son beş yılın verilerine göre; ilde en çok yetiştirilen meyvelerden kayısının dikim alanının 101 036 da, üretim miktarının ortalama 43 822 ton, ağaç başına veriminin 31.7 kg; çekirdekli sofr üzümü dikim alanının 63 911 da, üretim miktarının ortalama 47 725 ton, ağaç başına veriminin 747 kg; şaraplık üzüm dikim alanının 45 163 da, üretim miktarının ortalama 36 162 ton, ağaç başına veriminin 200 kg; bademin dikim alanının 17 655 da, üretim miktarının ortalama 3 228 ton, ağaç başına veriminin 208 kg; ceviz dikim alanının 14 346 da, üretim miktarının ortalama 2 435 ton, ağaç başına veriminin 97 kg; kirazın dikim alanının 6 678 da, üretim miktarının ortalama 4 425 ton, ağaç başına veriminin 38 kg; armudun dikim alanının 6 440 da, üretim miktarının ortalama 5 183 ton, ağaç başına veriminin 32 kg; elmanın (golden) dikim alanının 5 577 da, üretim miktarının ortalama 5 135 ton, ağaç başına veriminin 29 kg; diğer elmanın dikim alanının 6 375 da, üretim miktarının ortalama 4 181 ton, ağaç başına veriminin 46 kg; çileğin dikim alanının 3 902 da, üretim miktarının ortalama 9 687 ton;

vişnenin dikim alanının 3 046 da, üretim miktarının ortalama 3 984 ton, ağaç başına veriminin 30 kg; narın dikim alanının 192 da, üretim miktarının ortalama 314 ton, ağaç başına veriminin 54 kg; incirin dikim alanının 26 da, üretim miktarının ortalama 491 ton, ağaç başına veriminin 48 kg; dutun dikim alanının 966 da, üretim miktarının ortalama 5 473 ton, ağaç başına veriminin 25 kg; ayvanın dikim alanının 398 da, üretim miktarının ortalama 481 ton, ağaç başına veriminin 76 kg; eriğin dikim alanının 2 494 da, üretim miktarının ortalama 4 597 ton, ağaç başına veriminin 31 kg; nektarin dikim alanının 568 da, üretim miktarının ortalama 636 ton, ağaç başına veriminin 44 kg ve şeftalinin dikim alanının 2 630 da, üretim miktarının ortalama 2 570 ton ve ağaç başına veriminin 57 kg olduğu görülmektedir.

4.3. Süs Bitkileri ve Örtüaltı Sebzeleri

Elazığ ilinin son beş yıllık süs bitkileri ve örtüaltı sebzeleri yetiştiriciliğine ilişkin dikim alanı (da-m²) üretim miktarları (ton-adet) ve ağaç başına verim (kg) Çizelge 8’de verilmiştir. Çizelge 8’de görüldüğü üzere, Elazığ ilinin son beş yıllık süs bitkileri yetiştiriciliğine ait ortalamalara göre, en çok dış mekan süs bitkileri yetiştiriciliğinin yapıldığı ve süs bitkileri içerisindeki oranının %97 olduğu, çiçek soğanlarının ise %3 olduğu görülmektedir. Elazığ ilinin son beş yıllık örtüaltı sebze yetiştiriciliğine ait ortalamalara göre, en çok %68.5 ile sofralık hıyar (plastik sera) olduğu; onu %19 ile sofralık domates (plastik sera); %6.8 ile sofralık hıyar (yüksek tünel); %2.3 ile dolmalık biber (plastik sera); %1.2 ile taze soğan (plastik sera); %0.6 sivri biber (plastik sera); %0.5 ile patlıcan ve göbekli marul (plastik sera); %0.4 ile sofralık hıyar (alçak tünel) ve %0.2 ile taze soğan (alçak tünel) yetiştiriciliğinin takip ettiği izlenmektedir.

					100

Son beş yılın verilerine göre; ilde en çok yetiştirilen süs bitkilerinden dış mekân süs bitkilerin dikim alanının 144.6 da, üretim miktarının ortalama 654 104 adet, dekar başına veriminin 2 494 adet; çiçek soğanlarının dikim alanının 4.25 da, üretim miktarının ortalama 169 000 adet, dekar başına veriminin 39 750 adet olduğu görülmektedir.

Elazığ ilinin son beş yıllık örtüaltı sebze yetiştiriciliğine ait ortalamalara göre, sofralık hıyar (plastik sera) alanının 967 da, üretim miktarının ortalama 14 502 ton, dekar başına veriminin 15 kg; sofralık domates (plastik sera) alanının 268 da, üretim miktarının ortalama 4 020 ton, dekar başına veriminin 15 kg; sofralık hıyar (yüksek tünel) alanının 96.6 da, üretim miktarının ortalama 1 159 ton, dekar başına veriminin 12 kg; dolmalık biber (plastik sera) alanının 33 da, üretim miktarının ortalama 264 ton, dekar başına veriminin 8 kg; taze soğan (plastik sera) alanının 17.25 da, üretim miktarının ortalama 69 ton, dekar başına veriminin 4 kg; sivri biber (plastik sera) alanının 8.4 da, üretim miktarının ortalama 67 ton, dekar başına veriminin 8 kg; patlıcan (plastik sera) alanının 6.4 da, üretim miktarının ortalama 57 ton, dekar başına veriminin 9 kg; göbekli marul (plastik sera) alanının 6.4 da, üretim miktarının ortalama 12 ton, dekar başına veriminin 2 kg; sofralık hıyar (alçak tünel) alanının 6.2 da, üretim miktarının ortalama 62 ton, dekar başına veriminin 10 kg; taze soğan (alçak tünel) alanının 3.2 da, üretim miktarının ortalama 13 ton, dekar başına veriminin 4 kg olduğu görülmektedir.

5. SONUÇ

Elâzığ ilinde tahıl grubunda en çok arpa, buğday; baklagil grubunda nohut ve mercimek; endüstri bitkileri grubunda şeker pancarı; yem bitkileri grubunda fiğ; sebzeler grubunda domates ve kavun; meyveler grubunda kaysı; süs bitkileri grubunda dış mekan süs bitkileri ve örtü altı sebzeciliğinde sofralık hıyar ve domates yetiştiriciliği yapıldığı görülmektedir.

Bitkisel üretim açısından baktığımızda genel olarak Elâzığ ilinde en çok arpa ve buğday yetiştiriciliği yapılmakta olup sonra en çok, kuru nohut ve şeker pancarı yetiştiriciliğinin yapıldığı görülmektedir. Yapılan bu çalışmanın sonucunda Elâzığ ekolojik koşullarına uygun buğday, arpa, nohut, mercimek ve şeker pancarı çeşitlerinin tespit edilmesine yönelik çalışmalara ağırlık verilmesi yönünde kanaat oluşmuştur. Bu amaçla; Elâzığ ilinde zaten büyük oranda yetiştiriciliği yapılan bu bitkilerin hem verim ve kalitelerinin artırılması hem de ekim alanlarının artırılması amacıyla ilde bulunan kurum ve kuruluşlar (Başta Fırat Üniversitesi, GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü, İl Gıda, Tarım ve Hayvancılık Müdürlüğü olmak üzere diğer kurum ve kuruluşlar) tarafından yapılacak çalışmaların Elâzığ iline ve çiftçisine büyük katkılar sağlayacağı öngörülmektedir.

ÖZET

Dünya genelinde artan hayvansal ürün ihtiyacı, hayvan beslemenin önemini artırmaktadır. Baklagil yem bitkileri, dünyada ve ülkemizde hayvan besleme amacıyla yetiştirilen en önemli bitki türlerindedir. Baklagil yem bitkileri arasında en yaygın değerlendirilen cinslerden biri olan fiğın, ülkemizde en çok yetiştirilen türü ise yaygın fiğ (*Vicia sativa* L.)' dir. İklim ve toprak özellikleri bakımından adaptasyonu yüksek olan bir bitkidir. Bitkinin otunun, kıymetli kaba yem kaynağı olmasının yanı sıra, tohumları kesif yem kaynağı, tohumu alındıktan sonra geriye kalan samanı da değerlendirilebilen önemli bir yem bitkisidir. Bu çalışma, bazı yaygın fiğ genotiplerinin Sivas ekolojik koşullarında bazı agromorfolojik ve ot verimi özellikleri bakımından performanslarının değerlendirilmesi amacıyla yürütülmüştür. Çalışma Sivas Bilim ve Teknoloji Üniversitesi Tarımsal Araştırma ve Geliştirme merkezinde 2023 yılında gerçekleştirilmiştir. Deneme, tesadüf blokları deneme desenine göre 4 tekerrürlü olacak şekilde yürütülmüştür. Çiçeklenme gün sayısı (gün), bakla bağlama gün sayısı (gün), bitki boyu (cm), ilk bakla yüksekliği (cm), yaş ot verimi (kg/da) ve kuru ot verimi (kg/da) çalışmada incelenen parametreler arasında yer almaktadır. Genotipler arasında çiçeklenme gün sayısı 57.2-62.0 gün, bakla bağlama gün sayısı 67.2-72.0 gün, bitki boyu 43.8-57.0 cm, ilk bakla yüksekliği 20.6-36.2 cm, yaş ot verimi 179.2- 634.7 kg/da, kuru ot verimi 107.8- 220.3 kg/da arasında değişmiştir. Araştırma sonucunda, çalışılan yaygın fiğ genotiplerinden Uludağ yaygın fiğ çeşidinin, çeşitli agronomik ve ot verimi ile ilgili özellikler bakımından diğer genotiplere göre daha üstün bulunmuş ve Sivas ekolojik koşullarında yetiştiriciliğinin uygun olduğu belirlenmiştir.

Anahtar Kelimeler: Yaygın fiğ (*Vicia sativa* L.), ot verimi, yem bitkileri, kaba yem

**THE EVALUATION OF SOME COMMON VETCH GENOTYPES BROUGHT IN
CENTRAL ANATOLIAN CONDITIONS WITH RESPECT TO SOME
AGROMORPHOLOGICAL CHARACTERISTICS**

ABSTRACT

The increasing need for animal products around the world increases the importance of animal nutrition. Forage legumes are one of the most important plant species grown for animal feeding in the world and in our country. Common vetch (*Vicia sativa* L.) is the most widely grown type of vetch, which is one of the most commonly used forage legumes crops. It is a plant with high adaptation in terms of climate and soil characteristics. In addition to being a valuable forage source, the grass of the plant is an important forage plant whose seeds can be used as a concentrated feed source and the straw remaining after the seed is taken. This study was carried out to evaluate the performance of some common vetch genotypes in Sivas ecological conditions in terms of agromorphological and forage yield characteristics. The study was carried out in Sivas Science and Technology University Agricultural Research and Development Center in 2023. The experiment was carried out in a randomized block design with 4 replications. The number of days of flowering (days), the number of pods (days), plant height (cm), first pod height (cm), fresh grass yield (kg/da) and hay yield (kg/da) were among the parameters examined in the study. The number of flowering days is 57.2-62.0 days, the number of pods is 67.2-72.0 days, the plant height is 43.8-57.0 cm, the height of the first pod is 20.6-36.2 cm, the fresh hay yield is 179.2- 634.7 kg/da, the hay yield is 107.8- 220.3 has changed between. As a result of the research, Uludag cultivar, which is one of the common vetch genotypes studied, was found to be superior to other genotypes in terms of various agronomic and forage yield-related features and it was determined that it was suitable for cultivation in Sivas ecological conditions.

Keywords: Common vetch (*Vicia sativa* L.), forage yield, forage crops, roughage

GİRİŞ

Yaygın fiğ (*Vicia sativa* L.), ekonomik açıdan oldukça önemli tek yıllık bir baklagil yem bitkisidir (Mikić ve ark., 2009). Türün orijini Orta Doğu'nun kurak bölgelerinden gelse de, dünyanın birçok bölgesinde yaygın olarak yetiştirilmektedir. Yaygın fiğ, diğer tek yıllık ve çok yıllık baklagil yem bitkilerinin yetiştirilemediği aşırı soğuk veya kurak gibi olumsuz iklim koşullarında yetiştirilmeye uygun bir yem bitkisidir (Larbi ve Nie, 2006). Ayrıca tuzlu topraklar hariç, hafif bünyeli kumlu topraklardan ağır killi topraklara kadar çeşitli toprak türlerinde ve pH seviyesi 4,5 ila 9,0 olan topraklarda yetiştiriciliği yapılabilmektedir. Düşük ila orta yağışlı alan bölgeler (<325–450 mm) yaygın fiğ için uygun olmaktadır (Seymour ve ark., 2002).

Yaygın fiğ hayvan beslemede otlama, kuru ot veya silaj üretimi için kullanılabilir (Garduño-Castro ve ark., 2009; Rihawi ve ark., 2010; Larbi ve ark., 2011). Buna ek olarak taneleri de yüksek oranda sindirilebilir protein içerdiğinden yem rasyonlarının önemli bir birleşenini oluşturmaktadır.

Artan dünya nüfusu ile birlikte, dünya çapında 2050 yılına kadar günümüz ile kıyaslandığında %60 ile %70 arasında daha fazla hayvansal ürüne ihtiyaç duyulacağı tahmin edilmektedir. Bu durumun bir parçası olarak hayvan beslemede baklagil yem bitkilerine yönelik dünya talebinin artacağı öngörülmektedir. Tüm bu sebepler doğrultusunda ekolojilere uygun, verim ve kalitesi yüksek alternatif yem bitkilerinin belirlenmesi hayvancılığın sürdürülebilir olarak devam etmesinde önemli bir rol oynamaktadır (Makkar ve ark., 2016).

Bu çalışma, bazı yaygın fiğ çeşitlerinin Sivas ekolojik koşullarına adaptasyonunu ve agromorfolojik özellikler bakımından performanslarını değerlendirmek amacıyla yürütülmüştür.

MATERYAL ve METOT

Araştırma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi, Tarımsal Ar-Ge Merkezinde, 2023 yılı yazlık ürün yetiştirme sezonunda yürütülmüştür. Denemenin yürütüldüğü Sivas ili 39° 56' kuzey paralelleri ile 32° 51' doğu meridyenleri arasında yer almakta olup, denizden yüksekliği 1285 m'dir. Araştırmanın yürütüldüğü Mayıs 2023-Ağustos 2023 ayları arasında en düşük sıcaklık değeri Mayıs ayında (1°C), en yüksek sıcaklık değeri ise Ağustos ayında (39.1°C) gerçekleşmiştir. Denemenin yürütüldüğü yetiştirme sezonunda en düşük ortalama nispi nem değeri Ağustos ayında (%45.7), en yüksek ortalama nispi nem değeri ise Haziran ayında (%67.2) saptanmıştır. Araştırma sürecinde gerçekleşen toplam yağış miktarlarına bakıldığında ise en düşük değer Temmuz ayında (3.0 mm), en yüksek değer ise Mayıs ayında (56.4 mm) saptanmıştır (Tablo 1).

Tablo 1. Sivas ilinin deneme yılı ve uzun yıllar ortalamasına ait bazı iklim verileri*

UYO: Uzun Yıllar Ortalaması

Çalışmada 6 adet yaygın fiğ (Görkem, Selçuk, Kubilay, Kralkızı, SBTÜ-201, Uludağ) çeşit ve hattı materyal olarak kullanılmıştır. Tarla denemeleri, tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Ekimler ve hasatlar el ile yapılmıştır. Ekimde her bir parsel 5 m uzunluğunda ve sıra arası 25 cm olacak şekilde 6 sıradan oluşmuştur. Dekara 4 kg azot (N) ile 10 kg fosfor (P₂O₅) olacak şekilde gübreleme yapılmıştır. Araştırmada, çiçeklenme gün sayısı (gün), bakla bağlama gün sayısı (gün), bitki boyu (cm), ilk bakla yüksekliği (cm), yeşil ot (kg/da) ve kuru ot verimi (kg/da) özellikleri incelenmiştir. Çalışma sonucunda elde edilen veriler SAS 9.3 istatistik paket programında varyans analizine tabi tutulmuştur (SAS, 2013).

BULGULAR ve TARTIŞMA

Farklı yaygın fiğ çeşitlerinde incelenen çiçeklenme gün sayısı (gün), bakla bağlama gün sayısı (gün), bitki boyu (cm), ilk bakla yüksekliği (cm), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) özelliklerine ait ortalama değerler Tablo 2’de verilmiştir.

Tablo 2. Yaygın fiğ çeşitlerinin incelenen özelliklere ait ortalama değerler tablosu

Genotip	Çiçeklenme Gün Sayısı (gün)	Bakla Bağlama Gün Sayısı (gün)	Bitki Boyu (cm)	İlk Bakla Yüksekliği (cm)	Yaş Ot Verimi (kg/da)	Kuru Ot Verimi (kg/da)

ÖD: Önem düzeyi, **: 0.01 düzeyinde önemli, *: 0.05 düzeyinde önemli

Çalışmada, yaygın fiğ çeşitleri arasında çiçeklenme gün sayısı bakımından istatistiki olarak 0.01 düzeyinde farklılık olduğu belirlenmiştir. Ortalama çiçeklenme gün sayısı 60.3 gün olurken, çeşitler arasında çiçeklenme gün sayısı 57.2-62.0 gün arasında değişim göstermiştir. Kralkızı yaygın fiğ çeşidi (57.2 gün) en kısa çiçeklenme gün sayısına, Görkem (62.0 gün) ve Kubilay (61.5 gün) yaygın fiğ çeşitleri ise istatistiki olarak aynı grupta yer alarak en uzun çiçeklenme gün sayısına sahip olmuştur. Diğer bir ifade ile Kralkızı çeşidinin en erkenci, Görkem ve Kubilay çeşitlerinin ise en geççi çeşitler olduğu tespit edilmiştir. Yürütülen benzer çalışmalarda çiçeklenme gün sayısını, Erdurmuş ve ark. (2010), 126.4-133.5 gün, Albayrak ve ark. (2005), 166.7-172.3 olarak bildirmişlerdir. Çalışmalardaki çiçeklenme gün sayısındaki farkın yaygın fiğin yetiştirildiği ekolojik koşullardan, farklı genotip kullanımından ve üretim sezonundan ileri geldiği belirtilebilmektedir.

Yaygın fiğ çeşitleri arasında ilk bakla bağlama gün sayısı bakımından istatistiki olarak 0.01 önem düzeyinde fark olduğu belirlenmiştir. Çeşitler arasında bakla bağlama gün sayısı 72.0-67.2 gün arasında değişiklik göstermiştir. Ortalama bakla bağlama gün sayısı 69.3 gün, en kısa bakla bağlama gün sayısı (67.2 gün) Kralkızı çeşidinde, en uzun bakla bağlama gün sayısı ise Görkem (72.0 gün) ve Kubilay (71.5 gün) çeşitlerinde saptanmıştır. Araştırma bulguları incelendiğinde ilk çiçeklenme gün sayısı ile ilk bakla bağlama gün sayısı arasında önemli bir ilişki olduğu görülmektedir.

Bitki boyu bakımından yaygın fiğ çeşitleri arasında istatistiki olarak 0.01 düzeyinde farklılık tespit edilmiştir. Çeşitler arasında bitki boyu 43.8-57.0 cm arasında değerler almıştır. Ortalama bitki boyu 48.0 cm olurken, en kısa bitki boyu (43.85 cm) Kubilay yaygın fiğ çeşidinden elde edilmiştir. Ancak Görkem, Selçuk ve SBTÜ- 201 çeşitleri istatistiksel olarak Kubilay çeşidi ile aynı grupta yer almıştır. En uzun bitki boyu ise Kralkızı (57.0 cm) ve Uludağ (52.9 cm) çeşidinden elde edilmiştir. Konuyla ilgili farklı çalışmalar incelendiğinde bitki boyunu, Çağan ve Kökten (2017) 15.2-22.7 cm arasında, Seydoşoğlu (2014) ise 33.9-62.6 cm arasında değerler aldığını bildirmişlerdir.

Çalışmada, yaygın fiğ çeşitleri arasında ilk bakla yüksekliği bakımından istatistiki olarak 0.01 düzeyinde farklılık olduğu belirlenmiştir. Ortalama ilk bakla yüksekliği 25.5 gün olmuştur. Genotipler arasında ilk bakla yüksekliği 20.6-36.2 cm arasında değişim göstermiştir. Kralkızı yaygın fiğ çeşidi 36.2 cm ile en fazla ilk bakla yüksekliğine sahip olurken, Görkem (21.32 cm) ve Selçuk (20.6 cm) çeşitleri istatistiksel olarak aynı grupta yer alarak en düşük ilk bakla yüksekliğine sahip olmuştur.

Yeşil ot verimi bakımından yaygın fiğ çeşitleri arasında istatistiki olarak 0.05 önem düzeyinde fark olduğu belirlenmiştir. Çeşitler arasında yeşil ot verimi 179.2- 634.7 kg/da arasında değişiklik göstermiştir. Ortalama yeşil ot verimi 457.6 kg/da olmuştur. En yüksek yaş ot verimini Selçuk (634.7 kg/da) ve Uludağ (611.3 kg/da) yaygın fiğ çeşitleri verirken, en düşük yaş ot verimini Kubilay çeşidi (179.2 kg/da) vermiştir. Yeşil ot verimi ile ilgili yürütülen benzer çalışmalarda, Kaplan (2013), 1212.1-4386.0 kg/da arasında, Seydoşoğlu (2014) ise 1522.0-3232.3 kg/da arasında değiştiğini bildirmişlerdir. Çalışmalar arasındaki farkların yetiştiriciliğin yapıldığı ekolojilerden ve agronomik uygulamalardan ileri geldiği belirtilebilmektedir.

Çalışmada kullanılan yaygın fiğ çeşitleri arasında kuru ot verimi bakımından istatistiki olarak 0.01 önem düzeyinde farklılıklar olduğu saptanmıştır. Çeşitler arasında kuru ot verimi 107.8-220.3 kg/da arasında farklı değerler almıştır. Ortalama kuru ot verimi 172.9 kg/da olurken, en az kuru ot verimi SBTÜ-201 (107.8 kg/da) hattından, en fazla kuru ot verimi ise Uludağ (220.3 kg/da) yaygın fiğ çeşidinden elde edilmiştir. Yaygın fiğ ile ilgili daha önce yapılan çalışmalarda kuru ot verimleri; Çukurova koşullarında 504-673 kg/da (Yücel ve ark., 2004) ve 538-613 kg/da (Yücel ve Ayaşan, 2010), Antalya koşullarında 282-494 kg/da (Erdurmuş ve ark., 2010) ve Diyarbakır koşullarında 44,7-707,0 kg/da (Seydoşoğlu, 2014) olarak saptanmıştır.

Tablo 3. Yaygın fiğ genotiplerinde incelenen özelliklere ait korelasyon katsayıları

	ÇGS	BBGS	BB	İBY	YOV	KOV
ÇGS	1.0000	1.0000	-0.50552*	-0.77223**	0.07723	0.17253

ÇGS: Çiçeklenme gün sayısı, BBGS: Bakla bağlama gün sayısı, BB: Bitki boyu, İBY: İlk Bakla Yüksekliği, YOV: Yeşil ot verimi, KOV: Kuru ot verimi, ÖD: Önem düzeyi, *: 0,05 düzeyinde önemli, **: 0,01 düzeyinde önemli

İncelenen özellikler arasındaki korelasyon katsayıları Tablo 3'te verilmiştir. Tablo 3'e göre bitki boyu ile çiçeklenme gün sayısı (-0.50552) ve bakla bağlama gün sayısı (-0.50552) arasında negatif ve %5 düzeyinde önemli bir korelasyon saptanmıştır. İlk bakla yüksekliği ile çiçeklenme gün sayısı (-0.77223) ve bakla bağlama gün sayısı (-0.77223) arasında negatif ve

önemli düzeyde (%1), bitki boyu (0.75283) ile ise pozitif ve %1 düzeyinde önemli bir korelasyon belirlenmiştir.

SONUÇ ve ÖNERİLER

Çalışmada kullanılan genotiplerin erkenci – geçici durumlarının belirlenmesi amacıyla çiçeklenme gün sayısı ve ilk bakla bağlama gün sayısı gözlemleri alınmıştır. Bölge için en erkenci çeşitlerin Görkem ve Kubilay yaygın fiğ çeşitlerinin olduğu belirlenmiştir. Yaş ot verimi bakımından Selçuk ve Uludağ, kuru ot verimi bakımından ise Uludağ yaygın fiğ çeşidinin bölge için uygun olduğu tespit edilmiştir.

ÖZET

Yem bezelyesi (*Pisum sativum* L.) otu ve tanesi için yetiştirilen değerli bir yem bitkisidir. Yem bezelyesi kuru otunun % 15-20 ham protein içermesi ve sindirilebilirliğinin %70-80 gibi yüksek bir değerde olması, bitkinin kaba yem üretim potansiyelinin yüksek olduğunu göstermektedir. Özellikle hayvancılık sektörünün geliştiği bölgelerde kaba yem üretimi amaçlı yetiştiriciliği artmaktadır. Baklagil bitkisi olması sebebiyle kendinden sonra gelen bitki için daha uygun bir ortam oluşturmakta ve hastalık, zararlı, yabancı otların kontrolünde etkin bir rol alabilmektedir. İç Anadolu Bölgesinde kışlık olarak sulanmadan yetiştirilebildiği gibi, yazlık ikinci ürün olarak da yetiştirilebildiğinden, ekim nöbetinde önemli bir baklagil bitkisidir. Bu sebepler ile bölge ekolojisine uygun çeşit adaptasyon çalışmalarının tamamlanması gerekmektedir. Bu çalışmada, Sivas ekolojik koşullarında bazı yem bezelyesi genotiplerinin morfolojik özellikleri yanında ot verimlerinin değerlendirilmesi amaçlanmıştır. Çalışma Sivas Bilim ve Teknoloji Üniversitesi Tarımsal Araştırma ve Geliştirme merkezinde 2023 yılında gerçekleştirilmiştir. Deneme tesadüf blokları deneme desenine göre 4 tekerrürlü olacak şekilde yürütülmüştür. Araştırmada yem bezelyesi genotiplerine ait çiçeklenme gün sayısı (gün), bitki boyu (cm), dal sayısı (adet), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) özellikleri incelenmiştir. Yem bezelyesi genotiplerinde incelenen tüm parametreler istatistiki açıdan önemli bulunmuştur. Çalışma sonucunda yem bezelyesi genotiplerinde çiçeklenme gün sayısı 54.2-61.2 gün, bitki boyu 57.6-74.8 cm, dal sayısı 3.2-5.8 gün, yaş ot verimi 239.4-682.8 kg/da, kuru ot verimi ise 53.1-153.7 kg/da arasında değişim göstermiştir. Elde edilen sonuçlara göre yeşil ot üretimi bakımından Ulubatlı yem bezelyesi çeşidinin, kuru ot üretimi bakımından ise Taşkent, Kirazlı, Töre ve Ulubatlı yem bezelyesi çeşitlerinin yörede yetiştiriciliğinin uygun olduğu belirlenmiştir.

Anahtar Kelimeler: Yem bitkileri, bezelye (*Pisum sativum* L.), kaba yem, ot verimi

**EVALUATION OF SOME FORAGE PEA GENOTYPES GROWN IN SIVAS
ECOLOGICAL CONDITIONS IN TERMS OF SOME YIELD AND YIELD
COMPONENTS**

ABSTRACT

Forage pea (*Pisum sativum* sp. *arvense* L.) is a valuable forage crop grown for its fodder and grain. The fact that the forage pea dry herb contains 15-20% crude protein and has a high digestibility of 70-80% indicates that the roughage production potential of the plant is high. Especially in the regions where the livestock sector is developed, roughage production is increasing. Since it is a legume plant, it creates a more suitable environment for the next plant and can take an active role in the control of diseases, pests and weeds. Since it can be grown without irrigation in the Central Anatolia Region in winter, it can also be grown as a second crop in summer, so it is an important legume plant in crop rotation. For these reasons, it is necessary to complete the adaptation studies of varieties suitable for the ecology of the region. In this study, it was aimed to evaluate the morphological characteristics of some forage pea genotypes as well as forage yields in Sivas ecological conditions. The study was carried out in Sivas Science and Technology University Agricultural Research and Development Center in 2023. The experiment was carried out in a randomized block design with 4 replications. In the study, the number of flowering days (day), plant height (cm), number of branches per plant (piece), fresh hay yield (kg/da) and hay yield (kg/da) characteristics of forage pea genotypes were investigated. All parameters examined in forage pea genotypes were found to be statistically significant. The number of flowering days 54.2-61.2 day, plant height changed between 57.6 and 74.8 cm, number of branch varied from 3.2 to 5.8 piece, fresh hay yield varied from 239.4 to 682.8 kg/da, the hay yield changed between 53.1 and 153.7 kg/da. According to the results obtained, it was determined that the Ulubatlı forage pea variety was suitable for growing in the region in terms of green grass production, and the Taşkent, Kirazlı, Töre and Ulubatlı forage pea varieties were suitable for growing in the region in terms of hay production.

Keywords: Forage crops, pea (*Pisum sativum* L.), roughage, forage yield

GİRİŞ

Fabaceae, 751 cins ve 19.500 türden oluşan üçüncü büyük çiçekli bitkiler familyasıdır. Baklagillerin tür sayısının ve özelliklerinin çeşitli olması, çok yönlü kullanımlarına olanak sağlamaktadır. İnsan beslenmesi, yeşil gübreleme, bozulmuş alanların ıslahı bu kullanım alanlarının bazılarını oluşturmaktadır. Baklagillerin en önemli kullanım alanlarından bir tanesi de hayvan beslemedir. Baklagil bitkileri meralarda otlatma amacı ile, kuru ve yaş ot üretimleri ile çiftlik işletmelerinin kaba yem ihtiyacını karşılamada ve tanelerinin yem rasyonlarında kullanılması ile hayvan beslemesinde kullanılmaktadır (Sonta ve Rekiel, 2020). Diğer taraftan dünyada birçok baklagil türü yetiştirilmesine rağmen, bunlardan bazıları hayvan yemlerinde protein kaynağı olarak ekonomik öneme sahip olmaktadır. Baklagil yem bitkileri familyasında yer alan yem bezelyesi bu bitkiler arasında yer almaktadır.

Yem bezelyesi (*Pisum sativum* L.), ülkemizin birçok bölgesinde külür veya kürül ismi ile yetiştirilen önemli bir tek yıllık yem bitkisidir. Kuru otunda %15-20, tanesinde ise %20-30 civarında ham protein bulunması, yem bezelyesinin hayvan beslemede hem kaba yem üretimi hem de kesif yem üretimi bakımından önemli bir yere sahip olduğunu göstermektedir. Tanesi için yetiştirildiğinde elde edilen bezelye samanı (kes), tahıl samanından besin içeriği yönünden daha zengin bir içeriğe sahip olmaktadır. Ayrıca yem bezelyesi hububatlar ile karışım şeklinde ekilerek hayvan beslenmesinde dengeli bir besin içeriği oluşturmaktadır.

Ülkemizde özellikle hayvancılığın geliştiği bölgelerde, yem bezelyesinin önemi ve kullanımı her geçen gün artmaktadır (Tan ve Kadioğlu, 2018a). Birçok bölgemizde yem bezelyesi adaptasyonu ile ilgili çalışmalar yürütülmektedir (Tekeli ve Ateş, 2003; Tamkoç, 2007; Geren ve Alan, 2012; Karaköy vd., 2016). Yürütülen bu çalışmalar sonucunda, ülkemizde çok sayıda yem bezelyesi çeşidi geliştirilmiş ve tescil ettirilmiştir. Dolayısıyla mevcut ekolojiye uygun, verim potansiyeli yüksek yem bezelyesi çeşitlerinin belirlenmesi büyük önem taşımaktadır. Bu çalışmada, Sivas ekolojik koşullarında geliştirilmiş bazı yem bezelyesi hat ve çeşitlerinin verim ve verim komponentleri bakımından değerlendirilmesi amaçlanmıştır.

MATERYAL ve METOT

Çalışma Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi, Tarımsal Ar-Ge Merkezinde 2023 yılı yazlık yetiştirme sezonunda yürütülmüştür. Denemenin yürütüldüğü alanın denizden yüksekliği 1285 m olup, N39,720656-E36,917248 konumunda yer almaktadır. Denemenin yürütüldüğü 2023 yılı yetiştirme sezonuna ait iklim verileri Tablo 1’de verilmiştir. En düşük sıcaklık değeri (1 °C) Mayıs ayında, en yüksek sıcaklık değeri ise (39.1 °C) Ağustos ayında gözlemlenmiştir. Mayıs-Ağustos ayları arasındaki toplam yağış (114.2

mm), uzun yıllar ortalamasının (110.3 mm) üzerinde seyretmiştir. Aylara göre ortalama bağıl nem değeri %45.7 ile %67.2 arasında değişmiştir. Çalışma alanının toprağı siltli killi tın bünyeye sahip olup, pH değeri 7.28, kireçli (%19.6), potasyum içeriğı (K₂O) yüksek (93.59 kg/da), fosfor içeriğı (P₂O₅) düşük (3.40 kg/da), tuzsuz (0.33 mmhos/cm) ve organik maddece (%1.7) düşüktür (Tablo 2). Deneme alanının drenajı iyi ve taban suyu problemi bulunmamaktadır.

Tablo 1. Sivas ilinin deneme yılı ve uzun yıllar ortalamasına ait bazı iklim verileri*

Derinlik	Tekstür	pH	Kireç (%CaCO ₃)	Tuzluluk (%)	P ₂ O ₅ (kg/da)	K ₂ O (kg/da)	Organik madde (%)
0-30 cm	Siltli kili tın	7.28	19.6	0.33	3.40	93.59	1.7

Araştırmada Gölyazı, Taşkent, Kirazlı, Töre ve Ulubatlı yem bezelyesi çeşitleri ve Sivas Bilim ve Teknoloji Üniversitesi ıslah çalışmalarında kullanılmak üzere geliştirilen SBTÜ-1 ve SBTÜ-2 hattı olmak üzere 7 adet yem bezelyesi genotipi kullanılmıştır. Ekimde her bir parsel 5 m uzunluğunda ve sıra arası 25 cm olacak şekilde 5 sıradan oluşmuştur. Deneme tesadüf blokları deneme desenine göre 4 tekerrürlü olarak kurulmuştur. Ekimle birlikte dekara 4 kg N (azot) ile 10 kg P₂O₅ (fosfor) olacak şekilde gübreleme yapılmıştır. Yetiştirme süresi boyunca deneme alanında yabancı ot mücadelesi elle ve çapa ile yapılmıştır. Araştırmada, yem bezelyesi genotiplerine ait çiçeklenme gün sayısı (gün), bitki boyu (cm), dal sayısı (adet), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) parametreleri incelenmiştir. Elde edilen sonuçlar SAS 9.3 istatistik paket programı kullanılarak varyans analizine tabi tutulmuştur (SAS, 2011).

TARTIŞMA ve BULGULAR

Yem bezelyesi genotiplerinde incelenen çiçeklenme gün sayısı (gün), bitki boyu (cm), dal sayısı (adet), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) özelliklerine ait ortalama değerler Tablo 3'te verilmiştir.

Tablo 3. Yem bezelyesi genotiplerinde incelenen özelliklere ait ortalama değerler

Genotip	Çiçeklenme Gün Sayısı (gün)	Bitki Boyu (cm)	Dal Sayısı (adet)	Yaş Ot Verimi (kg/da)	Kuru Ot Verimi (kg/da)
Gölyazı	54.2 ^c	62.7 ^{bc}	4.3 ^{bc}	434.6 ^{bc}	95.8 ^{bc}
Taşkent	61.2 ^a	62.5 ^{bc}	4.8 ^{ab}	445.6 ^b	101.6 ^a
Kirazlı	56.5 ^b	64.1 ^b	4.3 ^{bc}	440.4 ^b	101.8 ^a
Töre	56.5 ^b	66.4 ^b	4.2 ^{bc}	499.4 ^{ab}	108.8 ^a
Ulubatlı	55.0 ^c	74.8 ^a	4.9 ^{ab}	682.8 ^a	153.7 ^a

Ö.D	**	**	*	**	*
CV	1.34	6.43	18.77	29.82	29.74

ÖD: Önem düzeyi, **: 0.01 düzeyinde önemli, *: 0.05 düzeyinde önemli

Çalışmada incelenen yem bezelyesi genotiplerinde ortalama çiçeklenme gün sayısı 56.8 gün olarak belirlenmiştir. En geç çiçeklenen Taşkent çeşidi (61.2 gün), en erken çiçeklenen çeşitler ise Gölyazı (54.2 gün) ve Ulubatlı (55 gün) yem bezelyesi çeşitleri olmuştur. Sonuçlar Gölyazı ve Ulubatlı çeşitlerinin diğer çeşit ve hatlardan daha erkenci olduğunu göstermiştir. Konuk ve Tamkoç (2018), en kısa çiçeklenme gün sayısını, yazlık ekimde; hem Konya hem de Altınekin’de Ulubatlı çeşidinden elde etmiştir. Tan ve Kadioğlu (2018b), Erzurum ekolojik koşullarında farklı ekim zamanları kullandığı bir çalışmada ortalama çiçeklenme gün sayısını 222.6 gün olarak tespit etmiştir. Çiçeklenme gün sayısı ekolojik koşullara, çalışmanın yürütüldüğü yıllara ve kullanılan çeşitlere göre değişim göstermekte olup, olgunlaşma süresini belirleyerek, bitkinin üretim desenindeki yerinin belirlenebilmesinde önemli bir parametreyi oluşturmaktadır. Çalışmada kullanılan genotipler arasında ortalama bitki boyu 64.1 cm olarak tespit edilmiştir. En uzun bitki boyu Ulubatlı yem bezelyesi çeşidinden (74.8 cm) elde edilmiştir. SBTÜ-2 (57.6 cm) hattı ise çalışmada en kısa bitki boyunu vermiştir. Koivisto vd. (2003), yemlik olarak yetiştirilen bezelye için daha uzun boylu çeşitlerin tercih edildiğini belirtmiştir. Ankara koşullarında yürütülen bir çalışmada yazlık olarak yetiştirilen bezelye genotiplerinde ortalama bitki boyu 86 cm olarak belirlenmiştir (Timurağaoğlu, 2004). Tan ve Kadioğlu (2018b), Erzurum koşullarında kışlık olarak yetiştirdikleri yem bezelyesi çeşitlerinde ortalama bitki boyunu 82.1 cm olarak tespit ederek, ekolojiye uygun olan çeşitlerin daha fazla boylandığını ifade etmişlerdir. Belirtilen çalışmalar ile bulgularımız arasındaki farklılığın bitkilerin yetiştirildiği dönem (kışlık-yazlık) veya çalışmada kullanılan çeşit farkından ileri geldiği belirtilebilmektedir. Çalışmada ele alınan materyalde dal sayısı ortalama değerinin 4.52 adet olduğu belirlenmiştir. En fazla dal sayısı SBTÜ-2 hattından (5.8 adet) elde edilirken, en az dal sayısı SBTÜ-1 hattından (3.2 adet) elde edilmiştir. Erkovan ve ark. (2020), Eskişehir

koşullarında yürüttükleri bir çalışmada ortalama bitki dal sayısını 5.5 adet olarak belirlemiştir. Bir başka çalışmada ise genotiplerde belirlenen dal sayısının 1.6-5.3 adet arasında değiştiği belirtilmiştir (Karayel ve Bozoğlu, 2012). Yaş ot verimi bakımından genotipler arasında istatistiksel açıdan %1 önem düzeyinde fark bulunmuştur. Çalışmada Ulubatlı yem bezelyesi çeşidinden (682.8 kg/da) en yüksek yaş ot verimi elde edilirken, SBTÜ-1 hattından (239.4 kg/da) ise en düşük yaş ot verimi elde edilmiştir. Konya ekolojik koşullarında yem bezelyesinin ekim zamanı ile ilgili yapılan bir çalışmada, yazlık ekimde yaş ot veriminin 1453- 4444 kg/da arasında değiştiği tespit edilmiştir (Konuk ve Tamkoç, 2018). Çalışmamız ile bahsedilen çalışma arasındaki farklılığın ekolojik koşullardan ileri geldiği belirtilebilmektedir. Çalışmada kuru ot verimi bakımından genotipler arasında %5 önem seviyesinde farklılıklar bulunmuştur. Taşkent (101.6 kg/da), Kirazlı (101.88 kg/da), Töre (108.8 kg/da) ve Ulubatlı 153.7 kg/da yem bezelyesi çeşitleri istatistiksel açıdan aynı grupta yer alırken en yüksek kuru ot verimine sahip olmuşlardır. En düşük kuru ot verimi ise 53.1 kg/da ile SBTÜ-2 hattından elde edilmiştir. Yem bezelyesinde daha önce yapılan çalışmalarda kuru ot verimi 189.5-762.1 kg/da arasında değişim göstermiştir (Timurağaoğlu ve ark., 2004; Bilgili ve ark., 2007; Geren ve Alan, 2012; Uzun ve ark., 2012; Seydoşoğlu, 2013; Kavut ve ark., 2016). Çalışmalar arasında meydana gelen farklılığın çalışmaların yürütüldüğü bölgenin ekolojik koşullarından, agronomik uygulamalardan ve genotip farklılığından ileri geleceği ifade edilebilmektedir.

Tablo 4. Yem bezelyesi genotiplerinde incelenen özelliklere ait korelasyon katsayıları

	Çiçeklenme Gün Sayısı (gün)	Bitki Boyu (cm)	Dal Sayısı (adet)	Yaş Ot Verimi (kg/da)	Kuru Ot Verimi (kg/da)
Çiçeklenme Gün Sayısı (gün)	1.00000	-0.25959	0.02937	-0.16309	-0.13255
Bitki Boyu (cm)		1.00000	0.01991	0.59255 **	0.57205**
Dal Sayısı (adet)			1.00000	-0.15139	-0.15535
Yaş Ot Verimi (kg/da)				1.00000	0.98657 **
Kuru Ot Verimi (kg/da)					1.00000

ÖD: Önem düzeyi, *: 0,05 düzeyinde önemli, **: 0,01 düzeyinde önemli

İncelenen özellikler arasındaki korelasyon katsayıları Tablo 4’te verilmiştir. Tablo 4’e göre yaş ot verimi ile bitki boyu (0.59255) arasında %1 düzeyinde önemli ve anlamlı bir korelasyon saptanmıştır. Kuru ot verimi ile bitki boyu arasında (0.57205) arasında pozitif ve %1 düzeyinde önemli bir ilişki belirlenmiştir. Kuru ot verimi ile yaş ot verimi arasında (0.98657) arasında pozitif ve %1 düzeyinde önemli bir korelasyon bulunmuştur.

SONUÇ ve ÖNERİLER

Baklagil yem bitkileri, hayvan beslemedeki öneminin yanında toprağın fiziksel, kimyasal ve biyolojik yapısını olumlu etkileyerek kendisinden sonra yetiştirilecek bitkiler için uygun bir ortam oluşturması yönünden oldukça önemli bir yere sahiptir. Bu nedenle bölgeye uyumlu yem bezelyesi genotiplerinin belirlenebilmesi için adaptasyon çalışmalarının yürütülmesi büyük önem arz etmektedir. Bu çalışmadan elde edilen sonuçlara göre, yeşil ot üretimi bakımından Ulubatlı yem bezelyesi çeşidinin, kuru ot üretimi bakımından ise Taşkent, Kirazlı, Töre ve Ulubatlı yem bezelyesi çeşitlerinin yörede yetiştiriciliğinin uygun olduğu belirlenmiştir.

ÖZET

Hayvancılık işletmelerinde ekonomik yem sağlamada en temel hususlardan bir tanesi yem bitkileri üretimidir. Hayvansal üretimde, besin maddelerinden yararlanılabildiği düzeyde verim alınabilmektedir. Bu sebepler ile hayvanların uygun beslenme koşullarında yetiştirilmesi oldukça önemli bir konudur. Yulaf (*Avena sativa* L.), ruminantların beslenmesinde yaygın olarak kullanılan bir buğdaygil bitkisidir. Yüksek lif içeriği ve glutamik asit içeriği ile hayvanların büyüme döneminde önemli bir enerji ve protein kaynağı olduğu bilinmektedir. Yemlik yulafın belirtilen özelliklerinden dolayı, ürün miktar ve kalitesinin artırılması için bölge ekolojisine uygun çeşit adaptasyon çalışmalarının tamamlanması gerekmektedir. Bu çalışmada beş adet farklı yemlik yulaf genotipi Sivas ekolojik koşullarında bazı verim ve verim komponentlerinin belirlenmesi amacıyla 2023 yılı yazlık ürün yetiştirme sezonunda tesadüf blokları deneme desenine göre 4 tekerrürlü olacak şekilde yürütülmüştür. Çalışma Sivas Bilim ve Teknoloji Üniversitesi Tarımsal Araştırma ve Geliştirme Merkezinde gerçekleştirilmiştir. Salkım çıkarma gün sayısı (gün), bitki boyu (cm), salkım uzunluğu (cm), yaş ot verimi (kg.da⁻¹), kuru ot verimi (kg.da⁻¹) çalışmada incelenen parametreler arasında yer almaktadır. Genotipler arasında incelenen özelliklerden salkım çıkarma gün sayısı 57.2-59.0 gün, bitki boyu 61.2-76.9 cm, salkım uzunluğu 18.1-26.0 cm, yaş ot verimi 1348.6-1795.1 kg.da⁻¹, kuru ot verimi 312.2-432.2 kg.da⁻¹ arasında değişim göstermiştir. Salkım çıkarma gün sayısı ve yaş ot verimi bakımından genotipler arasında istatistiki olarak önemli bir fark bulunmaz iken, çalışmada incelenen diğer parametreler istatistiki bakımdan önemli bulunmuştur.

Anahtar Kelimeler: Yulaf (*Avena sativa* L.), kaba yem, yem bitkileri, ot verimi

THE EVALUATION OF SOME FEED OAT GENOTYPES IN TERMS OF SOME YIELD AND YIELD COMPONENTS IN SIVAS ECOLOGICAL CONDITIONS

ABSTRACT

One of the most basic issues in providing economic feed in livestock enterprises is the production of forage crops. In animal production, efficiency can be obtained at the level that nutrients can be used. For these reasons, it is a very important issue to raise animals in suitable feeding conditions. Oat (*Avena sativa* L.) is a grassy plant widely used in the nutrition of ruminants. It is known to be an important source of energy and protein during the growth period of animals with its high fiber content and glutamic acid content. Due to the specified characteristics of forage oats, it is necessary to complete the variety of adaptation studies suitable for the region's ecology to increase the product's amount and quality. In this study, five different forage oat genotypes were carried out in a randomized block design with 4 replications in the summer crop growing season of 2023 to determine yield and yield components in Sivas ecological conditions. The study was carried out at Sivas Science and Technology University Agricultural Research and Development Center. The number of days of cluster removal (days), plant height (cm), cluster length (cm), fresh grass yield (kg.da⁻¹), hay yield (kg.da⁻¹) are among the parameters examined in the study. Among the characteristics examined among the genotypes, the number of cluster removal days was 57.2-59.0 days, the plant height was 61.2-76.9 cm, the cluster length was 18.1-26.0 cm, the fresh grass yield was between 1348.6-1795.1 kg.da⁻¹, and the dry grass yield ranged between 312.2-432.2 kg.da⁻¹. While there was no statistically significant difference between the genotypes regarding the number of days of clustering and wet forage yield, the other parameters examined in the study were statistically significant.

Keywords: Oat (*Avena sativa* L.), roughage, forage crops, forage yield

GİRİŞ

Türkiye’de yaklaşık olarak 23.5 milyon ha tarım alanı ve 14.6 milyon ha çayır ve mera alanı bulunmaktadır (TÜİK, 2021). Kaba yem açığını gideren doğal yem alanları olan çayır ve meraların, amaç dışı kullanımı ve bilinçsiz otlatma sonucunda verimleri düşmektedir. Bu alanların giderek küçülmesi ve verimlerinin azalması doğrudan kaba yem ihtiyacının artmasına neden olmaktadır. Bu nedenle ülkemizde kaba yem ihtiyacının sadece %40-65 kadarı karşılanabilmektedir (Gökkuş & Hanoğlu, 2022). Ülkemizde meraların erken otlatılmaya başlanması, mera bakımlarının yapılmaması ve aşırı otlatma kaba yem açığını artırmaktadır (Yolcu & Tan, 2008).

Yem bitkileri yetiştiriciliği, kaba yem ihtiyacının karşılanmasında çayır ve meralara kıyasla daha devamlı ve güvenli bir seçenektir (Akman ve ark., 2007). Serin iklim tahılları, nitelikli kaba yem kaynakları arasında besleme değeri ve üretim miktarları ile önemleri giderek artmaktadır. Kaba yem olarak yetiştirilmesindeki temel sebepler, uyum yeteneklerinin çok yüksek olması, çok ekstrem şartlarda bile yetişebilmeleri (tritikle ve çavdar), tuzlu topraklarda yetişme özelliği (arpa), çimlendikten sonra gelişimlerinin hızlı olması ve karbonhidrat, karoten, bazı vitamin ve minerallerce zengin olmalarıdır (Tan & Serin, 1997).

Yulaf (*Avena sativa* L.) dünya çapında insan beslenmesi ve hayvan yemi için önemli bir tahıl bitkisidir (Buerstmayr ve ark., 2007). Yulaf, tahıllar içerisinde kurağa ve soğuğa en hassas bitkidir. Bu nedenle buğday ve arpa ile kıyaslandığında kışlık tahıl yetiştiriciliği yapılan bölgelerimizde soğuktan oldukça zarar görebilmektedir. Yıllık yağış miktarının yaklaşık olarak 600-700 mm olması yulafın nem ihtiyacını karşılaması için yeterli olmaktadır. Yulafın yazlık olarak yetiştirildiği yerlerde ilkbahar yağışlarının yetersiz ve düzensiz olması tane ve ot verimi bakımından yulaf bitkisini olumsuz etkilemektedir (Barut, 2003). Ancak yağış miktarının yeterli olduğu düşük verimli topraklarda tahıl yetiştiriciliği için en uygun bitki konumundadır (Buerstmayr ve ark., 2007).

Yulaf sapsarı daha yumuşak ve yaprakları daha bol olduğundan, buğday ve arpa samanından organik ve mineral maddeler bakımından zengindir. Ayrıca yulaf, tahıl, yeşil yem, silaj, saman, yaygın fiğ ve yem bezelyesi gibi baklagillerin karışımını desteklemek için kullanılır. Tahıllar arasında yulaf, evcil hayvanların beslenmesinde en yüksek protein içeriğine ve kalitesine sahiptir. Yulaf aynı zamanda en yüksek yağ içeriğine sahip tahıldır. Türkiye’de 2021 yılında 137 bin ha alanda 276 bin ton yulaf üretilmiştir. Türkiye’de daha kaliteli yem açığını kapatmak için birim alandan elde edilen verim artırılmalıdır (Avcıoğlu ve ark., 2000). Türkiye’de 17 yulaf çeşidi (Faikbey, Seydişehir, Sebat, Yeniçeri, Sarı, Fetih, Kırklar, Kahraman, Haskara, Albatros,

Bc Marta, Dirilis, Arslanbey, Küçükyayla, Kehlibar, Kayı ve Kupa) tescil edilmiştir (Anonim, 2019). Bu çeşitlerin tamamı tahıl için yetiştirilmektedir. Yulaf, yüksek protein içeriği nedeniyle çiftlik hayvanlarının beslenmesinde önemlidir (Wood, 2001). Hayvansal üretimi artırmak için ucuz ve kolay temin edilebilir yem kaynaklarına ihtiyaç duyulmaktadır ve yulaf önemli bir alternatif bitkidir. Yulaf dünyada hayvan yemi olarak öncelikli bir ürün olup, ülkemizde de yulafın hayvan beslemedeki önemi dikkate alınırca üretiminin artırılması kaçınılmazdır (Serin ve Tan, 2009).

Bu çalışmanın amacı, Sivas ekolojik koşullarında daha çok tane verimi bakımından değerlendirilen yulaf bitkisinin, kaba yem açığına alternatif oluşturması bakımından 2023 yazlık ürün yetiştirme periyodunda bazı yemlik yulaf genotiplerinin verim ve verim komponentleri bakımından değerlendirilmesidir.

MATERYAL ve METOT

Araştırma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi, Tarımsal Ar-Ge Merkezinde, 2023 yılı yetiştirme sezonunda yürütülmüştür. Denemenin yürütüldüğü Sivas ili 39° 56' kuzey paralelleri ile 32° 51' doğu meridyenleri arasında yer almakta olup, denizden yüksekliği 1285 m'dir. Araştırmanın yürütüldüğü Mayıs 2023-Ağustos 2023 ayları arasında en düşük sıcaklık değeri Mayıs ayında (1.0°C), en yüksek sıcaklık değeri ise Ağustos ayında (39.1°C) gerçekleşmiştir. Denemenin yürütüldüğü yetiştirme sezonunda en düşük ortalama nispi nem değeri Ağustos ayında (%45.7), en yüksek ortalama nispi nem değeri ise Haziran ayında (%67.2) saptanmıştır. Araştırma sürecinde gerçekleşen toplam yağış miktarlarına bakıldığında ise en düşük değer Temmuz ayında (3.0 mm), en yüksek değer ise Mayıs ayında (56.4 mm) saptanmıştır (Anonim, 2023). Denemenin yürütüldüğü 2023 yetiştirme sezonuna ait iklim verileri Çizelge 1'de verilmiştir.

Çizelge 1. Sivas ili 2023 yetiştirme sezonuna ait iklim verileri.

2023	Yağış (mm)		Sıcaklık (°C)				Nispi Nem (%)			
	Top. Yağış	Uzun Yıllar	Min. Sıcaklık	Max. Sıcaklık	Ort. Sıcaklık	Uzun Yıllar	Min. Nispi Nem	Max. Nispi Nem	Ort. Nispi Nem	Uzun Yıllar
Mayıs	56.4	18,9	1.0	26.4	13.0	13,9	12.0	99.0	63.6	53,8
Haziran	51.4	77,7	7.9	30.0	17.3	18,6	16.0	99.0	67.2	55,2
Temmuz	3.0	4,6	7.0	35.9	20.1	20,3	10.0	99.0	51.9	50,5
Ağustos	3.4	9,1	9.6	39.1	23.4	22,3	5.0	99.0	45.7	48,4

5: Mayıs, 6: Haziran, 7: Temmuz, 8: Ağustos

Çalışmada 5 adet yemlik yulaf (Seydişehir, Faikbey, Diriliş, Checota, SBTÜ-101) genotipi materyal olarak kullanılmıştır. Tarla denemeleri, tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Ekim ve hasat işlemleri el ile yapılmıştır. Ekimde her bir parsel 5 m uzunluğunda ve sıra arası 20 cm olacak şekilde 6 sıradan oluşmuştur. Yetiştirme süresi boyunca gerekli kültürel işlemler eksiksiz olarak yerine getirilmiş, dekara 4 kg azot (N) ile 10 kg fosfor (P₂O₅) olacak şekilde gübreleme yapılmıştır. Araştırmada salkım çıkarma gün sayısı (SÇGS), bitki boyu (BB), salkım uzunluğu (SU), yaş ot verimi (YOV) ve kuru ot verimi (KOV) özellikleri incelenmiştir. Çalışma sonucunda elde edilen veriler SAS 9.3 istatistik paket programında varyans analizine tabi tutulmuştur (SAS, 2013).

BULGULAR ve TARTIŞMA

Araştırmada materyal olarak kullanılan yemlik yulaf genotiplerine ait salkım çıkarma gün sayısı (SÇGS), bitki boyu (BB), salkım uzunluğu (SU), yaş ot verimi (YOV) ve kuru ot verimine (KOV) ilişkin ortalama değerler Çizelge 2’de verilmiştir.

Salkım çıkarma gün sayısı bakımından yemlik yulaf genotipleri arasında istatistiki olarak bir fark bulunamamıştır. Genotipler arasında salkım çıkarma gün sayısı 57.25-59.00 gün arasında değişiklik göstermiştir. En kısa salkım çıkarma gün sayısına sahip genotip (57.25) Diriliş olurken, en uzun salkım çıkarma gün sayısına sahip genotip (59.00) Faikbey olmuştur (Çizelge 2). Salkım çıkarma gün sayısını, Naneli ve Sakin (2017) 155.3-179.0 gün arasında ve Düzme (2020) 100-113.75 gün arasında değiştirdiğini bildirmişlerdir. Bulgularımız ile önceki çalışmalar arasında ortaya çıkan farklar, yapılan çalışmaların kışlık vejetasyon periyodunda, çalışmamızın yazlık vejetasyon periyodunda yürütülmüş olmasından kaynaklanmaktadır.

Yemlik yulaf genotipleri arasında bitki boyu bakımından istatistiki olarak önemli farklar ($p<0.01$) bulunduğu saptanmıştır. Genotipler arasında bitki boyu 61.23-76.98 cm aralığında farklı değerler almıştır. Checota en kısa bitki boyuna (61.23 cm) sahip genotip olurken, SBTÜ-101 en uzun bitki boyuna (76.98) sahip genotip olmuştur (Çizelge 2). Yapılan farklı çalışmalar incelendiğinde bitki boyunu, Kara (2016) ortalama 108.78 cm, Tanrıku ve ark. (2020) yazlık ve kışlık olarak ayrı ayrı ekim zamanında sırasıyla 43.33-65.73 cm ve 104.8-154.13 cm arasında ve Kahraman ve ark. (2022) 84.4-105.4 cm arasında bildirmişlerdir. Önceki çalışmalar ile bulgularımız kıyaslandığında, kışlık ekim periyodunda yetiştirilen yulaf genotiplerinin bitki boyu bakımından bulgularımızdan çok daha üstün olduğu, ancak yazlık ekim periyodunda yetiştirilen yulaf genotiplerinin bulgularımızın altında değerler verdiği görülmektedir.

Çizelge 2. Yemlik yulaf genotiplerinin SÇGS, BB, SU, YOY ve KOV özelliklerine ait ortalama ve CV değerleri.

	SÇGS	BB	SU	YOY	KOV
Seydişehir	58.75	64.53	26.00	1578.7	331.6
Faikhbey	59.00	63.03	22.60	1400.1	314.3
Diriliş	57.25	74.23	18.15	1795.1	432.2
Checota	58.25	61.23	22.58	1348.6	312.2
SBTÜ-101	58.25	76.98	26.03	1573.6	403.5
Ortalama	58.30	68.00	23.07	1539.22	358.74
Önem Düzeyi	ÖD	**	*	ÖD	*
CV (%)	2.54	8.46	12.6	19.0	15.5

Çizelge 2 incelendiğinde salkım uzunluğu açısından istatistiki olarak önemli farklar ($p<0.05$) olduğu görülmektedir. Yemlik yulaf genotipleri arasında salkım uzunluğu 18.15-26.03 cm arasında değerler almıştır. En uzun salkım uzunluğu (26.03 cm) SBTÜ-101 genotipinden elde edilirken, en kısa salkım uzunluğu (18.15 cm) Diriliş genotipinden elde edilmiştir. Salkım uzunluğunu Erbaş ve Mut (2013) 16.9 ile 25.0 cm ve Mut ve ark. (2021) ortalama 28.99 cm olarak bildirmişlerdir. Salkım uzunluğu bakımından önceki çalışmalar ile bulgularımız benzerlik göstermektedir.

Yaş ot verimi bakımından yemlik yulaf genotipleri arasında istatistiki olarak fark oluşmamıştır. Genotipler arasında yaş ot verimi 1348.6-1795.1 $\text{kg}\cdot\text{da}^{-1}$ arasında farklı değerler almıştır. En az yaş ot verimi (1348.6 $\text{kg}\cdot\text{da}^{-1}$) Checota genotipinden elde edilirken, en fazla yaş ot verimi (1795.1 $\text{kg}\cdot\text{da}^{-1}$) Diriliş genotipinden elde edilmiştir. Yemlik yulaf genotipleri arasında kuru ot verimi bakımından istatistiki olarak önemli farklar ($p<0.05$) olduğu saptanmıştır. Genotipler arasında kuru ot verimi 312.2-432.2 $\text{kg}\cdot\text{da}^{-1}$ aralığında farklı değerler almıştır. En az kuru ot verimi (312.2 $\text{kg}\cdot\text{da}^{-1}$) Checota genotipinden elde edilirken, en fazla kuru ot verimi (432.2 $\text{kg}\cdot\text{da}^{-1}$) ise Diriliş genotipinden elde edilmiştir (Çizelge 2). Kahraman ve ark. (2022) ortalama yaş ot verimini 5084 $\text{kg}\cdot\text{da}^{-1}$, kuru ot verimini 1293 $\text{kg}\cdot\text{da}^{-1}$, Kılınç ve Gökkuş (2022) ortalama yaş ot verimini 3412.5 $\text{kg}\cdot\text{da}^{-1}$, kuru ot verimini 1165.9 $\text{kg}\cdot\text{da}^{-1}$ olarak bildirmişlerdir. Bulgularımız

önceki çalışmalara kıyasla daha az yaş ve kuru ot verimi elde ettiğimizi göstermektedir. Bu farkların ekim zamanı ve iklim şartlarından kaynaklandığı düşünülmektedir.

Çizelge 3. Yemlik yulaf genotiplerinde incelenen özellikler arasındaki korelasyon ilişkileri

	SÇGS	BB	SU	YOV	KOV
SÇGS	1.00				
BB	-0.095	1.00			
SU	0.112	-0.170	1.00		
YOV	-0.121	0.608**	-0.110	1.00	
KOV	-0.116	0.758**	-0.246	0.863**	1.00

Yemlik yulaf genotiplerinde incelenen özellikler arasındaki korelasyon tablosu Çizelge 3'te verilmiştir. Çizelge 3 incelendiğinde, BB ile YOV ve KOV, YOV ile KOV verimi arasında pozitif ve istatistiki olarak önemli ilişkiler olduğu saptanmıştır. SÇGS ile BB, YOV ve KOV arasında, BB ile SU arasında ve SU ile YOV ve KOV arasında negatif bir ilişki olduğu ancak istatistiki olarak önemli olmadığı saptanmıştır.

SONUÇ

Araştırma sonucunda, Diriliş ve SBTÜ-101 genotiplerinin Sivas ekolojik koşullarında alternatif kaba yem kaynağı olarak yetiştirilebileceği düşünülmektedir. Yıllara göre değişen iklim faktörleri göz önüne alındığında elde edilen verilerin güvenilirliği bakımından denemelerin sürdürülmesinin yararlı olacağı düşünülmektedir.

ABSTRACT

Fish farms need real-time monitoring systems to increase efficiency and achieve sustainability goals. Various aquatic products, fish, shrimp and mussels are grown in these farms. Environmental conditions and needs of fish, development of fish, sea water temperature, salinity and oxygen content are constantly monitored and controlled in farms. Similarly, the feeding, health status, and growth performance of the fish are carefully observed. The decline of natural fish stocks and the increasing demand for seafood emphasize the importance of monitoring the maturity of the fish. Grading machines are important tools used to determine the size of fish raised in fish farms. These systems ensure that the fish are harvested at the right time when they reach the size suitable for the market. This study focuses on the technologies used in grading machines in fish farms, examining their functioning, advantages, and contributions to the industry. Various machines, supported by different technologies, facilitate the monitoring of the fish harvesting process for size grading. Grading machines are being developed with the support of optical sensors, image processing technology, laser technology, machine learning, and artificial intelligence. The incorporation of these complementary technologies allows for their portability and usability in the field, providing a significant advantage. In the industry, it has been observed that devices using optical sensors and image processing methods may face contamination on their cameras and LEDs as the fish pass through them. This issue creates a burden for user companies, leading to a lower preference for systems developed with this method. Consequently, systems based on laser technology, machine learning, and artificial intelligence have higher accuracy rates, making them more preferable choices.

Keywords: Fish Farms, Grading Machines, Optical Sensors, Advanced Technologies, Artificial Intelligence, Machine Learning

INTRODUCTION

Aquaculture is becoming increasingly important as one of the food production sectors worldwide. Fish, shrimp, mussels and other aquaculture species, grown and processed sustainably, constitute one of the main sources of protein for humans. However, the continuous decline of natural fish stocks and the rapid increase in demand for seafood have highlighted the issues of sustainability and efficiency of the aquaculture industry.

Aquaculture requires constant monitoring and management due to the complexity of the conditions in the marine environment and the growth conditions of aquaculture. The growth rate of fish, their health status and adaptation to environmental conditions are among the factors that determine the success of fish farms. Therefore, the temperature, salinity, oxygen levels and other environmental parameters of water on farms are constantly monitored and controlled. Additionally, the nutrition, disease status and growth performance of the fish are carefully monitored (Dikel,2022)

However, executing these complex monitoring and management processes can be challenging with traditional methods and may face some limitations. Traditional sizing methods measure the size of fish using optical sensors and image processing technology. However, these methods can sometimes cause fish to contaminate the camera and LEDs. This can impact the accuracy of data and add additional workload to businesses.

Therefore, the aquaculture industry has begun to adopt advanced technologies that offer a more precise and efficient approach to the sizing process. These advanced technologies are integrated into fish sizing machines and used to optimize the sizing process. In particular, advanced technologies such as laser technology, machine learning and artificial intelligence have increased the accuracy rates of sizing machines.

This study aims to examine and analyze these technological developments in the aquaculture industry. Focusing on technological innovations in sizing machines used in fish farms, the operation, advantages and contributions of these technologies to the industry will be discussed in detail.(SARIÇAM,S.,&Baylam., 2023)

One of the main objectives of the study is to provide information on how these advanced technologies can be applied for experts, researchers and farm managers in the aquaculture sector. It will also provide an overview of how these technologies can contribute to sustainability goals and meet the future challenges of aquaculture.

The results of this study will contribute to developing a comprehensive understanding of technological advances in the aquaculture industry, helping the industry move towards a more sustainable and efficient future.

MATERIALS and METHODS

The main purpose of this study is to investigate and analyze technological developments in sizing machines used in the aquaculture industry. For this purpose, the functioning, advantages and contributions of the technologies used in sizing machines to the industry were taken into consideration. The materials and methods used for the study are explained in detail below:(Kübra&A.K.,2023)

2.1. Materiel

The material part of the study focuses on sizing machines used in the aquaculture industry. Different types, sizing methods and technological features of these machines are discussed in this section. In addition, how these machines are used in various types of aquaculture (e.g. fish, shrimp, mussels) and under what conditions they are efficient were also examined. The material section also contains information about the manufacturers, models and places of use of these machines.

Another important component of the material part of the study includes the sizing machines as well as the advanced technologies these machines integrate. In particular, how technologies such as optical sensors, image processing technology, laser technology, machine learning and artificial intelligence are applied to sizing processes and how they work are explained in detail. This material will help us develop an understanding of how these technologies contribute to the sizing process.

2.2. Method

Figure 1. fish grading machine

This study used a range of research methods to examine and analyze technological advances in sizing machines in the aquaculture industry. The methods used are explained below:

At the beginning of the study, observations were made on the sizing machines in different fish farms. These observations have helped us better understand the operating principles of these machines, their technical features and the conditions in which they are used. Additionally, by observing the operation of these machines, we have determined which types of seafood they are preferred for sizing and understand the conditions under which they are most effective.(YILDIRIM et al., 2022)

The literature review was a key component of the study. To analyze technological developments, current scientific articles, industry reports and publications of manufacturing companies were scanned. These resources were used to examine the application areas and advantages of advanced technologies used in sizing machines. This literature review created the theoretical framework of the study and enabled us to examine existing scientific knowledge in depth.(TAŞGIN,2022)

During the data analysis phase, the collected observation data and literature review results were evaluated. A comprehensive analysis was made on the performance, technological features and usage advantages of sizing machines. This analysis has helped us better understand the contribution and future potential of sizing machines to the aquaculture industry.(Başaran et al.,2006)

These methods represent the approach used to obtain the main findings and conclusions of the study. The results obtained provide an in-depth understanding of the technological developments of sizing machines in the aquaculture industry, highlighting how they can contribute to the sustainability and efficiency goals of this industry.(Tonguç et al., 2022)

FINDINGS and DISCUSSION

This chapter aims to discuss the findings regarding technological advancements in sizing machines in the aquaculture industry and various aspects of these findings. The findings and discussion will address the integration of advanced technologies into sizing machines, which is one of the main focuses of the study.

3.1. Technological Features of Sizing Machines

Based on the data presented in the material section of the study, it has been determined that there are different types and technological features of sizing machines used in the aquaculture industry. These machines are equipped with advanced technologies such as optical sensors, image processing technology, laser technology, machine learning and artificial intelligence. By

helping to optimize sizing processes, these technologies increase efficiency in the aquaculture industry.

3.2. Usage Areas According to Fishery Products Types

The study examined how sizing machines are used in different types of aquaculture. Aquaculture, especially fish, shrimp and mussels, provides examples of the uses of these machines. The findings show which machines are more suitable for sizing different types of seafood. This highlights the diversity and specific requirements of the aquaculture industry.

3.3. Contributions of Integrated Technologies

In this section, it is discussed how advanced technologies integrated with sizing machines contribute to the sizing processes. In particular, the focus is on the sensitivity of optical sensors, the accuracy of image processing technology, the speed of laser technology, the data analysis capabilities of machine learning, and the automation capability of artificial intelligence. It is emphasized that these technologies contribute to making sizing processes more efficient and reliable.

3.4. Sustainability and Efficiency Contributions

Finally, the findings and discussion section addresses how sizing machines in the aquaculture industry can contribute to sustainability and efficiency goals. It is discussed how these technological advances can help preserve natural fish stocks, use resources more effectively, and improve production processes.

3.5. Future Perspectives

In conclusion, the findings and discussion section highlights the future potential of sizing machines in the aquaculture industry and the continued development of these technologies. With wider acceptance of advanced technologies, the aquaculture industry will continue to move towards a more sustainable and efficient future.

CONCLUSION and RECOMMENDATIONS

This study was carried out to examine and analyze technological developments in sizing machines in the aquaculture industry. Based on the data presented in the findings and discussion section, the conclusions and recommendations derived from these results are summarized below:

4.1. Results

This study revealed the diversity and technological features of sizing machines used in the aquaculture industry. It has been found that different sizing machines are used for different types of aquatic products. It has been observed that advanced technologies, especially optical

sensors, image processing technology, laser technology, machine learning and artificial intelligence, are used effectively in these machines.

The results of the study highlight the importance of adopting advanced technologies to increase the efficiency of the aquaculture industry's sizing operations and the conservation of natural resources. While these technologies refine sizing processes, they contribute to sustainability goals by making processes faster and more automated.

4.2. Advices

Based on the results of this study, some recommendations are presented aimed at optimizing the use of sizing machines in the aquaculture industry:

Increasing Technological Integration: The aquaculture industry can increase efficiency by integrating more advanced technologies into sizing machines. Wider adoption of technologies such as optical sensors, image processing, laser technology and artificial intelligence should be encouraged.

Training and Awareness Raising: Training and awareness should be provided to industrial workers on how to use these advanced technologies. This ensures that the machines are used effectively and their full potential is exploited.

Sustainability-Focused Approach: The use of sizing machines should be supported by practices that encourage sustainable management of natural resources. The aquaculture industry should contribute to efforts to protect marine ecosystems.

Innovation and R&D Investments: Innovation and R&D investments should be encouraged to develop advanced technologies and make sizing machines more efficient. This can increase the competitiveness of the industry.

These recommendations can help the aquaculture industry maximize the potential of sizing machines and contribute to achieving the industry's sustainability goals.

ABSTRACT

Aquaculture is a rapidly growing and increasingly important sector worldwide. Fish farms are specialized facilities that allow controlled growth and cultivation of fish in optimized environments. Various technologies and innovative approaches support the proper feeding of fish and the optimization of their environmental conditions in these facilities. Technological advancements and artificial intelligence-based applications in fish farms have significant potential to enhance efficiency and achieve sustainability goals in the industry. This study provides a detailed examination of the technologies used in fish farms and presents applications of AI-supported techniques. The employed technologies include automation systems, computer vision, data analytics, machine learning, deep learning, and decision support systems. These tools are utilized to optimize fish farm operations, increase efficiency, reduce energy consumption, and minimize environmental impacts. Automation systems reduce the risk of human errors and lower operating costs by automating fish farm processes. They continuously monitor crucial parameters such as weight values, feed costs, and feed calculations and can apply necessary corrective measures automatically. This optimization of living conditions supports the healthy growth of fish. Particularly, artificial intelligence technology contributes to informed decision-making and more effective management of fish farms. Environmental factors in fish farms are monitored, data is collected, and analyzed within this context. Computer vision techniques prove successful in tracking fish numbers, while artificial intelligence is used for 3D density calculations. Deep learning algorithms, trained with data from underwater cameras and previously collected fish data, enable fish detection. Machine learning is employed to determine the weight values of fish in fish farms. Regression solutions, in particular, are preferred among machine learning methods. With the development of these technologies, fish farms can establish a sustainable structure through future growth predictions, optimal feeding strategies, and effective resource management.

Keywords: Fish Farms, Artificial Intelligence, Image Processing, Machine Learning

INTRODUCTION

Fish farming is a sector that is increasingly important around the world and plays a critical role in sustainable food production. The continuous increase in population, the rise in demand for seafood and the need to prevent overfishing of natural fishing resources have led to the rapid growth of the fish farming sector. This sector plays a critical role in increasing seafood consumption and ensuring food security. (ALPBAZ &A.G., 1974)

Fish farms are special facilities that allow fish to be raised and raised in a controlled environment. These facilities have adopted various technological advances to ensure efficient production, taking into account factors such as monitoring water quality, feeding fish, disease control and optimizing environmental conditions. These technological advances are among the tools used to optimize fish farms' operations, reduce energy consumption and minimize their environmental impact.

Especially in recent years, the applications of artificial intelligence (AI) technologies in fish farms have gained great momentum. Artificial intelligence has become an important tool to increase the efficiency of fish farms with its ability to analyze large amounts of data, make complex decisions and learn. Artificial intelligence subfields such as data analytics, machine learning and deep learning are used in processes such as data collection, water quality monitoring, fish counting and feeding management in fish farms. (Dikel, 2022)

This study aims to present a detailed review of technological developments and artificial intelligence-based applications used in fish farms. It also aims to evaluate the effects of these technologies on the efficiency, sustainability and food safety of fish farms. The study aims to be an important reference source to shape the future growth of the sector by discussing the role and potential of technologies such as automation systems, image processing, data analytics, machine learning and decision support systems in fish farms.

In this context, the methodology of the study includes steps such as data collection, data analysis and artificial intelligence modelling. The data collection process includes surveys, interviews and remote monitoring systems to understand technological applications and use of artificial intelligence in fish farms. While data analysis involves processing the collected data using statistical and data analytics methods, artificial intelligence modeling involves training artificial intelligence models using data from fish farms and evaluating their performance.

MATERIALS and METHODS

This study provides a detailed review of the technological developments used in fish farms and the application methods of these technologies. The main focuses of the study are data collection, data analysis and the use of decision support systems.

Data collecting

Figure 1. data generation

The data collection process was carried out through observations and measurements carried out in different fish farms. These observations and measurements are continuously provided by automation systems, sensors and data collection devices located in fish farms. These devices monitor environmental conditions, making it possible to record water temperature, water quality, oxygen levels, pH values and similar parameters. (Kübra & A.K., 2023)

Additionally, cameras, image sensors, and other observation tools used in fish farms have been used to monitor fish behavior and their environment. These observation data have created an important resource for understanding the behavior and growth patterns of fish. (TAŞGIN,2022)

Data analysis

The collected data was examined in detail using various data analysis techniques in order to increase the efficiency of fish farms and achieve sustainability goals. Machine learning methods have been used to estimate fish weights. These methods included regression analysis and similar statistical approaches to estimate fish weights using the data. (Başaran et al., 2006)

Figure 2. data tagging

Deep learning algorithms were trained with underwater cameras and previously collected fish data and used for fish detection and population counting. These algorithms provided high accuracy for identifying and counting fish. Image processing techniques have been used to analyze images recorded by cameras in fish farms and track the number of fish. These techniques have provided important data to optimize the operations of fish farms. (Tonguç et al., 2022)

Decision Support Systems

The obtained data analysis results were used by decision support systems to make more informed decisions in the management of fish farms. These systems guide farm operators by constantly monitoring and analyzing environmental factors and operational parameters. In this way, more effective decisions can be made on issues such as optimal feeding strategies, water quality management and resource management. This study explains in detail the materials and methods used to examine technological developments used in fish farms. These materials and methods provide important tools to increase the sustainability and optimize the efficiency of fish farms.

FINDINGS and DISCUSSION

In this section, a detailed review of the findings regarding technological developments used in fish farms and the meaning of these findings is presented. The findings include the results obtained from the data collection and analysis phases.

Data Collection Findings

The data collection process on fish farms has made it possible to continuously record important environmental and operational data. This data includes important parameters such as growth rates of various fish species, water quality, water temperature, oxygen levels and pH values. In addition, valuable information about fish behavior and populations was obtained thanks to images recorded by underwater cameras.

Results obtained using machine learning techniques have high accuracy rates in estimating fish weights. This has helped fish farms optimize their feeding strategies. Deep learning algorithms have also shown successful results in fish detection and counting, which has increased operational efficiency.

Data Analysis Findings

Data analysis results provide important clues to increase the efficiency of fish farms. In particular, fish populations have become more accurately monitored thanks to deep learning algorithms. This has given farm operators more control to intervene when necessary and ensure a healthy environment.

Image processing techniques have helped fish farms manage their operations more effectively. Critical decisions such as monitoring fish numbers, stock management and harvest timing are based on the results of these techniques.

Argument

The findings of this study demonstrate the potential to increase the efficiency of technologies used in fish farms. Machine learning and deep learning techniques have been successfully used in important tasks such as predicting fish growth and monitoring fish populations. This could help fish farms produce more products at lower costs. Additionally, thanks to image processing techniques, fish farms can gain better control over minimizing environmental impacts and achieving sustainability goals. These technologies can help fish farms optimize their operations, which has the potential to reduce energy consumption and increase environmental sustainability. In conclusion, this study shows that technological advances used in fish farms may play an important role. However, appropriate training and infrastructure is required to successfully implement these technologies. In the future, wider adoption of these technologies could help fish farms become more sustainable and efficient.

CONCLUSION and RECOMMENDATIONS

This study highlights the importance of technological advances used in fish farms. Technologies such as machine learning and deep learning play an important role in improving the efficiency of fish farms. Image processing techniques give farm operators greater control over minimizing environmental impacts and achieving sustainability goals. Technologies used to optimize the operations of fish farms have the potential to reduce energy consumption and improve resource management. The results of this study demonstrate opportunities for fish farms to increase environmental sustainability while producing more products. In the future, appropriate training and infrastructure should be provided for fish farms to adopt these

technologies more widely. Further research and development of technological advances used in fish farms could help the sector become more sustainable and efficient.

ÖZET

Bu çalışmanın amacı, Marielle Heller’in yönetmenliğini üstlendiği 2018 yılı yapımı “Beni Affedebilir Misin?” isimli filmin bilimsel yayın etiği bağlamında incelenmesidir. Biyografi komedi ve drama tarzında olan bu filmin kazandığı 6 ödül, 23 tane de ödül adaylığı bulunmaktadır. Film, Leonore Carol Israel’ın 2008 yılında yayınlanan, anılarından hareketle yazdığı otobiyografisiyle aynı isimli kitabından uyarlanmış ve Amerika Birleşik Devletleri’nde yine aynı isimle vizyona girmiştir. Araştırmada bu film; “bilimsel yayın etiğine uygun davranışlar”, “bilimsel yayın etiğinde görülen ihlaller” ve “bilimsel yayın etiğinde etik dışı davranışlara yol açan etmenler” açısından ele alınmıştır. Araştırma verileri, nitel araştırma yöntemlerinden biri olan doküman analizi yöntemi kullanılarak elde edilmiştir. Leonore Carol Israel’ın kaleme aldığı otobiyografisinin sinema perdesine uyarlandığı bu film; kişilerin dürüstlikle, işlerini doğru yaptıklarında her zaman kazanamadıklarının, kitabın toplumun gözündeki değerinin olması gereken yerde olmadığı, her alanda işleri suistimal edecek bundan kar sağlayacak kişilerin kendilerine yer bulabildiklerini, popülist yaklaşımların her yerde olduğunu göstermesi açısından önemlidir. Sadece akademik alanda değil hangi alanda olursa olsun kişilik özelliklerin ve ekonomik nedenlerin etik ihlallere yol açmada daha etkili olduğu düşünülmektedir. “Beni Affedebilir Misin?” filmi, özellikle etik dışı davranışlara yol açan etmenleri ortaya koymak açısından “araştırma etiği” ve “bilimsel araştırma etiği” derslerinde akademisyen adaylarına önerilebilir ve ders materyali olarak kullanılabilir.

Anahtar Kelimeler: Akademik etik, Bilimsel yayın etiği, Film analizi, Beni Affedebilir Misin?

**AN ANALYSIS OF THE MOVIE “CAN YOU EVER FORGIVE ME?” IN TERMS OF
SCIENTIFIC PUBLICATION ETHICS**

ABSTRACT

The aim of this study is to examine the 2018 movie titled "Can You Ever Forgive Me?", directed by Marielle Heller, within the context of scientific publication ethics. This movie, which falls under the genres of biography, comedy, crime, and drama, has received 6 awards and has been nominated for 23 awards. Adapted from the autobiography of Leonore Carol Israel, published in 2008, the movie shares the same name and was released in the United States under the same title. In this research, the movie is approached from the perspectives of "ethical behaviors in scientific publication", "violations observed in scientific publication ethics", and "factors leading to unethical behaviors in scientific publication ethics". The research data has been gathered using the qualitative research method of document analysis. The analysis phase of the obtained data is currently ongoing, and the findings that emerge from the analysis will be shared with participants at the conference. This movie, which brings Leonore Carol Israel's autobiography to the cinema screen, is significant in depicting that individuals don't always win when they act with honesty and do their work correctly, that the societal perception of a book might not align with its actual value, that those who exploit and profit from misdeeds can find their place, and that populist approaches are present in various fields. The movie shows that personality traits and economic reasons play a more influential role in leading to ethical violations, not only in the academic sphere but also in any other field. The movie titled “Can You Ever Forgive Me?”, particularly in highlighting the factors contributing to unethical behaviors, could be recommended as a resource for "research ethics" and "scientific research ethics" courses for aspiring academics, serving as valuable teaching material.

Keywords: Can you ever forgive me?, movie analysis, scientific publication ethics, unethical behavior

Giriş

Akademik dünyanın üyesi olan akademisyenlerin en temel görevi; bilimin ilerlemesi, gelişmesi ve bir sonraki çalışmalara yol göstermesi için bilimsel bilgi üretmektir. Akademik camiada üretilen bilginin niteliğine ilişkin bir değerlendirme yapılırken dikkate alınan temel ölçütlerden biri de bilginin üretimi sürecinde etik kurallara uyulup uyulmadığıdır. Etik kurallar, toplumsal hayatı düzenleyen, uyulmadığı takdirde birtakım düzensizliklere ve aksaklıklara neden olabilen değerlerdir. Akademisyenlerin çalışmalarını yürütürken etik kuralları göz ardı etmeden bu kurallar çerçevesinde hareket etmeleri, bilimin gelişerek ilerlemesi açısından son derece önemlidir (Akkaya ve Yıldırım, 2017, s. 78).

Yükseköğretim Kurulu (YÖK) tarafından hazırlanan “Yükseköğretim Kurumları Etik Davranış İlkeleri” kitapçığında etik, *“kişilere, kurumlara ve meslek mensuplarının davranışlarına rehberlik eden, iyiyi ve doğruyu belirlemede yardımcı olan kılavuz değerler, ilkeler ve standartlar bütünü”* olarak tanımlanmaktadır. Aynı kaynakta akademik etik için ise *“akademisyenlerin bilimsel çalışma ve akademik etkinlikleri sürecinde birikim ve bilgilerini paylaşma ve öğrencilerine aktarmada, bilimsel çalışmaların üretilmesi ve değerlendirilmesinde, toplumun farklı paydaşları ile ilişkilerinde ödüllendirme ve yükseltme aşamalarında, bilim kurumları ve üniversitelerin bilimsel yetkinliğe dayalı yapılandırılması ve iyi eğitilmiş bilim insanlarının yetiştirilmesi faaliyetlerinin her aşamasında etik davranış kurallarına uymayı ifade eder”* şeklinde bir açıklama yer almaktadır (YÖK, 2014).

Bilimsel çalışmalar genel olarak bilgi edinme, bilgi üretme, bilgiyi yorumlama ve onu çeşitli kanallar ile yayma amacıyla gerçekleştirilen süreçlerden oluşur. Bu süreçler; bir amacı merkeze koyarak dürüst, güvenilir, objektif, tarafsız, değer yargılarından bağımsız, sorumluluk ve hakkaniyet bilinci taşıyan bir tutum içerisinde bilgiyi sistemli bir şekilde kullanmak, eleştirel düşünmek, karşılaştırılabilir analizler yapmak, özgün bilgi üretmek, model oluşturmak gibi birtakım ilkelere dayalı olarak inşa edilir. Tüm bu ilkeler üzerinde ise herkesin uyması gereken bir değer olarak ‘bilimsel etik’ bulunmaktadır (Uluç, 2012, s. 130).

Etik, doğru ve yanlışın sistematik olarak değerlendirildiği ve felsefenin bir alt disiplini olan bir kavramdır. Etik alanı, bireylerin ve grupların birarada yaşayabilmeleri için birbirine karşı olan yükümlülükleri ve sorumluluklarını tanımlar. Bu nedenle etik; değerlerin, tercihlerin ve eylemlerin analizi edilmesini gerektirir (Heitman, 2002; akt. Aydın, 2019, s. 45). Bilim etiği veya akademik etik, başta üniversiteler olmak üzere bütün eğitim ve bilim kuruluşlarında yürütülen faaliyetlerin genel ahlak felsefesine ve mesleki etiğe uygun yapılması olarak tanımlanabilir. Bu bağlamda bilimde etik kavramını; araştırmada etik, eğitimde etik, öğrenci ile

ilişkilerde etik, yönetimde etik olarak da boyutlandırmak mümkündür. Akademik etik yalnızca araştırma ile sınırlı değildir, aynı zamanda bilginin üretim ve teknolojiye dönüşümü, bilginin yayılımı ve öğretilmesiyle bir bütün teşkil etmektedir (Örnek Büken, 2006, s. 167).

Calabrese ve Roberts (2004), akademik dünyada etik ilkeleri *“bir çiftliği kuşatan çitlere benzetmekte ve bu çitlerden bir kısmının yıkılması halinde geri kalanların da gücünü arda ardına kaybedeceğini; benzer biçimde etik ilkelerin ihlal edilmesinin görmezden gelinmesi durumunda da akademideki araştırma iskeletinin zayıflayacağı ve akademik dürüstlüğün kaybolacağını”* vurgulamaktadır. Bu açıdan bakıldığında etik, bilimin teminatıdır. Akademik etik değerler; dürüstlük, nesnellik, doğruluk, dikkat, açıklık, gizlilik, meslektaşlara saygı, öğrencilere saygı, entelektüel sermayeye saygı, özgürlük, bilimsel yeterlilik, yasallık, güvenlik şeklinde sıralanmaktadır (Aydın, 2019, s. 59-62). YÖK’ün (2014) etik davranış ilkeleri ise şu beş temel değer ve ilkeye dayanmaktadır: (1) Akademik özgürlük ve özerklik, (2) Akademik dürüstlük, (3) Sorumluluk ve hesap verebilirlik, (4) Temel hakların korunması ve güçlendirilmesi, (5) Başkalarına saygı.

Bilim; akademisyenleri güven ilkesi ve sorumluluk bilincine dayalı olarak bilimsel değer ve ilkelere, etik tutum ve davranış standartlarına uygun hareket etme yükümlülüğü altına sokar. Bilimde her bireyin değer ve onuruna saygı, gerçeği izleme, kusursuz arayış esastır. Bu bağlamda akademik özgürlük ve özerklik, akademik dürüstlük, sorumluluk ve hesap verebilirlik, başkalarına saygı, temel hakların korunması, liyakat temel değerler arasındadır. Etik olmadan bilim olmaz (İnci, 2015, s. 282).

Bilimsel araştırma sürecinin her aşamasında dürüstlük ilkesinin bilerek ya da bilmeyerek ihlal edilmesi “bilimsel yanıltma” olarak kabul edilir (Blunt ve Wells, 2003). Bilimsel yanıltma iki ayrı grupta ele alınabilir. Birinci grupta disiplinsiz araştırmaların yol açtığı dürüst hatalar yer almaktadır. İkinci grupta yer alan bilimsel yalancılıkta bilerek ve kasıtlı biçimde yanıltma niyeti olduğu için dürüst hatalarla aynı şekilde ele alınmamaktadır (Aydın, 2019, s. 80). Etik kuralların, standartların en ciddi ihlali “bilimsel suistimal”dir. Bunun en ağırı olanı akademik hırsızlık-çalma (plagiarism), başkasının eserini kendi adına geçirme olarak tanımlanabilir. İkinci büyük suistimal olan uydurma-sahtecilik (fabrication)i olmayan veri ve sonuçlar yaratma şeklinde açıklanabilir. Bilimsel nedeni olmaksızın veri ve sonuçları değiştirme, nedeni olmaksızın veri atlama, yanıltmacılık-çarpıtma (falsification) üçüncü büyük suistimal olarak kabul edilir. Bunların diğerlerinden en önemli farkı bilerek aldatma niyetidir (İnci, 2015, s. 282).

Bir akademik ortamı paylaşan tüm insanlar, akademik görgü kuralları çerçevesinde; birbirlerine saygı ile yaklaşmalı ve bir kalite düzeyi çerçevesinde, önyargısız, bireysel çıkar ve kaygılardan uzak, objektif olma mecburiyeti içinde etik kuralların zorunluluklarını yerine getirmelidir. Akademik etik, tüm akademisyenlerin oluşturdukları takımın paydaşları arasında en özenle uygulanması gereken, bilim özgürlüğü çerçevesindeki toplumsal ve bilimsel sorumlulukların tanımlandığı temel değerlerdir (Örnek Büken, 2006, s. 167).

Bilimsel araştırma ve yayın etiği birlikte değerlendirilir. Bilimsel araştırmada etik dışı bir durum varsa doğal olarak yayına da yansımacaktır. Bir araştırmada uygulanacak temel ilkeler; araştırmanın tasarımı ve yürütülmesinde gerekli yeterliliğe sahip olmak, araştırmanın yapılışı ve bulguların analizi sırasında özeleştirici, dürüstlük ve saydamlığı korumak, aynı konuda araştırma yapmış veya yapmakta olanların çalışmalarına saygılı olmak, araştırmaya katılan herkesin katkısını görünür kılmaktır. Bilimsel yayının amacı, üretilen ve geliştirilen bilginin, bilgi birikiminin paylaşarak yayılmasını ve bilimin insanlık yararına geliştirilmesini sağlamaktır. Bu doğrultuda hazırlanan bilimsel bir yayında, yayının içindeki bilgilerin doğru ve tam olması, yayının kasıtlı olarak eksik bilgi içermemesi, bilgilerin üretimi ve geliştirilmesi aşamalarında “bilimsel etiğe” uygun davranılması gereklidir (İnci, 2015, s. 285).

Sahibinden habersiz, izinsiz, ona atıfta bulunmadan veri, bilgi, belge vb. kullanmak sadece akademik araştırmalar sırasında karşılaşılan bir etik kural ihlali değildir. Gazetecilik, habercilik, sosyal medya, sanatsal ürünler (edebiyat, tiyatro, senaryo, moda, müzik, resim gibi) söz konusu olduğunda da intihal olgusuna sıkça rastlandığını ve etik kuralların ihlal edildiğini gözlemlemek mümkündür (Uluç, 2012, s. 131). Edebiyat alanında gerçekleşen edebi sahtecilik (literary forgery) “*tarihi veya uydurma bir yazara kasten yanlış atfedilen ya da yanlış veya hayali bilgi ve içeriklere sahip olduğu halde aldatıcı bir biçimde gerçekmiş gibi sunulan sözde bir anı veya diğer kurgusal olmadığı varsayılan yazı tarzlarından biri şekilde tasarlanan bir el yazması ya da edebi eser benzeri yazı*” olarak tanımlanmaktadır (The Columbia Electronic Encyclopedia, 2013). Bilimsel araştırmalar, birikimli bir biçimde, önce yapılmış araştırmalar üzerine inşa edilerek gelişir ve süreklilik kazanır. Bu doğrultuda bilimsel çalışmalarda yararlanılan kaynakların aktarımında ve verilerinin kullanımında belli kurallara uyulması esastır. Bilimsel araştırmaların planlanması ve sonuçların ortaya konulması aşamalarında, bilerek ya da farkında olmadan yapılan hatalar, araştırmanın geçerlilik ve güvenilirliğini zedelediği gibi, çalışmanın yapıldığı bilim alanında da zarar vermektedir (Uçak ve Birinci, 2008, s. 188).

İlgili alanyazın incelendiğinde, bilimsel yayın etiği temel alınarak genel izleyici kitlesine uygun filmlerin analiz çalışmalarının yok denecek kadar az sayıda yapılmış olduğu görülmektedir.

“Beni Affedebilir Misin?” filmi, konusu bakımından bilimsel yayın etiği açısından incelenmek için uygun bir içeriğe sahiptir. Bu çalışmanın amacı, 2018 yılında gösterime giren “Beni Affedebilir Misin?” filminin bilimsel yayın etiği açısından incelenmesidir. Bu çalışmanın, bilimsel yayın etiği ihlallerini önlemek adına bu konuya dikkat çekmesi ve alanyazında bilimsel yayın etiği bağlamında gösterebilimsel bir çalışma olarak alana katkı sağlaması hedeflenmektedir.

YÖNTEM

Bu araştırma, bilimsel yayın etiği bağlamında betimsel analiz içeren bir çalışmadır. Veriler, nitel araştırma yöntemlerinden doküman incelemesi yoluyla elde edilmiştir. Doküman analizi, yazılı ve görsel malzemenin toplanıp incelenmesi olarak tanımlanabilir. Kitaplar, dergiler, fermanlar, anılar, makaleler, layihalar, romanlar, öyküler, şiirler, yazıtlar yazılı kaynaklar grubuna girerken; görsel malzemeler ise resimler, slaytlar, filmler, anıtlar, giyim-kuşam, araç gereçler, pullar, flamalar olabilir (Sönmez ve Alacapınar, 2017, s. 108). Doküman analizi, belli bir amaca dönük olarak kaynakları bulma, okuma, not alma ve değerlendirme işlemlerini kapsamaktadır (Karasar, 2015, s. 183).

İşlem yolu

Çalışmada doküman olarak kullanılan kaynak, “Beni Affedebilir Misin?” adlı filmidir. Lee Israel’in aynı adlı romanından uyarlanan bu filmin senaryosunu Nicole Holofcener ve Jeff Whitty birlikte yazmış, Marielle Heller yönetmenliğini üstlenmiştir. Tablo 1’de “Beni Affedebilir Misin?” filminin künyesi verilmiştir.

Tablo 1. Filmin Künyesi

Filmin Adı	Beni Affedebilir Misin?	
Orijinal Adı	Can You Ever Forgive Me?	
Yönetmen	Marielle Heller	
Senarist	Nicole Holofcener Jeff Whitty	
Uyarlama	Can You Ever Forgive Me? – Lee Israel	
Vizyon Tarihi	1 Eylül 2018 (ABD)	
Oyuncular	Melissa McCarthy	Ana karakter (Lee Israel)
	Richard E. Grant	Arkadaşı (Jack Hock)
	Jane Curtin	Menajeri (Marjorie)
	Anna Deavere Smith	Lee’nin kız arkadaşı (Elaine)
	Dolly Wells	Kitapçı (Anna)
	Christian Navarro	Jack’in erkek arkadaşı (Kurt)
Tür	Biyografik komedi, Dram	
Ülke	ABD	
Süre	1 saat 46 dakika 22 saniye	

İncelenen filmin kazandığı 6 ödül, 23 tane de ödül adaylığı bulunmaktadır. Kazandığı ödüller; Bağımsız Ruh En İyi Yardımcı Erkek Oyuncu Ödülü (2019), New York Film Eleştirmenleri Birliği En İyi Yardımcı Erkek Oyuncu Ödülü (2018), Amerikan Senaryo Yazarları Birliği Film Dalında En İyi Uyarlama Senaryo Ödülü (2019), Satellite Film Dalında En İyi Yardımcı Erkek Oyuncu Ödülü (2019), Bağımsız Ruh En İyi Senaryo Ödülü (2019), Satellite En İyi Uyarlama Senaryo Ödülü (2019) şeklindedir. Ödül adaylıkları ise; En İyi Kadın Oyuncu Oscar' ı (2019), En İyi Yardımcı Erkek Oyuncu Oscar' ı (2019), Bağımsız Ruh En İyi Yardımcı Erkek Oyuncu (2019), Altın Küre Sinema Dalında En İyi Yardımcı Erkek Oyuncu (2019), En İyi Uyarlama Senaryo Oscar' ı (2019), BAFTA En İyi Kadın Oyuncu Ödülü (2019), New York Film Eleştirmenleri Birliği En İyi Yardımcı Erkek Oyuncu (2018), Film Eleştirmenleri En İyi Yardımcı Erkek Oyuncu (2019), Altın Küre Drama Dalında En İyi Kadın Sinema Oyuncusu (2019), Beyaz Perde Sanatçıları Derneği En İyi Yardımcı Erkek Oyuncu (2019), BAFTA En İyi Yardımcı Erkek Oyuncu Ödülü (2019), Beyaz Perde Sanatçıları Derneği En İyi Kadın Oyuncu (2019), Film Eleştirmenleri En İyi Kadın Oyuncu (2019), ABD Ulusal Film Eleştirmenleri Derneği En İyi Kadın Oyuncu (2019), ABD Ulusal Film Eleştirmenleri Derneği En İyi Yardımcı Erkek Oyuncu (2019), Amerikan Senaryo Yazarları birliği Film Dalında En İyi Uyarlanmış Senaryo (2019), BAFTA En İyi Uyarlama Senaryo Ödülü (2019), Film Eleştirmenleri En İyi Uyarlama Senaryo (2019), Satellite Film Dalında En İyi Yardımcı Erkek Oyuncu (2019), Bağımsız Ruh En İyi Senaryo Ödülü (2019), ABD Ulusal Film Eleştirmenleri Derneği En İyi Senaryo (2019), Satellite Drama Filmi Dalında En İyi Kadın Oyuncu (2019), GLAAD Medya En İyi Film Ödülü (Sınırlı Gösterim) (2019), Gotham Bağımsız Film En İyi Erkek Oyuncu Ödülü (2018), Satellite En İyi Uyarlama Senaryo ödülü (2019).

Filmin konusu kısaca şu şekildedir:

Film, Lee Israel'ın gece saat 3'te iş yerinde buzlu içki bardağı şingirdamasıyla başlıyor. Lee Israel kedisi ile yaşayan, arkadaşı olmayan, alkol bağımlısı yalnız bir yazardır. Yazdığı birkaç biyografi ile başarı sağlamış, yazdığı biyografilerde kişilerin önüne geçmediği için yazar olarak ün kazanamamıştır. İş yeri kurallarına uymadığı için işine son verilmiştir. Kedisi hastadır ancak veterinerlere birikmiş borcu olduğu için onu tedavi ettiremez. Birkaç aylık kirası birikmiştir, ekonomik olarak sıkıntıları vardır, yeni bir biyografi çalışması için menajerinden kendisine avans bulmasını talep eder ancak olumlu cevap alamaz. Hasta kedisinin tedavisi için elindeki kitapları ikinci elden satmak için kitapçıya götürür ama hepsini satamadığı gibi ihtiyacı olan parayı da alamaz. En sonunda Katharine Houhgtton Hepburn'un kendisine el yazısı ile yazdığı mektubunu satmaya karar verir. Bu mektuptan kitaplardan kazandığı

paranın çok daha fazlasını kazanır. Çaresizlik içerisinde barda içki içerken Jack Hock ile karşılaşır. İkilinin arkadaşlığı başlar. Biyografi çalışması için kütüphanede araştırma yaparken bir zarf bulur ve içinden çıkan iki mektubu gizlice alır. Bu mektuplardan birini satarken kitapçının mektubu yavan bulduğunu ifade etmesi üzerine Lee Israel elindeki diğer mektuba ekleme yaparak onu satar. Aldığı para kedisini tedavi ettirmeye ve kiralarını ödemeye yetmiştir. Lee Israel'ın kendi deyimi ile “mektupları/edebi eserleri süsleme” serüveni böylece başlamış olur. Arkadaşı Jack Hock da Lee Israel gibi tanınmayan bir yazardır; hayatını idame ettirebilmek için uyuşturucu satmakta ve sokaklarda yaşamaktadır. Lee ile yolları kesiştikten sonra ikili çeşitli maceralara ve illegal işlere birlikte karışırlar. Lee'nin tanımadığı yazarların ağzından yazdığı mektuplar kendisini ele vermesine sebep olur, kara listeye alınır. Bir süre yazdığı mektupları satma işini arkadaşısı Jack'e verir ancak piyasa alarına geçtiği için bunda başarılı olamaz. Jack ilk yaptığı gibi gerçek mektupları bulup onları sahteleri ile değiştirerek satmasını tavsiye eder. Lee, evini ve kedisini Jack'e emanet eder ve şehir dışında bir arşive sahte bir araştırma onayı yazısı ile gider ve oradaki mektubun sahtesini yazabilmek için içeriğini not alır. Ertesi gün tekrar arşive gider ve yazdığı mektubu aslı ile değiştirir, mektubu çantası arandığı için botunun içinde dışarı çıkarır ve evine döner. Eve döndüğünde kedisi ölmüştür. Lee hem üzgün hem de Jack'e çok kızgındır. Yeniden insanlara güvendiği için pişmandır ancak çaldığı mektubu satması için Jack'e ihtiyacı vardır. Bu onların son mektup satma girişimidir. Bu girişimden sonra Jack yakalanır ve itirafçı olur, Lee mahkeme tarafından beş yıl ev hapsi cezası ile alkol tedavisi görme kararı ile karşı karşıya kalır. Yaşadıklarından sonra Lee kendi biyografisini yazmak ve Jack ile yaptıklarına kitabında yer vermek için son kez Jack ile görüşür ve Jack'in onayını alır. Jack kısa bir süre sonra ölür, Lee kitabını yazar ve yazdığı kitap New York Times tarafından “Can You Ever Forgive Me?: Memoirs of a Literary Forger” adıyla yayınlanır.

Güvenirlilik ve Geçerlik

Araştırmanın güvenirlilik ve geçerliğini arttırmak amacıyla film dört farklı zamanda izlenmiştir. İlk izleme, filmi tanımak ve yol haritası oluşturmak amacıyla kesintisiz olarak yapılmıştır. İkinci izlemede olaylar ve gelişim aşamaları not edilmiş, ara ara film durdurulmuştur. Üçüncü izlemede filmdeki kişiler, olaylar bilimsel yayın etiği açısından incelenmiş ve alınan notlar akademik etik ilkelerle ilişkilendirilmiştir. Dördüncü izlemede bütün film, alınan notlarla karşılaştırılarak olay ve olguların gözden kaçmaması için gözden geçirilmiş ve bir bütünlük sağlanmaya çalışılmıştır.

Verilerin Analizi

Ele alınan filmin analizine başlamadan önce akademik etik ile temel kavramları gözden geçirilmiş ve filmin baştan sona transkripsiyonu yapılmıştır. Yapılan transkripsiyon sonrası film tekrar tekrar izlenerek sekanslara ayrılmıştır. Araştırma verilerini ağırlıklı olarak diyaloglar oluştursa da analiz sırasında sözel olmayan görsel içeriklerin diyaloglar ile uyumuna da dikkat etmek adına gerekli notlar alınmıştır. Araştırmanın ana çözümleme kategorisi bilimsel yayın etiğidir. Bilimsel yayın etiği; alanyazındaki çalışmalar baz alınarak bir kontrol listesi hazırlanmıştır. Bu kontrol listesine göre filmdeki sahneler incelenmiştir.

BULGULAR

Bu araştırmada ele alınan filmin incelenmesinde “bilimsel yayın etiğine uygun davranışlar”, “bilimsel yayın etiğinde görülen ihlaller” ve “bilimsel yayın etiğinde etik dışı davranışlara yol açan etmenler” kategorileri ve filmdeki gösterim yerleri belirlenmiştir.

Tablo 2’de “bilimsel yayın etiğine uygun davranışlar” kategorisine ilişkin kavramların açıklamaları ve devamında sekansların bu kavramlara göre analizi yer almaktadır.

Tablo 2. Bilimsel Yayın Etiğine Uygun Davranışlar ve Gösterim Yerleri

Bilimsel Etik Değerler	Bilimsel Yayın Etiğine Uygun Davranışlar	Filmdeki Gösterim Yeri
Bilimsel Yeterlilik	Yazdığı biyografilerde şöhret uğruna biyografisini yazdığı kişinin önüne geçmemek	24'.18''
Entelektüel Sermayeye Saygı		24'.26''
Dikkat	Kitabı yazarken açıklıkla her şeyi yazmak	1.37'.27''
Doğruluk		1.38'.02''
Dürüstlük	Mahkemede aleyhine karar çıkma ihtimaline rağmen yaptıkları ile ilgili duygu ve düşüncelerini açıklıkla, dürüstçe söylemek	1.27'.06'' 1.29'.38''
Özerklik	Yazacağı kitap için Jack Hock'tan izin almak	1.34'.04'' 1.36'.02''

Tablo 3’te “bilimsel yayın etiğinde görülen ihlaller” kategorisine ilişkin kavramların açıklamaları ve devamında sekansların bu kavramlara göre analizi yer almaktadır.

Tablo 3. Bilimsel Yayın Etiğinde Görülen İhlaller ve Gösterim Yeri

Bilimsel Etik İhlaller		Açıklaması	Filmdeki Gösterim Yeri
Uydurma-Sahtecilik (Fabrication)		Olmayan verilerin, sonuçların ya da kayıtların oluşturulması ve bunların raporlaştırılması (Shamoo ve Resnik, 2003)	28'.59" 30'.09" 47'.30" 48'.40" 49'.06" 49'.13" 55'.22" 55'.55"
Yanıltmacılık-Çarpıtma (Falsification)		Araştırma materyallerinin, ekipmanların ya da araştırma süreçlerinin manipüle edilmesi, araştırma verilerinin ya da sonuçlarının göz ardı edilmesi (Shamoo ve Resnik, 2003)	27'.19" 27'.50"
Diğer Etik İhlaller	Yasal dışı yollara başvurma	Kamuya ait belgeyi izinsiz almak/çalmak	20'.43" 21'.25" 1.10'.30" 1.16'.08"
		Sahte imza atma	30'.10" 31'.10"
		Kâr amacıyla orijinal/sahte evrak satma	21'.45" 22'.30" 28'.08" 28'.14" 31'.34" 34'.36" 49'.25" 50'.09" 1.03'.30" 1.04'.30"
			Delilleri yok etme
	İş yeri kurallarına uymama	İş yeri kurallarına uymama, iş arkadaşlarına ve diğerlerine kaba davranma	00'.51" 1'.47" 9'.55" 10'.13" 1.05'.18" 1.06'.18" 1.07'.19" 1.07'.29"
	Meslektaşlara saygısızlık	Diğer yazarlar hakkında kötü konuşma	5'.26" 5'.27" 22'.49" 22'.52" 23'.24" 23'.37"
	Araştırma için gerekli izinleri almama	Sahte izin belgesi sunma	1.10'.01" 1.10'.20"
	Toplumunu yanıltma	Yazdığı sahte mektup ile Edebiyat Kongresinde tartışmalara sebep olma, yanlış yönlendirme	1.01'.45" 1.01'.59"

Tablo 4'te "bilimsel yayın etiğinde etik dışı davranışlara yol açan etmenler" kategorisine ilişkin kavramların açıklamaları ve devamında sekansların bu kavramlara göre analizi yer almaktadır.

Tablo 4. Bilimsel Yayın Etiğinde Etik Dışı Davranışlara Yol Açan Etmenler

TÜBA'ya Göre Bilimsel Yayın Etiğinde Etik Dışı Davranışlara Yol Açan Etmenler	Değerlendirme
Bilimsel Araştırmalara Yönelik Eğitim ve Disiplin Yetersizliğinden Kaynaklanan İhlaller	Özensiz çalışma
Araştırmayı Yapan Kişinin Kişisel Özelliklerinden Kaynaklanan İhlaller	Alkol bağımlılığı, asosyal davranışlar
Bilimsel Çalışma Platformunda Çok Sayıda Ürün Vermenin Nitelikli/Kaliteli Ürün Vermekten Daha Fazla İtibar Getireceği Düşüncesiyle Ortaya Çıkan İhlaller	Maddi kazanç ve itibar elde etmek için etik dışı yollara başvurma
Mali/Ekonomik Nedenlerden Dolayı Yapılan İhlaller	İşsiz kalması, kedisini tedavi ettirecek parası olmaması, birikmiş kira borcu, yazacağı biyografi için avans bulamaması

SONUÇ

Kaliteli bir yaşam sürdürmek için birçok alanda bilimsel çalışma ve araştırma yapılması gerekmektedir. Bilimsel araştırmalar yapılırken sonuçların adil, hesap verebilir, güvenilir ve geçerli olması bilimin ilerlemesi ve gelişmesi için önemlidir. Araştırmacıların bilimsel araştırmanın her aşamasında belirlenmiş olan etik kodlara uyması beklenmektedir (Gürkan, 2020, s. 196).

Bilimsel bilgi üretiminin en önemli aracı olan bilimsel araştırmalarda, problemin saptanmasından elde edilen sonuçların yayımlanması ve paylaşılmasına kadar her aşamada etik kurallara sadık kalmak son derece önemlidir. Başka bir ifadeyle bilimsel araştırmaların tasarımdan verilerin toplanmasına, işlenmesine, raporun yazılmasından okuyucuyla buluşmasına kadar geçen sürecinin tamamında araştırma ve yayın etiği kurallarına uyulmalıdır (Karatay, 2022, s. 205).

Bilimsel yayında akademik değerlerin korunması elzemdir. Bilim insanlarının etik değerlere aykırı davranışlarda bulunmamaları beklenir. Bununla birlikte bilimsel çalışmanın dürüst yapıldığına, doğru temellere dayandığına, araştırma verilerinin doğru yöntemlerle toplandığına, doğru istatistiklerin kullanıldığına ve sonuçların uygun rapor edildiğine, sonuçların yazılım, sunum ve paylaşımında etik standartlara uyulduğu kabul edilir (İnci, 2015, s. 282). Günümüzde teknoloji dünyasında yaşanan yeniliklerle birlikte, bilgi hemen her ortamdan kolaylıkla erişilir hale gelmiştir. Bilim dünyasının geliştirmesini sağlayan ve değerini arttıran bu değişim diğer

yandan bilimsel yayınlarda etik kuralların daha rahat göz ardı edilmesine neden olabilmektedir (Akkaya ve Yıldırım, 2017, s. 78).

Bu çalışmada, “Beni Affedebilir Misin?” isimli film bilimsel yayın etiği bağlamında incelenmiştir. Leonore Carol Israel’in kaleme aldığı otobiyografisinin sinema perdesine uyarlandığı bu film, etik ihlallerin sadece bilim alanında olmadığını çarpıcı bir örneğidir. Gerçek hayatın sahneye yansıdığı bu film; kişilerin dürüstlikle, işlerini doğru yaptıklarında her zaman kazanamadıklarını, kitabın toplumun gözündeki değerinin olması gereken yerde olmadığını, her alanda işleri suistimal edecek ve bundan kâr sağlayacak kişilerin kendilerine yer bulabildiklerini ve popülist yaklaşımların her yerde olduğunu göstermesi açısından önem arz etmektedir.

“Beni Affedebilir Misin?” isimli filmde sadece akademik alanda değil hangi alanda olursa olsun kişilik özelliklerinin ve ekonomik etmenlerin etik ihlale yol açmada ne kadar etkili olduğu görülmektedir. Yapılan araştırmalar bazı psikolojik sıkıntılara ve psikosomatik rahatsızlıklara sahip bireylerin normal insanlara göre daha fazla etik dışı davranış sergilediğini, etik ihlal yapmaya daha yatkın olduklarını göstermektedir (Erdem, 2012). Filmin ana karakteri Lee Israel psikolojik sıkıntıları olan, insanlarla pozitif ilişkiler kuramayan ve alkol bağımlısı yalnız bir yazardır.

Bu araştırmada ele alınan bu filmde; belli bir yaştan sonra arkadaş bulmanın nasıl zorlaştırdığını, kalabalıkların insanı nasıl yalnızlaştırdığını ve bu yalnızlığın insanı alkol bağımlılığına itmesi gibi psikososyal sonuçlar çıkarılabildiği gibi bir yazarın kimliğini kaybetmeden hayatta kalmak için sahtecilik gibi etik dışı yollara nasıl başvurabilir hale gelebilmesi gözler önüne serilmektedir. Filmde Lee Israel; uydurma-sahtecilik, yanıltma-çarpıtma, yasal dışı yollara başvurma, iş yeri kurallarına uymama, meslektaşlara saygısızlık, araştırma için gerekli izinleri almama ve toplumu yanıltma gibi etik dışı davranışları sergilemektedir.

Bilimsel sahtekarlık, hem akademik dünyanın kendi iç işleyişini bozmakta hem de toplumun bilim merkezleri olan üniversitelere ve akademisyenlere olan güvenini sarsmaktadır. Veri uydurmanın temel nedenleri arasında tembellik ve açgözlülük yer almaktadır (Blunt ve Wells, 2003; akt. Aydın, 2019, s. 82). Filmde Lee Israel’in, maddi kazanç ve itibar elde etmek için etik dışı yollara başvurmaktadır.

TÜBA (2002), etik ihlallerinin nedenlerini bilimsel araştırmalara yönelik eğitim ve disiplin yetersizliğinden kaynaklanan ihlaller, araştırmayı yapan kişinin kişisel özelliklerinden kaynaklanan ihlaller, bilimsel çalışma platformunda çok sayıda ürün vermenin nitelikli/kaliteli

ürün vermekten daha fazla itibar getireceği düşüncesiyle ortaya çıkan ihlaller ve mali/ekonomik nedenlerden dolayı yapılan ihlaller olmak üzere dört temel nedene dayandırmıştır (Uğurlu, 2020, s. 74). Filmde Lee Israel'in, bu dört temel nedene bağlı olarak etik dışı davranışlarda bulunduğu görülmektedir.

Sonuç olarak "Beni Affedebilir Misin?" filmi, özellikle etik dışı davranışlara yol açan etmenleri ortaya koymak açısından "araştırma etiği" ve "bilimsel araştırma etiği" derslerinde akademisyen adaylarına önerilebilir ve ders materyali olarak kullanılabilir.

ABSTRACT

The concept of the Metaverse, which is often talked about today, had already manifested itself with the production of Ultima Online, which was produced by the digital gaming world in 1997. This production, which was largely overlooked at the time because it was only experienced by a specific group of individuals, led to the emergence of many other MMORPG game genres, especially in the subsequent years. In the same period, with the developing internet network and innovations in telecommunications, millions of players all over the world found themselves in this online world in a short time. MMORPG games have created a place where thousands of people, connected to a single server, can enter the game 24/7, organize together and communicate in every sense, just like in the real world. Among these games, World of Warcraft, which was produced in 2004, has reached an enormous audience with a population of 14.5 million in 2009, allowing players to have different experiences in this virtual world. In fact, the communication methods initially started with the game's inherent possibilities, they were manipulated by the players and took on different forms over time. In many ways, a new form of language has emerged within the game and people have fallen into the middle of an existence in different ways. The research is an ethnographic study. The aim of the article is to examine, analyze and compare the existence and the communication methods created in the game World of Warcraft - which is still active today - with the metaverse world, based on Presence and Telepresence theory.

Keywords: Digital Gaming - Communication - Metaverse - Gaming - World of Warcraft - MMORPG

INTRODUCTION

The names Metaverse and Web 3.0 have been mentioned a lot in recent years. As a matter of fact, we first encountered the word Metaverse in 1992 in the book Snow Crash written by American science fiction writer Neal Stephenson. In the intervening time, the Metaverse started to become more and more evident in our lives after the emergence of coins, which are digital money, and the great interest in Oculus' Kickstarter campaign in 2012, is a concept that almost everyone has heard today. In fact, this framework, which was expected to allow digitalisation to be experienced in a different way, both materially and spiritually, has gradually fall out of favour in recent years. Investors looking for a new area to make money commercially have not been able to find what they are looking for, and coins have lost a great deal of value in a short period of time. As a result, although most people have heard of the Metaverse and experienced it to some extent, they have not fully grasped what it actually is (Schöbel et al., 2023). Due to its structure, the concept of Metaverse is remains distant to many people. However, in 1992, when the word metaverse was first used in the digital game world, this idea had already been realised by digital games. Thanks to productions such as Zork, a Text Based game, the idea of existing in a different world was well developed. Produced in 1991, Neverwinter Nights managed to keep many players alive in its own world until 1997 when it was closed. Thanks to the continuous development of internet networks and graphics technology, a tremendous MMORPG experience is offered today. Particularly the game named World of Warcraft, which was released in 2004, has taken the game and existence experience to a different point. In many respects, MMORPGs have been doing what the so-called metaverse has been trying to do for a long time. They offer their own communities, content for players, and an endless world experience. Thanks to the content they offer, long before the creation of the metaverse, players have been able to experience the possibility of existing in the digital world in detail.

MATERIALS and METHODS

MMORPG games are places where we exist online. They are virtual worlds where the server remains open 24/7 except for maintenance between 03:00 and 04:00 every Wednesday. In addition to the concepts of day and night, climate changes specific to regions are also experienced by users. In this way, they give players the feeling of existing in a different world. In the game, which is included with different characters created, of course, existence has an important place. During the research, Presence Theory was used to analyse the concept of existence. Today, presence has an impact on every point even in the world we live in. We still have to prove our existence to other people in order to get a loan from a bank or for some

documents. Although technology has developed and we can make online transactions, there are still points where presence must be visible and tangible. The issue of social presence may be explored by examining a variety of constructs which may contribute to the social climate of the classroom. (Short et al., 1976) define social presence as the "degree of salience of the other person in the interaction and the consequent salience of the interpersonal relationships..." (p. 65). This means the degree to which a person is perceived as a "real person" in mediated communication. (Gunawardena, C. 1995) Based on this communication theory in which the reality of the person is questioned differently, the concept of presence in the online worlds is similar. World of Warcraft, which was experienced by 14.5 million people in 2008 and created a huge virtual world for the players, is the MMORPG game that will be used during the research. Especially Bonnie A. Nardi's book "My Life as a Night Elf Priest" supports the methodological research. In order to reinforce the interaction in the created virtual world, it is necessary to observe the created communication environment. At this point, especially the subject can be examined by Telepresence and it is observed that it can be used in MMORPGs in a different place than it has been used since 1976 when it was introduced. As stated in the book titled The Social Psychology of Telecommunications, "Discovering the impact of telecommunications upon society may seem rather like trying to eat an elephant: it is difficult to know where to start." (Short, J., Williams. E., Christie. B. 1976). In summary, this research is a digital ethnography study conducted by the author, who experiences the game, through the concepts of Social Presence and Telepresence.

Metaverse and MMORPG

The concept of metaverse is one of the concepts that has become a household word in the last few years. The metaverse, which emerged especially with the Web3 infrastructure, basically allows the creation of a virtual worlds and the purchase and sale of products through an economy of its own within this world. Especially with the introduction of the use of coins, which is digital money, it has aroused great curiosity and caused many people to buy digital land for big money (Goldberg et. al., 2021). As a matter of fact, as of the date of publication of this article, both the people who spent money on this virtual realm in the past have suffered great losses and many people have not understood what the metaverse is. This system, which shone and disappeared in a short time, has been shrinking day by day because it could not attract investors and could not be experienced. At this point, it is observed that metaverse has difficulty in explaining the themes of existence and existence elsewhere. On the other hand, MMORPGs, or Massive Multiplayer Role Playing Game games, have been around much longer than the

metaverse, and have already done and continue to do what the metaverse has been trying to do for years. The only difference between them is that MMORPGs appeal to a specific player base, while the metaverse aims to appeal to "everyone". Of course, the fact that the games are accepted as "nerd" and "geek" experiences by certain social circles, along with their limited presence in mainstream media, has led to a lack of awareness in the broader media landscape. However, MMORPG games are an enormous milestone especially for the field of communication studies. The first known game with a 2.5 dimensional isometric camera angle is Ultima Online. Released in 1997, the game had 100,000 monthly active players at the time. In this sword & sorcery themed game where we created a character and dived into it, we had to opportunity to learn many different skills, specialise our character in various professions, such as a warrior, a mage or a healer. Thanks to the regular updates of the game by the producers, different events could be added in the game every day or every week, and it was possible to participate in these events or missions with other people. In-game communication was done through written texts that appeared above the characters' heads. Experiences such as building a house, decorating the house, organised attacks on different enemy units were offered. There were hundreds of different armours and weapons that could be obtained from different creatures. When the enemy was killed by the player, all items were looted and it was necessary to collect them all from the beginning.

Released in 2004, World of Warcraft was developed by Blizzard, a company so well known that it entered the Oxford dictionary as a game company after a snowstorm with very strong winds. The most important point of the game is Warcraft: Orcs & Humans, released in 1994, Warcraft II: Tides of Darkness and Warcraft III: Reign of Chaos and its expansion pack in 2002-2003. The production team, which has made great strides in the past ten years, especially in the narrative part, has actually managed to create an enormous world. World of Warcraft, which came on this world with many stories, different characters and events, has managed to create millions of people who want to be in this huge game world that is already known and loved. At this point, World of Warcraft, which achieved the most important thing that metaverse could not do, namely world creation, also managed to create the feeling of existing in a virtual world in an unprecedented way. Following this success, in addition to the stories, the time and space in the created world also draws attention. Each of the races that players can create for themselves has its own starting point. These points both define them and connect them to the relevant capital city in a short time. Thanks to the developed architecture, the player establishes a connection between the race he created and the space he is in. The use of spaces is manifested

in almost every point on the huge map of the game. The game has its own currency within the game. When we compare games with the metaverse platforms, questions are asked about the use of real money. In WoW, there is a currency of its own, called "gold". Although this money is increased by doing quests in the early stages of the game, it reaches large sums with buying and selling as soon as a certain economic freedom is achieved. Auction House is a system open to everyone and bids can be made through this system in the form of auction and buy now. The economic structure, which proceeds entirely on the supply / demand curve, is open to manipulation. As the game progressed, the total amount of in game gold increased. In other words, the total amount of gold that existed in the first year of the game grew by millions over the course of the eighth year. The increase in gold and the demand for it brought along illegal gold sales. In this way, people called Gold Farmer emerged in many different countries, especially in China. Blizzard, which did its best to prevent gold from being sold online with real money, has still not won this war today.

All this structure brings with it is human communication. It is possible to communicate with all players in the game. Just like in Ultima Online, communication with the text method that appears on your character is also used in this game. But it is also possible to whisper directly to a person. Thanks to this system called private chat, it is possible to talk to anyone anywhere in the game, just like talking on whatsapp. In addition, players in the same group can communicate in different ways simultaneously through group chat, and those in raid groups between 10 and 40 people can communicate in different ways through raid chat. An informational exchange between two or more persons is referred to as interpersonal communication. It is also a field of study that aims to comprehend how people employ verbal and nonverbal cues to achieve various relationship and personal objectives (Berger, 2008). This description accurately portrays the in-game experience in the WoW world. In the World of Warcraft experience, it is not possible to fully engage in the end-game content without socializing with other players. However, it is possible to reach the best items promised by the game by gathering under a guild. This means doing raids between 10 and 40 people. When we look at the issue from this point of view, we see that the six topics suggested by the interpersonal communication research support the general structure established by WoW. At least six kinds of inquiry are addressed by interpersonal communication research: 1) How people adjust their verbal and nonverbal communication when they are face-to-face with others; 2) How messages are produced; 3) How uncertainty affects behaviour and information-management strategies; 4) Deceptive

communication; 5) Relational dialectics; and 6) Social interactions that are mediated by technology. (Berger, 2005)

During the MMORPG experience, the importance of the community is also of great importance. Players have to become a member of different guilds for endgame experience. It is very difficult to organise a large group without a guild. Each guild has its own rules. Players in the guild have different titles. While applications such as Teamspeak and Ventrilo were used during raids in the early 2000s, today it is known that voice interaction is available through Discord channels. Thanks to the content offered by Discord, guild members who interact in the game also actively interact over Discord channels. It is possible to see many different channels dealing with the game and even other topics. This community created by players for the end-game experience can progress to out-of-game interaction. The issue of presence in MMORPGs, which offer a human-oriented structure, has also attracted attention with Bartle's chart put forward in 1996. According to Bartle, there are four different player types in MMORPG worlds. These are classified as Achievers, Explorers, Killers and Socialisers (Figure 1).

Figure 1. Bartle Taxonomy of Players (Bartle, 1996)

Stating that players fall into these categories through their actions, Bartle also underlined what kind of identities an online existence would reveal. Indeed, Nick Yee conducted a more recent and detailed study in 2007 and approached player identities and motivations from a different perspective. Yee conducted a comprehensive survey among MMORPG players, which included 39 multiple-choice questions and 3200 participants. He then decomposed the results into sub-components and then into primary components using factor analysis. In total, ten sub-components were found, each corresponding to three primary components. The main factors, which differed from each other, had no influence on the players' motivation towards the other main factors. The discovered main components were named Achievement, Social, and Immersion, and the sub-components were Advancement, Mechanics, Competition, Socialising, Relationship, Teamwork, Discovery, Role-Play, Customization, and Escapism.

Although it is somewhat easier to understand online existence in the light of academic studies dating back to the existence of MMORPG games, especially after the emergence of community-oriented applications such as Discord and Twitch, online existence has started to be discussed on a different plane. As a matter of fact, the community created by MMORPG games and the MMORPG games created by this community have begun to make players feel a sense of belonging to a great extent and have offered the opportunity to socialise online. This socialisation is not only limited to the actions that the game asks the player to do, because players have managed to create a playground of their own on a regular basis. Undoubtedly one of the most important features of MMORPGs is to offer an open world to the player. In this way, he/she can interact in many different in-game interactions that he/she not only has to do, but also wants to do. For example, if we take WoW as an example, players can focus only on their professions and have a trade-oriented experience that does not actually focus on the end game that the game offers to the player, or instead of bringing their character to the final level, they can be involved in battlefields where teams with players within a certain character level range can enter. This feeling of freedom created is in a sense a deconstruction of the Magic Circle mentioned by Huizinga. According to him, if the rules in the magic circle are broken, the game is completely over and ceases to be fun. However, thanks to the communities created in MMORPGs, many different games emerge within the game. Thanks to these structures that overturn the rules laid down by the producer, the player's sense of existence increases and indirectly the game is experienced more.

FINDINGS and DISCUSSION

The idea of existing in a virtual world has long attracted attention. As a matter of fact, this existence is still not accepted or understood by many users. Especially when we look at the issue from the Social Presence theory, it is not difficult to understand why the metaverse concept is weak in terms of making people exist, because consistency and credibility are lacking in the world they try to exist in. Social Presence refers to the degree to which one perceives the presence of participants in communication. Social Presence theory argues that because media differ in the ability to convey visual and verbal cues (e.g., physical distance, gaze, postures, facial expressions, voice intonation), media differ in the ability to convey the psychological perception that other people are physically present. Some mediums (e.g. video conferencing or telephone) have a greater social presence than other mediums (e.g. e-mail), and media that are higher in social presence are more effective for relational communication. (i.e., building and maintaining interpersonal relationships), as they involve social/personal issues and thoughts. Covid - 19 the online experience that emerges in almost all kinds of working environments is also observed as one of these topics. It is known that students who take online courses have more difficult access to information and cannot pay attention to the lesson compared to those who take physical courses. (Bird et. al., 2022). Similarly, it is observed that efficiency decreases especially in crowded company meetings. Online communication, which offers a structure where a presentation is not made specifically about a subject and not everyone is gathered for this presentation, and where generalised narratives are less memorable than physical, still succumbs to the physical communication structure. In the findings of the research, (Corneliussen et. al., 2008). The fact that the user enters an MMORPG world such as WoW with his/her own will strengthens the perception of his/her existence in this world from there, because he/she has accepted to exist in this world. Pre-accepted world structures also affect the user's bonds with their characters in a different way. The question of whether the user entered the game as himself or as the character he created in the game is still being discussed. Nevertheless, the characters created in MMORPG games have limitations predetermined by the game. For example, while an Orc warrior you create in WoW will take part on the role of a very good Tank, he will never be a good healer. Here, too, a set of predetermined rules comes into play. The concept of Magic Circle, which Huizinga mentioned in his book *Homo Ludens*, clearly expresses the difference between what the metaverse cannot do and what MMORPG games can do. According to Huizinga, in order to enter the magic circle, it is necessary to accept the rules of the relevant game. Players who know the rules in advance and enter the game in

line with these rules clearly perceive where they win, where they lose, what is right and what is wrong. This makes it easier for them to exist in the created world. If a player acts against the rules, then the magic circle is broken and in a sense, existence ends. Thanks to a digital environment where the beginning and end are so clear, the relationship between the player and the avatar is also provided in different ways. According to Lowenthal (2010), Social Presence Theory is based on a continuum. According to him, the focal point is either the interpersonal emotional connection or the perception of being "present", "there" or "real". There are many topics that support the state of being there. Foremost among these is the role taken. In the Metaverse worlds, no role is assigned to the experiencers yet. In other words, everyone tries to exist as they do in real life. At this level of existence, of course, there is no real difference. As such, interaction with other people proceeds no differently than in the real world. What is more interesting is that people who experience the game in the metaverse will treat other people as they would in the real world. However, the fact that the created world has its own rules, its own roles and can be manipulated by people to a certain extent when necessary, will deeply affect the metaverse structures.

CONCLUSION and RECOMMENDATIONS

As a result, it is known that the formation of what is called the metaverse today has been offered to the experience of people for a long time by many MMORPG games, especially Ultima Online, by the game world. At this point, when it comes to MMORPG, World of Warcraft, which is discussed in the article, is just one of the dozens of examples that can be given. It should not be forgotten that millions of different users have had different online experiences on many different MMORPG worlds to date. Among these games, there are also big names that the whole world knows, such as Star Wars and The Matrix. The biggest reason for the explosion of the MMORPG genre is undoubtedly the increase in internet connection speeds. With the increase in internet speeds and the introduction of DLS technology into our lives, instant connection to servers almost anywhere in the world has been provided in a stable and fast way. From an academic point of view, the difference and similarity between metaverse and MMORPG can be explained by Presence theory. Although it is undoubtedly very difficult to understand the existence of individuals in a different plane, it has been observed that the MMORPG experiences offered to them somehow attract the player to their immersion, and that there is a clear difference between their presence in this world and their presence in the real world. In this context, it is still unknown to what extent the player experiences the character he/she/they created in the game and to what extent he/she/they is himself/herself/themself.

Especially the sides and classes that players choose in MMORPGs are thought to cause difficulties in this determination. The fact that actions that cannot be done in real life can be done in games makes it even more difficult to give a clear answer to this issue. Finally, although it is generally positive that games are becoming more popular every year and new channels are created through games, it is observed that a group of people who do not know where the games come from enter an experience just because everyone is there. The game world is a much bigger medium than it is thought to be, and it is very difficult to say what is new and what is different without conducting a detailed study on it. In general terms, the research has been developed within an ethnographic and autoethnographic framework. Of course, conducting this study with a large group of people who actively experience the metaverse will make these arguments more acceptable.

ÖZET

Sübhâneke duâsı, namazlarda iftitâh tekbirinden sonra ve Fatiha suresinden önce okunan bir duadır. Bir sure ya da bir ayet olmayıp bazı yerleri Kuran-ı Kerim’de geçmektedir ve bu duayı okumak, bazı mezheplerde bir sünnet olarak görülmüştür. Sübhan, “Her türlü kusurdan, noksandan, beşerî nitelik ve zaafılardan uzak olan” anlamında Allah’ın isimlerinden olup bu duada da Allah’ın bu özellikleri ve ondan başka ilah olmadığı vurgulanarak Allah’ın bir övgüsü yapılmaktadır. Bu dua, birçok dini kitapta namazda okunması için öğrenilmesi gereken duaların başında gelmekte ve hem Arapça okunuşu hem de manası namaz kılacak kişilere ezberletilmektedir. Çalışmamıza konu olan Hediyyetü’l-Muhlisin adlı eser, XVIII. yüzyılda yaşamış olan ancak doğum ve ölüm tarihleri bilinmeyen Şeyh Mûsâ Emânî’ye ait bir eserdir. Bu eserde müellif Sübhâneke duâsının ayrıntılı bir manasını verir. Ayrıca namaz kılan her kişinin bu duâyı okumasının sünnet, doğru okumasının farz ve manasını bilmesinin de vacib olduğunu söyler. Çalışmamızda Sübhâneke duâsının genel bir manasını açıklayıp namazda bu duayı okumanın hükmünden kısaca bahsettikten sonra Şeyh Mûsâ Emânî’nin hayatı ve eserleri hakkında kısaca bilgi vereceğiz. Daha sonra Şeyh Mûsâ Emânî’ye ait Hediyyetü’l-Muhlisin adlı eserin muhteva incelemesini yapacağız ve eserin transkripsiyonlu metnini vereceğiz. Bu çalışma ile hem Şeyh Mûsâ Emânî hakkında bilgi vermek hem de Hediyyetü’l-Muhlisin adlı eseri ilim alemine tanıtmak amaçlanmaktadır.

Anahtar Kelimeler: Türk İslam Edebiyatı, Sübhaneke, Şeyh Mûsâ Emânî, Hediyyetü’l-Muhlisin.

SUBHANEKE PRAYER AND SHEIKH MUSA EMANI'S HEDIYYETU'L-MUHLISIN

ABSTRACT

Subhaneke prayer is a prayer that is read after the iftitah takbir and before the Fatiha sura. It is not a chapter or a verse, but some parts of it are mentioned in the Qur'an, and reading this prayer has been seen as a sunnah in some sects. Subhan is one of the names of Allah in the meaning of "free from all kinds of faults, deficiencies, human qualities and weaknesses", and in this prayer, a praise of Allah is made by emphasizing these characteristics of Allah and that there is no god but Him. This prayer is one of the most important prayers to be learned to be read in prayer in many religious books, and both its Arabic reading and its meaning are memorized by those who will pray. The work called Hediyyetü'l-Muhlisin, which is the subject of our study, is in the XVIII. It is a work belonging to Sheikh Musa Emani, who lived in the 19th century but whose birth and death dates are unknown. In this work, the artist gives a detailed meaning of the Subhaneke prayer. He also says that it is sunnah for every person who prays to recite this prayer, and it is obligatory for him to know the fard and meaning of reading it correctly. In our study, after explaining a general meaning of the prayer of Subhaneke and briefly mentioning the ruling of reciting this prayer in prayer, we will briefly give information about Sheikh Musa Emani's life and works. Later, we will analyze the content of Sheikh Musa Emânî's Hediyyetü'l-Muhlisin and give the transcription of the work. With this study, it is aimed both to give information about Sheikh Musa Emani and to introduce Hediyyetü'l-Muhlisin to the world of science.

Keywords: Turkish-Islamic Literature, Subhaneke, Sheikh Musa Emani, Hediyyetü'l-Muhlisin.

GİRİŞ

Sübhâneke duâsı, namazlarda iftitâh tekbirinden sonra ve Fatiha suresinden önce okunan bir duadır. Bir sure ya da bir ayet olmayıp bazı yerleri Kuran-ı Kerim’de geçmektedir ve bu duâyı okumak, bazı mezheplerde bir sünnet olarak görülmüştür.

Hanefî ve Hanbelî Mezhebî imâmlarına göre sünnet sayılmış ve iftitah tekbirinden sonra okunmuştur. Şâfiî Mezhebi’ne mensup kimseler, tekbirden sonra başka bir duâ okurken Mâlikiler ise hiçbir duâ okumazlar (Erdim, 2021).

Bu dua, birçok dini kitapta namazda okunması için öğrenilmesi gereken duaların başında gelmekte ve hem Arapça okunuşu hem de manası namaz kılacak kişilere ezberletilmektedir. Çalışmamıza konu olan Hediye-tü’l-Muhlisin adlı eser, XVIII. yüzyılda yaşamış olan ancak doğum ve ölüm tarihleri bilinmeyen Şeyh Mûsâ Emânî’ye ait bir eserdir. Bu eserde müellif Sübhâneke duâsının ayrıntılı bir manasını verir. Ayrıca namaz kılan her kişinin bu duâyı okumasının sünnet, doğru okumasının farz ve manasını bilmesinin de vacib olduğunu söyler. Bu çalışma ile Şeyh Mûsâ Emânî ve onun Hediye-tü’l-Muhlisin adlı eseri hakkında bilgi vermek amaçlanmaktadır.

Sübhâneke Duâsı ve Anlamı

Sübhaneke duası şu şekildedir:

Sübhâne-kellâhümme ve bi hamdik ve tebâra-kesmük ve teâlâ ceddük ve celle senâük ve lâ ilâhe ğayrük.

Ancak (vecelle senâük) bölümü sadece cenaze namazlarında (ve teâlâ ceddük'ten sonra) eklenerek okunmaktadır.

Anlamı:

Allah'ım! Sen eksik sıfatlardan pak ve uzaksın. Seni daima böyle tenzih eder ve överim. Senin adın mübarektir. Varlığın her şeyden üstündür. Senden başka ilah yoktur.

Şeyh Mûsâ Emânî’nin Hayatı ve Eserleri

Şeyh Mûsâ Emânî hakkında kaynaklarda var olan bilgiler onun *Nûr-ı Vehhâc* adlı eserine dayanmaktadır. Bu eser üzerine bir çalışma yapan Mehmet Asağ, bu esere dayanarak müellif hakkında özetle şunları söyler:

Doğum ve vefat tarihleri bilinmeyen Emânî’nin babasının adı Ahmed olup doğum yeri bugün Bulgaristan sınırları içinde kalan Zağra-i Atık (Stra Zagora) kazasına bağlı Husâm Şâh Ganî (Odman Baba) yakınlarındaki Hasköy’ün üst taraflarında bulunan Oruçlar köyüdür. Mısır’a

gidip Kahire’de Ezher’e yakın bir mahallede bir süre kalan Şeyh Mûsâ Emânî, buradan Kudüs’e geçer ve orada üç yıl kalır. Kudüs’te pek çok türbe ve makamı ziyaret ettiğini belirten Şeyh Mûsâ Emânî, bu seyahatlerinde birçok ilim sahibinden ve eserden istifade ettiğini bildirmiş, ayrıca nâsîh olup halka nasihatlerde bulunmak için de buralarda çok dua etmiştir. Bu seyahatlerin sonunda bir divân yazmak arzusu ile doğduğu köye yakın Çırban kasabasına dönmüştür. Kayıtlardaki künyesinde Celvetî ifadesi bulunan Edirne Selimiye Camii İmamı Merzifonî Mehmed Efendi’den aynı eserinde “Şeyhimiz” diye bahsetmesinden yola çıkılarak Şeyh Mûsâ Emânî’nin de Celvetî olduğu belirtilmiştir (Asağ 2017: 23-26).

Eserleri:

Ravzu’l-Vârisîn: Kırk beyitlik bu eserinde Emânî, on üç başlık altında İslâm miras hukukuna ait kaideleri vermiştir (Asağ 2017: 31).

Hüccetü’l-Huccâc ve Netâicü’l-Menâsik: Nûr-ı Vehhâc’da bilgisi verilen eserin herhangi bir nüshasına ulaşılmamıştır. *Nûr-ı Vehhâc*’ın hacca dair faslında adı geçen bu eserin isminden hareketle menasik türünde olduğu söylenebilir (Asağ 2017: 13).

Verdü’s-Sâlihîn: Şeyh Mûsâ Emânî tarafından 1155/1742-43 tarihinde kaleme alınan Verdü’s-Sâlihîn manzum bir nasihat-nâmedir (Yıldız, 2023:558). Eser üzerinde Fakirullah Yıldız tarafından bir çalışma yapılmıştır.

Hediyyetü’l-Muhlisîn: Çalışmanın konusu olan bu eser aşağıda ilgili başlık altında incelenecektir.

Nûr-ı Vehhâc: Şeyh Mûsâ Emânî, elli fasıldan oluşan *Nûr-ı Vehhâc*’da dînî ve ahlakî konularda nasihatlerde bulunmuş ve bu nasihatlerini, Kur’an-ı Kerim’den ayetler, Hz. Peygamber’in (s.a.v) hadisleri, peygamber kıssaları, sahabe hayatından örnekler ve bazen muhtelif hikayelerle açıklamıştır (Asağ 2017: 69-101).

Hediyyetü’l-Muhlisin’in İncelenmesi

Bilinen tek nüshası İstanbul Atatürk Kitaplığında bulunan eser OE Yz 504 demirbaş numarası ile kayıtlı mecmua içinde 164b-165b varakları arasında yer alan küçük bir risaledir. Eser h. 1163 / m. 1749/50 tarihinde telif ve h. 1210 / m. 1795 tarihinde de istinsah edilmiştir. Ancak kütüphane kayıtlarına kaydedilirken h. 1210 istinsah tarihi, telif tarihi olarak kaydedilmiştir.

Eserde Sübhâneke duasının manası verilmiş ve dua kısaca izah edilmiştir. Eser hamdele ve salveleden ile başlar ve kısa bir sebep-i telif ile devam eder. Burada müellif, fıkıh kitaplarına göre namaz kılan her kişinin bu duâyı okumasının sünnet olduğunu ancak doğru okumasının

farz ve manasını bilmesinin de vacib olduğunu söyler. Daha sonra eserin ismini neden *Hediyetü'l-Muhlisîn* koyduğunu Kur'an-ı Kerim'den bir ayete dayanarak açıklar.

Sübhâneke duasının manasını bölümler halinde açıklamaya başlayan müellif, öncelikle bölümün manasını verir, sonra bölümü gramer yönünden inceler. Bölümleri oluşturan harf sayılarına da ayrı bir anlam veren müellif, özellikle ilk bölümle ilgili bir de hadis-i şerif söyler. “Ve celle senâük” bölümünün sadece cenaze namazlarında okunduğunu söylemiştik. Müellif de burada “ Bu kelâm-ı celâlet-nümâ şalât-ı cenâzeniñ ğayrıda revâ görölmedi, ğâlâ ictihâd böylece vâķi olındı. “ diyerek bunu teyit eder ve bu bölümün neden sadece cenaze namazlarında okunduğundan bahseder. Ona göre diğere namazlar Allah'ın bir hediyesidir ve merhamet, iyilik yeridir. Ancak cenaze namazında ise korku, ürperti, sıkıntı vardır.

Eserin başında ve bazı yerlerinde yer alan Arapça duaları saymazsak, Arapça ve Farsça kelime ve terkiplerin az kullanıldığı, dil ve üslup bakımından gayet açık ve anlaşılır bir anlatıma sahip olduğu söylenebilir.

Daha sonra müellif, eserini tamamlar ve bunun için Allah'a hamd eder ve bir de tarih verir.

Transkripsiyonlu Metin

Heze Hediyetü'l-Muhlisîn

El-ğamdülillâhillezi yüsebbiğü lehü mâ fi's-semâvâti ve'l-arzı ve hüve'l-azizü'l-ğakim ve's-şalâtü ve's-selâmu ğalâ seyyidinâ Muğammedin ellezi sebbağa beyne yedeyye'l-ğacer ve hüve ğalâ ğalağ ğazim ve ğalâ âlihî ve aşğâbihî ellezîne sabbeğullâhu Teğâlâ ve ağazze aşğâbü'l-cağim.

Bu ğağir Emâni eydür ki kütb-i fuğahâda gördüm her muşalli kişi duğa-yı şenâyı ellerini bağladığda oğumağ sünnetdir ammâ dürüst oğumağ farz dağı mağnâ-yı laşifini tağlim idüp teğenni ve teğemmül vâcib dimişlerdür. ABSTRACT

The daily routine of university students is saturated with busy work and socialization problems associated with lack of time and mental stress. Also, it is worth noting that the high rate of neuroticism and the tendency to introversion are especially often manifested in students of international faculties, which is associated with changing the living environment, adapting to a foreign culture and society, etc. The aim of our study was to reveal the indicators of mental health—neuroticism and introversion-extraversion in students of the International Faculty of Medicine of Tbilisi State Medical University and to see how high it is compared to students of the Georgian (national) faculty. A cross-sectional study was conducted, in which 192 students from the international faculty and 212 students from the Georgian faculty of Tbilisi State Medical University were involved. The Eysenck Personality Questionnaire (EPQ) was used for the research, through which we determined the upper personality characteristics. As it turned out, the risk of a high rate of neuroticism among international faculty students is quite high and the female gender has a protective function among international faculty students. Thus, students of the international faculty are more stressed than those of the Georgian faculty. There must be a combination of factors, that are the cause, thus specific risk factors must be identified and appropriate interventions made.

Keywords: International Student, Mental Health, Eysenck Questionnaire

INTRODUCTION

As is known, the daily routine of university students is saturated with busy work and study schedules and socialization problems associated with lack of time and mental stress. [7] Recently, the increasing number of suicides among students has led to public attention to the mental health of adolescents and young adults [6]

According to the latest (fall 2022) data from the American College Health Association, 32.9% of American college students surveyed suffer from anxiety, 25.5% from depression, and 21.6% from both [1]. The degree of socialization is also an important determinant of the rate of depression, which, in turn, is related to the type of person - how introverted or extroverted he/she is [2]. A very important determinant of the quality and effectiveness of students' learning is personal motivation, which is related to the level of neuroticism. [7] According to the work of Yasushi Kudo and colleagues, the 5 main reasons for the decrease in motivation are "Difficulties acquiring knowledge of public health," "Inappropriate attitudes of public health teachers," "Thinking lightly about the national examination in the field of public health," "Lack of understanding the importance of learning public health," and "Future plans that do not specialize in public health" [5]. The quality functioning of the educational system and the objective assessment-teaching system are also related to the personal characteristics of the students - how prone the type is to lying, which determines the degree of their honesty and integrity. Also, it is worth noting that the high rate of neuroticism and the tendency to introversion are especially often manifested in students of international faculties, which is connected with the difficulties associated with changing the living environment, adapting to a foreign society and culture, scarcely familiar people around, language communication problems and others. [4]

Aim

Our study aimed to identify the above-mentioned characteristics - neuroticism, introversion-extraversion and lying indicators among students of the Faculty of Medicine of Tbilisi State Medical University. Also, we determined their connection with the gender and nationality of the students - whether they were students of the Georgian sector, or in the case of the international faculty, and also, in the case of the students of the Georgian sector, whether they were from the capital or from any district.

MATERIALS and METHODS

3rd year georgian and international students of Tbilisi State Medical University were involved in the study. The mentioned course was selected based on its difficulty - the 3rd academic year

is the hardest among the 6 academic years. Thus, their indicators, as a rule, should have been found to be the most radical among the possible results. The age of the people involved in the study was 19 or 20 years (mean = 19.6).

The Eysenck Personality Questionnaire (EPQ), which is a questionnaire to assess the personality traits of a person, was used for the research. It was devised by psychologists Hans Jürgen Eysenck and Sybil B. G. Eysenck. [3]

Eysenck originally conceptualized personality as two biologically based independent dimensions of temperament, E and N, measured on a continuum, but later expanded this to include a third, P. Thus, the questionnaire can determine the following personality characteristics: Extraversion/Introversion, Neuroticism/Stability, Psychoticism/Socialisation and Lie/Social Desirability. Thus, the said questionnaire was ideal for collecting information interesting for our research.

The possible indicators of the listed scales are explained as follows:

- **Extraversion** - manifested in active, optimistic, convincing and impulsive behavior;
- **Introversion** - manifested in non-communicative, passive, calm, judgmental behavior;
- **Ambiversion** - refers to a personality type that has a balance of extroverted and introverted traits;
- A person with high neuroticism is characterized by hypersensitive reactions, tension, anxiety, dissatisfaction with oneself and the environment, rigidity;
- A person with low neuroticism is calm, balanced, carefree, hopeful. [2] [3]

The questionnaire consists of 57 simple closed-ended questions. Students filled in the mentioned questionnaire at the end of the lessons. In addition to the Eysenck questionnaire, their answer sheet included information about their age, gender, and nationality.

RESULTS

192 students of the international faculty and 212 students of the Georgian faculty were interviewed as part of the research. According to the research results, the risk of high rate of neuroticism among international faculty students is quite high - 31.3% (n=62) and, as it turned out, much higher than among Georgian faculty students (OR=17,406; CI=1.11-2.72; p<0.05). Female gender has a protective function among international faculty students (OR=0.46; CI=0.25-0.86; p<0.05). The said protective function is especially revealed in ambiverts (OR=0.38; CI=0.17-0.86; p<0.05).

None of the surveyed students had a high score on the lie scale, which confirms the relevance of the results.

CONCLUSION

As it turned out, students of the international faculty are more stressed than those of the Georgian faculty. There must be a combination of factors, that are the cause, which are notheworthy. Thus specific risk factors must be identified and appropriate interventions made. It is important to study, control and take appropriate measures of the psycho-emotional state of young adults.

ÖZET

Mobil teknolojiler, bir dizi sektörde büyük bir etki yaratmıştır. Sağlık sektöründe, mHealth (mobil sağlık) uygulamaları, hastaların sağlık hizmetlerine daha kolay erişim sağlar ve tedavi yönetimini iyileştirir. Eğitimde, mobil öğrenme, öğrencilerin daha etkili bir şekilde öğrenmelerini ve öğretmenlerin öğretim süreçlerini zenginleştirmelerini destekler. Ticaret dünyasında, mobil ticaret (m-ticaret) tüketicilere hızlı ve kolay alışveriş imkanı sunar. Gıda ve tarım sektörü, çiftçilere verimliliği artırma ve ürün izleme konusunda yardımcı olmak için mobil uygulamaları benimsemektedir. Turizmde, seyahat edenlere kişiselleştirilmiş rehberlik ve seyahat bilgisi sunan uygulamalar, turist deneyimini iyileştirir. Bu sektörlerde mobil teknolojilerin hızla büyümesi, işletmelerin rekabet avantajı sağlamak için bu alanlarda fırsatları keşfetmelerini teşvik eder. Bu nedenle, mobil uygulamaların bu sektörlerde yaygınlaşması ve gelişmesi beklenmektedir. Her sektör, mobil teknolojilerin sunduğu potansiyelden yararlanmak için kendi benzersiz ihtiyaçlarına uygun uygulamalar geliştirmektedir.

Anahtar Kelimeler: Mobil uygulamalar, mobil cihaz teknolojisi, sektörler

THE IMPORTANCE OF MOBILE APPLICATIONS ON SECTORS

ABSTRACT

Mobile technologies have had a significant impact across various industries. In the healthcare sector, mHealth (mobile health) applications facilitate easier access to healthcare services for patients and improve treatment management. In education, mobile learning supports students in learning more effectively and enriches the teaching processes for educators. In the business world, mobile commerce (m-commerce) provides consumers with quick and convenient shopping opportunities. The food and agriculture sector is adopting mobile applications to help farmers enhance productivity and track their products. In tourism, personalized guidance and travel information applications enhance the tourist experience for travelers. The rapid growth of mobile technologies in these sectors encourages businesses to explore opportunities to gain a competitive advantage. Therefore, the proliferation and development of mobile applications in these sectors are expected. Each sector is developing applications tailored to its unique needs to harness the potential offered by mobile technologies.

GİRİŞ

Teknolojik ilerlemeler, özellikle yeni bilgi ve iletişim teknolojileri alanında, bir dizi yüksek teknoloji ürünü ve hizmeti günlük yaşamın önemli bir parçası haline getirerek mevcut paradigmayı değiştirmiştir. Bu teknolojik gelişmeler sonucunda ortaya çıkan hizmetler, ayrı ve belirgin sektörler olarak ortaya çıkmıştır (Özkoçak, 2016). Modern teknoloji, teknolojik çevre içerisinde, sürekli olarak insanların farklı alanlardaki etkileşim ve iletişim kanallarını değiştiren önemli bir faktördür (Portolan ve ark., 2011). Bu dönüşümün anahtar eğilimlerinden biri, mobil cihazların kullanımının artmasıdır. Tüketicilerin mobil cihazlara olan talebinin sürekli olarak artmasıyla birlikte, günümüz dünyasında mobil cihazların sektörel etkisi de büyümektedir (Kırlar ve ark., 2017).

Mobil uygulamaların küresel olarak pozitif bir etkisi vardır; gelişmiş ülkelerde geliştirilen mobil uygulamalar sayesinde insanlar kolaylık sağlanmakta ve gelişmekte olan ülkelerin toplumu kendilerini yükseltmekte ve yeni bir tür bilgi teknolojisi altyapısı oluşturmaktadır (Mobile Marketing Association, 2008). Kullanıcılar her yerden mobil uygulamanın avantajından faydalanabilir ve günlük yaşamları ve iş hayatları için birçok şey yapabilirler (Yang ve ark., 2010). Mobil uygulamalar, aynı zamanda iş dünyasında da önemli bir rol oynar. Birçok sektör, mobil uygulamaları kullanarak verim elde etmektedir (Ngai ve Gunasekaran, 2007). Mobil uygulamalar, kullanıcı dostu, ucuz, indirilebilir ve birçok mobil cihazda çalışabilen bir uygulama olduğu için insanlar bu kolaylığı tercih etmiş ve bu uygulamalar sayesinde geniş bir hizmet yelpazesine kavuşmuştur (Islam ve ark., 2010). Mobil uygulamaların artmasıyla birçok endüstrinin işleyişinde önemli değişiklikler yaşanmış, hemen hemen her sektör, müşterilerine daha fazla konfor sağlamak için bir uygulama geliştirmeye başlamıştır. Böylelikle şüphesiz ki mobil uygulamalar, birçok endüstrinin kaderini değiştirmiştir (Stocchi ve ark., 2021). Bu büyük mobil uygulama pazarına ise, sayısı artan mobil uygulama geliştiricileri, yayıncılar ve sağlayıcılar soluksuz hizmet vermeye çabalamaktadır (Islam ve ark., 2010). Mobil uygulamaların sektörlerde kullanımına birkaç örnek verilecek olursa; kullanıcılar banka işlemi yapmak istediklerinde, finansal uygulamalar sayesinde müşteriler bankaya gitmek zorunda kalmazlar. Kullanıcılar market alışverişi yapacağı zaman, bir uygulama sayesinde evden çıkmadan alışveriş yapabilirler. Boş vakitlerde ise verimlilik sağlamak için sayısız uygulama yine bulunmaktadır (Lamberton ve Stephan, 2016). Birçok sektör mobil uygulamaları başarıyla piyasaya sürmüştür. Mobil uygulamaları en çok kullanan bazı sektörler; iletişim, eğlence, yönetim, sağlık, eğitim, gıda ve yiyecek, alışveriş, turizm ve finans sektörleri örnek verilebilir (Beimborn ve Palitza, 2013).

Sağlık Sektöründe Mobil Uygulamalar

Günlük yaşam içerisinde, bilginin aktarılması ve bilgiye erişim, mobil teknolojilerin yaygın kullanımı sayesinde her an ve her yerde kolayca gerçekleştirilebilmektedir. Bu bağlamda, mobil uygulamaların sağlık sektöründe kullanımı hızla artış göstermektedir (Özmen ve ark., 2019). Mobil sağlık, genellikle mHealth olarak adlandırılır ve "halk sağlığını ve klinik uygulamaları desteklemek için kablosuz iletişim cihazlarının kullanımı" olarak tanımlanabilir (Kahn ve ark., 2010). Mobil cihazlar taşınabilir elektronik cihazlar arasında yer alır ve mobil telefonlar, kişisel dijital asistanlar, hasta izleme cihazları ve diğer kablosuz cihazları içerir. Bu nedenle, mHealth uygulamaları, mobil teknolojilerin dünya genelinde yaygınlaşması ile giderek daha fazla ilgi çekmektedir (Kay ve ark., 2011). Mobil tıbbi uygulamalar, bireyler ile sağlık sistemleri arasındaki iletişimden (çağrı merkezleri, randevu hatırlatıcıları, tedavi uyumu gibi) sağlık izleme ve gözetlemeye (anketler, hasta izleme cihazları dahil) ve bakım noktasında bilgi erişimine (sağlık kayıtları, karar destek) kadar geniş bir yelpazede kullanılmaktadır (Kay ve ark., 2011). Mobil sağlık alanları, sağlık hizmeti sağlayıcıları için hayati öneme sahip olan "tıbbi olmayan" uygulamaları içermektedir. Bu uygulamalar arasında ilaç referansları, tıbbi literatür incelemeleri, tedavi uygulamaları, tıbbi hesap makineleri, tıbbi terim çevirileri, genel sağlık referansları, hasta eğitimi, uzmanlık eğitimi, sürekli tıp eğitimi, fiziksel ve psikolojik değerlendirme, sağlık teşhisi ve sosyal ağlar üzerinden bilgi paylaşımı gibi konular bulunmaktadır (Oniani ve ark., 2018). Mobil sağlık uygulamaları, eğitim ve farkındalık sistemleri, hastalık önleme, bakım desteği ve tanılar, klinik bakım ve tanı için karar destek sağlama, hasta izleme ve tedaviye uyumu konusunda, hem hastalara hem de sağlık profesyonellerine destek sunmaktadır. Ayrıca, hastalık ve salgın izleme, bulaşıcı hastalıkların anlık izlenmesi, acil tıbbi müdahale sistemleri, kazalar ve felaketler için uyarılar sağlama gibi uygulamalar da bulunmaktadır (Barton, 2012). Kronik hastalıkların artması ve ortalama yaşam süresinin uzaması, sağlık maliyetlerinin artmasına rağmen bireylerin gerektiği gibi takip edilememesi, sağlık hizmetlerinin kişiselleştirilmesi ve bireylerin sağlık konularındaki farkındalığının artırılması gibi nedenlerle mobil sağlık uygulamalarına olan ihtiyaç artmıştır. Bu nedenle, diyabet gibi kronik hastalıklara sahip olan hastalar, mobil uygulamalar aracılığıyla hastalıklarını daha etkili bir şekilde takip edebilmektedir (Mather ark., 2014).

2008 yılında merkezi mobil uygulama depolarının (örneğin, Google Play ve Apple Store) piyasaya sürülmesi sonrasında, mHealth uygulamalarının sayısında büyük bir artış gözlenmiştir. Bu durum, mobil uygulama geliştiricilerinin uygulamalarını geniş bir kullanıcı kitlesiyle daha kolay bir şekilde paylaşabilmesine olanak tanımıştır (Lupiáñez-Villanueva ve

ark., 2010). Dijital sağlık alanında danışmanlık ve araştırma hizmetleri sunan Research2guidance isimli bir kuruluş, 2017 yılında uygulama mağazalarına toplamda 78.000 yeni mHealth uygulamasının eklediğini raporlamıştır. Aynı rapor ayrıca mHealth uygulama indirmelerinin 3.7 milyar olduğunu ve dijital sağlık sektörünün 2017 yılında 5.4 milyar ABD dolarına ulaşan bir pazar geliri sağladığını göstermiştir (Research2guidance, 2018). Sağlık sektöründe, mobil teknolojilerin kullanımının, hastalarla uzaktan iletişim ve sözsüz davranışlar gibi kişiler arası iletişim temel unsurlarını ve dokunma ve koku gibi duyuşal bilgilere erişimi sınırlayabileceği endişesi olmasına rağmen, bu teknolojinin mesleki memnuniyeti artırabileceği ve sağlık profesyonelleri ile hastalar arasındaki zamanı daha etkili bir şekilde yönetebileceği düşünülmektedir (Miller, 2003). mHealth ayrıca, sağlık verileri ve tavsiyelerinin değişimini aşarak, sağlık personeli ile hastaları çok yönlü seviyelerde bir araya getirme potansiyeline sahiptir ve böylece daha sık ve sürekli iletişim yoluyla ilişkilerin geliştirilmesini teşvik eder. Hasta ile sağlık personeli arasındaki olumlu ilişkilerin kurulması, tedaviye uyumu artırarak daha iyi hasta sonuçları ve hasta memnuniyetini destekler (Saultz ve Lochner, 2005).

Eğitim Sektöründe Mobil Uygulamalar

Mobil öğrenme (M-Öğrenme) alanı, dijital teknolojiler içinde en hızlı büyüyen ve en dinamik olarak kabul edilen bir sektördür (Consortium for School Networking, 2019). Akıllı cihaz teknolojilerinin ve mobil uygulamaların ortaya çıkışı, öğretmenlerin öğrencileri etkilemek ve sınıf içi tartışmaları kolaylaştırmak için yeni platformlar sunmaktadır. Öğrencilerin bu akıllı cihazları eğitim deneyiminin vazgeçilmez bir parçası olarak kabul etmesi, eğitimcileri bu yeni teknolojileri öğretim yöntemlerine entegre etmeye yönlendirmektedir (Luna-Nevarez ve McGovern, 2018). Konsorsiyum for School Networking danışmanlarının yüzde 49'u, mobil cihazların yakın gelecekte eğitim ve öğrenimde yenilikleri hızlandırmak ve geliştirmek için en önemli teknoloji olduğunu düşünmektedir (Consortium for School Networking, 2019). Günümüz çocukları, boş zamanlarının büyük bir bölümünü çevrimiçi platformlarda geçirmekte ve sık sık tabletler veya akıllı telefonlar gibi mobil cihazlarda oyunlar oynamaktadır (Kapp, 2012). Bu gelişmeler, öğrenme ve oyun aracılığıyla veya eğitimde mobil teknolojilerin öğrencilerin düşünme ve bilgi işleme biçimini değiştirdiği yeni bir paradigma değişimine yol açmıştır (Ge ve Ifenthaler, 2018). Bu nedenle, eğitim uygulamalarıyla etkileşim kurmanın öğrencilerin yeteneklerini artırdığı, takım çalışması sırasında ilişkisel ve iletişimsel beceriler kazandırdığı ve öğrencilerin görsel seçici dikkat gibi diğer bilişsel, motivasyonel ve duygusal faydalarını artırdığı ve bu sayede öğrencilere olumlu bir etki sağladığı belirtilmektedir (Camilleri, 2019).

Akıllı cihaz teknolojilerinin ve mobil uygulamaların ortaya çıkışı, eğitimcilerin öğrencilere sınıf materyali üzerinden etkileşimde bulunma ve sınıf içi tartışmaları kolaylaştırma imkanı sunmaktadır (Blunsdon ve ark., 2003). Öğrencilerin bu akıllı cihazları eğitim deneyiminin ayrılmaz bir parçası olarak benimsemesi, öğretmenleri bu yeni teknolojileri öğretim tarzlarına adapte etmeye teşvik etmektedir. Ayrıca, mobil öğrenmenin öğrenci öğrenimini artırmak amacıyla bir araç olarak kabul edilmesi literatürde tartışılmıştır (Yeap ve ark., 2016). M-öğrenme, öğrencilerin düşünme yeteneklerini geliştirmeye ve derin öğrenmeye yönlendirmeye yardımcı olarak anlamlı bir bilgi oluşturmalarına katkı sağlamaktadır (Praveen ve Vasimalairaja, 2019). Mobil öğrenmenin önemli avantajlarından birkaçı şunlardır: mobil öğrenme, her zaman ve her yerde erişilebilen ek bir öğrenme kaynağıdır; herhangi bir zaman, herhangi bir yer, herhangi bir ağ, herhangi bir kablosuz cihaz üzerinden kullanılabilir (Praveen ve Vasimalairaja, 2019). Ayrıca, mobil öğrenme, öğrenme materyalini farklı formatlarda sunarak öğrenme ilgisini artırır ve öğrenciler arasındaki iletişimi destekler. Mobil cihazlar aracılığıyla ders materyallerine erişim hızlıdır ve bu ders içeriğinin öğrencilerin yeteneklerini ve özgüvenlerini artırmasına yardımcı olur (Yeap ve ark., 2016). Son zamanlarda, yeni mobil teknolojilerin ortaya çıkması, m-öğrenmeyi desteklemek için uygulamaların ve yazılımların geliştirilmesini hızlandırmıştır. Özellikle üniversite öğrencileri, uzaktan eğitim fırsatları, kişisel gelişim, dil öğrenme gibi nedenlerle bu mobil uygulamalara büyük ilgi göstermektedir (Oliveira ve ark., 2021). Araştırmacılar ayrıca dijital oyunların ve diğer eğitim uygulamalarının çocukların bilişsel gelişiminde önemli bir rol oynadığını ve öğrenme süreçlerini desteklediğini göstermişlerdir (Huang, 2010). Bu nedenle, mobil öğrenme teknolojileri, iletişim teknolojileri aracılığıyla öğrencilerin bilgi, beceri ve öğrenme performansını artırma potansiyeline sahiptir (Camilleri, 2019).

Ticaret Sektöründe Mobil Uygulamalar

Teknolojik ilerlemeler, işletmelerin rekabetçi stratejilerini değiştiren özellikle iş dünyasında rekabet avantajı sağlamayı hedefleyen işletmeler için bir dizi dönüşümü beraberinde getirmiştir. Geçmişte e-ticaret yaygın olarak kullanılırken, son zamanlarda işletmeler "mobil ticaret" olarak adlandırılan yeni bir kavramla karşı karşıya kalmıştır. E-ticaretin doğal bir evrimi olarak, "m-ticaret" olarak adlandırılan bir kavram literatürde kendine yer bulmuştur (Özdemir, 2006). İlk başta basit işlevler için kullanılan mobil uygulamaların yelpazesi, zamanla daha karmaşık işlerin yerine getirilmesine yönelik uygulamaları içerecek şekilde genişlemiştir. Bu nedenle, e-ticaretin mobil versiyonu olarak adlandırılan m-ticaret, kullanıcılara mobil cihazlar üzerinden alışveriş yapma olanağı sunarak öne çıkmaktadır (Çelik ve Akadal, 2015). Mobil ticaret, "mobil

bir ağ aracılığıyla gerçekleştirilen herhangi bir maddi değere sahip işlemi" ifade eder (Clarke, 2001). M-ticaret hizmetlerinin ve uygulamalarının tasarımında, mobil kullanıcıların ihtiyaçlarını belirlemek kritik bir faktördür. Ayrıca, m-ticaret hizmetlerinin ve uygulamalarının sunduğu işlevselliğe dayalı olarak sınıflandırılması gerekmektedir (Andreou ve ark., 2002).

M-ticaret, teknolojik açıdan bir dönüm noktasını temsil etmektedir ve nispeten yeni olması, hızlı büyümesi ve potansiyel uygulama alanları nedeniyle akademik araştırmalar için oldukça çekici bir alan olarak kabul edilmektedir (Coursaris ve ark., 2003). Mobil uygulamalar, tüketici davranışlarını etkilemekle kalmayıp, aynı zamanda eğlence, görüş paylaşımı, bilgi edinme ve satın alma platformları sunarak iş, pazarlama ve tanıtım stratejilerini dönüştürmüş, mevcut müşterilerle ağlar oluşturmuş ve potansiyel müşterileri çekmiştir (Cheung ve To, 2017). Kullanıcılar, e-bankacılık gibi e-ticaret işlemlerini gerçekleştirirken veya ürün satın alırken artık kişisel bir bilgisayar sistemine gereksinim duymamaktadır. Aslında, çeşitli e-ticaret faaliyetlerini gerçekleştirmek için Kişisel Dijital Asistanlar ve mobil telefonlar gibi çeşitli mobil cihazları kullanabilirler (Kippenberger, 2000). Mobil cihazlar, pazarlama alanında potansiyel müşterilerle etkili iletişim kurma, özel fiyat teklifleri sunma ve satın alma işlemine teşvik etme kapasitesi sunmaktadır. Ayrıca, mobil cihazların zaman ve mekan sınırlaması olmaması, bu cihazları hem işletmeler hem de bireyler için önemli bir araç haline getirmiştir. Bireyler, mobil cihazları aracılığıyla web sitelerini ve mobil alışveriş uygulamalarını kullanarak ödemelerini gerçekleştirebilir ve alışverişlerini tamamlayabilirler (Çelik ve Taş, 2021). Geçmişte, bu tür mobil cihazlar veya teknolojiler, bireyler için lüks bir unsur olarak kabul edilmekteydi. Ancak, bu durum artık değişmiştir ve son birkaç yılda mobil teknolojiler pazarı büyük bir ivme kazanmıştır (Kwon ve Sadeh, 2004). E-ticaret perakendeciliği alanında, tüketiciler online alışveriş yaparken mobil uygulamalar aracılığıyla bilgiye erişme ihtiyacı duymaktadır. Bu nedenle, etkili uygulama tasarımları, tüketicilerin hızlı bir şekilde gerekli bilgilere ulaşmalarına yardımcı olabilir. Bu süreç, e-ticaret perakendeciliğinde mobil uygulamaların kullanım kolaylığını içerir (Hansen ve ark., 2018). Mobil uygulamanın kullanım kolaylığı, işlevlerin açıklığı ve gezinmenin kolaylığı gibi özellikler, e-ticaret perakendeciliğinin başarılı bir şekilde faaliyet göstermesi için önem taşır (Campbell-Grossman ve ark., 2018). Tüketiciler için mobil teknoloji, ürün ve fiyat araştırması yapma konusunda önemli bir kaynak haline gelmiştir ve böylelikle işletmelerin pazarlık güçleri etkilenmektedir. Bu nedenle, işletmeler genellikle yeni teknolojilere direnme lüksünü yaşayamazlar ve rekabetçi kalabilmek için sürekli olarak yeni teknolojileri benimsemeye odaklanarak, müşteri ilgisini çekmek için farklılaştırıcı stratejilere yönelmektedir (Özdemir, 2006).

Gıda ve Tarım Sektöründe Mobil Uygulamalar

Dünya genelinde mobil kullanımın hızla artış göstermesi, mobil ağların yaygınlaşması için yeni fırsatlar sunmaktadır. Bu mobil devrim sadece devam etmekle kalmayacak, aynı zamanda organizasyonlar tarım sektörü için yenilikçi mobil hizmetler ve kritik uygulamalar sunmak amacıyla daha fazla kaynak tahsis etmektedirler (Xin, 2015). Yirminci yüzyıl tarımı, bir dizi zorluğa maruz kalmaktadır, bunlar gıda güvenliği, iklim değişikliği, sürdürülebilir doğal kaynak yönetimi, zararlılarla mücadele, artan uluslararası ticaret ve rekabet, ve artan enerji talebi gibi durumları içermektedir. Bu zorluklarla başa çıkmak için, küresel bilgi tabanlı ekonomide Bilgi Teknolojisi (BT), hem mevcut hem de gelecekte karşılaştığımız bu zorluklara çözüm sunmak ve sağlam bir temel oluşturmak için giderek daha önemli bir rol oynamaktadır (Gartner, 2013). Ek olarak, e-tarım ve tarımsal bilişim uygulamaları sayesinde çiftçiler, ürünlerini farklı müşteri gruplarına sunarak pazar rekabetinde daha güçlü bir konum elde etmektedirler (Hacıyusufoğlu ve Güler, 2016). Günümüz tarımı, büyük ölçüde bilgi yoğun bir sektör haline gelmiştir. Bu bağlamda, Amerikalı çiftçiler ve işletme sahipleri, BT ve mobil çözümleri kullanarak verimliliği artırmak ve daha yüksek kar elde etmek amacıyla bu teknolojileri benimsemektedirler (Brugger, 2011). Bu nedenle, tarım alanında potansiyel uygulamaları vurgulamak ve düşük maliyetli ürün geliştirme yaklaşımlarını benimsemek, çeşitli platformlara erişimi kolaylaştırmaktadır (Xin, 2015). Verimliliği artırmak için en iyi uygulamalar, yeni teknolojiler, hasattan sonraki işleme ve katma değer konusunda ilgili ve uygun bilgilere erişim, verimliliği artırmak için kilit bir rol oynamaktadır (Munyua vd., 2009).

Gıda sektöründe, artan akıllı telefon kullanımı, yemek kültüründe bir dizi önemli değişikliğe yol açmış ve yemek teslimatı mobil uygulamaları, çağdaş restoran endüstrisindeki en yenilikçi değişikliklerden biri olarak öne çıkmaktadır (Cho ve ark., 2019). Bu yemek teslimatı uygulamaları, tüketicilere ve restoran işletmelerine birçok avantaj sunar. Örneğin, yemek kategorilerine göre arama yapma, sipariş verme ve izleme, inceleme yazma ve kuponlar ile puanlara erişim gibi çeşitli özellikler sunarlar. Bu durum tüketicilere geleneksel kağıt broşürler kullanmak yerine daha uygun ve verimli bir şekilde yemek siparişi verme imkanı tanır (AsiaOne, 2014). İlginç bir şekilde, yemek teslimatı pazarının yaklaşık olarak 2 milyar ABD doları büyüklüğünde olduğu bir dönemde, gıda teslimatı broşürlerinin israfı dramatik bir şekilde azalmıştır (S. W. Lee ve ark., 2019; Statista, 2019). Ayrıca, günümüzde giderek artan bir insani kriz olarak kabul edilen gıda israfını önlemeye yönelik mobil uygulamalar da mevcuttur (Çavuş, 2021).

Turizm Sektöründe Mobil Uygulamalar

Turizm işletmeleri, artan taleple başa çıkmak amacıyla fiziksel kapasitelerini artırmaya ek olarak, mevcut pazarlarını sürdürmek için bilgi teknolojilerini daha yoğun bir şekilde kullanma eğilimindedirler. Özellikle internet aracılığıyla potansiyel müşterilere ulaşma ve mevcut müşterileri elde tutma amacıyla bu teknolojileri benimsemektedirler. Bu çabalar, geleneksel dağıtım kanallarının dönüşmesine ve kişiselleştirilmiş uygulamalarla doğrudan pazarlama kanallarının genişlemesine neden olmuştur. Bu durum da bilgi teknolojilerinin yaygın kullanımıyla birlikte gerçekleşmiştir (Şanlıöz ve ark., 2013). Özellikle seyahat edenler ve onları destekleyen mobil uygulamalar arasında son yıllarda büyük bir popülerlik kazanmıştır. Mobil uygulamalar, e-turizm alanında temel kavramları ve teknolojileri belirlemiştir (Wörndl ve Herzog, 2020). Modern e-turizm uygulamaları, seyahat edenlerin ziyaret edebileceği yerleri gözden geçirme ve filtreleme olanağı sunarak bu yerleri ilginç ve kullanışlı seyahat deneyimlerine dönüştürebilir. Ayrıca, bu sektör, turistler tarafından sıkça kullanılan sosyal medya platformları, eğlence uygulamaları ve diğer benzeri teknolojileri içermektedir (Wörndl ve Herzog, 2020).

Seyahat ve turizm sektöründe, mobil uygulamaların işlevleri sadece belirli coğrafi bilgileri sunma veya kullanıcının konumuna dayalı olarak yerler ve rotalar hakkında önerilerde bulunma işlevini aşmaktadır. Bu uygulamalar, turistlerin ilgi alanlarını ve özel ihtiyaçlarını değerlendirmek için geniş bir teknoloji yelpazesini kullanabilirler ve böylece kullanıcıya uygun ve kişiselleştirilmiş bilgi sunabilirler (Ribeiro ve ark., 2018). Son yıllarda, internetin gelişimi ile turizm sektöründe faaliyet gösteren işletmeler, çevrimiçi rezervasyon siteleri gibi internet tabanlı hizmetler kurarak bu değişiklikleri yakından takip etmektedirler. Bu nedenle, çevrimiçi rezervasyon siteleri, konaklama işletmelerinin ürünlerini pazarlamada sadece uygun fiyatlarla değil, aynı zamanda sitedeki derecelendirme sistemi ve önceden aynı konaklama işletmesinde konaklamış müşterilerin çevrimiçi platformlarda otel hakkındaki yorumlarını paylaşmaları gibi faktörlerle de büyük bir etkileşim içindedir (Güzel ve Başaran, 2019).

SONUÇ

Bu yazıda, farklı sektörlerdeki mobil uygulamaların rolünü ve önemini ele aldık. Mobil uygulamaların sağlık sektöründe, eğitim sektöründe, ticaret sektöründe, gıda ve tarım sektöründe, turizm sektöründe nasıl kullanıldığını ve hangi avantajları sunduğunu inceledik. Bu farklı sektörlerdeki mobil uygulamaların, hem işletmeler hem de tüketiciler için bir dizi fayda sağladığını gördük.

Sağlık sektöründe, mobil uygulamaların hasta takibi, sağlık izleme, bilgi erişimi ve tedaviye uyum gibi bir dizi önemli rolü bulunmaktadır. Kronik hastalıkların artışı ve sağlık hizmetlerinin kişiselleştirilmesi ihtiyacı, mobil sağlık uygulamalarına olan talebi artırmıştır. Aynı zamanda, sağlık profesyonelleri ile hastalar arasındaki iletişimi ve ilişkileri geliştirme potansiyeline sahiptirler.

Eğitim sektöründe, mobil öğrenme uygulamaları öğrencilerin öğrenme deneyimlerini zenginleştirme ve öğrenme materyallerine daha hızlı ve kolay erişim sağlama yeteneği sunar. Mobil öğrenme, öğrencilerin düşünme yeteneklerini geliştirir ve farklı öğrenme biçimlerini destekler.

Ticaret sektöründe, m-ticaret (mobil ticaret) giderek daha fazla yaygınlaşmaktadır. Mobil uygulamalar, tüketicilere kolay ve hızlı alışveriş imkanı sunar ve işletmelere müşteri bağlılığı oluşturma ve pazarlama stratejilerini geliştirme fırsatı sunar. Ayrıca, mobil cihazlar aracılığıyla ödeme yapma ve alışveriş yapma kolaylığı sunarlar.

Gıda ve tarım sektöründe, mobil uygulamalar çiftçilere ve tarım işletmelerine verimliliği artırma ve ürünlerini daha etkili bir şekilde pazarlama konusunda yardımcı olabilir. Ayrıca, gıda israfını önlemeye yönelik uygulamalar da bu sektörde önemli bir rol oynamaktadır.

Turizm sektöründe, mobil uygulamalar seyahat edenlerin seyahat deneyimlerini özelleştirme, yerleri keşfetme ve rezervasyon yapma konularında yardımcı olur. Ayrıca, turistlerin konaklama işletmeleri hakkındaki incelemeleri ve önerileri paylaşmalarına olanak sunar.

Sonuç olarak, mobil uygulamalar farklı sektörlerde önemli bir rol oynamaktadır ve işletmelerin rekabet avantajını artırmalarına ve müşterilere daha iyi hizmet sunmalarına yardımcı olmaktadır. Mobil teknolojilerin sürekli olarak gelişmesi, bu uygulamaların gelecekte daha da önemli hale gelmesini sağlayacaktır. Bu nedenle, işletmelerin mobil uygulama geliştirme ve kullanma konusundaki stratejilerini dikkatli bir şekilde planlamaları gerekmektedir.

ABSTRACT

The field of economics and business administration pertaining to electric cars encompasses a range of elements, such as market analysis, consumer behavior, supply chain management, business models, financing and investment, and infrastructure development. Among these elements, infrastructure development is of utmost importance for the growth and sustainability of the electric car industry. It involves the establishment of networks of charging stations, advancements in battery technology, and the integration of smart grid systems. These three components, which we will define and explore as the latest technology in this field evolves, play a critical role in ensuring the success of electric cars as a practical alternative to gasoline-powered vehicles. The availability of charging stations, advancements in battery technology, and the integration of smart grid systems contribute to increased convenience and practicality of electric cars, reduced ownership costs, and enhanced sustainability within the industry.

Keywords: Electric cars, Infrastructure development, Charging station networks, Advancements in battery technology, Sustainability.

INTRODUCTION

Infrastructure development plays a crucial role in the electric car ecosystem, enabling the widespread adoption and effective operation of electric vehicles (EVs). It encompasses several key components, including the establishment of charging station networks, advancements in battery technology, and the integration of smart grid systems.

1. charging stations

It plays a pivotal role in supporting the usability and practicality of electric cars by providing a reliable and convenient means of recharging. They are an essential component of the infrastructure necessary for the widespread adoption and success of electric vehicles because facilities or points where electric vehicles (EVs) can be charged.

1.1 Types of Charging Stations:

Charging stations come in different forms and charging capabilities, catering to various needs and charging speeds. Here are some common types:

1.1.1 Level 1 Charging:

This is the simplest and slowest form of charging, typically using a standard household electrical outlet (120 volts AC). Level 1 chargers are portable and come with most electric vehicles. However, they provide the slowest charging rate and are best suited for overnight charging at home.

1.1.2 Level 2 Charging:

Level 2 chargers operate at higher power levels (240 volts AC) and provide faster charging compared to Level 1. They require specialized charging equipment and are commonly installed in public locations, workplaces, and residential areas. Level 2 chargers can fully charge an electric vehicle in a few hours, depending on the battery capacity.

1.1.3 DC Fast Charging:

DC fast chargers, also known as Level 3 chargers, offer the fastest charging speeds for electric cars. They operate at much higher power levels (typically 400 volts or higher) and can charge an EV to 80% or more in around 30 minutes. DC fast chargers are commonly found along highways, commercial areas, and EV charging networks.

1.2 Charging Station Components:

1.2.1 Charging Unit:

The charging unit is the main component of a charging station. It contains the necessary hardware and software to provide electricity to the electric vehicle's battery.

1.2.2 Connector:

We have several type :

- ❖ J1772 Connector: The J1772 connector is the standard connector for Level 1 and Level 2 charging in North America. It features a plug and socket design, allowing for the safe and secure connection between the charging station and the electric vehicle.
- ❖ CCS (Combined Charging System) Connector: CCS connectors are used for DC fast charging and are widely adopted in Europe and North America. They combine the AC charging pins of the J1772 connector with additional DC charging pins for high-speed charging.
- ❖ CHAdeMO Connector: CHAdeMO connectors are primarily used for DC fast charging and are common in Asian markets. They have a distinct plug design and enable high-power charging for compatible electric vehicles.
- ❖ Tesla Supercharger Connector: Tesla vehicles use their proprietary connector for high-speed charging at Tesla Supercharger stations. Tesla vehicles also come with an adapter that allows them to be charged using other charging connectors.

1.2.3 Display and Payment System:

Charging stations often feature a display panel that provides information such as charging status, energy consumption, and sometimes payment options. Payment systems can include credit card readers, mobile payment apps, or RFID cards.

1.2.4 Networking and Communication:

Many charging stations are connected to a network, allowing for remote monitoring, maintenance, and payment processing. Networked charging stations provide real-time information on availability, usage, and charging rates.

2. Examples of smart grid systems being integrated with electric car infrastructure

Integrating smart grid systems with electric car infrastructure is an important step towards optimizing the charging process, managing energy flow, and enhancing the overall efficiency of the electric grid. Here are some examples of how smart grid systems can be integrated with electric car infrastructure:

1. Demand Response Programs: Smart grid systems can enable demand response programs, where charging stations can adjust their charging rates or schedules based on the grid's supply and demand conditions. This allows for better load management and can help prevent grid congestion during peak periods.

2. **Vehicle-to-Grid (V2G) Technology:** V2G technology enables bidirectional energy flow between electric vehicles and the grid. Electric vehicles can not only draw electricity from the grid but also send excess energy back to the grid when needed. This capability can help balance the grid, support renewable energy integration, and provide grid services such as frequency regulation.
3. **Smart Charging Management:** Smart grid systems can facilitate intelligent charging management, allowing for optimized and coordinated charging of electric vehicles. Charging stations can communicate with the grid to determine the best charging times, considering factors such as electricity prices, grid load, and renewable energy availability.
4. **Grid-Friendly Charging Infrastructure:** Smart grid systems can enable the development of grid-friendly charging infrastructure. This includes features such as load balancing, where charging stations distribute the load evenly across the grid to prevent localized overloads. It can also include the capability to communicate with the grid to receive real-time grid status updates and adjust charging accordingly.
5. **Grid Integration with Renewable Energy Sources:** Smart grid systems can integrate electric vehicle charging with renewable energy sources. Charging stations can prioritize charging when renewable energy generation is high, promoting clean energy utilization and reducing the reliance on fossil fuel-based power generation.

3. Advancements in battery technology:

The potential to significantly improve the efficiency and range of electric vehicles (EVs) in several ways:

1. **Increased Energy Density:** Battery technology advancements can lead to higher energy density, allowing for more energy storage within the same physical size or weight of the battery pack. This means that EVs can store more energy, resulting in longer driving ranges without the need for frequent recharging.
2. **Improved Energy Efficiency:** Enhanced battery technology can improve the overall energy efficiency of EVs. This includes reducing energy losses during charging and discharging processes, minimizing internal resistance within the battery cells, and optimizing the battery management system. By improving efficiency, more energy can be effectively used to propel the vehicle, resulting in longer ranges for the same amount of stored energy.

3. **Rapid Charging Capability:** Advancements in battery technology can enable faster charging times. This includes the development of fast-charging technologies and the ability to handle higher charging currents without negatively impacting battery life. Rapid charging capabilities reduce the time required to recharge an EV, making them more convenient and comparable to refueling a gasoline-powered vehicle.
4. **Longer Battery Lifespan:** Battery technology advancements can improve the durability and longevity of EV batteries. This includes advancements in electrode materials, cell chemistry, and thermal management systems. Longer battery lifespan reduces the need for frequent battery replacements, lowering the overall cost of ownership and improving the practicality of EVs.
5. **Enhanced Thermal Management:** Efficient thermal management systems for batteries can prevent overheating and thermal degradation, ensuring optimal battery performance and longevity. Improved cooling and heating mechanisms can maintain the battery within an optimal temperature range, maximizing its efficiency and extending its lifespan.
6. **Solid-State Batteries:** The development of solid-state batteries, which replace the liquid electrolyte with a solid-state electrolyte, shows promise for higher energy density, improved safety, and faster charging times. Solid-state batteries have the potential to revolutionize EVs by addressing current limitations and unlocking even greater efficiency and range.

CONCLUSION

The field of economics and business administration related to electric cars encompasses various elements, including market analysis, consumer behavior, supply chain management, business models, financing and investment, and infrastructure development. Infrastructure development, particularly the establishment of charging station networks, advancements in battery technology, and integration of smart grid systems, is crucial for the growth and sustainability of the electric car industry.

The availability of charging stations ensures that electric car owners have convenient access to charging facilities, addressing concerns about range anxiety and promoting widespread adoption. Advancements in battery technology improve the efficiency, range, and charging capabilities of electric vehicles, making them more practical and comparable to traditional gasoline-powered cars. Integration of smart grid systems allows for intelligent management of

energy flow and optimization of charging processes, enhancing the overall efficiency and sustainability of the electric car ecosystem.

By focusing on these three components, the electric car industry can achieve increased convenience, reduced ownership costs, and improved sustainability. Continued research and technological advancements will undoubtedly shape the future of electric cars, making them a viable and attractive alternative to conventional vehicles.

ÖZET

Gıda konusu, nüfusun arttığı, ülkelerde kıtlık emarelerinin daha çok görüldüğü ve gıda atığı konusunda yeni yeni hassasiyetin geliştiği bu dönemde araştırmacıların önem ve ilgi göstermesi gereken bir alan olarak ortaya çıkmaktadır. Ekonomik bir değer olarak gıdanın birey ve toplum açısından kazanımları ve maliyetleri bulunmaktadır. Aynı zamanda gıdaların tüketilmeden israf edilmesinin yarattığı atık, ekonomik kayıp ve vicdani-sosyolojik boyut ise birey ve toplum açısından incelenmesi gerekmektedir. Özellikle tedarikçi, üretici, satıcı ve tüketici arasındaki ilişkide gıdaların satışını başka bir deyişle bilinçli tüketilmesini sağlayacak uygulamaların varlığı ekonomi ve sürdürülebilirliğe hizmet etmesi açısından giderek daha fazla önem kazanmaktadır. Tüketicilerin gıdanın orijini, üretim ve taşıma süreçleri, gıda ürünün ömrü gibi hususlarda artan merakı işletmelerin bu yönde kendilerini geliştirmelerine vesile olmaktadır. Kıt kaynaklar ve gıda işletmelerinden beklenen toplumsal duyarlılık gereği gıda tedarik zinciri paydaşlarından gereksiz kullanımlarını azaltarak gıda israfını önleme çabası beklenmektedir. Nesnelerin interneti (IoT), 5G ve Endüstri 4.0 devrimlerinin önemli yapı taşlarından birisidir. Böylesi bir uygulamanın bu konuda getireceği çeşitli avantajlar olacaktır. Bu çalışmanın amacı nesnelerin interneti ve gıda tedarik zinciri konusundaki çalışmaların varlığını incelemek ve bu alandaki eksikliği tespit etmektir. Çalışmada bibliyometrik analiz kullanılarak literatürün durumu incelenmiştir. Yapılan analizin bu alanda çalışmak isteyenler için araştırma imkanı bulunan alanların tespiti açısından bir ön çalışma olması amaçlanmıştır.

Anahtar Kelimeler: gıda tedarik zinciri, nesnelerin interneti (IoT), izlenebilirlik

**THE PLACE OF INTERNET OF THINGS TECHNOLOGY
IN THE FOOD SUPPLY CHAIN**

ABSTRACT

The issue of food emerges as an area that researchers should pay attention to in this period when the population is increasing, the signs of famine are more common in countries and the new sensitivity about food waste is developing. As an economic value, food has gains and costs for the individual and society. At the same time, the waste, economic loss and conscientious-sociological dimension created by the waste of food without consumption should be examined in terms of the individual and society. Especially in the relationship between the supplier, producer, seller and consumer, the existence of practices that will ensure the sale of food, in other words conscious consumption, is gaining more and more importance in terms of serving the economy and sustainability. The increasing curiosity of consumers in matters such as the origin of food, production and transportation processes, and the life of the product is conducive to the development of businesses in this direction. Due to scarce resources and social awareness expected from food businesses and stakeholders are expected to try to prevent food waste by reducing their unnecessary use. Internet of Things (IoT) is one of the important building blocks of 5G and Industry 4.0 revolutions. Such an application will have various advantages in this regard. The aim of this study is to examine the existence of studies on the internet of things and food supply chain and to identify the deficiency in this area. In the study, the state of the literature was examined by using bibliometric analysis. The analysis is intended to be a preliminary study for those who want to work in this field in terms of determining the areas with research opportunities.

Keywords: food supply chain, internet of things (IoT), traceability

GİRİŞ

Gıda, son dönemlerde yaşanan çatışmalar, pandemi ve tedarik zincirlerinin bozulmasıyla ülkeler için stratejik bir araç haline gelmektedir. Bulunması ve ulaşması oldukça zorlaşan gıdanın ülke içerisinde ve dışarısında akışını ve izlenebilirliğini sağlamak için bilgi teknolojilerine ihtiyaç duyulmaktadır. Tüketiciler de en taze ve güvenilir gıdaya hızlı ulaşmak istemektedir. Pal & Kant (2018) gıda tedarik zincirleri verimsizliğinin gıdanın bozulmasıyla atık ile sonuçlanmasından çok bozulan gıdaların ortaya çıkardığı hastalık vakalarına vurgu yapmaktadır. Bu açıdan bakıldığında gıda tedarik zincirleri için operasyon verimliliği giderek önem kazanmaktadır. (Pramatari, 2015).

Gıda tedarik zincirlerinin esnek bir yapıya kavuşmasında diğer üretim sektörlerinde olduğu gibi bilgi teknolojilerinin payı bulunmaktadır. Bilgi teknolojileri ihtiyaç duyduğu veriyi karekod ve RFID teknolojileri ile sağlayarak nesnelerin interneti aygıtları ile yorumlayabilmekte ve karar destek sistemlerine yardımcı olmaktadır. Gıda ürünlerinin hasat edilmesi, paketlenmesi, tedarik noktasından teslimat noktasına taşınması, imalat tesislerinde işlenmesi ya da perakende noktalarında reyonlarda hazırlanması ve tüketiciye ulaştırılması gibi üretimden tüketime kadar hemen her aşamada gıdanın izlenmesi bilgi teknolojileri sayesinde mümkün olabilmektedir. Ürünlerin üzerindeki karekod, etiket veya çip altyapısı ürüne dair bilgilerin dijital olarak okunmasını ve depolanmasını sağlamaktadır. Bu sayede ürün bir kimlik kazanmaktadır.

Yeni gelişen bilgi paylaşım platformları depolanan bilginin müşterilerce edinimini kolaylaştırmaktadır. Ürünün üretim ve dağıtım süreçlerinin müşterilere açılması sayesinde güven artırıcı mekanizma kendisinden oluşmaktadır. Ayrıca operasyonlar sırasındaki ürüne ait elde edilen verilerin işlenmesi sayesinde ekonomik ve çevresel iyileştirmeler yapılabilmektedir. Gıda taşıması iklimlendirme gerektirdiğinden hem enerji hem de ürün bozulabilirliği açısından diğer birçok tüketim ürününden farklı konumdadır. Gıdanın tazeliğini ve kalitesini koruması enerji sarfiyatını artırarak olumsuz çevresel sonuçlar yaratmaktadır. Diğer taraftan yeterince korunamayan ürünler ise hızla bozulabilirlik doğrudan atığa dönüşebilmektedir. Gıda tedarik zinciri için bu iki nokta arasında hassas denge bulunmaktadır. Tüketicilere ürünün kaliteden ödün verilmeden ulaştırılmasını sağlayacak karar destek sistemleri için bilgi teknolojisi altyapısına ihtiyaç duyulmaktadır. Nesnelerin interneti, bilgi teknolojilerinin koordinasyon içerisinde çalışmasına yardımcı olmaktadır. Taşıma araçları, tesisler ve aygıtlar, ürünün orijini, taşınan gıda ürününün olması gereken sıcaklık, teslimat yeri, yükleme ve boşaltma zamanları gibi bilgilerin gerekli paydaşlarla paylaşımını sağlayarak verimliliğin artırılmasına katkı sağlamaktadır.

Bu çalışma nesnelerin interneti teknolojisinin gıda tedarik zincirleri konusundaki yerini, yıllar içerisinde araştırmacıların bu alana duyduğu ilgiyi ve çalışma alanlarını tespit etmeyi amaçlamaktadır. Çalışmanın ilerleyen bölümlerinde literatür araştırması yapılmış, veri tabanlarından elde edilen meta veriler analiz edilerek konu hakkındaki bulgular paylaşılmıştır.

LİTERATÜR ARAŞTIRMASI

Nesnelerin interneti konusu üretim sektörleri için hali hazırda revaçta olan ve sürekli geliştirilmeye çalışılan bir alandır. Buna rağmen IoT verilerini kullanan modeller ve karar destek sistemleri ile ilgili literatür hala başlangıç ve gelişme aşamasındadır (Ben-Daya vd., 2020). Kaur vd. (2022) bu konuda bir derleme çalışması gerçekleştirmiş IoT ve blok zincir teknolojilerinin gıda tedarik zinciri için idealliğinden bahsetmişlerdir. IoT teknolojisi konusunda yetişmiş uzman bulunması kolay olmadığından uygulama aşaması için biraz daha zamana ihtiyacın olduğu görülmektedir. Çoğu çalışma IoT teknolojisinin gıda tedarik zincirlerine uyarlanmasını kolaylaştırıcı faktörleri tartışmaktadır. Aamer vd. (2021) IoT teknolojisinin gıda tedarik zincirlerine entegrasyonu sırasında ortaya çıkacak zorlukları derleyerek uygulamanın nasıl özümsenebileceği konusunda önerilerde bulunmaktadır. Narwane vd. (2022) gıda tedarik zincirinde IoT teknolojisinin benimsenme kararını etkileyen kritik faktörleri incelemişlerdir. Yöntem olarak DEMATEL çok kriterli karar verme metodunu kullanarak faktörler arasındaki sebep sonuç ilişkisini araştırmışlardır. Pang vd. (2015) raf ömrü tahmini ve maliyet unsurlarının belirlenip hızlandırılmış veri işleme yeteneğiyle, kendi kendine öğrenen raf ömrü tahmini ve gerçek zamanlı tedarik zinciri yeniden planlaması gerçekleştirebilen üç katmanlı bir IoT modeli önermektedir. Benzer olarak Zhao vd. (2015) gıda tedarik zinciri için ürününü tarladan, tedarik zinciri paydaşları içerisinde ve gıda işleme ortamlarında takip ederek gıda ürününün tanımlama ve izlenebilirliğini gerçekleştiren yeni bir IoT mimarisi tanıtmışlardır.

ARAŞTIRMA ve BULGULAR

Gıda tedarik zinciri ve nesnelerin interneti konusunda yapılan sistematik literatür taraması için bibliyometrik analizden faydalanılmıştır. Bamakan vd. (2022) bibliyometrik analiz konusunda adimsal olarak sistematik bir yol önermektedir. Bibliyometrik analiz için takip edilen sistematik adımlar şu şekildedir:

- Adım 1- Akademik veri tabanı seçimi: Araştırmada özgünlük ve nitelik açısından kaliteli yayınları tercih etmek amaçlanmıştır. Bu sebeple kapsamlı ve herkesçe kabul edilen Web of Science veritabanı analiz verisi toplamak için tercih edilmiştir.

- Adım 2- Anahtar kelimelerin tanımlanması: Araştırmanın doğru anahtar kelimelerle kapsamının belirlenmesi önemlidir. Araştırma kapsamını geniş tutarak konunun özünden kopmamak, aynı zamanda çok spesifik kelimeler kullanarak da çalışma alanını kısıtlamamak gerekmektedir. Bu bakış açısıyla analiz için, gıda tedarik zinciri ve nesnelerin interneti terimlerinin İngilizce karşılıkları tercih edilmiştir.
- Adım 3- Bulguların filtrasyonu: Anahtar kelimeler doğrultusunda yapılan taramada 234 adet yayın elde edilmiştir. Yayınların tümü İngilizce dilindedir. Yayın sayısının aşırı fazla olmaması nedeniyle herhangi bir ek filtre işlemi uygulanmamıştır.
- Adım 4- Analiz: Bulgular tarihsel gelişim, çalışma alanları, çalışıldığı ülkeler, yazarların ülkeleri gibi alanlarda sınıflandırılmaktadır.
- Adım 5- İlgili literatür sentezinin oluşturulması

Web of Science veritabanından elde edilen bilgiler için platformun ön analiz kısmından sağlanan bilgiler doğrultusunda Şekil 1’de konunun araştırma alanları görülmektedir. Gıda tedarik zinciri ve nesnelerin interneti konusundaki çalışmaların ağırlıklı olarak mühendislik ve bilgisayar bilimleri alanlarında olduğu görülmektedir. Buna karşın sosyal bilimler alanlarında yapılan çok az sayıda çalışma bulunmaktadır.

Şekil 1. Araştırma alanları

Konuya gösterilen ilginin yıllar içerisindeki değişimi de dikkat çekicidir. Nitekim Şekil 2.’ye göre 2013 yılında yapılan ilk ve tek çalışma sonrası yıllar içerisinde konuya dair yapılan

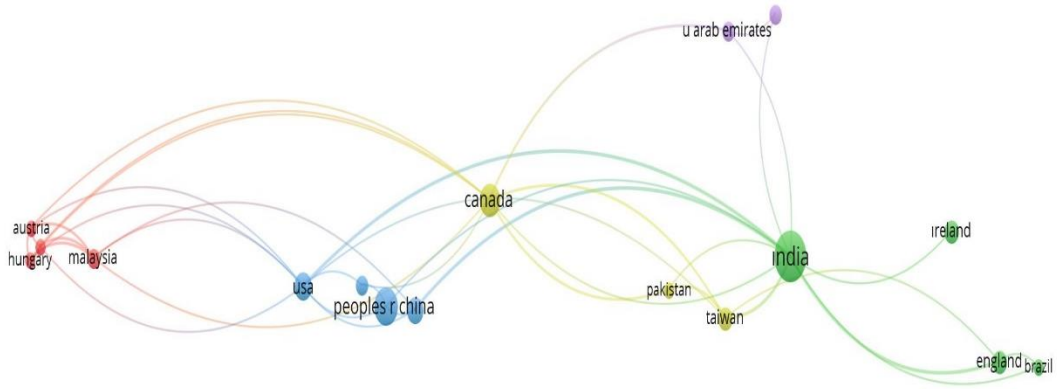

araştırmalar ivmeli olarak artış göstererek 2022 yılı itibari ile 54 sayısına ulaşmaktadır. Fakat hala bu alanın bakir olduğu yorumu yapılabilir.

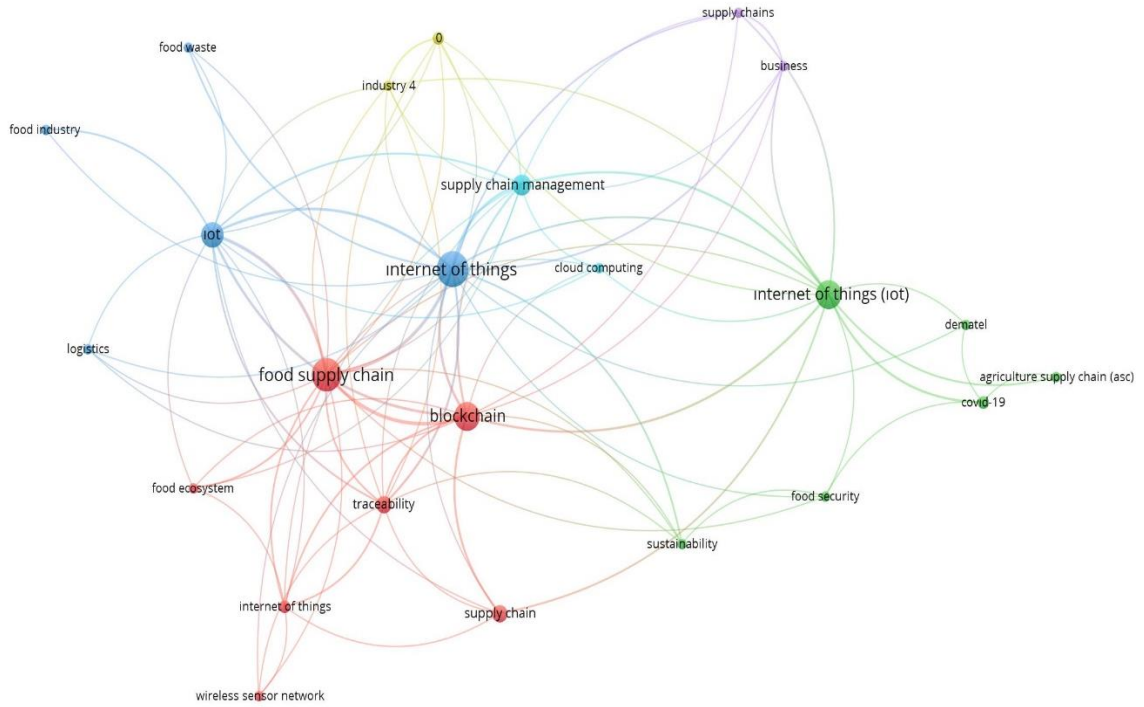

Şekil 2. Yıllara göre yayın sayısı

Woswiever uygulaması ile yapılan analizde çalışmaların yapıldığı ülkeler araştırılmış ve Şekil 3.' deki sonuçlara ulaşılmıştır. Buna göre özellikle Çin ve Hindistan gibi Asya ülkelerinde yapılan araştırmaların yoğunluğu dikkat çekicidir. Avrupa'da ise özellikle İngiltere tarafındaki araştırmacılar konuya hassasiyet göstermektedir. Asya tarafındaki yoğunluğun sebebi son dönemlerde bu bölgedeki bilgi teknolojisi alanındaki gelişmelerin etkisi olabilir.

Gıda tedarik zinciri ve nesnelerin interneti konularıyla ilgili diğer konular yani bağlantılı araştırma alanları ise Şekil 4.'de yer almaktadır. Buna göre nesnelerin interneti ve gıda birlikteliğine dair çalışma alanları bulunmaktadır. Gıda tedarik zincirleri, gıda güvenliği, gıda endüstrisi, gıda ekosistemi, izlenebilirlik ve sürdürülebilirlik gibi konuların nesnelerin interneti ile ilişkilendirildiği ve bu birlikteliklerde yine bulut sistemler, blok zincir gibi endüstri 4.0 uygulamalarının da çeşitli rolleri olduğu görülmektedir.

Şekil 3. Ülkelere göre konu çalışma yoğunluğu

Şekil 4. Konu çalışma alanları

SONUÇ

Bibliyometrik analiz konu hakkında anahtar kelimeler yoluyla veri tabanlarından elde edilen bilginin analiz edilmesinde ve yorumlanmasında kullanışlı bir araçtır. Çalışmada gıda tedarik zincirleri ve nesnelerin interneti konularının birlikte çalışıldığı alanlar araştırılmıştır. Yine araştırmacıların bulunduğu ülkelerin görülmesi konu hakkında yapılan çalışmaların hangi bölgelerde yoğunlaştığını göstermesi açısından faydalıdır. Nesnelerin interneti, gıdanın izlenmesi ve güvenliği için giderek çok daha aranan bir araç haline gelmektedir. Bu çalışma araştırma alanının trend ve bakir bir alan olduğunu göstermesi bakımından görsel bir yol haritası niteliği taşımaktadır. Gelecek çalışmalarda bu iki konunun birleştirildiği uygulama ağırlıklı çalışılacak ve gıda tedarik zinciri alanında gerçek hayat problemlerine nesnelerin interneti uygulamalarıyla çözüm aranacaktır.

ÖZET

Sağlıklı ve dengeli beslenmek için hayvansal kökenli gıda tüketimi büyük bir önem arz etmektedir. Dünya Sağlık Örgütü (WHO), sağlıklı bir insanın her bir kilogram vücut ağırlığı için günde 1 gram protein tüketmesi ve bunun da %42'sinin hayvansal kökenli olması gerektiğine vurgu yapmaktadır. Hızla artan dünya nüfusunun hayvansal kökenli protein ihtiyacını karşılamada kanatlı sektörü önemli bir kaynak olmaya devam etmektedir. Yemden yararlanmayı artırmak, büyümeyi teşvik etmek ve hastalıkları önlemek gibi amaçlarla kanatlı yemlerine ilave edilen antibiyotiklere karşı bakteri direncinin oluşması nedeniyle 2006 yılından beri büyümeyi teşvik edici olarak antibiyotik kullanımı yasaklanmıştır. Bu durum, kanatlı performansını ve sağlığının yanı sıra ürün miktar ve kalitesini de iyileştiren alternatif doğal katkı maddelerine olan ilgiyi giderek artırmaktadır. Denizlerde, göllerde ve tatlı sularda doğal olarak yetişmeleri ve zengin besin bileşimleri nedeniyle kanatlı yemlerine dahil edilebilme olanakları sıklıkla araştırılan alternatif katkı maddelerinden biri de mikroalgler olmuştur. Mikroalgler, güneş ışığını kullanarak karbondioksiti biyomasa (biyokütle) dönüştüren tek hücreli ve mikroskobik organizmalardır. Sucul ekosistemlerde besin zincirinin en alt halkasını oluşturan ve oldukça hızlı büyüyen mikroalgler, biyokütlesinde barındırdıkları karotenoid, lutein, pigment, alkaloid ve asteroitler gibi farklı biyoaktif bileşenleri vasıtasıyla kanatlı diyetleri için değerli bir bileşen olabilmektedir. Hayvan besleme çalışmalarında oldukça farklı mikroalg türü kullanılmakla beraber kanatlı besleme çalışmaları, yüksek protein, doymamış yağ asidi, vitamin ve pigment içerikleri nedeniyle daha çok *Spirulina*, *Chlorella*, *Haematococcus* ve *Dunaliella* isimli dört ana mikroalg üzerinde yoğunlaşmıştır. Bu çalışmada, dört ana mikroalg türünün (*Spirulina*, *Chlorella*, *Haematococcus* ve *Dunaliella*) bazı fizikokimyasal özellikleri, kanatlı sağlığı üzerine etkileri ve yem katkı maddesi olarak kullanım potansiyeli üzerinde durulmuştur.

Anahtar Kelimeler: Mikroalgler, *Spirulina*, *Chlorella*, *Dunaliella*, *Haematococcus*, Kanatlı besleme.

**POTENTIAL TO USE *SPIRULINA*, *CHLORELLA*, *HEMATOCOCCUS* AND
DUNALIELLA MICROALGAE AS ALTERNATIVE ADDITIVES IN POULTRY
FEEDS**

ABSTRACT

Consumption of food of animal origin is of great importance for a healthy and balanced diet. The World Health Organization (WHO) emphasizes that a healthy person should consume 1 gram of protein per kilogram of body weight per day, of which 42% should be of animal origin. The poultry industry continues to be an important source in meeting the animal-based protein needs of the rapidly increasing world population. The use of antibiotics as growth promoters has been prohibited since 2006 due to the formation of bacterial resistance to antibiotics added to poultry feeds for purposes such as increasing feed efficiency, promoting growth and preventing diseases. This situation is increasingly fueling interest in alternative natural additives that enhance poultry performance and health, as well as improve product quantity and quality. Microalgae has been one of the alternative additives that are frequently explored for their inclusion in poultry feeds due to their natural growth in seas, lakes and fresh waters and their rich nutrient composition. Microalgae are unicellular, microscopic organisms that convert carbon dioxide into biomass using sunlight. Microalgae, which form the lowest link of the food chain in aquatic ecosystems and grow quite rapidly, can be a valuable component for poultry diets with their different bioactive components such as carotenoids, lutein, pigments, alkaloids and steroids in their biomass. Although quite different types of microalgae are used in animal nutrition studies, poultry nutrition studies have mostly focused on four main microalgae namely *Spirulina*, *Chlorella*, *Haematococcus* and *Dunaliella* due to their high protein, unsaturated fatty acid, vitamin and pigment contents. In this study, some physicochemical properties of four main microalgae species (*Spirulina*, *Chlorella*, *Haematococcus* and *Dunaliella*), their effects on poultry health and their potential for use as feed additives were emphasized.

Keywords: Microalgae, *Spirulina*, *Chlorella*, *Dunaliella*, *Haematococcus*, Poultry feeding

GİRİŞ

Beslenmenin sağlıklı ve dengeli olabilmesi her gün belli miktarlarda hayvansal kökenli gıda tüketimi gerekmektedir. Dünya Sağlık Örgütü (WHO), %42'si hayvansal kökenli olmak kaydı ile sağlıklı bir insanın her kilogram vücut ağırlığı için günde 1 gram protein tüketmesini önermektedir (TİGEM, 2020). Artan dünya nüfusunun hayvansal kökenli protein ihtiyacının karşılanmasında kanatlı ürünleri (beyaz et ve yumurta) her geçen gün biraz daha öne çıkmaktadır. Tavuk, bıldırcın, keklik, hindi, kaz, ördek gibi kümes hayvanlarından elde edilen ve beyaz et olarak tanımlanan kanatlı etleri kırmızı ete oranla kısmen yüksek ve ucuz protein kaynağı olmalarının yanı sıra düşük kalori ve kolesterol içeriği ile yüksek sindirim oranına sahiptirler (Yücesoy & Kaya, 2022). Öte yandan biyolojik değeri 100 olarak kabul edilen yumurta proteini esansiyel aminoasitlerin hepsini, esansiyel olmayan aminoasitlerin ise büyük bir kısmını uygun oran ve miktarlarda içermektedir (Çelebi & Karaca, 2006). Ortalama %10 düzeyinde protein içeren 60 gr ağırlığındaki bir tavuk yumurtası, WHO verilerine göre 70 kg ağırlığındaki yetişkin bir insanın günlük alması gerekli hayvansal kökenli protein ihtiyacının yaklaşık %20'sini karşılayabilmektedir. İnsan beslenmesinde oldukça önemli bir yere sahip olan kanatlı sektöründe uzun yıllar boyunca yemden yararlanmayı artırmak, büyümeyi teşvik etmek ve hastalıkları önlemek gibi amaçlarla kullanılan antibiyotiklere karşı bakteri direncinin oluşması gerekçesi ile Avrupa Birliği'nin 2002 yılında almış olduğu kararla, 1 Ocak 2006 yılından itibaren büyümeyi teşvik edici olarak antibiyotik kullanımı yasaklanmıştır (Erhan, 2015). Bu nedenle bilimsel çalışmalar kanatlı performansı ve sağlığı ile ürün miktar ve kalitesini artıran alternatif doğal katkı maddeleri arayışlarına yönelmiştir. Kümes hayvanı diyetlerinde kullanımı son yıllarda kapsamlı bir şekilde araştırılan bir diğer alternatif katkı maddesi de mikroalglerdir.

Fitoplankton olarak da adlandırılan mikroalgler, güneş ışığını kullanarak karbondioksiti biyomasa (biyokütle) dönüştüren tek hücreli ve 1-50 µm çapında mikroskobik canlılardır (Carlsson et al., 2007; Türkmen & Akyurt, 2021). Fotobiyoreaktör olarak adlandırılan tanklarda, doğal göllerde veya özel üretim göletlerinde kültüre alınarak üretilen mikroalgler mavi-yeşil (*Cyanophyceae*), altın sarısı (*Chrysophyceae*) ve yeşil alglerin (*Chlorophyceae*) bazı türlerini içermektedirler (Carlsson et al., 2007). Sucul ekosistemlerde besin zincirinin en alt halkasını oluşturan mikroalgler oldukça hızlı büyürler ve biyokütleleri hayvan diyetlerinde değerli bir bileşen olabilmektedir (Tavernari et al., 2018). Mikroalglerin biyokütlesinde bulunan protein, karbonhidrat ve lipit düzeyi hayvan beslemede yaygın olarak kullanılan tohumlarda bulunandan çoğunlukla daha yüksek olabilmektedir (Lum et al., 2013). Hayvan

besleme çalışmalarında oldukça farklı mikroalg türü kullanılmakla beraber kanatlı besleme çalışmaları yüksek protein, doymamış yağ asidi, vitamin ve pigment içerikleri nedeniyle daha çok *Spirulina*, *Chlorella*, *Haematococcus* ve *Dunaliella* isimli dört ana mikroalg üzerinde yoğunlaşmıştır (Wahyuni et al., 2023; Tohidifar et al., 2023; Kasmani et al., 2023; Lee et al., 2023; Roques et al., 2022; Heng et al., 2021; Fernandes et al., 2020). Ayrıca *Spirulina* mikroalginin fikosiyanın ve γ -linolenik asit (Chu, 2012), *Chlorella* mikroalginin astaksantin (ASTA) (Ritu et al., 2023), santaksantin (Pelah et al., 2004) ve lutein (Jacob, 2013), *Haematococcus* mikroalginin ASTA (Ritu et al., 2023; Chu, 2012), *Dunaliella* mikroalginin ise β -karoten (Chu, 2012) ve glutation (Li et al., 2004) gibi yüksek değerli biyoaktif bileşikler bakımından da zengin oldukları bildirilmiştir.

Son yıllarda kümes hayvanları ile yürütülen birçok araştırma, bu mikroalg türlerinin yapısında bulunan zengin besin madde kompozisyonları ve farklı biyoaktif bileşiklerin antioksidan (Yalçınkaya, 2022; Fernandes et al., 2020; Heng et al., 2021; Mirzaie et al., 2020), immünomodülatör (El Shabrawy et al., 2022; Kang et al., 2017), antienflamatuar (Al-Otaibi et al., 2022; Roques et al., 2022; Tolba et al., 2020), hipolipidemik (Omar et al., 2022; Pestana et al., 2020; Gao et al., 2020) ve antimikrobiyal (Wahyuni et al., 2023; Abdel-Wahab et al., 2023; Kang et al., 2017) aktivite gösterdiği, et (Alfaia et al., 2021; Oh et al., 2015) ve yumurtada (Wahyuni et al., 2023; Tufan, 2018; Kim & Kang, 2015) doğal renk arttırıcı olarak hareket edebildiği ve çoklu doymamış yağ asitleri bakımından zenginleştirdiği (Coelho et al., 2021; Lemahieu et al., 2013) ve bağırsaktaki faydalı bakterileri popülasyonunu artırarak kanatlı sağlığını iyileştirdiği (Kasmani et al., 2023; Kang et al., 2017; Kim & Kang, 2015; Waldenstedt et al., 2003) bildirilmektedir. Kanatlı besleme çalışmalarında genellikle ilgi çeken dört ana mikroalg türünün besin madde kompozisyonu Tablo 1’de verilmiştir.

Table 1. Dört ana mikroalg türünün besin madde kompozisyonu

Besin Maddeleri	Değer			
	<i>Spirulina platensis</i>	<i>Chlorella vulgaris</i>	<i>Haematococcus pluvialis</i>	<i>Dunaliella salina</i>
Kuru madde	94.4 g/100 g	94.8 g/100 g	94.00 g/100 g	99.40 g/100 g
Ham Protein	56.4 g/100 g	60.6 g/100 g	23.62 g/100 g	58.60 g/100 g
Ham Yağ	7.2 g/100 g	12.8 g/100 g	13.80 g/100 g	5.87 g/100 g
Karbonhidrat	14.2 g/100 g	14.2-35.5 g/100 g*	38.00 g/100 g	53.13 g/100 g*
Ham Selüloz	0.02 g/100 g	13.0 g/100 g		
Ham kül	7.5 g/100 g	4.5 g/100 g	17.71 g/100 g	
Enerji	43.6 TE MJ	3720 ME kcal/kg		3906 TE kcal/kg
Kalsiyum	436.3 mg/100 g	10 mg/100 g	% 1.58	1.40 g/kg*
Fosfor	124.5 mg/100 g	1060 mg/100 g		4.43 g/kg*
Sodyum	220.1 mg/100 g	1120 mg/100 g		34.34 g/kg*
Potasyum	167.8 mg/100 g			3.61g/kg*
Magnezyum	400 mg/100 g*	360 mg/100 g	% 1.14	1.99 g/kg*
Bakır	1.2 mg/100 g*	1.4 mg/kg		3.59 mg/kg*

Kanatlı diyetlerinde *Spirulina platensis* kullanım etkileri

Spirulina pek çok organizmanın büyüemeyeceği yüksek alkali sularda yetişebilen, spiral şekilli, gerçek çekirdeği olmayan çok hücreli bir bitkidir (Jacob, 2013). İpliksi bir siyanobakteri (mavi-yeşil algler) olan *Spirulina (Arthrospira) platensis*'in yetiştirilmesinin kolay olması, mükemmel besin madde profiline sahip olması ve fikosiyanin, β -karoten, zeaksantin, klorofil ve γ -linolenik asit gibi biyoaktif bileşikler açısından zengin olması kanatlı beslenmesinde alternatif katkı maddesi olarak kullanımını mümkün kılmaktadır (Tavernari et al., 2018; Kolluri et al., 2022; Abd El-Hady et al., 2022). *Spirulina*'nın bileşiminde fazla miktarda bulunan fikosiyaninin deneysel modellerde antikanserojen, antioksidan ve antienflamatuar aktivite (Chu, 2012; Jensen et al., 2015) sergilediği bildirilmiştir. Yüksek düzeyde protein içermesi ve amino asit profilinin soya fasulyesi (Yalçınkaya, 2022) veya süt proteini kazeine (FAO, 2008)

benzer, dengeli bir amino asit kompozisyonuna sahip olması nedenleri ile alternatif protein kaynağı olarak da düşünülmektedir. Kanatlı besleme çalışmalarında *Spirulina platensis* mikroalginin etkilerinin incelendiği son literatür Tablo 2’de verilmiştir.

Tablo 2. Kanatlı diyetlerine *Spirulina platensis* (SP) algi ilavesi

Kanatlı türü ve mikroalg dozu	Etki	Referans
81 haftalık Lohmann Brown yumurtacı tavuk diyetine %0.3 SP ilavesi	-yumurta sarısı indeksi ve renginde iyileşme -eritrosit sayısında artış ve bağırsak bakteri dengesinin korunmasında etkin rol -amonyak atılımında azalma	Wahyuni et al. (2023)
7 haftalık yumurtacı Japon bildirici diyetine %0.02 ve %0.04 <i>Spirulina platensis</i> fikosiyenin veya fukoidan ilavesi	-yumurta verimi ve kalitesi ile serum protein, albümin, HDL düzeylerini ve bakteri sayılarında olumlu yönde etkilenme -yumurta depolama süresindeki artış ile ürün güvenliğini artırabilme olasılığı	Tohidifar et al. (2023)
Aflatoksin B1 (AFB1) ile kontamine olmuş yemle beslenen Ross 308 etlik piliç diyetlerine 1000 mg/kg SP ilavesi	-canlı ağırlık kazancı (CAK) ve yem tüketimi (YT)'nde artış, yemden yararlanma oranı (YYO)'nda azalma -karaciğer oksidatif stres ve hasar belirteçlerinde azalma ve antioksidan parametrelerinde artış, -bağırsakta laktik asit bakterilerinde artış, koliform bakterilerinde azalma -AFB1'in biyodetoksifikasyonunda da etkili bir kullanım	Kasmani et al. (2023)
10 günlük Japon bildirici diyetlerine % 1.5, %3.0, %4.5 veya %6.0 SP tozu ilavesi,	özellikle %4.5 ilave seviyesinde -büyüme performansında iyileşme -bağırsak <i>Lactobacillus</i> popülasyonunda artış, <i>Escherichia coli</i> (<i>E. coli</i>) ve <i>Salmonella</i> popülasyonlarında azalma -karaciğer fonksiyonu, toplam lipid profili, antioksidan parametreler ve bağışıklık tepkisinde iyileşme	Abdel-Wahab et al. (2023)
Düşük proteinli (%10) karma yemle beslenen Ross 308 etlik piliç diyetlerine %0.1 ve %0.2 düzeylerinde SP ilavesi	özellikle %0.1 ilave seviyesinde -YYO’nda iyileşme -karaciğer ve ette oksidatif stres indeksinde azalma -toplam antioksidan ve antioksidan enzim aktivite düzeylerinde artış -serum trigliserit (TG) düzeyinde azalma	Yalçinkaya (2022)
Etlik piliç diyetlerine 30 veya 50 g/kg SP ilavesi	-büyüme performansı ve serum immünoglobulin seviyelerinde artış	El Shabrawy et al. (2022)
Sıcaklık stresine maruz kalan 45 haftalık HY-Line W-36 yumurtacı tavuk diyetlerine %3, %6 veya %9 SP ilavesi	seviye artışı ile doğrusal olarak -yumurta verimi ve ağırlığı ile yem tüketiminde artış, YYO’nda azalma -serum ve yumurta sarı total kolesterol (T-KOL) düzeyi ve serum düşük yoğunluklu lipoprotein kolesterol (LDL-C) düzeylerinde azalma -serum yüksek yoğunluklu lipoprotein kolesterol (HDL-C)’de artış	Al-Otaibi et al. (2022)

	-interlökin (IL)-1 β , IL-6 ve tümör nekrosis factor-alfa (TNF- α), seruloplazmin, malondialdehit (MDA), total antioksidan kapasitesi (TAC) ve glutatyon peroksidaz (GPX) düzeylerinde azalma	
Etlik piliç diyetlerine 0.25, 0.5, 0.75 ve 1 g/kg <i>SP</i> ilavesi	seviye artışı ile doğrusal olarak -performansta iyileşme -serum toplam protein, albümin ve globulin seviyelerinde artış -serum TG, T-KOL ve LDL-C'de azalma -serum glukoz ve leptin seviyelerini etkilemeden tiroksin ve büyüme hormon seviyelerinde artış -serum TAC, katalaz (CAT) ve süperoksit dismutaz (SOD) düzeylerinde artış, MDA'da azalma -serum proinflatuar sitokinler IL-1 β seviyeleri üzerinde herhangi bir etki olmamakla beraber kaspaz-3 ve TNF- α immün etiketleme indeksinde artış	Omar et al. (2022)
14 günlük etlik piliç diyetlerine 5 g/kg <i>Spirulina</i> biyokütlesi ilavesi	-eritrosit, hematokrit, lökosit, hemoglobin (Hb) konsantrasyonunda artış, nötrofil, bazofil, trombosit sayısında artış, lenfositler ve eozinofillerin sayısında azalma	Matveev et al. (2022)
Sıcak iklim koşullarında yetiştirilen etlik piliçlerin içme suyuna 5, 10, 15 ve 20 g/L <i>SP</i> ilavesi	-Hb ve kırmızı kan hücresi (RBC) sayısında artış -serum lipid ve transaminaz içeriğinde azalma -15 ve 20 g/L gruplarında serum protein konsantrasyonunda artış -but eti renk parametrelerinde gelişme -20 g/L ilavesi ile fitohemaglutinin-P ve Newcastle hastalığı aşılmasına karşı hücre aracılı ve hümmoral bağışıklık artışı	Kolluri et al. (2022)
Etlik piliç diyetlerine %0.25, 0.5 veya %1.0 <i>SP</i> ilavesi	-%1 <i>SP</i> ilavesi ile büyüme performansında iyileşme -%0.5 ve %1.0 <i>SP</i> ilavesi ile serum toplam proteini ve globülinde artış ve serum T-KOL düzeyinde azalma -%0.25, 0.5 veya %1.0 <i>SP</i> ilavesi lenfosit yüzdesinde artış	Hassan et al. (2022)
Etlik piliç diyetlerine %3 veya %6 <i>SP</i> ilavesi	-Büyüme performansında iyileşme -serum Hb, WBC (beyaz kan hücresi) ve RBC sayıları ile ve lenfosit değerlerinde artış, -serum total lipid, T-KOL, MDA, LDL ve TG konsantrasyonlarında azalma, HDL ve GPX konsantrasyonlarında artış -serum ve tibia külü Ca ve P konsantrasyonlarında artış -bağırsak villus yüksekliği, 100 enterosit başına goblet hücresi ve kript derinliğinde artış	Abd El-Hady et al. (2022)
63 haftalık Hy-Line W-36 yumurtacı tavuk diyetine %1 veya %2 <i>SP</i> ilavesi	-%2 <i>SP</i> ilavesi ile yumurta kabuk kalınlığı, kırılma mukavemeti ve sarı renginde iyileşme -yumurta sarısı T-KOL içeriğinde azalma -serum aspartat aminotransferaz (AST) ve alanin aminotransferaz (ALT) konsantrasyonlarında azalma, SOD ve TAC'da artış	Tufarelli et al. (2022)

AFB1'e maruz kalan etlik piliç diyetlerine 10 g/kg <i>SP</i> ilavesi	-büyüme performansında iyileşme -AFB1 etkisi ile artan serum AST ve ALT aktiviteleri, karaciğer ve abdominal yağ nispi ağırlığında ve bağırsak koliform sayısında iyileşme	Feshanghchi et al. (2022)
Etlik piliç diyetlerine %0.33, %0.66 veya %1 mikrokapsüllü veya mikrokapsülsüz <i>SP</i> tozu	-kapsüllü ya da kapsülsüz <i>SP</i> tozu ile serum süper oksit dismutaz aktivitesinde artış	Shakoori et al. (2020)
23 haftalık yumurta tavuğu diyetlerine (White Leghorn veya Rhode Island Red) %1 veya %3 <i>SP</i> ilavesi	-%3 <i>SP</i> ilavesi ile daha yüksek yumurta sarısı retinol düzeyinde artış, α -tokoferol düzeyinde azalma -%1 <i>SP</i> ilavesi ile yumurta sarısı L* renk parametresinde azalma ve a* ve b* renk parametrelerinde artış -yumurta sarısı yağ asidi bileşiminde değişim	Rey et al. (2021)
Yumurta tavuğu diyetlerine %0.1, %0.2 veya %0.3 <i>SP</i> ilavesi	-%0.2 <i>SP</i> ilavesi ile yumurta ağırlığı, kütlesi ve verimi, yumurta albümin indeksi ve Haugh birimi ile yumurta sarısı L* ve a* değerlerinde artış	Khan et al. (2021)
Ross 708 erkek piliçlerin düşük proteinli diyetlerine 100 g/kg <i>SP</i> ilavesi	-kemokin, 3-inflamazom içeren NOD benzeri reseptör ailesi pirin alanı ve proinflamatuvar sitokinlerin ekspresyon seviyeleri (IL-3, IL-6, IL-4, IL-18 ve TNF- α)'nde azalma	Mullenix et al. (2021)
Deneyisel <i>Salmonella enteritidis</i> ile mücadele eden 7 günlük Japon bıldırcını diyetlerine 1 veya 2 g/kg <i>SP</i> ilavesi	-büyüme performans parametrelerinde iyileşme -organ kolonizasyonunda azalma -sekal proinflamatuvar gen ekspresyonları (IL-6, IL1 β ve TNF- α) ve sekal serum amiloidinin gen ekspresyonunda azalma -antienflamatuvar sitokin (IL-10)'nde artış -TAC ve serum biyokimyasal parametrelerinde iyileşme	Abd El-Dayem et al. (2021)
60 haftalık yumurta tavuğu diyetlerine %1 veya %2 <i>SP</i> ilavesi	-yumurta sarısı L* renk özelliğinde azalma a*ve b* renk parametrelerinde artış	Curabay et al. (2021)
Etlik piliç diyetlerine 5 veya 10 g/kg <i>SP</i> ilavesi	-CAK'nda artış, YYO'nda azalma -intestinal <i>Lactobacillus sp.</i> popülasyonunda artış, <i>E. coli</i> popülasyonunda azalma -karaciğer ağırlığında azalma, kalp ağırlığında artış -serum Hb düzeyinde artış, hemotokrit, lökosit ve euzonofil düzeylerinde azalma	Alwaleed et al. (2021)
Etlik piliç diyetlerine 1 g/kg <i>SP</i> ilavesi	-göğüs eti eikosapentaenoik (EPA), dokosaheksaenoik (DHA), araşidonik asit, n-3 çoklu doymamış yağ asidi (PUFA) ve lisin, metiyonin, triptofan ve histidin amino asit düzeylerinde artış -göğüs eti MDA ve PC (protein karbonil) düzeylerinde azalma, SOD düzeyinde artış -göğüs eti pişirme kaybı, 1 ve 5. gün belirlenen aerobik bakteri sayısı ve aerobik bakteri büyüme hızında azalma	El-Bahr et al.. (2020)
Etlik piliç diyetlerine %15 <i>SP</i> ilavesi	-büyüme performansında kötüleşme -deodenum ve jejenum uzunluğunda ile sindirim viskozitesinde artış -serum glukoz, total lipit ve T-KOL, triaçilgliserol, LDL ve γ glutamil transferaz düzeylerinde artış	Pestana et al. (2020)

	-serum kreatinin, AST ve ALT aktivitelerinde azalma -göğüs eti sululuk değerlendirmesi ile göğüs ve but eti b* renk değerinde artış -göğüs ve but eti α -tokoferol ve γ - tokoferol düzeylerinde azalma, total klorofil ve karotenoid düzeylerinde artış -göğüs ve but eti SFA ve n-6/n-3 oranında artış, PUFA ve PUFA/SFA oranında azalma	
Etlik piliç diyetlerine 1, 1.5 ve 2 g/kg SP ilavesi	özellikle 2 g/kg SP ilavesi ile -performans ve karkas randımanında iyileşme -heterofil seviyesinde azalma, lenfosit seviyesinde artış -Newcastle aşısına karşı antikor titresi üzerinde etki -villus uzunlukları ve goblet hücre sayısında artış -net ve brüt gelirdede artış	Khan et al. (2020)
Sıcaklık stresi uygulanan toplam 98 günlük Japon bildiricini diyetlerine %0.1, %0.3 veya %0.5 SP ilavesi	özellikle %0.5 düzeyinde SP ilavesinin -bağırsak <i>E. coli</i> popülasyonunda azalma, -serum MDA düzeyinde azalma -heterofil oranı ile heterofil/lenfosit oranında azalma, lenfosit oranında artış	Hajati et al. (2020)
Etlik piliç diyetlerine 6, 12 veya 18 g/kg SP ilavesi	-büyüme performansında artış -kan paketlenmiş hücre hacmi, Hb sayısı, RBC ve WBC üzerine önemli etkiler -serum glukoz, TG, toplam protein, globulin, AST, ALT ve ALP değerlerinde artış	Opoola et al. (2019)
38 haftalık ATAK-S yumurtacı tavuk diyetlerine %0, %0.5, %1 ve %2 SP ilavesi	-yumurta sarı genişliği ve indeksi ile a* renk skorunda artış L* renk skorunda azalma -yumurta sarısı stearik asit, linoleik asit, omega-6 ve çoklu doymamış yağ asitlerinde değişim -%1 SP ilavesi ile raf ömründe artış	Tufan (2018)
Etlik piliç diyetlerine 7, 21 veya 35 gün boyunca %1 düzeyinde SP ilavesi	-35 gün SP tüketen piliçlerde YYO'nda azalma, çekum nispi ağırlığında artış, Hb, eritrosit ve hematokrit, lökosit ve lenfosit sayılarında azalma -21 gün SP tüketen piliçlerin ileum koliform sayısında azalma	Sugiharto et al. (2018)
Döngüsel sıcaklık stresi uygulana etlik piliç diyetlerine 5, 10 veya 20 g/kg SP ilavesi	-stres hormonu konsantrasyonu ve bazı serum lipid parametrelerinde azalma -humoral bağışıklık tepkisi ve TAC'da artış	Mirzaie et al. (2018)
Etlik piliç diyetlerindeki soya proteininin %50'si SP unu ile değiştirildiğinde	-göğüs eti pH _{20min} ve L* renk değerinde azalma, pH _{24h} ile a* ve b* renk değerlerinde artış - göğüs eti yüksek su tutma kapasitesi ve duyuusal testlerde (metalik tat, sertlik ve gevreklik) iyileşme.	Altmann et al. (2018)

Kanatlı diyetlerinde *Chlorella vulgaris* kullanım etkileri

Chlorella vulgaris, gıda, yem ve biyoyakıt üretimi gibi çeşitli endüstriyel uygulamalara sahip, deniz suyu, tatlı su ve toprak gibi çeşitli yaşam alanlarında gelişebilen yeşil algleri (*Chlorophyceae*) türünden biri olup ökaryotik küresel şekilli, tek hücreli fotosentetik bir mikroorganizmadır (Borowitzka, 2013; Jacob, 2013; Mondal et al., 2016; Spínola et al., 2023).

Farklı büyüme koşullarına adapte olabilir ve *Spirulina* mikroalginden 100 kat daha küçük boyutu nedeniyle hasat için daha karmaşık ekipman gerektirir (Jacob, 2013). Ayrıca *Chlorella vulgaris*'in besin bileşimi yetiştirme koşullarından etkilenmekle beraber, proteinler, lipitler, peptitler, vitaminler ve minerallerin zengin bir kaynağı (Kang et al., 2013; Madhubalaji et al., 2021) olduğu gibi optimize edilmiş kültür koşulları ve besin kaynakları altında yüksek konsantrasyonda lutein (%8.8), ASTA (%4.6), β -karoten (%3.9) gibi karotenoidleri ürettiği bildirilmektedir (Yadav et al., 2020). En etkili ve güçlü antioksidanlardan biri olan ASTA kanatlı hayvanların büyüme (Hosseindoust et al., 2020; Ulaiwi & Al-Khafaji 2020), bağışıklık (Awadh & Zangana 2020; Hosseindoust et al., 2020) ve yaşam gücünü artırma (Ritu et al., 2023), et (Hosseindoust et al., 2020) ve yumurtanın (Gouveia et al., 2002; Batista et al., 2013) kalitesini iyileştirme gibi potansiyel faydaları vardır. Beslenme açısından, *Spirulina* ve *Chlorella* benzer olmakla birlikte *Spirulina* biraz daha yüksek protein içeriğine sahip iken *Chlorella* antioksidan aktivite ve B12 vitamin içeriği bakımından daha zengindir ve ayrıca *Chlorella* iyi bir lutein kaynağıyken *Spirulina*'da lutein hiç yoktur (Jacob, 2013). Kanatlı besleme çalışmalarında *Chlorella vulgaris* mikroalginin etkilerinin incelendiği son literatür Tablo 3'te verilmiştir.

Tablo 3. Kanatlı diyetlerine *Chlorella vulgaris* (CV) algi ilavesi

Kanatlı türü ve mikroalg dozu	Etki	Referans
10 günlük Ross 308 etlik piliç diyetlerine %0.5 CV ilavesi	-CD4+ T hücrelerinde bir artış -intestinal epitelyal bariyer işleviyle ilişkili belirteçlerin (okludin ve avian-defensin 5) nispi mRNA ekspresyonunda yükselme - sekal bakteri popülasyonunda zenginlik	Lee et al. (2023)
Ross 308 etlik piliç diyetlerine %0.8 CV ilavesi	-CAK'nda artış, YYO'nda azalma -büyüme evresinde haptoglobin ve interlökin-13 tepkilerinde azalma	Roques et al. (2022)
Ross 308 etlik piliç diyetlerindeki soya fasulyesi küspesi yerine %10, %15 veya %20 CV ilavesi	-%15 ve %20 CV ilavesi ile canlı ağırlık (CA), CAK ve YT'nde azalma -%20 CV ilavesi ile daha yüksek su tutma kapasitesi ve daha düşük pişirme kaybı -10% CV grubundaki göğüs etinde en yüksek duysal analiz kabul puanı tüm CV ilaveleri ile -ileal sindirim viskozitesi, çeşitli gastrointestinal bölümlerin ağırlık ve boyutunda artış - göğüs eti verimi, klorofil a, klorofil b ve toplam karotenoid içeriğinde artış, DHA+EPA ve n-3 PUFA konsantrasyonlarında artış, n-6/n-3 PUFA oranında azalma - et bakteri sayısında azalma	Cabrol et al. (2022)

Ross 308 etlik piliç diyetlerine %10 CV ilavesi	-plazma TAG, LDL-C, T-KOL, üre ve toplam proteinde artış, plazma HDL-C'de azalma -karaciğer n-6/n-3 oranı ve γ -tokoferol, β -karoten ile toplam karotenoidlerde iyileşme	Coelho et al. (2021)
Ross 308 etlik piliç diyetlerine %10 CV ilavesi	-sindirim viskozitesinde artış göğüs ve but eti gevreklik, toplam karotenoidler ve b* renk parametresi ile bazı yararlı yağ asidi bileşimlerinde iyileşme	Alfaia et al. (2021)
22 günlük Ross 308 etlik piliç diyetlerine 10 ve 20 g/kg CV ilavesi	-10 g/kg CV ilavesi ile en yüksek toplam antikör ve immünoglobulin G (IgG) titrelerinin yanı sıra daha yüksek kutanöz aşırı duyarlılık tepkisi, bağırsak villus yüksekliği ve kript derinliğinde artış -20 g/kg CV ilavesi ile serum SOD aktivitesinde artış ve MDA konsantrasyonunda azalma	Mirzaie et al. (2020)
Etlik piliç diyetlerine 1 g/kg CV ilavesi	-36. gün CAK'nda artış -göğüs eti MDA ve PC düzeyleri ile pişirme kaybı, 1 ve 5. gün aerobik bakteri sayısında azalma	El-Bahr et al. (2020)
Etlik piliç diyetlerine 25, 50 veya 75 g/kg CV ilavesi	CV ilavesinin seviye artışı ile doğrusal olarak -performansta iyileşme -plazma IgG, IgM ve IgA konsantrasyonlarında artış -sekal içerik <i>Lactobacillus</i> konsantrasyonunda artış ve <i>E. coli</i> ve <i>Salmonella</i> konsantrasyonlarında azalma -villus yüksekliği ve kript derinliğinde artış, villus yüksekliği/kript derinliği oranında azalma	Kang et al. (2017)
Etlik piliç diyetlerine %0.05, 0.15 veya %0.5 CV ilavesi	-performansta iyileşme -serum total lipid konsantrasyonlarında azalma, serum IgG ve IgM seviyelerinde artış	An et al. (2016)
Pekin ördeği diyetlerine 1000 mg/kg veya 2000 mg/kg fermente edilmiş CV ilavesi	-CAK ve YT'nde artış -karaciğer nispi ağırlığında azalma -tibia kemiği kırılma mukavemetinde artış -göğüs eti b* renk parametresi ve pH değeri ile but eti L* renk parametresinde artış	Oh et al. (2015)
28 haftalık Hy-Line Brown yumurta tavuğu diyetlerine 25, 50, or 75 g/kg CV ilavesi	-yumurta verimi ve YT'nde iyileşme -yumurta sarı rengini ve Haugh birimi, plazma IgG ve IgM konsantrasyonları ve sekal <i>Lactobacillus</i> popülasyonunda artış	Kim & Kang (2015)
28 haftalık ISA Brown yumurta tavuğu diyetlerine 1.25 g/kg veya 2.5 g/kg <i>Chlorella fusca</i> ilavesi	-yumurta sarısı başta DHA olmak üzere farklı n-3 uzun zincirli-PUFA seviyelerinde zenginleşme, α -linolenik asit düzeyinde artış	Lemahieu et al. (2013)
Etlik piliç diyetlerine %1.0 kurutulmuş <i>Chlorella</i> unu, <i>Chlorella</i> büyüme faktörü veya taze sıvı <i>Chlorella</i> ilavesi	-kurutulmuş <i>Chlorella</i> unu ilavesi ile CAK ve plazma IgA ve IgM konsantrasyonları artarken taze sıvı <i>Chlorella</i> ilavesi ile beyaz kan hücreleri ve lenfosit sayısı, plazma IgG ve IgM konsantrasyonu ve bağırsak <i>Lactobacillus</i> popülasyonunda artış	Kang et al. (2013)

Kanatlı diyetlerinde *Haematococcus pluvialis* ve *Dunaliella salina* kullanım etkileri

Haematococcus pluvialis, fotoototrofik ve heterotrofik olarak büyüeyebilen ~30 μ m çapında ökaryotik, tek hücreli, küresel, çift kamçılı ve tatlı su yeşil mikroalgidir (Ritu et al., 2023). Kuru ağırlığının yaklaşık %6'sı kadarını ASTA, β -karoten ve lutein gibi karotenoidler (Jomova &

Valko, 2013) ve büyük çoğunluğunu omega-3 ve omega-6 yağ asitlerinin oluşturduğu %35 lipit içeriği ile *Haematococcus pluvialis*, hem güçlü bir renklendirici madde hem de çeşitli sağlık bozukluklarının ve metabolik hastalıkların önlenmesinde potansiyel etkiye sahip bir antioksidan kaynağıdır (Castillo et al., 2020). Mikroalgler arasında *Haematococcus pluvialis*, doğal kırmızı hücre içeren ASTA'nın en iyi kaynağıdır (Ritu et al., 2023). Ayrıca, *Haematococcus pluvialis* kaynaklı ASTA çevre dostu doğal bir kaynak olmasının yanında kanatlı diyetlerinde genellikle immünolojik (Awadh ve Zangana, 2021; Tolba et al., 2020), hematolojik (Magnuson et al., 2018) ve antioksidan (Gao et al., 2021; Heng et al., 2021; Sun et al., 2018) özellikleri iyileştirmek için de kullanılmaktadır.

Karotenoidlerce zengin, halofil ve yeşil tek hücreli bir mikroalg türü olan *Dunaliella salina*, yaklaşık %8'e kadar esansiyel amino asit, %30-50'ye kadar protein, %10 kadar lipid, yüksek karbonhidrat, vitamin ve pigment içerikleri nedeniyle (Fernandes et al., 2020; Mawed et al., 2022) kanatlılar için doğal bir yem olarak önerilen mikroalgdir (Sanderson, 2018; Fernandes et al., 2020). Zeaksantin, β -karoten, omega-3 çoklu doymamış yağ asitleri ve B12 vitamini açısından zengin olduğu ve ayrıca antibakteriyel ve antiviral aktivitelere, antioksidan ve antienflamatuar özelliklere sahip olduğu bildirilmiştir (Mawed et al., 2022). *Dunaliella salina* ve *Haematococcus pluvialis* mikroalglerinin kanatlı hayvanları üzerindeki etkilerinin incelendiği son literatür Tablo 4'te verilmiştir.

Tablo 4. Kanatlı diyetlerine *Haematococcus pluvialis* (HP) ve *Dunaliella salina* (DS) algleri ilavesi

Kanatlı türü ve mikroalg dozu	Etki	Referans
Sıcaklık stresi altında yetiştirilen etlik piliç diyetlerine 10, 20, 30 veya 40 mg/kg HP kaynaklı doğal ASTA ilavesi	-Bursa fabricus nispi ağırlığında artış - Newcastle hastalığına yönelik antikorların boyut standardında üstünlük -Cambro hastalığına yönelik antikorların boyut kriterinde daha iyi performans - bazı immünolojik özelliklerde iyileşme	Awadh & Zangana (2021)
Yumurta tavuğu diyetlerine 20, 40, 80 veya 160 mg/kg HP kaynaklı doğal ASTA ilavesi	-ASTA ilavesinin seviye artışı ile doğrusal olarak yumurta sarı renginde artış, karaciğer ve böbrek hidroksil radikalleri ile süperoksit anyonlarının süpürme yeteneklerinde artış, MDA içeriğinde ise azalma -40 mg/kg ASTA ilavesi ile böbrekte GPX aktivitesinde, karaciğer, böbrek ve plazmada ise toplam SOD aktivitesinde artış - 40 mg/kg ASTA ilavesi ile karaciğer ve böbrekte Cu-Zn SOD, Mn SOD ve nükleer faktör E2 ile ilişkili faktör 2'nin mRNA ekspresyonunda artış, -40 ve 80 mg/kg'da diyet ASTA ilavesi ile karaciğer ve böbrek GPX4 mRNA seviyesinde artış	Heng et al. (2021)

53 haftalık Jinghong No. 1 yumurtacı damızlık horoz diyetlerine 25, 50 veya 100 mg/kg HP kaynaklı ASTA ilavesi	-semen kalitesinde iyileşme -antioksidan aktivite, hidroksil radikaller ve süperoksit anyonları temizleme yeteneğinde artış -antioksidan enzim mRNA seviyeleri, mitojenle aktive olan protein kinaz, nükleer faktör-eritroid 2 ile ilişkili faktör 2'nin mRNA ve protein seviyelerinde artış	Gao et al. (2021)
Etlik piliç diyetlerine 10, 20, 30 veya 40 mg/kg HP kaynaklı ASTA ilavesi	- CA, CAK, YT ve YYO'nda yüksek iyileşme -mortalitede azalma	Awadh & Zangana (2020)
40 haftalık yumurta tavuğu diyetlerine %0.25, 0.50, 0.75 veya %1 <i>Dunaliella salina</i> (DS) ilavesi	- <i>Dunaliella salina</i> biyokütlesinin dahil edilme seviyeleri, performans, kalitatif parametreler ve yumurtaların fizikokimyasal parametreleri üzerinde olumlu etkiler -duodenum ve ileum villi uzunlukları ve villus/kript oranı ile ve karaciğerdeki karotenoidlerin metabolizasyonunda artış	Fernandes et al. (2020)
Sıcaklık stresi uygulanan etlik piliç diyetlerine 20, 40 veya 80 ppm HP kaynaklı ASTA ilavesi	-but eti MDA düzeyi ve damlama kaybında azalma, TAC düzeyinde artış -göğüs eti a* ve b* renk parametrelerinde artış -plazma CAT ve SOD seviyelerinde yükselme -80 ppm ASTA uygulaması ile but eti 3-etilbenzotiazolin-6-sülfonat indirgeme aktivitesinde, 40 ppm ASTA uygulaması ile de 2,2-difenil-1-pikrilhidrazil radikal süpürme kapasitesinde bir artış -40 veya 80 mg/kg ASTA ilavesi karaciğer ısı şok proteini (HSP)27, HSP70, TNF- α ve IL-6 ekspresyonunda azalma	Hosseindoust et al. (2020)
Oksidatif stres uygulanan etlik piliç diyetlerine 40, 50 veya 60 mg/kg mikroalg kaynaklı ASTA ilavesi	-50 mg/kg düzeyinde ASTA ilavesi ile final CA, CAK, YT ve YYO'nda gelişme	Ulaiwi, & Khafaji. (2020).
Sıcaklık stresi uygulanan Cornish etlik piliç ve yumurtacı tavuk diyetlerine 10, 20, 40 veya 80 mg/kg HP kaynaklı ASTA ilavesi	-hem etlik piliç hem de yumurtacı tavuklarda artan diyet mikroalg ASTA ilavesi redoks durum, ısı stresi, iltihaplanma ve lipid metabolizması ile ilgili gen ekspresyonu üzerine etkiler	Tolba et al. (2020)
Nongda No.3 yumurta tavuğu diyetlerine 20, 40, 80 veya 160 mg/kg HP kaynaklı ASTA ilavesi	artan diyet ASTA ilavesi ile -yumurta sarı renginde koyulaşma -yumurtaların depolanması sırasında artan sarı indeks ve Haugh birimlerinde azalma - yumurta sarı pH'ı ve ağırlık kaybındaki artışı geciktirme	Heng et al. (2020)
50 haftalık Hy Line Brown yumurta tavuğu diyetlerine 25, 50 veya 100 mg/kg HP kaynaklı ASTA ilavesi	-plazma, karaciğer ve yumurta sarısı TAC, SOD ve GPX seviyelerinde artış, MDA içeriğinde azalma -karaciğer ve yumurtalık mRNA ekspresyonlarında yükselme -50 ve 100 mg/kg gruplarında plazma LDL-C seviyesinde azalma -100 mg/kg grubunda plazma HDL-C artarken TG seviyesinde azalma	Gao et al. (2020)

Sıcaklık stresi uygulanan 21 haftalık White Leghorn yumurta tavuğu diyetlerine 10, 20, 40 veya 80 mg/kg HP kaynaklı ASTA ilavesi	-plazma ve yumurta sarısında ASTA ve toplam karotenoid zenginleşmesi -karaciğer ve yumurta sarısı oksijen radikali bağlama kapasitesinde artış -karaciğer toplam glutatyon, GPX ve glutatyon-S transferaz aktivitelerinde azalma -yumurta sarısı a* renk parametresinde artış -lipit profilinde değişim	Magnuson et al. (2018)
Etlik piliç diyetlerine yem katkı maddesi olarak %0.01, 0.025, 0.05, 0.1 veya %0.5 düzeylerine veya yem fraksiyonu olarak %1, %10 veya %20 yağı alınmış <i>Dunaliella salina</i> ilavesi	-yem katkı maddesi olarak %0.1'e varan oranlarda <i>Dunaliella salina</i> alg biyokütlesi ilavesi ile YYO'nda iyileşme ve CA'da artış, %0.05 seviyesinde karkas ağırlığında iyileşme -yem fraksiyonu olarak %10 veya %20 <i>Dunaliella salina</i> ilavesi ile performans ve karkas ağırlığında azalma	Sanderson (2018)
Sıcaklık stresi uygulanan etlik piliç diyetlerine 10, 20, 40 veya 80 mg/kg HP kaynaklı ASTA ilavesi	-plazma, karaciğer, göğüs ve but etinde ASTA ve toplam karotenoidlerde zenginleşme -oksijen radikal absorban kapasitelerinde artış -dokularda glutatyon konsantrasyonu ve GPX aktivitelerinde azalma	Sun et al. (2018)
<i>Campylobacter jejuni</i> ile enfekte edilen etlik piliç diyetlerine 7, 36 veya 179 mg/kg HP kaynaklı ASTA ilavesi	- <i>Clostridium perfringens</i> 'in sekal kolonizasyonunda azalma -doku ASTA ve karotenoid konsantrasyonlarında artış.	Waldenstedt et al. (2003)

SONUÇ ve ÖNERİLER

Artan dünya nüfusunun en önemli hayvansal protein kaynaklarından biri olarak kabul edilen kanatlı hayvanların yemlerinde kullanılan antibiyotiklerin, patojen bakteri direnci oluşturması ve gıdalarda bıraktığı kalıntılarla insan sağlığını tehdit etmesi gibi olumsuzluklar nedeniyle büyümeyi teşvik edici olarak kullanımının 2006 yılında yasaklanması, araştırmacıları alternatif doğal yem katkı maddelerine yönlendirmiştir. Bu bağlamda mikroalglerin bilhassa *Spirulina*, *Chlorella*, *Haematococcus* ve *Dunaliella* türlerinin yem katkı maddesi ya da yem maddesi olarak kullanım potansiyeli üzerine son yıllarda çok sayıda çalışma yürütülmüştür. Yapılan çalışmalar incelendiğinde *Spirulina*, *Chlorella*, *Haematococcus* ve *Dunaliella* mikroalglerinin kanatlı hayvanların beslenmesinde zengin besin madde kompozisyonu ve özel metabolik içerikleri nedeniyle gerek yem hammaddesi gerekse yem katkı maddesi olarak kullanım potansiyeli yüksek olan alternatif kaynaklar oldukları görülmektedir.

Bugüne kadar yapılan araştırmalar, kanatlı hayvan diyetlerine ilave edilen *Spirulina*, *Chlorella*, *Dunaliella* ve *Haematococcus* mikroalg türlerinin karotenoid, lutein, pigment, alkaloid ve

steroidler gibi farklı biyoaktif bileşik içerikleri vasıtasıyla oluşan antienflamatuvar, antibakteriyel, antiviral, antifungal, antitümör ve antialerjik etkilerinin yanısıra genel olarak;

- ✓ Büyüme ve verim performansını iyileştirmede,
- ✓ Hayvanın serum biyokimyasal bileşenlerini ve sağlığını geliştirmede,
- ✓ Yumurta sarısı ve et rengini olumlu etkileme ve ürün kalitesi ile tüketici tercihini artırmada,
- ✓ Bağırsak mikrobiyal popülasyonu dengeleme ve bağırsak sağlığını geliştirmede,
- ✓ Antioksidan durumu düzenleme ve oksidatif stres etkilerini hafifletmede,
- ✓ Lipid peroksidasyonu düşürme ve depolama süresindeki artış ile ürün güvenliğini sağlamada,
- ✓ Serum immunoglobülin seviyelerini artırma ve hümorale bağışıklık tepkisini iyileştirmede,
- ✓ Serum ve tibia Ca ve P konsantrasyonları ve kemik mukavemetini artırmada,
- ✓ Salmonella enfeksiyonu hafifletmede,
- ✓ Yemlerin biyodetoksifikasyonu ile yumurtaların zenginleştirilmesini sağlamada

alternatif yem katkı maddesi olarak değerlendirilebileceğini göstermektedir. Ayrıca yapılan çalışmalar kanatlıların düşük proteinli kanatlı diyetlerine %10'a kadar *Spirulina platensis* veya *Chlorella vulgaris* mikroalgleri ilavesinin soya küspesi ve balık unu gibi protein kaynaklarına alternatif değerli bir protein kaynağı olabileceğine dikkat çekmektedir. Mikroalgler yüksek biyoaktif bileşenleri ve kaliteli protein profiline sahip olmaları nedeniyle yem fraksiyonu ve yem katkı maddesi olarak ümit verici görülmektedir. Ancak, yetiştiriciliği tuzlu sularda yapılan *Dunaliella salina* mikroalginin kanatlı diyetlerine ilavesinin etkilerini inceleyen daha fazla çalışmaya ihtiyaç olduğu düşünülmektedir.

ABSTRACT

Death is inevitable as every living thing must at some point in life go to rest and it comes with a sober reflection. However, the distortion attached to how burial rites are done in contemporary times comes with innovation that are not known to the early practices and ethics of the religions and are perceived to have implications in future management of burials among Islam, Christianity, Judaism, and Hinduism. For this reason there is need to call for urgent attention for religious adherents to reverse to the status quo because It is evident that the contemporary funeral rites are invaded with practices alien to both religions culminating in deviation from the acceptable norms. religions in the world : Study of Islam Judaism and Christianity. and death related rituals of some of the major religions in the world: Study of Islam, Judaism, Christianity, and Hinduism unravels the reason for the new trend in contemporary time. It is established that if this new trend is not addressed, it will impel serious misconception of this practices , thereby distorting established norms. The recommends that all the religious adherents should practice the recommended funeral rituals in tandem with their on religious provisions ,this would help in reviving the proper way of funeral rites that will eradicate the innovative practices among the adherents.

Keywords: Funeral, Death, Rituals, Islam, Christianity, Judaism, Hinduism

INTRODUCTION

Funeral rites are the traditional ceremonies associated in connection with burial or cremation. These rites vary across religious groups often with a specific set of rules for what to do. (William 2013). Burial or interment is a method of final disposition wherein a dead is lowered into the grave. It is the act of putting a dead body into the ground accompanied with ceremonies or practices across all religions. Burial and disposal of the dead are a manner of duty reflecting religious worldviews and ideas about life purity and social obligation².

Responses to death and the rituals and beliefs surrounding it tend to vary widely across the world. In all societies, however, whether customs prescribe overt displays of grief or restrained behaviour, the issue of death brings into focus certain fundamental cultural values. The various rituals and ceremonies that are performed are primarily concerned with the explanation, validation and integration of a people's view of the world.

Death is one of those concrete life experiences that pervade the mind of every religious person especially as it generates a feeling of uncertainty and absurdity. All world religions have various interpretations or ways they respond to the reality of death and the funeral practices of their religion. As a matter of fact, each has a tradition of funeral rites (documented or unwritten), in which their perceptions of death and funeral are seen clearly. Hence, the major concern of this paper is to comparatively discuss the funeral practices and death related rituals of some of the major religions in the world : Study of Islam Judaism and Christianity, and death related rituals of some of the major religions in the world: Study of Islam, Judaism, Christianity, and Hinduism. Burial rites and its essence as seen in the three major religions in the world. It will also try to discover whether their common conceptions could be harnessed for social cohesion and nation building.

FUNERAL PRACTICES IN ISLAM,

Death is Inevitable: One reality that each and every person must face is death. When a person dies, he passes on to the life of the grave and he remains there until he is resurrected on Judgment Day. The transition between this life and the next is a tremendous moment for everyone, and as such Allah (SWT) has legislate the Islamic funeral.

Funeral rituals in Islam involve different kinds of activities: preparations for death and burial, interment of the body, mourning, and memorialization. The funeral prescriptions

² Hoy, William G. (2013). *Do Funerals Matter? Purposes and Practices of Death Rituals in Global Perspective*. Routledge. ISBN 978-0415662055.

which are based on the interpretation of the Quran, Hadith, and the consensus of the Ulama, include: pronouncing the testimony of faith prior to death and turning the dying person's face toward Makkah; ritually washing and shrouding the corpse; performing funeral prayers; conducting the body to the cemetery; burial of the corpse on its right side, with the face turned to Makkah; mourning and visiting the grave³, One striking thing about Islamic funeral is the inexpensive style it adopts. The corpse may be dressed in ordinary but not expensive clothing, Burial should be performed at a nearby graveyard within twenty four hours of death, Imam's responsibility to lead in the funeral prayer. These prayers are commonly held outdoors, in a courtyard or public square, not inside the mosque.⁴

The Arabic word Janazah or Salat al-Janazah (Funeral prayer) is a part of the Islamic funeral rites. It is a prayer observed in congregation to seek pardon for the deceased and all Muslims dead or alive⁵. Salat al-Janazah is a collective obligation upon Muslims that is Fardal-Kifayah, which is, if some Muslims take the responsibility of doing it, the obligation is fulfilled, but if no one fulfills it, then all Muslim will be accountable⁶.

The issue of death which leads to the practice of Janāzah has been properly addressed by both the Glorious Qur'an and Sunnah of Prophet Muhammad (May the peace and blessings of Allah be with him). Some of these are the saying of the Almighty Allah:

Everyone shall taste death. And only on the Day of Resurrection shall be paid your wages in full. And whoever is removed away from the Fire and admitted to Paradise, he indeed is successful. The life of this world is only the enjoyment of deception (a deceiving thing)⁷.

In another verse Allah says:

Tell those who are running away from death that one day they will be trapped unaware and you will be produced before the Almighty. They will be called upon to answer for their action by Him Who is All-Knowing⁸.

⁴ Sharif, J. S. (1972). Islam in India or the Qanun-i-Islam: The Customs of the Musalmans of India Comprising a Full and Exact Account of Their Various Rites and Ceremonies from the Moment of Birth to the Hour of Death. p.98-112. London, UK: Oxford University Press

⁵ (Steingass, 1978)

⁶ Ibn Rushd, M. A., (1975). Bidayat al-Mujtahid wa Nihayat al-Muqtasid, Cairo: Dar Mustafa al-Bāl.

⁷ (Qur'aan 3:185)

⁸ (Qur'aan 62:8)

From the above teachings, once death has occurred the following is required for a proper funeral rite.

The Shahadah: It is required that those present at the time of the death of any member of their family/relatives should encourage the dying person to say the Kalima al-Shahadah until he/she passes away. This is by repeating to him/her the statement: ‘La ilāha illā Allāh’ (there is no god but Allah). This is according to a Hadith reported by Abu Sa’id al-Khudri (may Allah be pleased with him) which says the Messenger of Allah says:

Exhort to recite: ‘There is no god but Allah’ to those of you dying⁹.

As for those who received the news of the death of their relatives or friend are encouraged to invoke the Name of the Almighty Allah. Thus, Allah says:

Those who when afflicted with calamity say: "To Allah we belong, and to Him is our return"¹⁰.

Washing of the Corpse the next step is the preparation of a corpse for bath. Once a Muslim die, male or female Islam commands that he/she should be washed and prepared for burial without delay. It is reported that Aisha (May Allah be pleased with her), the wife of Prophet Muhammad (May the peace and blessings of Allah be with him) said:

Once the Messenger of Allah (May the peace and blessings of Allah be with him) returned from Baqi’ and found me suffering from headache and I was saying: “Oh my head!” on that he said: “Nay! It is I, Oh Aisha who has more claim to say: O my head”, then the Messenger of Allah (May the peace and blessings of Allah be with him) further said: “What is harm on you, O Aisha if you died before me, so that I would stand upon you, in order to wash your (dead body), shroud you, offer funeral prayer for you and then bury you¹¹.

It should be noted from the above tradition that once a Muslim dies it is upon his/her close relatives to prepare for his/her burial by first washing his/ her corpse. It is permitted that Muslim men should be washed by men, and women by women. But a husband is permitted to wash his wife and vice versa. But a husband is permitted to wash his wife and vice versa. If the man

⁹ (Sahih Muslim, Book 11, Hadith 1)

¹⁰ (Qur’ān; 2:156)

¹¹ (Sunan Abi Dauda, Hadith No. 3162, vol. 3)

pass-away and no man around him to wash the dead person it is permitted his wife to wash him, but as long as there is a man ready to wash him then no need his wife to wash him. The bath is not obligatory but a recommended act of worship¹². Concerning the number of washing, the corpse is suggested to be washed three times, and camphor should be used at the last washing. The idea behind the command for washing is for hygienic measures to protect one against contagious disease¹³.

Shrouding of the Corpse: Shrouding is an important aspect of funeral rites in Islam where the body of a deceased to be covered. It should be noted that shrouding is obligatory in Islam. This is based on the tradition of the Prophet Muhammad (May the peace and blessings of Allah be with him) which says:

While a man was riding (his Mount) in `Arafat, he fell down from it (his Mount) and broke his neck (and died). The Prophet (May the peace and blessings of Allah be with him) said, "Wash him with water and Sidr and shroud him in two pieces of cloth, and neither perfume him, nor cover his head, for he will be resurrected on the Day of Resurrection saying, 'Labbaik,' (i.e. like a pilgrim)

14

It is also important to note that the shroud should be clean, most preferably white, thick and long enough sheets to wrap him/her up. The shroud should be bought from the wealth left by the deceased and should not be too expensive and lavish. The shroud should be sufficient to cover the whole body¹⁵.

The Funeral Prayer: The last but one stage of Janāzah is the observance of prayer called Salah al-Janāzah. The prayer is an obligatory act upon the entire Muslim community (Fardal-Kifāyah)¹⁶. Funeral prayer differs from the prescribed regular prayers. It has no fixed time but can be offered at any time. However, in performing Janāzah, certain conditions must be met and where any of the conditions is not met, the prayer is invalid. The conditions are:

1. Intention: There must be an intention and it should be said silently. This is according to the tradition of the Prophet (May the peace and blessings of Allah be with him) which says:

¹² Al-Juzayri, A., (2001). *Al-Fiqh ala al-Madhahib al-Arbi'ah*, NP: np.

¹³ Bello, A. M., (2010). *The Practical Janazah*, Kaduna: National Library Cataloguing. p.67

¹⁴ (Sahih al-Bukhari, Book 23, Hadith 26)

¹⁵ Sabiq, S., (2011). *Fiqh al-Sunnah*, Lebanon: Dar al-Ma'arif. pp 24-26

¹⁶ Ibid

Verily, all deeds (of a person) will be judged in the light of the intentions behind them, and every person will attain what he intends¹⁷.

2. Standing in Prayer: The majority of the scholars regard it as an essential condition for a person performing funeral prayer to stand while praying, except where one is physically challenged
3. Four Takbir: This is according to a report transmitted by Imam Al-Bukhari and Muslim: “On the Authority of Jabir who said: “Allah’s Messenger, peace upon him, offered a prayer for Najashy (Negus) and said four Takbirs”.
4. Rising of One’s hands during the Takbirs: it is Sunnah to raise one’s hands while saying the Takbir. This is only required during the first Takbir, while it is only recommended during the remaining three, except when one changes from one posture to another as in regular prayer.

Recitation: it is required that Surah al-Fatiha must be recited as reported from authentic Hadith. Talha, the son of Abdullahi bn Awf said: “I prayed the funeral prayer behind Ibn Abbas for a dead person and he recited (aloud) the Fatihah and said you should know that (what I have done) is the Sunnah”¹⁸.

After the second Takbir it is required to recite Assalatul-Ibrahimiyyah (Salutations on The Prophet (S) (Durood-e-Ibrahim) all Madhabs agree upon this. After the third Takbir, then make dua’ (Supplicate) for the deceased. And after the fourth Takbir, then make dua’ (Supplicate) for all dead Muslims. In the case of a dead baby or young child, make dua’ (Supplicate) for his parents. Then say, “Assalamu alaykum” like you say in other Salats. Tasleem could be said only once.

Burial: That is the final stage of janāzah in Islam is the burial. Following washing, shrouding and prayer, the body is then taken for burial (al-Dafin). The exact manner, customs and style of the grave, the burial and so forth may vary by regional custom.

The grave should be perpendicular to the direction of the Qibla (i.e. Mecca) so that the body, placed in the grave without a coffin [clarification needed] lying on its right side, faces the Qibla.al-Misri, ¹⁹The grave should be dug deep and wide, and be well-prepared. ²⁰

¹⁷ Riyadh al-Salihin, Hadith No. 2

¹⁹ Al-Misri, A. N. (1994). *Reliance of the Traveler* (edited and translated by Nuh Ha Mim Keller. Amana Publications. pp. 238–239. ISBN 0-915957-72-8.

²⁰ (Sunan Ibn Mâjah, Vol.2, p.425, Hadith 1560]

Shape of the Grave - The grave may be dug straight down (shaqq) with a burial chamber in the middle or with a niche (lahd) to create the burial chamber on the side. However, in both cases, a burial chamber is created from the earth, and sealed with bricks of unbaked clay. Both methods were practiced in the time of the Prophet Sallallâhu 'Alayhi wa Sallam. However, the Prophet Sallallâhu 'Alayhi wa Sallam favored the Lahd style.²¹

Number of Bodies in a grave - Two or more bodies may be buried in the same grave. This may be due to the large number of dead resulting from a natural calamity or plague, or dead may be from the same family²².

The injunction concerning placing the body in the grave preferably only men should be responsible for placing the dead body inside the grave, even if the dead person is a woman. This is due to the fact that it has been the custom among Muslims from the time of the Prophet Sallallâhu 'Alayhi wa Sallam until today. The process requires a certain amount of strength, and men are generally stronger than women. Near Relatives - The blood relatives of the dead have more right to place the body in the grave, based on the general meaning of the following Qur'ānic verse: Blood relatives have more right to one another in in the Glorious Qur'ān²³.

In prophetic tradition Ibn 'Umar said, Whenever the Prophet Sallallahu 'Alayhi wa Sallam placed a dead person in his grave, he would say, "In the name of Allah, and according to the way (Sunnah) of the Messenger of Allah."²⁴

The corpse is then fully buried by the gravediggers, who may stamp or pat down the earth to shape. Commonly, the eldest male will supervise. After the burial, those gathered pay their last respects to the dead by collectively praying for the forgiveness of the dead.

Du'a - On the completion of the burial, it is recommended that those present at the grave-site offer prayers on behalf of the deceased.²⁵ According to Sunni Islam, loved ones and relatives are to observe a three-day mourning period.²⁶ Islamic mourning is observed by increased devotion, receiving visitors and condolences, and avoiding decorative clothing and jewelry in accordance with the Qur'an²⁷.

²⁶ (Sahih Muslim Volume 2, Book 23, Number 369–371)

²⁷ (Qur'an2:234)

Widows observe an extended mourning period (Iddah, "period of waiting"), four months and 10 days long²⁸. (During that time, the widow is not to remarry or to interact with non-mahram (a man she can marry). This rule is to confirm that the woman is not pregnant with the deceased's child prior to remarrying.

FUNERAL PRACTICES IN JUDAISM

Judaism reflects a difference in opinion in beliefs related to death²⁹. While people of the Jewish faith believe in the reign of the Messiah and Paradise, or heaven, there is debate among Jews in regards to one's soul. Some Jews believe that the soul will never die and upon death in this present life, will enter into eternity. However, based on Talmudic studies, others believe that one's soul will enter into eternity after a period of waiting, which will take place in the Garden of Eden³⁰. Based on this belief, after the coming of the Messiah the dead will be resurrected and will reunite with their bodies. Although, there is some debate over whether or not a soul immediately enters eternity, there is no dispute in regards to what takes place after the resurrection, the judgment day. On this day, each individual will be judge according to his or her devotion to Yahweh.³¹

Most Jewish individuals believe that when an individual dies his or her begins to return to heaven immediately³². The Jewish Sabbath begins at sunset on Friday and ends an hour after sunset on Saturday, and commemorates the seventh day when God rested after the Creation. During this time religious Jews do not travel, write, cook or use electrical equipment. That's why unless death occurs after sunset on Friday, in which case the burial is postponed until Sunday, the Orthodox Jewish tradition prescribes that funerals should take place within twenty-four hours. No professional undertakers are involved since all arrangements are made through the Synagogue. The body is dressed in a white shroud (kittel), which is then placed in a plain wooden coffin. Men are buried with a prayer shawl (tallith) with its tassels cut off. While the body is in the house, Jews believe that it should not be left unattended. Candles are placed at the head and the foot of the coffin and sons or other near relatives of the deceased maintains a constant vigil. If no relatives are present, professional mourners are called in.³³

³³ Ibid

Jewish belief that the body houses the soul of the individual, the deceased's body is treated with great care and respect³⁴. To demonstrate this care, a family member or friend of the deceased will engage in a practice called *shemirah*, watching over the body from the time of death until the time of burial³⁵. In preparation for burial, the body is ceremonially washed and dressed in a white linen shroud by the *chevrah kadisha*, a holy Jewish society³⁶. After cleansing, the body is not embalmed or cremated, but is placed in a simple wooden casket. These practices are followed in order to allow the natural process of death and decomposition to take place so that the body of the deceased may return to the earth in a natural state³⁷

In regard to the mourner, those who practice Judaism offer great amounts of care to those who have experienced a loss. Immediately after death, the family of the deceased enters a time of deep grief mourning known as *Aninut*. A Psychology professor at the University of Haifa members to arr , explains that the process of *Aninut* requires family anger and perform a timely burial. During this time, members of the family are released from their normal practices so that they may “bring the body to burial”³⁸. Once the body has been returned to the earth and the state of *Aninut* comes to an end, family members will signify the grief that tears their lives by tearing their clothing³⁹.

After prayers offered by the rabbi at the house, the coffin is carried out and mourners usually follow on foot to the cemetery. If the cemetery is not within walking distance, transport is permitted, but many Orthodox Jews insist on covering at least part of the way on foot. Progressive liberal Jews permit cremation. However according to the orthodox tradition, cremation is forbidden, as human beings are created in the image of God and it would therefore be wrong to deliberately destroy a body.⁴⁰

At the cemetery the dead body is taken to a special room. Mourners usually wait outside until the coffin is placed in the center of the room. Then the men stand on the left and the women stand on the right of the coffin. There are no flowers or music at the funeral ceremony, ensuring that there is no distinction made between rich and poor. Prayers and psalms are recited and the rabbi makes a special mention of the virtues of the person who has died. The coffin is then

carried to the grave followed by the mourners. The sons and brothers of the deceased shovel some earth on the coffin. After the burial the special prayer for the dead, the Kaddish, is recited for the first time by the male relatives. A special meal is provided of eggs, salt-herrings and bagels. Peas or lentils are also suitable foods to serve on this occasion as, according to Jewish tradition, roundness signifies life.⁴¹

In orthodox families, from sunrise to sunset during the seven days of intensive mourning, close relatives of the deceased must wear their torn garments and special slippers that are not made of leather. Prayers are said throughout the day. Neighbours and friends visit to offer condolences and help. The ritual prescribed for women ends with this seven-day period. Men however, are forbidden to cut their hair or shave for thirty days. The sons or other male mourners go to the Synagogue every day to say the Kaddish for eleven months. The gravestone is then erected, symbolizing the end of the official period of mourning.

Every year on the anniversary of the death, the family says the Kaddish and burn a candle for twenty-four hours. The grave is visited at least once a year, especially before the Jewish New Year, to ensure that cherished memories do not fade. After the ending of Aninut, the family of the deceased will enter into the other stages of mourning according to Jewish customs⁴². During this time, the immediate family is greeted by visitor's family and averts their attention from the loss⁴³. Shloshim is the first 30 days after the process of Shivah. During these 30 days, the family will continue to mourn and will not attend any celebrations; however, they will begin to integrate themselves back into normal life routines⁴⁴. Furthermore, once one has experienced Aninut, Shiva, and Shloshim they may continue on with the proper period of mourning, which is one year as stated by Jewish tradition. This process begins with death and ends on the anniversary of the deceased's death⁴⁵. After one year has passed, the family may commemorate the death by the marking of the grave with a gravestone and will no longer be in a time of mourning. Altogether, Jewish death and funeral practices communicate a care for the deceased and the mourning, coming to terms with death, and the use of religion to provide one's self with structure during a time of loss and chaos⁴⁶.

FUNERAL PRACTICES IN CHRISTIANITY

According to Christian beliefs, death is the direct result of “the fall” of man, or the act of sinning⁴⁷. However, Christians believe they will “claim victory over death” through Jesus Christ⁴⁸. In the eyes of a Christian, death is more than the ending of one life, but it is the beginning of another life that is pure and holy. Even though death is inevitable, Christians cling to the belief of heavenly life after death⁴⁹. However, one may not enter into this eternity unless they share the core Christian beliefs that encompass the Trinity, sin, and eternal life.

Within the Christian faith it is accepted that there is only one God; however, Christians hold a belief that God is three individuals within one being that share the same will, nature, and essence⁵⁰. Although each figure of God shares the same attributes, not all Christians perceive them in the same way⁵¹.

Generally, Christians bury a deceased member in a consecrated ground. Until recent times, Christians never welcomed cremation of corpse on certain theological (eschatological) grounds. In the modern times, this objection seems to have disappeared. Nevertheless, Christians forbid cremation when it is chosen for reasons which are contrary to Christian teaching⁵². Notwithstanding Cremation is not a common practice in Christianity but the Catholic Church is slowly adopting it⁵³. Unlike other religions, Christians take time to mourn for the dead before they bury them, which may take a period of some days⁵⁴.

The Structure of Christian Funeral depends on the different funeral rites which are in keeping with the situations and traditions of each region. From the past, Christian funerals followed a predictable pattern. The vigil, the funeral Mass, and that rite of committal formed a familiar threefold structure⁵⁵. The vigil is the principal rite celebrated by the Christian community in the time following death and before the funeral liturgy⁵⁶. The funeral mass is the central celebration of the Christian community for the deceased⁵⁷. The rite of committal is the conclusion of the funeral rites, the final act of the community

of faith in caring for the body of its deceased member⁵⁸. In Catholic liturgy, the funeral celebrations follow a common order: The greeting of the community, the liturgy of the Word, the Eucharistic Sacrifice, and final commendation, final commendation is the last farewell by which the Christian community greets one of its members before his body is brought to its tomb⁵⁹. After the burial an entry is to be made in the register of the dead, in accordance with particular law⁶⁰.

Place of Burial The funeral of a Christian takes place in the Church (parish) where he/she belongs. However, those in charge of the deceased person's funeral, with the consent of the parish priest, may choose another church⁶¹. If a parish has its own cemetery, the deceased faithful are to be buried there, unless another cemetery has lawfully been chosen by the deceased person, or by those in charge of that person's burial⁶². The prevalent practice among African Christians is burying the deceased in the family (ancestral) land, after the Holy Mass or Funeral Service has taken place in the Church. 1

3.5 Those Eligible for Christian Funeral Catechumens and children whose parents had intended to have them baptism but who died before baptism, may be allowed Church funerals by the local Ordinary⁶³. Unless they gave some signs of repentance before death, these categories of persons are not accorded Christian burial: notorious apostates; heretics and schismatic; those who for antichristian motives chose that their bodies be cremated; other manifest sinners to whom a Church funeral could not be granted without public scandal to the faithful. If any doubt occurs, the local Ordinary is to be consulted and his judgment followed⁶⁴. Christian funeral is arranged in such a manner that it brings honor to the deceased and bestows hope on the mourners⁶⁵.

Unlike other religions, Christians take time to mourn for the dead before they bury them, which may take a period of some days⁶⁶. However, despite the variations in Christian funeral rituals there are general beliefs that are incorporated into the ritual's ceremony⁶⁷. According to

professor of historical theology and ethics ⁶⁸ a at Augsburg College of Minneapolis, there two primary focuses of the Christian funeral. The first is the emphasis of the deceased belonging to the family of God and not to a specific earthly family. According to the Bible, all individuals are children of God; therefore, the Christian funerary practice aims to reflect the restoration of one's soul to God. The second focus of a Christian funeral is the body of Christ instead of the body of the deceased. This focus reflects Christ's sacrifice for the living, therefore giving the survivors hope for the dead.

Muslims believe that there is one God, Allah. Muhammad (peace be upon him) is the prophet of God. There is only one life to be lived. There will be a day of judgment when each soul is judged according to their deeds on earth. Extravagant expressions of grief are against the will

DISCUSSION

In these three religions one discovers an essential point of convergence: a place where they all meet in their conception of the essence of life and the eschatological implications of death. All of them, in their care and attitude towards the dead, manifest the belief in the life after death. The eschatologist of Christians and Muslims fundamentally possess the dogmatic principles of heaven and hell. So also people of the Jewish faith believe in the reign of the Messiah and Paradise, they also believe that when an individual dies his or her begins to return to heaven immediately. There is no dispute in regards to what takes place after the resurrection, the judgment day, and on this day, each individual will be judge according to his or her devotion to Yahweh.

Secondly all the three religions each has a tradition of funeral rites (documented or unwritten), in which their perceptions of death and funeral are seen clearly. It was observed that the distortion attached to how burial rites are done in contemporary times comes with innovation that are not known to the early practices and ethics of the early religions. Examples in Islam there is an innovated practice of Wailing, upon which the Prophet strictly forbade, that's screaming. Furthermore, he identified such practices as acts of Kufr (disbelief), because they indicate displeasure with what Allah has decreed. Îman (faith) includes the belief that Allah is the source of all good and that all of His actions are wise. Proper Iman would never allow those who possess it to commit such acts of ignorance.

Abu Hurayrah narrated that the Prophet said,

⁶⁸ Stortz, M. E. (2014). Practicing resurrection: grief and the Christian funeral. *Word & World*, 34(1), 15–23

There are two practices found among people, both of which indicate disbelief: ridiculing the ancestry (of others) and wailing over the dead. ⁶⁹

Also on issues of striking cheeks and tearing of clothes, the manner of which the Prophet (SAW) said,

Whoever slaps his face, tears his clothes, or invites (others) to an un-Islamic slogan is not of us. ⁷⁰

However, it's the custom of organizing gatherings in the home, at the grave or in the masjid to give condolences to the family of the deceased which is against the Sunnah of the Companions of the Prophet(SAW). Imam ash-Shafi'i said,

"I dislike gatherings, even if there is no wailing or crying. For it only renews the [family's feelings of] sorrow and puts burdens on their food supplies." ⁷¹,

Furthermore, it was the practice of the Prophet (SAW) to have his family prepares food for the relatives of the dead. People later elaborated on this practice until it became an exaggerated ritual with much pomp and show. Later scholars considered its distorted form an innovation and abandoned it. ⁷²In Islam coating the grave with paint, plaster or any other type of adornment is an innovation. It says in *al-Mawsu'ah al-Fiqhiyyah* (32/250): The jurists are unanimously agreed that it is disliked to plaster graves, because of the report narrated by Jabir (may Allah be pleased with him): The Messenger of Allah (blessings and peace of Allah be upon him) forbade plastering graves, sitting on them, and building structures over them.

However, Christian funeral practices are actively shifting from a ceremony of religious meaning to an experimental, personalized experience. Instead of a time on which to focus on primary religious beliefs, the practice is becoming a celebration of life through memorialization and extravagant representations of social preferences ⁷³. Focus is also being redirected from commemorate Christian beliefs to satisfying the living instead ⁷⁴. Moreover, Christian funerals are evolving in such a way that religious beliefs have little to no effect on how the ritual is performed.

In early Judaism tradition there are no flowers or music at the funeral ceremony, ensuring that there is no distinction made between rich and poor. Prayers and psalms are recited and the rabbi makes a special mention of the virtues of the person who has died. But in the contemporary the reverse is the case as Jewish burial costs more than \$10,000, compared with less than \$1,000 for some cremations.(<https://www.sun-sentinel.com/2012/08/27/jews-wrestle-with-cremation-vs-traditional-burial/>)

Rev. Fr. Godfrey Gopep, the Parish Priest of St. Finberr's Catholic Church, Rayfield, Nigeria posit, decried the high cost of burial, particularly among Christians, said that the ceremony which ought to be solemn had become a "show" in society, that organizing an expensive burial for a loved one is not a guarantee that the deceased would make heaven, hence, should be done in a moderate manner. Strongly advise Christians to cut down how they spend huge amounts to bury the dead and learn to support people when they are alive,"⁷⁵

Jewish individuals believe that when an individual dies his or her begins to return to heaven immediately⁷⁶. The Jewish Sabbath begins at sunset on Friday and ends an hour after sunset on Saturday, unlike other religions, Christians take time to mourn for the dead before they bury them, which may take a period of some days⁷⁷.

According to Jews tradition, the body of the deceased is ceremonially washed and dressed in a white linen shroud by the chevrah kadisha, a holy Jewish society⁷⁸. After cleansing, the body is not embalmed or cremated, but is placed in a simple wooden casket. But now there is an innovation that Progressive liberal Jews permit cremation. However according to the orthodox tradition cremation is forbidden. While Cremation is not a common practice in Christianity but the Catholic Church is slowly adopting it⁷⁹. Christians never welcomed cremation of corpse on certain theological (eschatological) grounds. In the modern times, this objection seems to have disappeared.

In early Judaism tradition there are no flowers or music at the funeral ceremony, ensuring that there is no distinction made between rich and poor. Prayers and psalms are recited and the rabbi makes a special mention of the virtues of the person who has died. But in the contemporary the reverse is the case as Jewish burial costs more than \$10,000, compared with less than \$1,000 for some cremations⁸⁰.

CONCLUSION

The paper unveils the acceptable funeral practices and death related rituals of some of the major religions in the world: Study of Islam Judaism and Christianity. and death related rituals of some of the major religions I in the world: Study of Islam, Judaism, Christianity, and Hinduism unravels the reason for the new trend in contemporary time. New innovations were noted in all the religions. The innovations are in all steps of the process of the funeral, and vary from one community to another within the area under study. Thus, such innovations, by their essence, are not in harmony with the teachings of Islam. The long history of holding onto these innovations is what prompted this paper to critically study the concept of funerals and highlight the effects associated with such innovations. It is hoped that the study will help in reviving the proper way of conducting funeral rites in according to the ethics of each religion that will eradicate the innovative practices among the Muslims in the study area and beyond.

ABSTRACT

Most people in business life are exposed to mobbing without being aware of it, and even if they are aware of it, they do not speak up either because they are not aware of the legal procedure or because of the fear of being unemployed. In this study, the types of mobbing and the legal rights related to the subject will be emphasized. For this purpose, oral interviews were conducted with 40 volunteer Occupational Safety Specialists (OSS) and their experiences were presented in articles. Thus, an awareness process will be created against the oppression applied not only by Specialists who are not aware of it, but also among those working in different business lines. In the study, the biggest reason for choosing this occupational group is the targeting of Specialists because of large-scale accidents in recent years. It was seen that the main reason was the lack of education, unfavorable working conditions and the pressure they experienced rather than financial impossibilities. As a result of the interviews, it was determined that most of the experts who were mobbed quit their jobs, turned to different jobs or returned to their original profession. From here, it is understood how a wearing process mobbing is. Another finding is that the interviewees have a profession in a different field and gained the title of Expert by obtaining the necessary document by taking advantage of the law enacted in 2012 in order to find a job more easily. Most of the interviewees stated that they made this choice because of the financial opportunities of the profession. While some of those who came from Physics, Chemistry, Geology, Civil, Food and Agricultural Engineering and technical teaching professions returned to the teaching profession, some continued their profession. It has been determined that Occupational Safety Specialist, which is one of the most wearisome professions of today, was chosen as a training part by chance or because of economic needs. This research shows that experts are faced with mobbing in the first two years of their working life. In the study, it was determined that mobbing was applied to both genders in different ways. With the study, it was aimed to raise awareness by emphasizing one of the difficulties in business life.

Keywords: Occupational Health and Safety (OHS), Occupational Safety Specialist (OSS), Mobbing.

INTRODUCTION

The inherent urge of human beings to be social and avoid loneliness pushes them to be part of a group. He wants to achieve this sociality mostly in the business environment. However, sometimes people may be excluded from business life against their willpower (Akı, 2011). The reasons for this may be lifestyle, political views or outlook on life. This is where the concept of mobbing comes into play. Literally, it is translated from Latin as "mass attack or causing trouble" and from English as "disorganized crowd committing unlawful violence" (Koç and Bulut, 2009). The first emergence of the concept was put forward in the 1960s by an ethologist who studied animal behavior as a result of observing the aggressive behavior of animals towards each other (Ertürk, 2013). It is not considered mobbing in every situation encountered. In order for a behavior to be legally considered mobbing, certain processes must be carried out. First of all, the behavior must be systematic and continuous at work for at least 6 months. The action must be made in a way that will harm the personality and health of the employee and, moreover, lead to his dismissal. The party or parties who do this do so consciously, openly or secretly (Efeoğlu et al., 2023). The types of the word are as important as its meaning. The type seen especially among colleagues is horizontal mobbing. It may be due to jealousy, such as the inability of employees with equal status to attract each other, the possibility of being promoted before themselves, or it may be due to coming from different countries, religion, race or political views. The second type of mobbing, vertical mobbing, can be applied from top to bottom as well as bottom up. In top-down mobbing, apart from personal egos, there is also the concern that those working under them may rival their position. The opposite of this, bottom-up mobbing, may also involve lower-level employees uniting and aiming to leave them alone due to reasons such as finding their upper-level manager incompetent or some economic conditions. In the oral interviews, it was determined that Occupational Safety Experts (IGU) were exposed to different types of mobbing. An example can be given when the foreman does not listen to the IGU and excludes him along with other workers. This study focused on the problems that not only occupational safety experts but also other employees may encounter.

MATERIALS and METHODS

The study was created as a result of interviews with 40 experts living in different cities of Turkey. In the interviews, experts were asked to describe the most difficult situation they encountered in their working lives. Experts were reached through acquaintances and the internet. It has been determined that some groups do not know that the pressure exerted on them

is mobbing, while others exaggerate the issue and find themselves in a difficult situation because of problems related to themselves rather than psychological violence.

Mobbing Processes

Today, while most employees do not realize that they are exposed to mobbing, some employees think that mobbing is a reflection of the psychological processes they go through. Most people do not know the mobbing processes and think that mobbing is applied only because of the superior-subordinate relationship.

Mobbing can be applied in different ways. Putting the private life of the person on the agenda and spreading rumors, sending an employee to work outside the office for no reason, preventing him from doing his job by making working conditions difficult, interrupting his speech or not making a promise even though he wanted to speak, interrupting and ignoring the dialogue with the employee, being called by nicknames, blaming and criticizing for no reason, making inappropriate jokes, belittling one's status, being verbally or physically sexually harassed, verbally or in writing being fired or making threats to the person, being exposed to harassing behavior aimed at demotivating, being exposed to different activities outside of work. to be employed in other duties, or to be directed to different jobs by disrupting his work order, to sabotage and ignore his work, and most importantly to work for him to leave the job.

Despite top-down mobbing, regulations and laws, tea times, breaks, work, entry and exit times, etc. Actions can be taken in the form of taking action against the employee regarding the issues. Even though it's legal, he doesn't let you take leave, he constantly calls you, asks where you are or what you do. In this way, she/he constantly harasses, pressures and tries to put pressure. Doing this verbally, even without physical violence, is psychological harassment. In almost all of the interviews, it was seen that a policy based on oppression was followed at the beginning of the career. In this part of the study, as a result of interviews with occupational safety experts, they were asked to describe the mobbing cases they experienced. Some of the experts had to leave their jobs due to the mobbing they experienced. The mobbing processes experienced by experts have been tried to be expressed by grouping them as follows. Mobbing cases are also seen in public institutions, albeit to a lesser extent, and occur frequently in the private sector. Public institutions are under more control and there are no situations where very heavy processes such as illegal signature request or document blackening are requested.

Failure to Comply with Job Descriptions

During the interviews, it was determined that some experts were forced to have work done outside of their job descriptions. It is thought that those who turn to this profession due to

financial concerns are exposed to more pressure on this issue. Experts are assigned to different duties, apart from their personal duties, and are forced to work in the same status as workers. Even though they have a profession, employees who are known to have a certificate of expertise are sometimes assigned to work double shifts. It is especially common for employers who want the specialist to perform his/her specialty duty other than his/her main duty, due to the retirement of the specialist in his/her main duty or due to economic reasons. For example, a person may be pressured to combine both technician and occupational safety expertise.

Pay No Mind

In such cases, it is often desirable to cover things up and ignore them in order to increase the speed of work. For example, illegal behaviors such as the welder and painter working at the same time are requested. There is a risk of fire, and in such events, the expert is usually disabled. The fact that workers who do not wear seat belts stop working may cause the expert to be accused of slowing down the work. Sudden and imminent cessation of work by the specialist may lead to his dismissal. For example, detecting problems such as damage to the crane sling, lack of periodic maintenance of the crane basket and lack of a sling pointer team may cause disruption and prolongation of the work. Or, in order not to stop the work, there are situations such as ignoring the fact that the worker who is afraid of heights is forced to work at heights. Another example would be preventing the occupational safety specialist from intervening when a other healthcare personnel allows a worker with allergies to work in a job where he or she may experience an allergic reaction. In cases such as protective equipment shortage or renewal, the employer generally wants the situation to be ignored in order to be managed in this way. Another problem is that, if the deficiencies seen in the field are not included in the regulation, they are not seen as risks and there are no sanctions. It is necessary to write even the smallest negativities that occur in the diaries called actions and kept by experts. However, the experts or managers who are at the top in rank are disturbed by this. The biggest pressure they put on OHS experts is not to keep records of action. For this reason, he uses psychological violence and exhibits egoistic attitudes. This leads to the expert quitting his job. Especially in companies with top management, pressure is put on experts to prevent too much action from being taken from lower management. Likewise, near misses are also sought to be covered. Another of the cases that experts frequently experience is the "Action" explanation. This situation, which is a disagreement with Business Coordinators, prevents experts from recording the events that occur. This happens in the form of experts recording minor incidents for precautionary purposes, while coordinators ignore them or even put pressure on them. For example,

nonconformity in the power line must be recorded in the "approved notebook" and business owners prevent costly issues from being revealed. Or, a faulty forklift at the workplace can be prevented from being recorded in the approved book. In such cases, the employer wants these things to be managed for a period of about 1 year without being written in the approved notebook. Not only is he an Occupational Safety Expert, but he is also asked to ignore situations related to his/her own profession when he/she wants to prevent something he sees as wrong, based on his/her knowledge, from being done. For example, an Occupational Safety Expert with a geology background has the right to intervene on the ground where the tower crane will be installed. Because, as an engineer, he/she is aware that the tower crane will collapse due to the unstable ground.

Gender Discrimination

It was determined that among the experts interviewed, the experts who experienced this type of harassment were women and all of them worked in the construction industry. Although it is a very rare case among the number of interviews, it is important in terms of victimization. The harassers are usually employers or subcontractor owners. They want to go out to dinner together, spend time together, and meet outside. She states that people who think like this consider them as women, not as experts. Sexism can occur in the industry, sometimes openly and sometimes covertly. These are usually done with sentences such as "you can't do it because you're a woman", "it's not for you", "how would you know". Another situation that occurs among female specialists is the leaves they take during pregnancy and the post-pregnancy period. Vertical mobbing is usually applied by the employer as they try not to allow these leaves to be used, and horizontal mobbing is applied by colleagues due to working hours. It can also happen that the specialist during the pregnancy is left alone by other specialists under pressure to work less. In addition to the 16 weeks of unpaid leave given to female employees during maternity; If the employee wishes, she can be given unpaid leave for up to 6 months. Generally, the employer does not approve of the occupational safety specialist's request for 6 months of unpaid leave, which he is entitled to after giving birth, and they mobbing the occupational safety specialist and forcing him to resign

Humiliation

Generally, employers put pressure on experts to make them act outside the regulations, and they do this by complaining to the joint health and safety unit to which they are affiliated, humiliating the experts, putting them down, or even threatening to fire them. It is mostly seen in experts who are new to work. From workers to managers to experts of different classes, they see those

who are inexperienced as safety valves and take out their anger on this group even in the smallest problem. These experts are put under extreme pressure and treated as if they were below the hierarchy. Many experts stated that they were subjected to pressure even from workers in the first years of their working lives. However, the group that puts the most pressure on them is their superiors and their own colleagues. In these cases, horizontal mobbing is usually done by a class A specialist. Generally, it takes the form of belittling, making people do unnecessary work, preventing them from doing their job, complaining to the boss, provoking workers against the expert, making fun of and humiliating them by finding flaws in their work. Experts who cannot withstand such pressures often resign without even seeking their rights. Again, during the training provided, the training of Class C may be interrupted by Class A and humiliated in front of the workers. In this way, the other expert puts himself in the foreground while pushing the other into the background. In such cases, vertical mobbing from bottom to top is encountered. Especially workers who are close to the employer may ignore the expert's information and may also act harshly. Inexperienced experts hired after the experienced expert leaves the job constantly encounter supervisory events. His/her work is being inspected with very ugly expressions such as "Come and tell me what you wrote in the approved notebook today." She/he gets scolded for the smallest thing. They are trying to portray even the smallest abusive things as errors, such as being held responsible for the filing made by the previous expert, why did you put this in the plastic bag, damage, etc. Mobbing exists in every business sector. However, in OHS, experts mostly apply mobbing to each other, and the experts who are wanted to be sent last try to put pressure on first come, last go. This can be accomplished by the employer in different ways. The expert is prevented from concentrating on his/her own work by checking every job he does until a small gap is found and by giving him tasks that are not his/her job. The manager may humiliate the expert verbally and in public. By constantly making suggestions in front of the workers, such as, "You cannot even get a man to wear his helmet, you cannot influence even a handful of people, no one will listen to you here, this kind of work cannot be done," she/he undermines the authority of the expert towards the workers and makes them feel extra tired due to the meaningless assignments he requests during the work day. The manager's attitude towards the expert aims to reduce the expert's respect towards the workers and to tire him out. It can also occur by not allowing or ignoring the person to express their opinion about a situation, or by belittling the neighborhood they live in or the car they drive. On the contrary, it is possible to make disparaging remarks about things that are in a superior position. For example, using a very expensive phone may be criticized as stupidity. Or, by

comparing his automatic transmission car to a toy, it may be implied that he actually drives with money, not a license. Humiliation cases are often applied to dismiss the expert. Because experts who cannot stand this situation resign voluntarily.

Overtime Working

It is among the most common mobbings in the working institutions. After 19:00 in the evening, on weekends, off days or holidays, out-of-hours communication is established with company employees and employees are disturbed due to work-related situations. If the employees are not relieved outside of working hours, they will both get depressed and will not be able to work efficiently because they have not been rested in the work environment. In this case, while the employee will be depressed, the employer will have provided an unproductive work environment. These cases also occur in the form of asking to stay overtime from what is agreed in the employment contract. The employment contract, which is prepared with 1 day off per week, is not complied with in most workplaces. Weekly leave is mostly used as 1 day in two or three weeks. Another abuse seen in such cases is the manipulation of working hours. For example, working hours between 08:00 and 19:00 can be changed gradually on the pretext of not being able to complete the job. The arrival time, which is 08.00 in the morning, is pulled forward until 05.00 or 04.30 time zones, and the departure times are kept constant. This situation is not reflected in the salary, overtime wages are not paid, and overtime is paid at the hours seen on paper.

Othering

The fact that the expert does not ignore and reports the problems causes him/her to be marginalized. The employer can first be suspended from work by reducing the working days and then dismissed. With the fear of being unemployed, other colleagues and workers act with the employer. Such movements usually occur in the form of not being able to be added to whatsapp groups or not being aware of other alternative groups. In this way, the expert is prevented from being aware of some critical situations. In such cases, the specialist is left alone and does not want to go to work because he has no friends. Assignment of jobs by the employer to another specialist in a higher class causes the specialist to be excluded without being given responsibility. In this case, the specialist cannot improve himself/herself and feels bad. There are marginalizations in the form of being sent to temporary assignments when starting a new job, being questioned about why she/he is gone when she/he arrives, displaying an attitude as if she/he is bothered by her/his stay at work, looking hostile, not talking to the specialist who goes to them while eating or chatting, and cutting off the conversation or moving away from

the place where they are. An attitude is taken, such as alienating the person from work and forcing them to eat alone. Good morning and good evening addresses are not used by anyone in the workplace, communication is cut off. Organizing events such as business lunches and birthdays without informing the specialist can also be evaluated within this scope. This makes the person feel insignificant and stressed. Criticisms of the person's personality, religious and political views, and lifestyle are among the movements of marginalizing the person. Usually, he realizes that a person who speaks in such events is ostracized by others. Continual conversations and marginalization behind the back are a plus. Or, there are attitudes such as spreading rumors about the issue of employees with an equal duty to the specialist allowed by the employer due to the patient (cancer) they are obliged to take care of, and causing the marginalization of everyone by taking a stand.

Other Cases

Contrary to cases of contempt, there are also status conflicts with better-off experts. An expert working in a joint health and safety unit to gain experience before opening her/his own company may cause other experts to become jealous and verbally harass her/him. Or the fact that an expert has a better financial situation than others may cause his every move to be unfairly criticized. They may be subjected to harassing remarks such as paying that money for this phone is stupid, living in that neighborhood is insane, and smart people don't spend their money on clothes. These harassments may be caused by being in a higher class, having a master's or doctoral degree, or being a graduate of a good department.

Another reason is political opinion. While he does not experience any problems at work, he can receive warnings due to his political posts on social media. Because of her/his political views, she/he may be ridiculed by the workers and may be insulted by the employer. Or they may be subjected to intimidation activities by a newcomer. These activities are implemented by not approving annual leaves and increasing the workload. In such cases, they are removed from the mobbing environment by being sent to different places. Another mobbing style is related to the economic situation. The salary of someone who is wanted to be dismissed is not deposited regularly or is deposited incompletely. While trying to protect workers' rights, they may also be subjected to mobbing. To prevent a person with a fear of heights from working at heights, to keep a person with allergies away from environments to which they may be exposed, or if a worker who is not suitable for ergonomic conditions wants to change the location, they are prevented and pressure is applied.

FINDINGS and DISCUSSION

In the research conducted, it was observed that some participants were unaware of the pressures placed on them. The psychological pressures applied to the experts are constantly criticizing their efforts and work, constantly being reminded of the mistakes they made, being exposed to heavy jokes and ridiculed by the person or people with whom they are not on good terms, being ignored at work or being constantly teased, and doing illogical things that the expert cannot do. It has been determined that this is done by asking the expert to take away the tasks he/she is responsible for, assigning her/him to tasks she/he does not like or giving him excessive workload, removing her/him from the task or preventing him from performing the task, ignoring the success of the expert and hiding his success in a way that affects his performance, sabotaging the work he does, not paying attention to the opinion of the expert or interrupting her/him while she/he is talking. It has been determined that these pressures are carried out more clearly in the form of threatening by pointing fingers at the expert, blocking his path and verbally applying her/him, pushing her/him, giving her/him the wrong look, speaking hostilely, threatening her/him verbally or in writing. They are also exposed to even more unprofessional actions in the expert's work environment, such as spreading rumors, being ignored with resentment, constantly blaming, belittling and offending with rude words. The employer pays attention to the expert's times when she/he drinks tea, during breaks, the work she/he does, the reports she/he writes, and his entry and exit times. By not allowing her/him to use his legal right to leave, by constantly calling her/him, asking where she/he is and what she/he does, they pressure her/him, keep her/him under pressure, and even force her/him to quit her/his job.

As a result of the interviews, it was seen that some of those who received training outside the Occupational Health and Safety department and gained expertise through examination returned to their professions. The biggest reason for this is that the profession does not meet the expectations. A group of experts stated that the general perspective on occupational safety is not fully established and cannot be promoted, and that it is important to understand the occupational safety culture well. Some experts turned to this profession because it was more active than the department they graduated from, but they could not meet their financial expectations.

As a result, the person's motivation decreases and she/he does not want to go to work. Her/His working order is disrupted and she/he cannot concentrate on her/his work. Increasing pressure triggers stress and anxiety, causing psychological and physiological illness. As a result of these

intimidation policies, the employee leaves the job. Generally, there are cases where business agreements are terminated unilaterally by experts and people leave their jobs.

Employing the expert outside of her/his duties by not complying with the job descriptions and humiliating her/him in front of the workers prevents her/him from losing her/his reputation while performing her/his duty and doing her/his duty properly. As a result, the group she/he is trying to train will ignore her/him and not want to receive the training, and will not implement any of the procedures she/he says.

Today, while most employees do not realize that they are exposed to mobbing, some employees think that mobbing is a reflection of the psychological processes they go through. Most people do not know the mobbing processes and think that mobbing is applied only because of the superior-subordinate relationship.

CONCLUSION and RECOMMENDATIONS

The most effective way to deal with mobbing is to do the work in accordance with the standards as much as possible and to try to find a solution by talking to the employer when mobbing is felt. If the employer decides to use mobbing and wants to discourage the employee from working, after a certain period of time, the employee can look for a new job or apply for a superior, if any, and even if it is not directly related to the issue, the exhausting nature of the situation can be mentioned. In order for mobbing to be considered a crime, it must continue in the workplace for at least 6 months and be provable. The overall average duration is 15 months. The period in which the permanent and severe effects of the process appear varies between 29 and 46 months. Behaviors must be deliberate, systematic and interconnected. The victim's professional life or health must have been damaged as a result. An employee who thinks she/he has been subjected to mobbing must resolve this legally. For this, it is necessary to apply to the "Turkish Human Rights and Equality Institution", the Presidential Communication Center (CİMER)", "Alo 170 Labor and Social Security Communication Center" or the "Ombudsman Institution". As a result, a legal process will be initiated. The crime of torment in clause 97 of the Turkish Penal Code (TCK), the crime of insult in clause 125, and the crime of disturbing the peace and tranquility of people in clause 123 are among these legal remedies. According to the applicable provisions, criminal sanctions will be imposed on the defendant of the mobbing case. Since the obligation to protect and supervise workers is regulated within the framework of the Turkish Penal Code, Labor Law No 4857 and other relevant legislation, the rights and interests of employees exposed to mobbing can be protected based on the relevant provisions.

The statement "There can be no discrimination based on language, race, color, gender, disability, political opinion, philosophical belief, religion and sect and similar reasons in the employment relationship in Article 5 of the Labor Law No 4857" and the principle of equal treatment should also be taken into consideration. At the same time, clause 417 of the Turkish Code of Obligations also includes a regulation for the protection of the personality of the worker. Accordingly, the employer is obliged to protect and respect the personality of the employee within the service relationship and at the same time to ensure an order in accordance with the principles of honesty in the workplace. At the same time, it is the employer's obligation to take the necessary measures to prevent workers from encountering psychological and sexual harassment and to prevent those who have been subjected to this type of harassment from being harmed further. In addition to all these, ensuring health and safety in the workplace is one of the obligations of the employer. The employer has the responsibility to compensate for the damages caused by the employer's behavior contrary to the contract, including the provisions we have stated. As a result, we can say that a mobbing lawsuit will be filed by people who have been sexually or psychologically harassed at work, and the other party will be subject to criminal sanctions according to the provision of the article to be applied in the case.

Thanks and Information Note

I would like to thank the OHS experts and OHS students who participated in the research and contributed to the preparation of the study through oral interviews.

ÖZET

Pazarlama biliminin en temel unsurlarından olan müşteri odaklılığının en başat uygulaması müşteri beklentilerinin ve memnuniyet düzeylerinin ölçülmesidir. Bununla birlikte bu ölçüm hem yöntem hem de içerik olarak uzun yıllardır tartışılmaktadır. Bu araştırmanın amacı pek çok değişkenden etkilenen bu ölçüm sonuçlarına müşterilerin kazanılma ya da başka bir ifadeyle müşterilerin şirkete geliş kanalının ne oranda etkili olduğunu, kanallar arasında müşteri memnuniyet sonuçları açısından fark olup olmadığını ortaya koymaktır. Bu amaçla özel sağlık sektöründe bir uygulama gerçekleştirilmiştir. Türkiye’de faaliyet gösteren bir sağlık zincirinin KVKK kapsamında izinleri bulunan hastalarına SMS yöntemiyle yapılan anket uygulaması sonrasında geri dönüş sağlanan toplam 741 hastanın anket sonuçları değerlendirmeye alınmıştır. Altı ayrı kanal (çalışan tavsiyesi, hasta tavsiyesi, sosyal medya, kapıdan, internet-web sayfası ve anlaşmalı kurum) üzerinden gelen müşterilerin memnuniyet düzeyleri genel beklenti, hekim, resepsiyon, asistan ve görünüm/temizlik olmak üzere beş farklı kategoriye göre karşılaştırılmıştır. İstatistiksel analiz sonuçlarına bakıldığında beş memnuniyet alanından üçü için kanallar arasındaki ortalamalar anlamlı şekilde farklı çıkmıştır. Diğer yandan en yüksek memnuniyet düzeyi çalışan tavsiyesi üzerine gelen hastalarda ortaya çıkmıştır. Bu hastaların memnuniyet düzeyleri beş kategorinin tamamında diğer kanallardan gelen hastaların memnuniyetinden daha yüksek bulunmuştur. Beş kategorisinin ortalamasına göre çalışan tavsiyesi ile gelen hastaların ortalama memnuniyet düzeyi 4,87 iken diğer kanalların ortalama memnuniyet düzeyi 4,49 dur. En düşük memnuniyet düzeyi ise 4,38 ortalamaya sahip anlaşmalı kurum hastalarına aittir. Ortaya çıkan sonuç memnuniyet ölçüm değerlendirmelerinde müşterilerin geliş kanallarının dikkate alınması gerektiğini ortaya koymaktadır. Çalışanların tavsiyesi ile gelen müşteriler subjektif nedenlerle (tanıdığı çalışanların prim alması, mahcup olmamak vb.) daha yüksek değerlemeler yapabilmektedirler. Diğer yandan çalıştığı firmanın aldığı indirim nedeniyle gelen müşteriler ise tam tersine daha fazla yargılayıcı davranarak daha düşük puanlar verebilmektedirler. Dolayısıyla müşteri beklentilerini anlamak ve karşılamak isteyen pazarlamacıların değerlendirmelerinde bu subjektif bu duruma dikkat etmeleri önem arz etmektedir.

Anahtar Kelimeler: müşteri beklentisi, memnuniyet, tavsiye, müşteri kanalları

**AN APPLICATION ON THE SUBJECTIVE EFFECT OF CUSTOMERS'
ACQUISITION CHANNELS ON CUSTOMER SATISFACTION MEASUREMENT
RESULTS**

ABSTRACT

One of the fundamental factors of marketing science is customer orientation, and the most basic application of this is the measurement of customer expectations and satisfaction levels. However, this measurement has been a subject of debate for many years. The aim of this research is to reveal the extent to which customer acquisition channels, or in other words, the channels through which customers come to the company, affect these measurement results, and whether there is a difference in customer satisfaction results between channels. For this purpose, an application was conducted in the private healthcare sector. After a survey conducted via SMS to patients of a healthcare chain operating in Turkey, the results of a total of 741 patients who responded were evaluated. The satisfaction levels of customers coming through six different channels were compared according to five different categories. According to the statistical analysis results, three out of five satisfaction areas have shown significant differences among channels. Furthermore, the highest level of satisfaction was observed in patients who came through employee recommendation in all five categories with an average satisfaction level of 4.87, while the average satisfaction level of patients from other channels was 4.49. The lowest satisfaction level belonged to patients from contracted institutions, with an average of 4.38. The result shows that customer acquisition channels should be taken into account in satisfaction measurement evaluations. Customers who come through employee recommendations can make higher evaluations for subjective reasons (such as employees they know receiving bonuses, not wanting to feel embarrassed, etc.). On the other hand, customers who come due to the discounts the company they work at receive, conversely, can be more judgmental and give lower scores. Therefore, it is important for marketers who want to understand and meet customer expectations to pay attention to this subjective aspect in their evaluations.

Keywords: customer expectation, satisfaction, recommendation, customer channels.

INTRODUCTION

Understanding consumer behavior, predicting it, and if possible, managing it is the fundamental concern of marketing experts and researchers. This is because building a long-term relationship with consumers/customers, in other words, securing their loyalty, is the primary goal of every brand. In pursuit of these goals, the scope of consumer research has been expanding, diversifying, and renewing for many years. One of the most common types of research within consumer studies is customer satisfaction research. Companies want to know to what extent they meet their customers' expectations to keep them loyal, while also identifying their own strengths and weaknesses. However, understanding and measuring consumers, who are individuals, correctly is an extremely challenging task prone to errors.

Consumer behavior encompasses the processes and activities in which individuals engage when seeking, selecting, purchasing, using, evaluating, and disposing of products and services to fulfill their needs and desires (Engel, Blackwell, & Miniard, 1995). These activities are influenced by environmental factors and also affect how consumers feel, think, and act. Environmental factors include elements such as feedback from other customers, advertisements, packaging, price, and product appearance (Kotler et al., 2016). According to Jeddi et al. (2013), consumer behaviors require motivation, involve numerous activities, and result from a highly complex process depending on the context. Due to this complexity and difficulty, the accuracy and effectiveness of consumer research, especially satisfaction research, have been subjects of debate.

Determinants of customer satisfaction have been viewed as the perceived value of the product or service by customers (Parasuraman, 1997). In many studies, it has been revealed that perceived value is determined by corporate image, service quality, and price (Parasuraman et al., 1988; Zeithaml et al., 1990; Fornell et al., 1996; Johnston, 1995). This study will not delve into the history of customer satisfaction research but will only highlight one of the variables among many that influence satisfaction measurements: the customers' path to the brand, which subjectively affects satisfaction outcomes. Before explaining the methodology and content of the research, it would be useful to briefly mention similar studies conducted in recent times.

Garga, Maiyaki, and Sagagi (2019) found that in the mobile phone sector, the opinions of reference groups, i.e., other people, play a crucial role in customers' brand-switching behavior, while customer satisfaction has the opposite effect.

Hult et al.'s (2019) research, which compared online and offline customer experiences, indicates that perceived overall quality and customer expectations play a more significant role in customer satisfaction in online purchases. Furthermore, customers tend to be more sensitive to satisfaction in online shopping compared to offline experiences. These differences are often influenced by customer demographics such as gender, age, and education, as well as product categories. Table 1. illustrates the variations in the results of this study based on demographic characteristics like gender and age.

Table 1. The differences between online and offline

Proposition	Statement	Implications	Statistical Support Across Customers who Purchased:							
			Pooled Sample	Electronic Goods (n=913)						All Product Categories (n=7537)
				Gender		Age		Education		
				Female	Male	Young	Old	College	Non-College	
1	The impact of overall quality on customer satisfaction is stronger (i.e., more positive) in offline shopping	Customers seek a stronger quality purchasing experience in offline shopping	Yes	No	Yes	Yes	Yes	Yes	Yes	No
2	The impact of perceived value on customer satisfaction is stronger (i.e., more positive) in online shopping.)	Customers aim to derive a more positive value from the online shopping experience compared to the offline experience	Yes	Yes ^a	Yes	Yes	Yes	Yes	Yes	Yes ^a
3	The impact of customer expectations on satisfaction is stronger (i.e., more positive) in offline shopping.	Customers pay more attention to the expected product quality in offline shopping	Yes ^a	Yes	No	Yes ^a	No	No	Yes ^a	Yes
4	The impact of customer satisfaction on customer loyalty is stronger (i.e., more positive) in online shopping	Customer satisfaction is more important for gaining customer loyalty in online shopping	Yes	Yes	No	Yes	Yes	Yes	Yes	Yes

Source: Hult, G. T. M., Sharma, P. N., Morgeson III, F. V., & Zhang, Y. (2019). Antecedents and consequences of customer satisfaction: do they differ across online and offline purchases?. *Journal of Retailing*, 95(1), 10-23.

According to Shah et al. (2021), the determinants of patient satisfaction for high-risk and low-risk diseases are primarily related to hospital processes (hospital environment, location, hospital cafeteria service, parking facilities) and aspects related to doctors (doctor's knowledge, competence, attitudes, etc.). Instead, patients' concerns are related to the treatment experience and bedside behavior of staff for both disease categories.

Mugica and Berne (2020) have shown that customer loyalty is influenced by customer development channels, with consumers who prefer lower prices for more effort (transaction costs) being more inclined to engage in the purchase process. In other words, increasing customer engagement in indirect e-tourism channels leads to higher returns on loyalty, while the effect is lower in direct channels.

MATERIALS and METHODS

The satisfaction survey data regularly conducted with patients of a dental hospital chain operating within Turkey was evaluated within the scope of the research. For this purpose, between January 1, 2023, and March 31, 2023, data from patients who had received services from the mentioned hospital and had previously given consent under the scope of the KVKK (Personal Data Protection Law) and provided ratings between one and five for the survey questions listed in Table 2 were analyzed using the SPSS program.

Table 2. Survey Questions

Question No	Topic Title	Question Statement
Q1	Meeting Expectations	Did the services provided by our hospital meet your expectations?"
Q2	Asistance	Were the behavior and guidance of the dental assistant alongside the dentist sufficient?"
Q3	Reception	How did our initial reception staff at the hospital make you feel?"
Q4	Doctor/Dentist	If a close friend asked you if you knew a good dentist, how would you evaluate our dentist to recommend them?"
Q5	General Appearance and Cleanliness	How would you describe the overall cleanliness and appearance of our hospital?"

All patients who received services during the specified period were contacted. Surveys were conducted monthly via SMS with a web page link sent by the organization's call center, and they were completed in the April 2023 period. The total number of surveys obtained is 741. In the hospital's data system, in addition to patients' demographic information, there is also information about how patients came to the hospital (acquisition channel). These channels and the distribution of patients are shown in Table 3.

Table 3. Patient Channels

Channel	The Number of Patient
Recommendation from Hospitadent Employee	52
Recommendation from Hospitadent Patient	260
Internet - Website/Google	55
Walk-In Patient	121
Social Media	41
Contracted Institution	212
Total	741

RESULTS and DISCUSSIONS

The tables obtained after conducting statistical analyses using the SPSS program are as follows:

Within Groups	547,893	735	,745		
Total	559,914	740			
Q4 Between Groups	9,804	5	1,961	2,240,049	
Within Groups	643,443	735	,875		
Total	653,247	740			
Q5 Between Groups	3,887	5	,777	2,461,032	
Within Groups	232,218	735,316			
Total	236,105	740			

In the test of homogeneity of variances analysis, the significance values were only greater than 0.05 for Q2, indicating that the assumption was not met. For the others, it is evident that there is a significant difference. Looking at the results of the multiple analysis (ANOVA), since $p <$

0.05 for Q3, Q4, and Q5, there is a statistically significant difference in satisfaction among the channels, while for Q1 and Q2, there is no significant difference

CONCLUSION and RECOMMENDATIONS

When the statistical analysis results are examined, the means among channels are significantly different for four out of five satisfaction areas, including overall satisfaction and satisfaction with the doctor. The number of areas with significant differences reduces to three in the multiple analysis. Thus, it can be argued that although not very strong, the channels affect the results of customer satisfaction research, and differences exist among the channels. Upon detailed examination, the highest level of satisfaction within the channels is observed in patients who come through employee recommendations. Indeed, the satisfaction levels of these patients are higher than those of patients from other channels in all five categories. According to the average of the five categories, the average satisfaction level of patients who come through employee recommendations is 4.87, while the average satisfaction level of patients from other channels is 4.49. It can be claimed that the reason for this is that customers who come through employee recommendations gave higher satisfaction scores to the institution for some subjective reasons (such as employees receiving bonuses, not being in a difficult situation, not feeling embarrassed, etc.). On the other hand, contracted company patients are the least satisfied customer group with an average satisfaction score of 4.38. This may be due to the fact that this group of customers is more judgmental or has a more free approach for subjective reasons.

In conclusion, it is evident that companies should take into account the channels through which customers arrive when conducting customer satisfaction measurements. For example, customers who are likely to give higher satisfaction scores, such as those who come through employee recommendations, and customers who are likely to give lower scores, such as contracted company customers, can be evaluated separately.

Another result of this research is that subjective factors can be highly significant in customer satisfaction evaluations. This area is of great importance for marketing researchers and practitioners who want to understand and meet customer expectations.

Thanks and Information Note

The company officials who granted the necessary permissions for obtaining and sharing the data and who provided their assistance deserve the gratitude.

ABSTRACT

Capsaicin (8-Methyl-N-vanillyl-trans-6- nonenamide, C₁₈H₂₇NO₃, molar mass 305.41 g/mol) is a neurotoxin produced from red pepper. It is used as a spice in the food industry, as an insecticide in nature, and as a topical ointment and dermal plaster to treat neuropathic pain and arthritis. Capsaicin, an alkaloid found mainly in red hot peppers, has long been known for its burning sensation when consumed. However, scientific research has revealed a more intriguing aspect of capsaicin. Capsaicin may have antioxidant properties that may benefit human health. Antioxidants play a crucial role in neutralizing harmful free radicals in the body and thus protecting cells from oxidative damage. The antioxidant properties of capsaicin are attributed to its unique chemical structure and interaction with biological systems. Research has shown that capsaicin is able to scavenge free radicals, which are highly reactive molecules that can damage DNA, proteins and lipids in cells. This scavenging activity is partly due to the phenolic structure of capsaicin, which allows it to donate electrons to stabilize free radicals. Oxidative stress is a condition in which there is an imbalance between the production of free radicals and the body's ability to counteract their harmful effects. Studies have shown that capsaicin can modulate oxidative stress by upregulating the expression of antioxidant enzymes such as superoxide dismutase (SOD) and catalase. These enzymes play an important role in neutralizing reactive oxygen species (ROS) and minimizing cellular damage. Studies have revealed a potential powerful antioxidant function of capsaicin, a caustic compound responsible for the spiciness of peppers, going beyond its culinary role. In addition to combating oxidative stress, its ability to modulate inflammation, potentially reducing the risk of cardiovascular disease and cancer, makes it a subject of growing interest in the field of health and nutrition. Incorporating capsaicin-rich foods, such as chili peppers, into one's diet can provide a tasty way to reap these potential health benefits. As scientific research continues to explore the antioxidant effects of capsaicin, it is clear that this spicy secret has the potential to spice up the world of health and wellness.

Keywords: Capsaicin, Pepper, Antioxidant.

INTRODUCTION

Capsaicin is the active ingredient of chili peppers obtained from plants of the genus *Capsicum*, the most consumed red pepper in the world. *Capsicum annuum* (*Capsicum annuum*), a member of the *Capsicum* genus of the Solanaceae family, is native to South America, but has been cultivated for 7000 years in various parts of the world such as South Asian countries and the Southeastern Anatolia Region of our country and is used as a spice and sauce in meals due to its sharp and bitter aroma (Özalp, 2010). Capsaicin and related compounds form a naturally occurring chemical group called capsaicinoids. Compounds known as capsaicinoids cause the spicy aroma of the chili pepper fruit, which has a burning sensation. The primary capsaicinoid in chili peppers is capsaicin, followed by dihydrocapsaicin, nordihydrocapsaicin, homodihydrocapsaicin and homocapsaicin. Capsaicin and dihydrocapsaicin make up about 90% of the capsaicinoids in chili pepper fruit, are the two most potent capsaicinoids, and their molecules differ only in the saturation of the acyl group (Walpole et al., 1996; Kobata et al., 1998).

Capsaicin with the molecular formula (trans-8-methyl-N-vanillyl-6-nonenamide, $C_{18}H_{27}NO_3$) is a member of the vanilloid chemical family. Vanilloids have a vanillyl (4-hydroxy-3-methoxybenzyl) moiety that induces their biological activity. Like other vanilloids, capsaicin is structurally composed of a benzene ring and a hydrophobic carbon tail with an amide group (Akyuz et al., 2018). Capsaicin is a colorless, odorless, crystalline and lipophilic substance with very low water solubility (10.3 mg/L at 25 °C), but soluble in ethanol, chloroform, methanol, acetone and alkaline aqueous solutions (Hayman & Kam 2008). This compound is very stable in acids and alkalis at 25°C. It is also an off-white solid with a melting point of 62-65 °C and a molecular weight of 305.4 kDa (Shah et al., 2020). The molecular structure of capsaicin, first crystallized and named by Tresh in 1876, was solved by Nelson and Dawson in 1919 (Reyes et al., 2011) (Figure 1).

Figure 1. Structure of capsaicin.

Capsaicin is known to be effectively absorbed topically through the skin (Pershing et al., 2004). In a comprehensive study on the distribution, elimination and other active principles of capsaicin in tissues in orally administered animals, approximately 94% of orally administered capsaicin was absorbed and the maximum concentration in blood was reached 1 hour after administration. In addition, the maximum distribution of 24.4% of administered capsaicin in the blood, liver, kidney and intestine was seen within 1 hour and then decreased markedly until undetectable after 4 days (Suresh & Srinivasan, 2010). In vitro studies in human skin have found that the biotransformation of capsaicin is slow, with most capsaicin remaining unchanged and a small fraction metabolized to vanillylamine and vanillyl acid. This suggests that cytochrome P450 enzymes are minimally involved in the conversion of capsaicin in the skin compared to their role in hepatic metabolism. Capsaicin is mainly eliminated by the kidneys and a small untransformed fraction is excreted in feces and urine (Kawada & Iwai, 1985).

Pharmacological Properties

Capsaicin has been thought to have pharmacological effects since antiquity, pepper was probably used as a medicinal herb before cooking. The Mayans, for example, used pepper to treat asthma, coughs and sore throats (Bobinaitė et al., 2012). In Columbia, the Tukano group uses chili peppers to alleviate a hangover (Wen & Zheng, 2018). The Aztecs and Mayans mixed chili peppers with corn flour to produce chillatolli, which was widely used as a therapeutic diet to treat the common cold. The Teenek (Huastec) Indians of Mexico used chili peppers to treat infected wounds. Some other uses include putting red crushed berries on the feet to cure foot fungus and healing snake bites by making a drink from boiled green berries (Bosland & Votava, 2000).

Capsaicin and other members of the capsaicinoid group have effects on the gastrointestinal system, cardiovascular system, respiratory system, limbic system and thermoregulatory system (Surh & Lee, 1995). Research to date has shown that capsaicinoids, and capsaicin in particular, have antioxidant (Materska & Perucka, 2005), analgesic, antimicrobial (Lu et al., 2020; Srinivasan, 2016), anticarcinogenic (Macho et al, 2003; Szallasi, 2022), anti-obesity (Hsu & Yen, 2007; Leung, 2008), promoting energy metabolism and suppressing fat accumulation (Ohnuki et al., 2001) and anti-inflammatory (Sancho et al., 2002).

However, the potential applications of these molecules are limited due to the irritation caused by their pungency, which has led to the search and characterization of similar molecules that are natural and without undesirable effects (González Molinillo et al., 2010; Lida et al., 2003). Capsaicin has been included in topical treatments aimed at alleviating different neuropathic

pain conditions, although it can cause skin irritation. Capsaicin and its analogues have been used in topical creams and patches to treat chronic pain syndromes such as post-herpetic neuralgia, musculoskeletal pain, diabetic neuropathy, osteoarthritis and rheumatoid arthritis (Backonja et al., 2010; Tesfaye, 2009). It has also been applied to treat pain from rashes, psoriasis, mastectomy and bladder disorders (Seraglio et al., 2019). Adverse effects (burning, stinging and erythema) are normally limited to the application site, but respiratory irritation from inhalation of the cream and occasional systemic effects have been reported (Sawynok et al., 2005). Its actual efficacy in pain relief is still questionable due to the small number of participants and the different definitions of pain used in the studies. However, when administered alone or in combination with other treatments, it appears to be a good alternative for pain relief in patients who do not respond to other treatments (Derry et al., 2009).

Antioxidant Properties

Antioxidants are substances that can prevent or slow down the damage to cells caused by free radicals that the body produces in response to environmental and other stresses. Antioxidants are divided into two groups: natural and synthetic. Although synthetic antioxidants do not provide nutritional benefits, they are likely to have harmful effects on body health. Nowadays, due to the importance of food safety and consumers' interest in consuming foods free of synthetic additives, natural compounds with antioxidant activity are of great importance (Heř et al., 2019). The antioxidative and antimicrobial properties of many plant extracts are of great interest, as there is a growing trend towards replacing synthetic antioxidants with natural ones as natural additives used in both academia and industrial research (Shah & Mir, 2022). Several studies have reported the antioxidant activity and mechanism of capsaicin. The bioactive compounds in *Capsicum* species are mainly composed of capsaicin, 6,7-dihydrocapsaicin, homodihydrocapsaicin, nordihydrocapsaicin and homo-capsaicin (Deepa et al., 2007). On the other hand, Capsaicin, chemically defined as 8-methyl-N-vanillyl-6-none, is the main compound of the genus along with a group of similar substances called capsaicinoids. These compounds have been shown to be potent antioxidant substances in the plant (Abuelizz et al., 2020).

In 2008, Sim and Sil reported that red pepper pericarp and seed extracts showed strong antioxidant activity. Red pepper pericarp has high total flavonoid content and total phenolic content. Its strong antioxidant activity is due to its strong iron chelating activity and free radical scavenging activity, while paprika seed has high scavenging power against superoxide anion

radical and high ABTS radical scavenging activity. Therefore, paprika seed extract is a potent antioxidant agent.

The antioxidant properties of capsaicin are attributed to its unique chemical structure and interaction with biological systems. Research has shown that capsaicin is able to scavenge free radicals, which are highly reactive molecules that can damage DNA, proteins and lipids in cells. This scavenging activity is partly due to the phenolic structure of capsaicin, which allows it to donate electrons to stabilize free radicals (Surh, 2002).

Materska and Perucka (2005) investigated the antioxidant activity of phenolic compounds (flavonoids and capsaicinoids) of hot pepper fruit (*Capsicum annum* L.) at two growth stages (red and green). The main components of the capsaicinoid moiety are capsaicin and dihydrocapsaicin. They observed that the capsaicinoid fraction, phenolic acid and flavonoid fraction of red peppers exhibited similar antioxidant activity. Accordingly, they found that the antioxidant activity of both parts was highly correlated with the content of these components. According to their results, capsaicin was shown to have higher antioxidant activity than dihydrocapsaicin. They concluded that the double bond in the lipid chain of capsaicin may affect its antioxidant activity.

Studies have shown that capsaicin can modulate oxidative stress by upregulating the expression of antioxidant enzymes such as superoxide dismutase and catalase. These enzymes play an important role in neutralizing reactive oxygen species and minimizing cellular damage (Oyagbemi et al., 2012; Ghosh et al., 2017). Hossain (2008) found that capsaicin inhibits radiation-induced biochemical changes, including protein oxidation and lipid peroxidation. This study suggests that capsaicin in chili peppers may act as a radioprotective and antioxidant in physiological systems. In addition, antioxidants are also associated with reduced heart disease mortality rates (Hong et al., 2015) and reduced incidence of cancers of the pharynx, mouth, esophagus, stomach, colon and lung, as well as premature aging (Hertog et al., 1992). In intervention studies of capsaicin microemulsions in the food industry, both pure capsaicin and capsaicin microemulsions showed higher inhibitory capacity than the synthetic antioxidant BHT. This formulation can be used as a natural preservative in meat product preparations (Ezekiel & Oluwole, 2014).

CONCLUSION and RECOMMENDATIONS

Capsaicin, the fiery compound responsible for the spiciness of chili peppers, has expanded beyond its culinary role, emerging as a potential antioxidant powerhouse. Its ability to combat oxidative stress, modulate inflammation and potentially reduce the risk of cardiovascular

disease, obesity and cancer will make it a subject of growing interest in the field of health and nutrition. While more research is needed to fully elucidate its mechanisms and therapeutic applications, the antioxidant effects of capsaicin offer an exciting avenue for future research. Incorporating capsaicin-rich foods, such as chili peppers, into one's diet may provide a palatable way to take advantage of these potential health benefits. As the scientific community continues to explore the antioxidant effects of capsaicin, it is clear that this spicy secret has the potential to spice up the world of health and wellness.

**TRAFFIC PREDICTION AND CONGESTION CONTROL ALGORITHMS USING
MACHINE LEARNING TECHNIQUES - A REVIEW**

Assistant Professor Dr. Jogendra KUMAR

ABSTRACT

Traffic congestion is an ongoing challenge in urban areas, leading to various social, environmental, and economic issues. In recent years, machine learning techniques have gained prominence for addressing this problem by enabling traffic prediction and congestion control. This review paper critically evaluates the state of the art in machine learning-based algorithms for traffic prediction and congestion control. The paper starts by providing an overview of the significance of traffic congestion, highlighting its multifaceted impact on urban life. It then delves into the diverse machine learning techniques applied in traffic management systems, including regression models, clustering algorithms, neural networks, reinforcement learning, and ensemble methods. The primary focus of this review is to assess the effectiveness, scalability, and real-world applicability of these techniques. It examines their respective strengths and limitations, emphasizing the importance of selecting the most suitable approach based on the specific traffic conditions and urban environments. Furthermore, the review highlights the role of data sources, encompassing historical traffic data, real-time sensor information, and social media inputs, in enhancing the accuracy and efficiency of machine learning models. It also discusses the challenges associated with each technique, such as computational demands, data quality, and privacy concerns. The paper draws from case studies in different cities worldwide, showcasing successful implementations of machine learning algorithms for traffic prediction and congestion control. By doing so, it underscores the adaptability of these techniques to diverse traffic scenarios and validates their real-world applicability. This review provides a comprehensive assessment of the current state of machine learning techniques for traffic prediction and congestion control algorithms. It offers valuable insights for researchers, urban planners, and policymakers aiming to optimize transportation systems and alleviate traffic congestion. The paper also highlights the need for continued research to address existing challenges and leverage emerging technologies, ultimately contributing to more efficient and sustainable urban mobility solutions.

Keywords: Machine Learning, Traffic Prediction, Congestion Control .

1. INTRODUCTION

Urban areas around the world are grappling with a growing challenge: traffic congestion. As populations continue to urbanize and the number of vehicles on the road steadily increases, traffic congestion has become a pervasive issue that negatively impacts the quality of life for residents and hinders economic productivity. This review aims to delve into the problem of traffic congestion in urban areas, emphasizing the crucial role of machine learning techniques in predicting traffic patterns and effectively controlling congestion. Traffic congestion not only leads to frustrating delays for commuters but also has far-reaching consequences, including increased air pollution, higher fuel consumption, and a rise in road accidents. The conventional approach to managing traffic has often relied on static traffic management systems, which are limited in their ability to adapt to dynamic urban environments. Machine learning techniques have emerged as a powerful tool in addressing this complex problem. By harnessing vast amounts of traffic data, including real-time information from sensors, GPS devices, and traffic cameras, machine learning models can analyze and predict traffic patterns with unprecedented accuracy. These models can adapt to changing conditions, making them well-suited for dynamic urban environments where traffic congestion is a constant challenge.

- **Predict Congestion:** By analyzing historical and real-time traffic data, machine learning models can predict when and where congestion is likely to occur. This enables authorities to take proactive measures to alleviate congestion before it becomes a major issue.
- **Optimize Traffic Signals:** Machine learning algorithms can optimize traffic signal timings in real-time, reducing wait times at intersections and improving traffic flow.
- **Route Optimization:** Through machine learning-based navigation apps, drivers can receive real-time route recommendations that consider current traffic conditions, helping them avoid congestion and reach their destinations more efficiently.
- **Public Transportation Management:** Machine learning can also play a role in optimizing public transportation systems by predicting demand patterns and adjusting schedules accordingly.
- **Purpose and Scope of the Review:** The primary purpose of this review is to provide an in-depth exploration of the application of machine learning techniques in traffic prediction and congestion control within urban areas. It will encompass a wide range of topics, including the types of machine learning algorithms used, data sources, case studies from different cities, and the impact of these technologies on reducing traffic congestion and improving urban mobility. Furthermore, this review will also discuss the challenges and limitations associated with

machine learning-based traffic management, such as data privacy concerns, infrastructure requirements, and the need for collaboration between stakeholders. By examining both the opportunities and obstacles, this review aims to contribute to a comprehensive understanding of the role of machine learning in addressing one of the most pressing issues in urban planning and transportation management: traffic congestion.

2. Machine Learning Techniques for Traffic Prediction

Machine learning techniques have revolutionized the field of traffic prediction by enabling more accurate and dynamic forecasting models. In this section, we will provide an overview of various machine learning methods applied to traffic prediction, highlighting their strengths and applications.

- **Regression Models:** Regression models are widely used for traffic prediction due to their simplicity and interpretability. Linear regression, in particular, is a straightforward approach for modeling relationships between variables in traffic prediction. It can be applied to predict traffic congestion based on historical data, such as traffic volume, time of day, and weather conditions. These models help estimate the impact of different factors on traffic flow and congestion levels.
- **Clustering Algorithms:** Clustering algorithms play a crucial role in traffic pattern analysis. By categorizing similar traffic data points into clusters, these algorithms reveal underlying patterns and trends. K-means clustering, for instance, can group traffic data into clusters with similar characteristics, aiding in identifying congestion-prone areas or understanding spatial and temporal traffic patterns. Clustering is valuable for both traffic prediction and anomaly detection.
- **Neural Networks:** Neural networks, especially deep learning models like Convolutional Neural Networks (CNNs) and Recurrent Neural Networks (RNNs), have gained prominence in traffic prediction tasks. CNNs are adept at processing spatial data, making them suitable for analyzing traffic images and video feeds from cameras. RNNs excel in sequential data analysis, making them valuable for time-series traffic data. These networks can capture complex relationships within traffic data, enabling accurate short-term and long-term traffic predictions.
- **Ensemble Methods:** Ensemble methods combine the predictions of multiple models to improve accuracy and robustness. Techniques like Random Forests and Gradient Boosting are frequently employed in traffic prediction. They excel in handling noisy and high-dimensional data. Ensemble methods can incorporate various features and models, enhancing the overall

prediction performance. They are particularly useful when dealing with diverse data sources, such as sensor data, GPS data, and social media data.

3. Machine Learning Techniques for Congestion Control

Machine learning techniques have shown significant promise in addressing the challenge of congestion control in urban areas. In this section, we will provide an overview of various machine learning approaches for congestion control and discuss their applicability and effectiveness.

- **Introduction to Machine Learning Approaches for Congestion Control:** Congestion control in urban environments is a critical issue that affects not only the flow of traffic but also air quality and the overall quality of life for residents. Machine learning approaches offer dynamic and data-driven methods to alleviate congestion and improve traffic management. These techniques leverage real-time data, historical patterns, and optimization algorithms to make traffic management more efficient and adaptive.
- **Reinforcement Learning Algorithms and Their Applicability:** Reinforcement learning (RL) algorithms have gained attention for their potential in congestion control. RL agents can learn optimal control policies through interaction with their environment. In the context of traffic management, RL can be used to optimize traffic signal timings, route guidance for autonomous vehicles, or even control strategies for traffic lights. The adaptability of RL makes it suitable for dynamic urban environments where congestion patterns change frequently.
- **Neural Networks for Congestion Control Strategies:** Neural networks, particularly deep reinforcement learning models, have demonstrated effectiveness in optimizing congestion control strategies. These models can learn complex patterns from vast amounts of data, allowing them to make real-time decisions to mitigate congestion. Neural networks can be applied to traffic signal optimization, predictive traffic modeling, and adaptive route planning, offering fine-grained control over congestion-prone areas.
- **Real-Time Optimization Techniques Using Machine Learning:** Real-time optimization techniques, often based on machine learning, are essential for adaptive congestion control. These techniques can adjust traffic signal timings, reroute vehicles, and manage traffic flows dynamically based on current conditions and predictions. By harnessing data from sensors, cameras, and GPS devices, real-time optimization models can respond swiftly to changing congestion patterns and minimize delays for commuters.
- In conclusion, machine learning approaches for congestion control offer a data-driven and adaptive way to manage traffic in urban areas. Reinforcement learning algorithms, neural

networks, and real-time optimization techniques can work together to create efficient and adaptable congestion control strategies. These techniques have the potential to improve traffic flow, reduce congestion-related problems, and enhance the overall urban mobility experience.

4. Comparison of Machine Learning Techniques for Traffic Prediction and Congestion Control

Technique	Application	Strengths	Limitations	References
Regression Models	Predicting traffic congestion based on historical data, such as traffic volume, time of day, and weather conditions.	Simplicity, interpretability, suitable for straightforward relationships.	Limited ability to capture complex, non-linear patterns.	[1], [2], [3]
Clustering Algorithms	Analyzing traffic patterns, identifying congestion-prone areas, and understanding spatial and temporal traffic patterns.	Reveals hidden patterns, aids in anomaly detection, helpful for spatial analysis.	Dependent on the choice of clustering algorithm and initial conditions.	[4], [5], [6]
Neural Networks	Capturing complex relationships within traffic data for short-term and long-term traffic predictions.	Effective for sequential and image data, handles non-linearity, high model capacity.	Requires substantial data and computational resources, can be less interpretable.	[7], [8], [9]
Ensemble Methods	Combining multiple models to improve prediction accuracy, particularly useful for handling diverse data sources.	Improves accuracy and robustness, handles high-dimensional data, mitigates overfitting.	May be computationally intensive, complex to tune, and less interpretable.	[10], [11], [12]
Introduction to Machine Learning	Overview of using ML for congestion control.	Data-driven, adaptable, and dynamic approach.	Limited to available data, complexity of real-world traffic.	[1], [2], [3]
Reinforcement Learning Algorithms	Optimize traffic signals, route guidance, control strategies.	Adaptive, learns optimal policies, dynamic environments.	High computational requirements, extensive training.	[4], [5], [6]
Neural Networks for Congestion Control	Traffic signal optimization, predictive modeling, adaptive routing.	Handles complexity, real-time decisions, fine control.	Requires large datasets, potential overfitting.	[7], [8], [9]
Real-Time Optimization Techniques	Adjust traffic management dynamically.	Swift response to changing conditions, minimizes delays.	Dependency on data accuracy, model complexity.	[10], [11], [12]

Table 1: Comparison of Machine Learning Techniques for Traffic Prediction and Congestion Control

5. Challenges and Limitations

Challenges and Limitations	Description	References
Data Quality	Inaccurate, incomplete, or biased data can impact model performance.	[1], [2], [3]
Model Complexity	Complex models require substantial computational resources and time.	[4], [5], [6]
Overfitting	Overfit models may perform poorly on unseen data in dynamic traffic environments.	[7], [8], [9]
High Computational Demand	Computationally intensive models demand substantial processing power.	[10], [11], [12]
Scalability	Handling large urban areas and high-resolution data can be challenging.	[13], [14], [15]
Data Collection	Gathering real-time traffic data from various sources is expensive and challenging.	[16], [17], [18]
Data Preprocessing	Cleaning and preprocessing data can be time-consuming and require expertise.	[19], [20], [21]
Data Privacy	Balancing data utility with privacy protection is crucial.	[22], [23], [24]
Security	Ensuring data and model security against cyber threats is essential.	[25], [26], [27]
Model Interpretability	Complex models may lack transparency, making interpretation difficult.	[28], [29], [30]

6. CONCLUSIONS and FUTURE DIRECTION

In this comprehensive review, we have explored the application of machine learning techniques in the domain of traffic prediction and congestion control within urban areas. Our examination of various machine learning methods, including regression models, clustering algorithms, neural networks, and ensemble methods, has revealed their potential to revolutionize traffic management and improve urban mobility. While machine learning has made significant strides in addressing traffic congestion, there remains ample room for further research and advancement in this field. Future research efforts should focus on: the application of machine learning in traffic prediction and congestion control presents an exciting opportunity to transform urban mobility. Informed decision-making, driven by data and advanced algorithms, holds the key to building more efficient, sustainable, and livable cities. As we continue to innovate and address the challenges, the future of urban transportation looks promising.

ABSTRACT

This paper presents a comprehensive performance analysis of a proactive routing protocol in a wireless network environment using Constant Bit Rate (CBR) traffic. Proactive routing protocols are essential for maintaining up-to-date routing information in dynamic wireless networks, making them suitable for applications like mobile ad-hoc networks (MANETs) and wireless sensor networks (WSNs). The primary objective of this study is to evaluate the effectiveness of a proactive routing protocol under varying network conditions when subjected to CBR traffic patterns. The research employs simulation techniques to model and analyze the behavior of the proactive routing protocol. Key parameters, including network size, node density, mobility patterns, and CBR traffic load, are systematically varied to assess their impact on performance metrics such as packet delivery ratio, end-to-end delay, throughput, and routing overhead. This analysis provides valuable insights into the protocol's behavior and its adaptability to different scenarios. This paper offer crucial guidance for network designers and researchers aiming to deploy proactive routing protocols in wireless communication environments. By utilizing CBR traffic as a representative traffic pattern, we aim to simulate real-world scenarios effectively, enabling the evaluation of the protocol's performance under conditions that closely resemble practical applications. This research contributes to the understanding of proactive routing protocols' strengths and weaknesses, aiding in the selection and configuration of routing solutions for wireless networks. The insights gained from this simulation-based analysis can lead to the development of more robust and efficient wireless communication systems, benefiting various domains such as IoT, emergency response, and military communications.

Keywords: Distributed Networks, Proactive Routing Protocol, Parameters, CBR.

1. INTRODUCTION

Optimized Link State Routing (OLSR) is a proactive routing protocol designed for mobile ad-hoc networks (MANETs) and wireless mesh networks. It maintains an up-to-date routing table for every node in the network, enabling efficient and fast routing of packets. OLSR uses a proactive approach, meaning it continuously updates its routing tables regardless of network traffic. OLSR's proactive approach and optimized control message flooding make it suitable for scenarios where nodes need to maintain up-to-date routing information, such as wireless mesh networks and MANETs. It helps ensure efficient and reliable communication within these dynamic and self-organizing networks[1-3].

2. OPTIMIZED LINK STATE ROUTING (OLSR) ROUTING PROTOCOLS

- **Hello Messages:** In OLSR, nodes periodically exchange "Hello" messages with their neighbors to detect and maintain links to other nodes in the network. These Hello messages help nodes identify their 1-hop neighbors[1].
- **Link State Information:** Each node collects information about its neighbors and their links from the Hello messages. This information includes the identity of the neighbor nodes, the quality of the links (e.g., signal strength), and the status of the links (e.g., whether they are bidirectional)[1].
- **Topology Control:** OLSR employs a technique called "MultiPoint Relays" (MPRs) to optimize flooding of control messages. MPRs are selected nodes that forward control messages to reach the entire network. This reduces the overhead of control message flooding [1-3].
- **Routing Table Update:** Based on the information collected from Hello messages and MPR selection, each node calculates its routing table. The routing table contains entries for all destination nodes in the network, specifying the next-hop nodes to reach them [1-2].
- **Proactive Routing Efficiency:** OLSR is a proactive or table-driven routing protocol, continuously maintaining up-to-date routing tables. This proactive nature results in low end-to-end delay and low jitter, making it suitable for applications requiring real-time or low-latency communication [1-2].
- **Control Message Optimization:** OLSR employs techniques like MultiPoint Relays (MPRs) to optimize control message overhead. This helps reduce network overhead and ensures efficient use of available bandwidth [1].

- **Scalability:** OLSR is highly scalable and can perform efficiently even in larger networks. The use of MPRs and proactive updates contribute to its scalability [4].
- **Robustness:** OLSR demonstrates robustness in dynamic network environments, adapting well to topology changes, node mobility, and link variations. This robustness is valuable for scenarios where network conditions are unpredictable [5].
- **Throughput Efficiency:** OLSR can provide efficient throughput once routes are established. It balances control message exchange with data transmission, optimizing network capacity [7].

Let's consider an example of a wireless mesh network in a rural area with nodes representing Wi-Fi routers. The nodes need to establish efficient routing paths to deliver data packets to their intended destinations, such as homes or businesses. This process repeats for all nodes in the network, ensuring that each node has an updated routing table. When a node wants to send a data packet to a destination, it consults its routing table to determine the next-hop node. The packet is then forwarded through the network along the path specified by the routing table entries[8-9].

Destination Node | Next-Hop Node

-----	-----
B	B
C	C
D	B

- Node A sends Hello messages to its neighbors, including Nodes B, C, and D. It collects information about their link quality and status.
- Based on the link state information, Node A selects a subset of its neighbors as MultiPoint Relays (MPRs) for efficient control message forwarding. Let's say it selects Nodes B and C.
- Node A calculates its routing table, which includes entries for all destination nodes (e.g., Nodes X, Y, Z). For each destination, it specifies the next-hop node to reach them based on MPR selection and link quality information. For instance, to reach Node Z, Node A might choose Node C as the next-hop node.
- Node A periodically updates its routing table based on any changes in link quality or topology.

3. PERFORMANCE METRICS

- Total Packets Sent (TPS): The total number of packets sent by a network device.
- Total Packets Received (TPR): The total number of packets received by a network device.
- Average Jitter (AJ): Jitter is the variation in packet delay within a network. To calculate the average jitter, you can use the following formula:

$$AJ = (\sum |PacketArrivalTime - PacketSentTime|) / Total\ Packets\ Received \quad (1)$$

Where:

- Σ denotes the sum over all received packets.
 - PacketArrivalTime is the time the packet was received.
 - PacketSentTime is the time the packet was sent.
- Average End-to-End Delay (AED): The average time it takes for a packet to travel from the source to the destination. To calculate the average end-to-end delay, you can use the following formula:

$$AED = (\sum (PacketArrivalTime - PacketSentTime)) / Total\ Packets\ Received \quad (2)$$

Where:

- Σ denotes the sum over all received packets.
 - PacketArrivalTime is the time the packet was received.
 - PacketSentTime is the time the packet was sent.
- Throughput (T): The rate at which data is successfully transmitted over the network, typically measured in bits per second (bps). To calculate throughput, you can use the following formula:

$$T = (Total\ Data\ Received) / Total\ Time \quad (3)$$

Where:

- Total Data Received is the amount of data received during the measurement period.
- Total Time is the duration of the measurement period in seconds [12-18].

4. RESULTS and DISCUSSION

In figures 1 and 2 OLSR involves the periodic exchange of control messages (Hello and Topology Control messages) for neighbor discovery and routing table maintenance. The exact number of control packets sent and received depends on factors like network size and update intervals. Data packets are sent when there is actual data to transmit, and the number

of data packets sent and received depends on network traffic. In figures 3 OLSR typically provides low jitter due to its proactive nature. Control messages are exchanged at regular intervals, and data packets follow established routes, resulting in relatively stable and predictable latency. In figures 4 OLSR offers low end-to-end delay. Controls messages help maintain up-to-date routing tables, allowing for fast route establishment when data packets need to be transmitted. Once routes are established, data packets are forwarded with minimal delay. In figures 5 OLSR can provide efficient throughput once routes are established. The control message overhead is relatively low compared to some other protocols, which allows more bandwidth for data transmission. Throughput depends on factors like network topology, data rates, and traffic patterns.

Figure 1 : Total Packets Sent

Figure 2 : Total Packets Recieved

Figure 3 : Average Jitter (s)

Figure 4 : Average End –to-End Delay (s)

Figure 5 : Throughput (bits/s)

5. CONCLUSIONS

OLSR's proactive approach, control message optimization, scalability, and adaptability make it a strong choice for wireless ad-hoc networks, particularly in scenarios where low latency, efficient routing, and robustness to dynamic conditions are essential. However, as with any routing protocol, the effectiveness of OLSR depends on proper network design and configuration to align with specific application requirements and network characteristics. It's important to note that the specific values for these performance metrics in an OLSR-based network can vary widely based on network configuration, traffic load, and environmental

conditions. Proper network design and configuration, including setting appropriate control message intervals, can help optimize the performance of OLSR in terms of these metrics.

**ENSEMBLE LEARNING FOR HEART DISEASE DIAGNOSIS: A VOTING
CLASSIFIER APPROACH**

YOGESH S.

Mepco Schlenk Engineering College

ABSTRACT

Cardiovascular disease remains a serious public health problem internationally, responsible for a considerable number of fatalities. Early and correct detection of cardiovascular illness is crucial for optimal care and control of the condition. In this paper, we present an ensemble learning technique that includes voting classifiers to increase the reliability of cardiovascular disease diagnosis. We obtained a set of data from five cardiology databases, which included the Cleveland, Hungary, Switzerland, Long Beach VA and Statlog (Heart) datasets, which supplied us with a total of 1189 entries. We employed a feature engineering approach to extract relevant features from the dataset, enabling us to acquire vital information to enhance our model's performance. We trained and evaluated several machine learning algorithms, such as Random Forests, MLP, K-Nearest Neighbors, Extra Trees, XGBoost, Support Vector Machines, AdaBoost, Decision Trees, Linear Discriminant Analysis, and Gradient Boosting, and then incorporated these models using voting classifiers to produce more reliable and accurate models. Our findings reveal that the proposed ensemble learning process outperforms standalone models and conventional ensemble approaches, obtaining an accuracy rate of 91.4%. Our technique is likely to benefit clinicians in the early diagnosis of heart problems and improve patient outcomes. This work has major significance for the area of cardiology, indicating the possibility for machine learning approaches to boost both the reliability and accuracy of heart disease identification. The recommended ensemble learning technique may be adopted in hospitals to enhance patient care and eventually lessen the worldwide impact of cardiovascular disease. Further study is required to investigate the uses of predictive modeling in cardiology and other medical domains.

Keywords: Cardiovascular Disease; Heart Disease Diagnosis; Ensemble Learning; Voting Classifier; Machine Learning; Feature Engineering.

INTRODUCTION

Heart disease is a truly serious global medical issue, creating a significant amount of mortality each year. As per to data from the World Health Organization (WHO), coronary artery disease account for around 17.9 million deaths per year [1] , making it the top cause of death internationally. Among the various kinds of cardiovascular conditions heart disease ranks as one of the most prevalent and life-threatening. Heart disease involves a variety of conditions that impair the way that the hearts operate including clogged coronary arteries, cardiac arrhythmia and heart failure [2].

Considering the availability of improved medical technology and therapies, the prompt detection of heart ailments remains a difficulty. Early identification and proper identification of cardiovascular disorders are crucial for effective management and treatment of the illness. The usual techniques of assessment, including electrocardiogram, or ECG, and echocardiogram, have limits in regard to accuracy and reliability. There exists an urge for improved and more successful techniques of identifying cardiac disease [3].

Machine learning approaches have emerged as potential tools for enhancing the accuracy and dependability of cardiac disease detection. Machine learning algorithms may learn from data and detect patterns that are not clearly observable by humans. These algorithms may be trained on enormous amounts of patient data and medical pictures to detect early indications of heart failure and forecast the chance of acquiring cardiac disease in future years [4].

The implementation of machine learning methods in the area of medicine has already demonstrated promising outcomes. Several research have claimed promising findings in the early identification and diagnosis of cardiac conditions using predictive machine learning algorithms [5]. Yet, the precision and dependability of these algorithms may be improved by employing ensemble learning approaches.

Ensemble learning is a method for machine learning that mixes different models to enhance the overall efficiency of the system. The concept driving ensemble learning is to construct a set of different approaches that are able to support each other's capabilities and shortcomings. By merging the predictions of different models, the precision as well as the dependability of the system may be increased. [6]

In this paper, we present an ensemble learning technique for heart disease detection that incorporates voting classifiers. We utilized four cardiology datasets from the Machine Learning Repository at UCI - the Cleveland, Hungary, Switzerland, and Long Beach VA data sets [7] -

to construct a dataset of 1189 entries. We employed a feature engineering strategy to extract significant properties from the dataset, allowing us to acquire critical information to increase our model's performance. We trained and tested many machine learning methods, such as Random Forests [8], MLP, K-Nearest Neighbors, Extra Trees, XGBoost, Support Vector Machines, AdaBoost, Decision Trees, Linear Discriminant Analysis, and Gradient Boosting, to develop our base models. These models were then combined through voting classifiers to build more reliable and accurate models.

To examine the success of our proposed method of ensemble learning for heart disease detection, we applied different performance criteria. We tested our models using measures such as Accuracy, Precision, Sensitivity, Specificity, F1 Score, ROC, and Matthews Correlational Coefficient. These measures enabled us to assess the accuracy, dependability, and overall success of our method.

The dataset utilized in our investigation includes a total of 1189 records and 12 characteristics. The characteristics included patient information such as age, sex, chest pain type, resting blood pressure, cholesterol, fasting blood sugar, rest ECG, maximum heart rate reached, exercise-induced angina, ST depression, ST slope, and goal. The target characteristic, which was our major emphasis, had binary values of 0 and 1, where 0 indicated the absence of heart illness and 1 indicated the existence of heart disease. [9]

Overall, our study makes an important improvement in the discipline of predictive modeling in medicine, notably in the domain of heart illness identification. Our technique has the potential to increase the correctness and dependability of existing approaches for diagnosing cardiovascular disease, potentially contributing towards more efficient treatment and management of this life-threatening illness.

RELATED WORKS

Up to today, several study inquiries have been taken out on the early diagnosis of coronary artery disease and heart failure. They have utilized several machine learning prediction methods and obtained amazing performance. This section includes a complete literature review of research works in the domain of heart disease diagnostics underpinned by machine learning techniques:

In [10], the authors present an improved use of machine learning techniques that predicts heart disease probability. Their strategy comprises randomly splitting the data set and modelling each partition via a regression as well as classification tree strategy. A homogenous ensemble is built

from the multiple models using an accuracy-based weighted aging classifier ensemble. This technique obtained 93% and 91% classification accuracies on the Cleveland and Framingham datasets, respectively, exceeding existing machine learning algorithms and related efforts. The findings illustrate the usefulness of the suggested ensemble learning technique for forecasting heart disease risk.

In [11], the authors employed multiple machine learning techniques including deep learning to examine the UCI Machine Learning Heart Disease dataset. They handled extraneous characteristics utilizing Isolation Forest and normalized the findings. The research yielded encouraging findings, which were confirmed by applying accuracy and confusion matrices. Additionally, the research examined the possible coupling of this study with multimedia technologies on mobile devices. The deep learning method yielded an accuracy rate of 94.2%. In [12], the authors created an ensemble model for heart disease prediction utilizing the University of California, Irvine ML Repository. The meta-algorithm provided a steadier performance than baseline machine learning algorithms, leading to higher prediction accuracy and analytical output dependability. The Bagging Ensemble classifier was determined to have the greatest prediction probability score and was recommended for deployment. The authors provided a cost-effective and user-friendly graphical user interface for the ensemble heart disease prediction model, which is scalable and extendable. These data imply that the ensemble model is a viable prediction alternative for heart disease.

In [13], the authors developed a deep stacking ensemble model for predicting heart disease, which incorporates two pre-trained blended deep learning models (CNN-LSTM and CNN-GRU) with SVM acting as the meta-learner model. Recursive Feature Elimination (RFE) was utilized for feature selection optimization, and the suggested model was compared with five different machine learning models. The suggested model attained the maximum performance utilizing the whole feature set.

In [14], the authors suggest a StackingCVClassifier ensemble model built of Logistic Regression, K Nearest Neighbors, and Naïve Baye's classifiers as base learners to boost the diagnostic performance of these classifiers for predicting heart disease. They preprocessed the information from Cleveland Clinic Foundation adopting different data extraction and feature selection approaches to increase illness prediction accuracy. The suggested ensemble model attained a prediction accuracy of 90.0% on test data, beating the component models. The authors argue that such models may aid healthcare practitioners in creating medical diagnostic

systems, particularly in disadvantaged regions, and offer a noninvasive manner of illness diagnosis.

In [15], the authors present a novel ensemble model, named RSS-KNN, for early prediction of heart disease. The framework merges stochastic subspace and K-nearest neighbor (KNN) technique with an isolation-based outlier elimination approach and an upgraded squirrel optimizer. The suggested technique captures key information through RSS and then feeds it into KNN for accurate classification. The simulation results on the UCI ML dataset demonstrate that the ensemble model that has been suggested attains an accuracy of 98.56% with features and 98.10% specificity, exceeding current modern facilities classifiers.

In [16], the authors apply machine learning approaches to identify heart problems in people. The work combines both heterogeneous as well as homogeneous ensemble classifiers and leverages the Synthetic Minority Oversampling Technique (SMOTE) to solve class imbalance and noise. The suggested technique incorporates two steps: SMOTE preprocessing and classification utilizing Naive Bayes (NB), decision tree (DT), and their ensembles. The findings reveal that the AdaBoost-Random Forest predictor achieves 95.47% accuracy in the the early detection of heart disease.

In [17], the authors present a heart disease prediction model that incorporates body signals and an algorithm centered upon the integrated datasets and train-test split approach. They compare their findings with prior efforts and employ accuracy, precision, recall, F1-score, and ROC-AUC curves as performance measures for various classifiers. The Random Forest Classifier exhibits 100% performance on the combined heart disease datasets, whereas the Decision Tree, Random Forest, and Gradient Boosting Classifiers yield a 99-100% ROC-AUC. They also employ five-fold cross-validation and the Stacking CV Classifier to increase the machine learning algorithms' performance. The authors discover that the RFC classification algorithm's accuracy is excellent, and their proposed approach is efficient and accurate for predicting heart disease.

Overall, the studies demonstrate the effectiveness of ensemble learning and feature selection in enhancing heart disease prediction accuracy. The results of the research can be useful in developing more accurate and robust heart disease prediction models, which can assist in early diagnosis and treatment of the condition.

COMPUTATIONAL INTELLIGENCE TECHNIQUES

Computational Intelligence Techniques refer to the set of methods and algorithms that enable computers to learn from data, adapt to changing environments, and perform tasks that traditionally require human intelligence. These techniques encompass a wide range of subfields, including machine learning, artificial intelligence, and data mining. Machine learning algorithms are one of the key components of Computational Intelligence Techniques. These algorithms learn from data to improve performance on a specific task. In this section, we will discuss several popular machine learning algorithms that have been used to develop the ensemble model, including Random Forests, MLP, K-Nearest Neighbors, Extra Trees, XGBoost, Support Vector Machines, AdaBoost, Decision Trees and Gradient Boosting [18].

Random Forests

Random Forest is a powerful ensemble learning technique used for both classification and regression tasks. It builds a forest of decision trees on random subsets of data and features to reduce the risk of overfitting and increase the accuracy of the model. In this paper, we utilized the `RandomForestClassifier()` to implement the Random Forest algorithm with two different sets of parameters. The first set included the `criterion='entropy'` parameter, which measures the quality of splits, and `n_estimators=100`, which specifies the number of trees in the forest. The second set of parameters was `criterion='gini'` and `n_estimators=100`. This allowed us to compare the performance of Random Forest with different criteria for measuring the quality of splits.

Multi Layer Perceptron (MLP)

The Multi-Layer Perceptron (MLP) is a type of artificial neural network that is used for classification tasks. It has an output layer with numerous neurons connected by weighted connections, one or more hidden layers, and an input layer. The MLP classifier is a supervised learning algorithm that adjusts the weights between neurons using a backpropagation algorithm to minimize the error between predicted and actual output. We used the `MLPClassifier()` as one of the base model in this paper.

K-Nearest Neighbour (KNN)

K-Nearest Neighbor (KNN) is a classification algorithm commonly used in mining medical databases. It works by measuring the similarity between a new case and other cases in the dataset. The algorithm determines the distance between the new case and every other case in the model, and then assigns the new case to the output that contains the closest neighbors. The KNN algorithm has two steps:

- 1) finding the K training instances that are closest to the unidentified instance.
- 2) selecting the most frequently occurring classifications for these K instances.

In this paper, we have used the `KNeighborsClassifier()` to implement the KNN algorithm with $K=9$, which means that the algorithm considers the 9 nearest neighbors to the new instance for classification.

Extra Trees

Extra Trees is an ensemble learning method that uses a combination of multiple decision trees to generate a forest. It constructs a large number of random decision trees and averages their output to produce the final result. This approach helps to reduce overfitting and improve the accuracy of the model. In Python, the `ExtraTreesClassifier()` function is used to implement the Extra Trees algorithm for classification problems. The parameter `n_estimators` specifies the number of trees to be used in the forest. In this paper, we used three `ExtraTreesClassifier` models as base models for our ensemble model, with `n_estimators` set to 100, 500, and 1000 respectively.

XGBoost

XGBoost, short for eXtreme Gradient Boosting, is a gradient boosting algorithm used for supervised learning tasks. It is designed to enhance the performance of traditional gradient boosting algorithms by incorporating a regularization term to the loss function, which helps to prevent overfitting. XGBoost builds multiple decision trees iteratively, with each tree attempting to correct the errors of the previous tree. The algorithm assigns weights to each instance in the data, with the weights of the misclassified instances being increased in subsequent iterations. In this paper, we utilized the `XGBClassifier()` to create five models. The first model was built without any additional parameters, while the second model had `n_estimators` set to 2000. The third model was created with `n_estimators` set to 500, the fourth with `n_estimators` set to 100, and the fifth with `n_estimators` set to 1000. These models were used as the base models for our ensemble learning approach, aimed at improving the classification performance on our medical dataset.

Support Vector Machines (SVM)

Support Vector Machine (SVM) has shown excellent performance in the medical sector for disease prediction in recent years. SVM is a supervised learning technique designed for regression and classification tasks, with the primary goal of minimizing generalization errors. SVM works by classifying data into two classes over a hyperplane. It is highly effective in high-

dimensional spaces, even when the number of dimensions exceeds the number of samples. Mathematically, SVM represented as as follows.

$$\text{If } Y_i = +1; wx_i + b \geq 1 \quad (1)$$

$$\text{If } Y_i = -1; wx_i + b \leq 1 \quad (2)$$

$$\text{For all } i; y_i (w_i + b) \geq 1 \quad (3)$$

In the equation, x is a vector point and w is a weight and a vector. So, to separate the data in Equation (1) should always be greater than zero and the data in Equation (2) should always less than zero. Among all possible hyperplanes, SVM selects the one where the distance of hyperplane is as large as possible. In this paper, we have used the SVC() with kernel='linear', gamma='auto', and probability=True parameters. The SVC (Support Vector Classifier) is a type of SVM algorithm that is used for classification tasks. The kernel parameter specifies the type of kernel function to be used for the decision function, while the gamma parameter controls the width of the kernel function. The probability parameter is set to True to enable probability estimates for each class.

AdaBoost

AdaBoost is an ensemble learning method used for classification problems. It combines multiple weak classifiers to create a strong classifier. The weak classifiers are typically decision trees with a depth of 1 and are trained on subsets of the data. During training, the algorithm assigns weights to the samples in the data set and trains a new weak classifier in each iteration. The final classifier is a weighted sum of the weak classifiers, where each classifier is assigned a weight based on its accuracy. In this paper, we used the AdaBoostClassifier function without any parameters.

Decision Tree

Decision trees are powerful and popular tools for predicting and classifying medical data. Decision Tree is a classifier expressed as a recursive part of the information space depending on the values of the attributes. Each internal node splits the instance space into two or more subspaces according to certain function of the input attribute values. Each leaf is allocated to one class that represents the most appropriate value. There are many types of algorithms for DT. In this paper, we used the DecisionTreeClassifier() as one of the base models in our ensemble model. We did not specify any additional parameters for this model, meaning that it used the default parameters to build the decision tree.

Gradient Boosting

Gradient Boosting is an ensemble learning technique used for classification and regression problems. It builds trees in a sequential way by giving more weight to the misclassified instances in the previous tree. The GradientBoostingClassifier in Python uses the gradient boosting algorithm for classification problems, with `n_estimators` and `max_features` as important parameters. In our research, we used the GradientBoostingClassifier with `n_estimators=100` and `max_features='sqrt'` as one of the base models for our ensemble model.

METHODS and MATERIALS

In this study, to forecast the coronary artery heart disease, we use the following procedures, (1) Data collection, (2) Exploratory Data Exploration (EDA), (3) Data preprocessing, (4) Base Models Evaluation, (5) Feature Selection, and (6) Voting Ensembling. The following sections address all the processes in depth.

Data Collection

The data accumulating method is an important part of every research study as it assures the quality and confidence of the results. In this work, all the five data sets' collection was done using the Heart Disease dataset accessible via the UCI Machine Learning Repository. The Heart Disease dataset is an extensive database that is commonly utilized in studies relating to heart disease. The dataset utilized in this research is generated by combining five significant heart disease datasets, including Cleveland, Hungarian, Switzerland, Long Beach VA, and Statlog (Heart) Data Set, over 12 common features. This unification procedure has resulted in a single dataset that is the greatest heart disease dataset available for research reasons. By merging data from numerous sources, the dataset gives a more complete picture of cardiac disease, including its causes, risk factors, and possible therapies. The Heart Disease dataset covers both male and female patients, giving it a diversified sample for heart disease research. With an aggregate total of 1189 samples divided into 11 categories, the dataset provides a plethora of information for academics to evaluate. The 11 factors presumably include the clinical assessment information of the patient, which may give insights into the development and progression of cardiac disease. The target categorization, which is the presence or absence of cardiac disease, is the 12th characteristic, making it the subject of this investigation. The availability of such a vast and diversified dataset is a huge benefit for researchers investigating cardiac disease. The scale and variety of the dataset enable for more accurate and dependable discoveries, which may eventually lead to improved diagnosis, prevention, and treatment of

cardiac disease. More information regarding the dataset may be accessed in Table 1.

TABLE I. Description of the Heart Disease Dataset

S. No	Attribute	Datatype	Value
(i)	age	Numeric	[28 – 77]
(ii)	sex	Binary	1 = male, 0= female;
(iii)	chest pain type	Nominal	1 indicates typical angina, 2 indicates atypical angina, 3 indicates non-anginal pain, and 4 indicates no symptoms;
(iv)	resting bp s	Numeric	[94–200]
(v)	cholesterol	Numeric	[126–564]
(vi)	fasting blood sugar	Binary	1,0; > 120 mg/dl
(vii)	resting ecg	Numeric	According to Estes' criteria, 0 represents normal, 1 represents an abnormal ST-T wave, and 2 represents either definite or likely left ventricular hypertrophy.
(viii)	max heart rate	Nominal	[71–202]
(ix)	exercise angina	Binary	1 = yes; 0 = no
(x)	oldpeak	Numeric	1 = yes; 0 = no
(xi)	ST slope	Nominal	1 = upsloping; 2 = flat; 3 = downsloping;
(xii)	target	Binary	1 = heart disease; 0 = Normal;

Overall, the Heart Disease dataset utilized in this study is a great resource for researchers investigating heart disease and associated illnesses.

Exploratory Data Analysis (EDA)

Exploratory Data Analysis (EDA) is a crucial component in every data-driven research endeavour. It includes assessing and summarizing data to acquire insights and knowledge about underlying patterns and relationships between variables. EDA tools, like as visualizations and statistical summaries, may assist spot outliers, missing values, and irregularities in the data. By employing EDA, researchers may acquire a better understanding of the data and highlight any difficulties that may need to be resolved before further investigation. The goal of doing EDA on the dataset is to acquire insights into the distribution and relationships between variables. The information comprises numerous demographic, medical, and clinical variables, and examining these features might assist reveal possible risk factors and enhance preventive strategies. Additionally, EDA may assist uncover any missing or erroneous data pieces that might impair the accuracy of later research. Figure 1 depicts the correlation coefficients among every pair of features in the dataset. The graphic was built using Seaborn's heatmap() function with the "PuBuGn" colour map and illustrates the correlation values between each feature. Purple denotes a weaker correlation, whereas green represents a stronger correlation.

Figure 2 depicts the number of normal and the heart disease patients in this dataset. It displays the count of the patients on the x-axis and both categories on the y-axis. The green bars show

the normal patients, whereas the red column depicts the heart disease victims. The count for every category is presented at the end of the column. Figure 3 shows the distribution of gender in the dataset was investigated and the findings reveal that 76.4% of the people were male while 23.6% were female. This observation shows that the dataset may be biased towards a male population and might possibly affect any gender-related research or conclusions taken from the data.

Figure 1 - Correlation heatmap of the dataset

Figure 2 - Number of normal and heart disease patients

Figure 3- Count of Gender

In this research initiative, we have done an in-depth investigation of the dataset, which has yielded vital insights into the distribution and interactions between the variables. We have identified possible risk factors that could lead to heart disease and underlined the need to correct missing or erroneous data. Furthermore, we have detected a gender bias in the dataset, which may have ramifications for gender-related research or conclusions taken from the data. With these insights in mind, we will go to the data processing step, where we will prepare the dataset for future analysis.

Data Preprocessing

Data preprocessing is a vital stage in every machine learning effort. The performance of

classification problems is heavily reliant on the quality and standard of the dataset used for training and testing the models. One typical problem that may develop in datasets is missing values, which may impair the accuracy and dependability of the conclusions produced. Therefore, it is vital to detect and manage missing information effectively before continuing with any analysis. There are numerous techniques for addressing missing values, including altogether disregarding them, replacing them with a numeric value such as zero, replacing them with the most common value for that property, or replacing them with the mean value for that attribute. It is important to emphasize that there are no missing values in the dataset used for this research work. As a result, handling missing values is not necessary, and we can proceed to the following stage of data preparation. To make the categorical variables more intelligible, we have applied label encoding to the 'chest_pain_type', 'rest_ecg' and 'st_slope' columns.

During the exploratory data analysis phase, it was found that several of the numerical characteristics in the dataset contained outliers. Specifically, the age, resting blood pressure, cholesterol, and maximum heart rate reached had outliers that might possibly impair the accuracy and dependability of the machine learning models. Therefore, it is vital to detect and treat outliers effectively before continuing with any study. Various approaches, such as z-score, interquartile range, or Tukey's fences, may be used to detect and treat outliers. In this work, we employed the z-score approach to detect and eliminate outliers from the dataset to assure the correctness and reliability of the findings acquired from the machine learning models. In order to address outliers in the dataset, a threshold value of 3 was specified, which was used to detect data points that were more than 3 standard deviations away from the mean. This was performed using the `np.where()` function to find the indices of all data points that above the threshold value, and then filtering out those points from the dataset using the `all()` method with `axis=1` option. After eliminating outliers from the sample, the size of the dataset dropped from (1190, 12) to (1172, 12). This shows that a total of 18 data points were recognized as outliers and eliminated from the dataset. After outlier elimination, categorical variables in the dataset were encoded using one-hot encoding. The generated dataset comprised a total of 15 columns, containing 5 numerical variables and 10 category features. To analyze the performance of our model, we divided the data into training and testing datasets. In this paper, the data is divided into two sets: one for training and one for testing. The `stratify` option is set to `y`, which guarantees that the datasets used for training and testing have the same percentage of target variable classes as the original dataset. The `test_size` option is set to 0.3, which implies that 30% of the data is utilized

for testing, while the remaining 70% is used for training. The shuffle option is set to True, which implies that the data undergoes shuffle before splits, and the random_state parameter is set to 5, which assures that the findings are repeatable. In order to verify that all numerical features are on the same scale, we conducted normalization on the dataset using the MinMaxScaler from the scikit-learn module. The scaler stabilizes data that is within the range between 0 to 1. The age, resting blood pressure, cholesterol, maximum heart rate reached, and st depressive characteristics were all adjusted using this procedure. This normalizing method helps guarantee that no one characteristic dominates the others and that all features serve equally to the study. In summary, the data preparation phase includes different stages including resolving missing values, eliminating outliers, and encoding categorical variables. After all the preparation stages, we ended up with a total of 820 data points in the training set and 352 data points in the test set, both containing 15 columns. These data sets will be utilized to train and assess our machine learning model in the next part of the research work.

Base Model Evaluation

In this work, several machine learning approaches were employed to forecast the incidence of heart disease. The implementation specifics of these models were described in Section III. To further increase the prediction accuracy, an ensemble model utilizing the Voting Classifier approach was constructed. The Voting Classifier is a simple approach to aggregate predictions from many models, and it may enhance the overall performance of the model. The ensemble model was trained on the training data and deployed to predict the labels of the test data. The implementation specifics of the Voting Classifier model are as follows: initially, a Voting Classifier object was constructed with the estimators comprising all the individual models. The 'hard' voting approach was utilized, which means the projected class labels of each model were used to create the final forecast. The ensemble model was then trained on the training data and used to predict the labels of the test data. After building a voting classification model employing the combined results of the models, the model gets evaluated using the confusion matrix. The confusion matrix is used to illustrate the number of accurate and wrong predictions produced by the model. The true negative (TN), false negative (FN), true positive (TP), and false positive (FP) values are computed from the confusion matrix. This assessment helps to determine the usefulness of the model in predicting heart disease outcome. Figure 4 illustrates the confusion matrix associated with the voting classifier model. The TN value is 150, FP value is 22, FN value is 14, and TP value is 170.

Figure 4 - Confusion matrix for the ensemble model on the test set

Feature Selection

The feature selection process involves identifying the most relevant features from a dataset that contribute the most towards a model's predictive performance. It helps to remove redundant or irrelevant features, which can lead to overfitting and reduced model performance. Based on the Random Forest classifier, we have performed feature selection by selecting the most important features. The feature importances have been plotted to identify the important features, and a threshold of 0.05 has been used to select the most important features. The selected features have been used to create new training and testing sets, and the other less important features have been discarded. Figure 5 shows the feature importance plot generated by the Random Forest classifier. The plot displays the relative importance of each feature, with higher bars indicating greater importance.

Figure 5 - Feature importance plot generated using Random Forest classifier.

The feature importance plot generated using Random Forest classifier shows that the most important features for predicting heart disease are the maximum heart rate achieved, ST slope during upsloping, ST depression, cholesterol level, age, ST slope during flat, presence of exercise-induced angina, resting blood pressure, and male sex. The least relevant characteristics include chest pain kind (atypical angina, non-anginal discomfort, typical angina), fasting blood sugar level, and resting ECG findings (normal, left ventricular hypertrophy).

Next, these essential attributes will be utilized to develop a new ensemble voting classifier, which is projected to substantially increase the accuracy of the initial ensemble model.

Voting Ensembling

In this step, we defined a new voting classifier with soft voting and used the same machine learning models described in section III as estimators. The main difference is that the base voting classifier model has undergone feature engineering, where only the best features selected in the previous step are fed into the model. The voting classifier is then trained using the training set and evaluated using the test set. After training and assessing the voting classifier using the given features, we constructed a confusion matrix and estimated the true positives (TP), false positives (FP), true negatives (TN), and false negatives (FN). We then showed the confusion matrix using a heatmap with annotations to illustrate the number of correct and wrong predictions for each class. Figure 6 illustrates the confusion matrix of the feature-engineered Voting Classifier on the test set. In this case, the confusion matrix has TN = 98, FP = 13, FN = 7, and TP = 120.

Figure 6 - Confusion matrix of the feature-engineered Voting Classifier

Performance MEASURE

Using the confusion matrix, we can visualize the performance of both the voting classifier models. In the confusion matrix, four classification performance indices are present. The definition of these is given below:

TP = True Positive (Correctly Identified)

TN = True Negative (Correctly Rejected)

FP = False Positive (Incorrectly Identified)

FN = False Negative (Incorrectly Rejected)

To evaluate the performance of the system, the following qualities are measured.

(1) Accuracy: Ratio of correctly classified samples to total samples. It is represented by:

$$\text{Accuracy} = (TP + TN) / (TP + TN + FP + FN) \quad (4)$$

(2) Sensitivity: Ratio of correctly classified positive samples to total positive instances, given by:

$$\text{Sensitivity} = TP / (TP + FN) \quad (5)$$

(3) Specificity: Ratio of correctly classified negative instances to total negative instances, given by:

$$\text{Specificity} = TN / (TN + FP) \quad (6)$$

(4) Precision: Precision is calculated as the number of correctly positive predicts divided by the total number of positively predict, given by:

$$\text{Precision} = TP / (TP + FP) \quad (7)$$

(5) F1 Score: The range of F1 scores is between 0 and 1. The best value is 1 and the worst value is 0, F1 is represented as follows:

$$\text{F1 score} = 2TP / (2TP + FP + FN) \quad (8)$$

(6) Mathews Correlation Coefficient (MCC): For binary classification, the range of MCC is +1 to -1. When the value is +1 the best performance is shown and when the value is -1 the worst performance is shown. It is represented as:

$$\text{MCC} = (TP \times TN) - (FP \times FN) / \sqrt{((TP + FP) \times (TP + FN) \times (TN + FP) \times (TN + FN))} \quad (9)$$

EXPERIMENTAL RESULTS AND DISCUSSIONS

Experimental Setup

The experiment was done using Python programming language on a single Virtual Machine configured through Microsoft Azure with the following specifications , Intel (R) Xeon(R) Platinum 8272CL CPU @ 2.60GHz and 32 GB RAM, running on Windows 10 operating system. This information is supplied to aid understanding and replication of the findings.

Results Analysis

In this part, we give a performance assessment of several computational intelligence methodologies presented in Part III. We trained various machine learning models using the heart disease dataset, with a training-to-testing information ratio of 80:20. The accuracy ratings achieved by the various machine learning models are as follows: Random Forest (90.63%), Multi-Layer Perceptron (82.95%), K-Nearest Neighbors (80.68%), Extra Tree Classifier (89.77%), XGBoost (90.34%), Support Vector Classifier (82.67%), Stochastic Gradient Descent (73.86%), Adaboost (80.97%), and Classification and Regression Trees (82.95%). In addition to accuracy, we also examined the performance of the heart disease prediction model using numerous other measures, including precision, sensitivity, specificity, F1 score, and Mathew correlation coefficient. The results of these measures are provided in Table 2.

We then integrate these different models into a hard voting classifier to increase the overall accuracy. The hard voting classifier aggregates the outcomes of each individual model and picks the class that has the highest number of votes. After merging the separate models, we achieved an accuracy score of 90.34%, which is greater than the individual models. This implies that the mix of models has a beneficial influence on the overall accuracy of the classifier.

We sought to increase the accuracy of the vote classifier by doing feature selection. Our feature selection strategy enhanced the accuracy of the voting classifier, with an accuracy score of 91.91% which is greater than the original voting classifier's accuracy of 90.34%. This indicates that feature selection may be a useful strategy to increase the accuracy of the classifier.

Overall, our findings suggest that integrating separate models into an ensemble model and conducting feature selection may greatly increase the accuracy of the heart disease prediction model. These results have crucial implications for the creation of more accurate and reliable heart disease prediction models that may assist in the diagnosis and treatment of heart disease. To further show the efficacy of our final feature-selected voting classifier model, we have included a Receiver Operating Characteristic (ROC) curve plot in Figure 7. The ROC curve is

a graphical depiction of the true positive rate (sensitivity) versus the false positive rate (1-specificity) for various classification thresholds. The area under the ROC curve (AUC) gives a single statistic to assess the performance of the model, with values ranging from 0.5 to 1.0. An AUC value of 0.5 suggests random chance, whereas an AUC value of 1.0 shows flawless categorization.

TABLE 2. Evaluation metrics of the heart disease prediction system

Parameters	RF	MLP	KNN	SVC	GBM	CART	XGB	Voting Classifier
Sensitivity (%)	94.56	87.50	83.69	85.32	87.50	82.06	91.30	94.35
F1 Score	91.33	84.29	81.91	83.73	84.96	83.42	90.81	92.49
Accuracy (%)	90.62	82.95	80.68	82.67	83.80	82.95	90.34	91.91
Precision (%)	88.32	81.31	80.20	82.19	82.56	84.83	90.32	90.69
Specificity (%)	86.30	77.97	77.38	79.76	79.76	83.92	89.28	89.18
MCC	0.813	0.659	0.659	0.652	0.675	0.659	0.806	0.838

Figure 7- ROC curve plot for the final feature-selected voting classifier model

As illustrated in Figure 7, our final feature-selected voting classifier model attained an AUC of 0.96, demonstrating outstanding performance in differentiating between positive and negative instances of heart disease. The steep curve and high AUC value reflect the high sensitivity and specificity of the model, suggesting that it can reliably predict both genuine positive and true negative situations.

Besides this, a ROC curve plot, we additionally included a Precision-Recall curve plot for the final feature-selected voting classifier model in Figure 8. The Precision-Recall curve is another

essential assessment measure for binary classification issues, especially in circumstances when the classes are unbalanced. The curve is constructed by graphing the precision (positive predictive value) against the recall (true positive rate) for various categorization thresholds. The area under the Precision-Recall curve (AUC-PR) gives a single statistic to assess the performance of the model, with values ranging from 0 to 1.

Figure 8 - Precision-Recall curve plot for the final feature-selected voting classifier model.

As illustrated in Figure 8, our final feature-selected voting classifier model obtained an AUC-PR of 0.95, showing good accuracy in detecting positive instances of heart disease while reducing false positive predictions. The high accuracy and recall numbers reflect the model's ability to reliably identify positive instances, while the steep curve and high AUC-PR value imply a low false positive rate.

CONCLUSION

In conclusion, our work reveals that merging different machine learning models into an ensemble model and employing feature selection strategies may considerably increase the accuracy of heart disease prediction models. The individual models we examined, including Random Forest, Multi-Layer Perceptron, and XGBoost, showed great accuracy rates, but integrating them into a hard voting classifier significantly increased the total accuracy. Moreover, adding feature selection methods to identify the most significant characteristics for prediction enhanced the accuracy of the voting classifier even more.

Our results have major implications for improving heart disease detection and therapy. With reliable prediction models, physicians and medical professionals may offer more effective treatment and preventative measures for individuals at risk of heart disease. The integration of several models and feature selection strategies may also be used to other healthcare domains to increase the accuracy of prediction models and help clinical decision-making.

While our study gives encouraging findings, there are still several limitations that need to be addressed in future research. For instance, the dataset utilized in this research only comprises a limited number of characteristics, and it may be interesting to examine other features that might increase the accuracy of the prediction models further. Additionally, it would be helpful to study the generalizability of our technique across diverse datasets and demographics.

Overall, our work illustrates the possibility of combining machine learning models and employing feature selection strategies to increase heart disease prediction accuracy. Our results offer a platform for ongoing study and development of precise and reliable prediction models to enhance clinical decision-making in the battle against heart disease.

ACKNOWLEDGEMENT

We would like to convey our profound thanks to Dr. K. Ruba Soundar, Associate Professor, CSE Dept, MSEC for his significant help, advice, and mentoring during the study endeavor. We are thankful for his continual encouragement, unshakable support, and useful suggestions, which have considerably contributed to the effective completion of this task.

We would also want to recognize the contribution of the authors of the heart disease dataset utilized in this research, as well as the developers of the numerous machine learning tools and frameworks used in this study. Their effort has made this research feasible and supplied us with the tools and resources required to perform this investigation.

Finally, we would like to thank our colleagues and friends who have given us with vital comments, encouragement, and support throughout the study process. Their suggestions and thoughts have been incredibly helpful in constructing this study article.

**IMPROVED MANAGEMENT STRATEGIES IN THE 21ST CENTURY: A REVIEW
OF THE IMPACT OF TECHNOLOGY ON MANAGEMENT**

ABSTRACT

The application of technology in management cannot be over emphasized; as essential part of modern management and administration systems are largely dependent on technology. Infact, advancement in technology has made management to be an easy strategy in the 21st century. The effects of technology over the course of human history are well documented. We now live in a global village; a world firmly connected and driven by technology. For instance, technology, especially information and communication technology is changing the manner in which human beings and businesses are managed; create and capture value, how and where we work, and how we interact and communicate. In particular, technology has continued to help managers to do things better and faster, and more efficiently, which has brought about a lot of changes at the workplace. This piece aimed to review the impact of technology on management, with a view to contributing to existing literature on the subject matter. The paper describes technology as a powerful tool influencing and changing management in the 21st Century. The review thus, aimed to encourage application of technology in modern management systems and by all managers, businesses and organizations, to enhance management efficiency, precision and effectiveness.

Keywords: Management, management strategy, 21st century, Technology

INTRODUCTION

We live in a global world where technology, especially information and communication technology, is changing the manner in which businesses create and capture value, how and where we work, and how we interact and communicate. Consider five technologies that are transforming the very foundations of global business and the organizations that drive it: cloud and mobile computing, big data and machine learning, sensors and intelligent manufacturing, advanced robotics and drones, and clean-energy technologies. These technologies are not just helping people to do things better and faster, but they are enabling profound changes in the ways that work is done in organizations. As Murray (2015, p. 6) contends, “Together these innovations are hurtling us toward a new industrial revolution. Savvy corporate leaders know they have to either figure out how these technologies will transform their businesses or face disruption by others who figure it out first.” Academic literatures not only in business (VanHoose 2011), but also in medicine (Ross P, Sepper R, Pohjonen H. 2010), engineering (Kühnle 2010, Smith A, Anderson J. 2014), sciences (National Research Council 1999) and social sciences (Castells 1996, Wellman & Haythornthwaite 2002) echo this observation. Barley (2015) suggests that although digital technology is rapidly becoming as infrastructural as electricity, there is surprisingly little research on how it is altering work systems or the work that people do.

The last great wave of technological innovation was all about social interaction. The next one may well feature the emerging general technology paradigm known as ubiquitous computing. This concept is not about one technology. Rather, it reflects information and communication environments in which computer sensors (such as radio frequency identification tags, wearable technology, smart watches) and other equipment (tablets, mobile devices) are unified with various objects, people, information, and computers as well as the physical environment. The combination of these developments is giving us a new kind of world, “one that is hyper connected and data saturated, a world where an Internet of everyone is linked to an Internet of everything” (Wooldridge 2015, p. 29). These new technologies, disruptive as they are, did not just appear overnight. Rather, many other developments in technology preceded them, and their effects on work and organizations over the past several decades have been far-reaching, as we shall see. Work is defined here as the application of human, informational, physical, and other resources to produce products/services (Alter 2013). Given the increasing reliance on technologies to get work done within and across organizations, the question of how technology

is changing work and organizations is highly salient for scholars of organizational psychology and organizational behavior (OP/OB).

In today's global business world either private or public, there is tough competition among firms, government agencies and institutions. Hence, organizations and institutions must be able to meet their customers' demands and expectations satisfactorily by changing their ways of doing business. Because of these requirements, organizations need to improve cost, delivery time, quality and management. As a result, organizations and institutions must constantly develop their products, services, and processes faster, more efficiently and cost effective. In order to achieve these developments, they are obliged to renew both their hardware and business processes. This regenerative process could be possible only with the help of technological development. Global competition, shortened product life cycles, and developments in manufacturing technologies compel manufacturing firms and institutions to compete in complex and dynamic markets. In continuously increasing competitive environment, the companies must improve their costs, quality, and delivery times to meet and even exceed customer needs and expectations in the best possible way. Technology has great importance for both competitive advantage of firms, institutions and development of countries.

In today's competitive markets companies are required to obtain knowledge and new technologies from extrinsic environment. Thus, they take the advantage of their opinions and generate new products. Quality is one of the various competitive strategic instruments in businesses. Thus, companies have noticed that quality is an important major factors for developing products and services to encourage sustained achievement (Boateng-Okrah and Fening, 2012). In addition, technologies enable companies for developing high quality products and services. Nowadays, total quality management is a very important driver for the growth and success of companies in local and international markets. Implementing total quality management helps to increase the market share of companies and thus to improve their competitive capacity. Because customers demand better quality, lower prices, and quick response, improving the product and service quality of an organization is essential for business achievement. Total quality management is a management system and also an integrated philosophy, which improves the competitiveness of firms.

In the global competitive markets, total quality management and technology have become two of the important factors for business achievement and organizational growth. All departments in a company are compelled to act together toward the same goals in order to be successful in the market. Also, they must recognize that all employees and activities influence others, and in

turn they are influenced by others. In order to improve competitiveness, companies search for a higher level of influence across all functions and processes. Companies implement total quality management and new technologies for staying in business. Total quality management and technology have been studied individually so far, but the researches incorporating these are very rare. Thus, the exact nature of the links between these concepts has not been well clarified. The aim of this study is to identify the Impact of technology on management.

Management has been practiced as far back as the olden days when the only means of livelihood was Agriculture (Subsistence Agriculture). At that time people lived in communal setting made up of father, wife or wives, sons, daughters, sons-in-law, daughters-in-law, children etc. so there were enough farm hands or workers. Regardless of what managers were called at that time, someone had to plan what was to be done, organize the family members and the farming tools and other materials, lead and direct the workers and impose some controls to ensure that everything was done well. This task usually fell on the head of the family, the father, who organizes the men and lead the way while the women follow after them.

Management in business area and human organization activity is the act of getting people together to accomplish desired goals and objectives. Management comprises executive planning, organizing, staffing, leading or directing, and controlling an organization (a group of two or more people) or effort for the purpose of accomplishing a goal (Maicibi, 2016)

The building of the ancient Egyptian Pyramids and the great walls of China gives credence to the fact that organized endeavors directed by people responsible for planning, organizing, leading and controlling activities have existed for thousands of years. The construction of a single pyramid occupied more than 100,000 people for 20 years. There were people, who were in charge; who ensured that there were enough stones at the site, told the workers what was to be done and organized them. With the ancient Egyptians, the whip, ball and chain were effective ways of getting things done through people.

Also in the olden days where the feudal System was practiced in the Roman Empire, the landowners needed no other principles to guide their management of the serfs but their hereditary title. This was a period of enormous extremes, characterized by the lords and the peasants, the emperor and the slaves, the haves and the have-nots etc. During this pre scientific –management period, all that was needed was for one to be in a position of authority, for authority meant power and control in the social and economic systems of the period other example of early management practices was during the 1400s in the city of Venice, Italy.

The Venetians developed an early form of business enterprise and engaged in various activities common to today's organizations such as an assembly line that standardized production, warehouse, inventory system to monitor the contents of the warehouse, personnel functions required to manage the labour force and so forth.

The first historical event that promoted the study of management was the publication of *The Wealth of Nations* by Adam Smith (1776). In his writings, Adam Smith argued that organizations and the society would gain a lot of economic advantages from division of labour (the breaking down of jobs into narrow, repetitive tasks). Smith used a pin manufacturing as an example where he stated that 10 individuals each doing a specialized task could produce as much as 48,000 pins a day compared to when each person was working separately and performing different tasks at the same time.

Smith was of the view that division of labour increased productivity by increasing each worker's skill and dexterity, by saving time that is commonly lost in changing tasks and by creating labour-saving inventions and machinery. The general acceptance of job specialization in service jobs today such as teaching, medicine and assembly lines is undoubtedly due to economic advantages cited more than 230 years ago.

The Industrial Revolution is the second and possibly the most important pre-twentieth century influence on management. It began in the eighteenth century in Great Britain and by the end of the civil war it had crossed the Atlantic to America. The major contribution of Industrial Revolution was the substitution of machine power for human power which in turn made it more economical to manufacture goods in factories rather than at home. These large efficient factories using power-driven equipment required managerial skills because managers were needed to forecast demand, ensure that enough materials were on hand to make products, assign tasks to people, direct daily activities, coordinate various tasks, ensure that machines were in good working condition and so on.

The advent of machine power, mass production and efficient transportation led to the development of big corporations that would require formalized management practices. Due to the tremendous changes brought about by the industrial revolution, there was the need for a formal theory to guide managers in running their organizations. The first major step toward developing such a theory was in the early 1900s.

Contemporary Management thinking can best be understood in the light of its historical development as far back as when the head of the family leads members of the nuclear and extended family to the farmlands planned and organized the work to be done in the farm.

The pre scientific period was also an era where workers were mostly dominated by their supervisors, and their relationship based on social caste system of autocracy like the ancient Egyptians and feudal system of the ancient Roman Empire.

This era of social caste system of autocracy was subsequently followed up by two major historical events which promoted the study of management and these were the Publication of Wealth of Nations by Adam Smith in 1776, which focused on division of labour and the Industrial Revolution which began in the 18th century in Great Britain.

The Industrial Revolution which began in Britain in 18th century and crossed over to America by the end of the civil war led to the advent of machine power, mass production and development of big Corporations. These changes brought about by Industrial Revolution meant that the need for a formal theory to guide managers in running their organizations had arrived. The first major step toward developing such a theory began in the early 1900s.

CONCEPT OF TECHNOLOGY

The dynamic nature of technology has contributed to the existence of various definitions and concepts of technology by previous studies which are related to technology. The discussion on the concept of technology is crucial in getting a clear understanding of the nature of impact of technology on management. Past studies have shown that defining the concept of technology is not easy (Reddy and Zhoa, 1990); therefore, view technology from different perspectives. Existing studies on technology have attracted researchers from a cross-section of disciplines including organizational management, political science, economics, sociology, anthropology, marketing and recently management of technology (Cusumano and Elenkov, 1994; Zhoa and Reisman, 1992). The term ‘technology’ is inherently abstract concept which is difficult to interpret, observe and evaluate (Blomstrom and Kokko, 1998). Regardless of the extensive research done on this subject, many of the literatures are fragmented along different specialties and generally there is no commonly accepted paradigm (Reddy and Zhoa, 1990).

MacKenzie and Wajcman (1985) defined technology as the integration of the physical objects or artifacts, the process of making the objects and the meaning associated with the physical objects. These elements are not distinctive and separable factors but form a ‘seamless web’ that constitutes technology (Woolgar, 1987). In defining the term technology, all the three elements must be understood as being inter-connected to each other and a change in one element will affect the other two elements. In the definition given by Mascus (2003) has broadened the concept of technology where technology is defined as ‘the information necessary to achieve a

certain production outcome from a particular means of combining or processing selected inputs which include production processes, intra-firm organizational structures, management techniques, and means of finance, marketing methods or any of its combination'. Other scholars such as Tepstra and David (1985) suggested that technology as a cultural system concerned with the relationships between humans and their environment. From the systems perspective, technology can be explained as encompassing the basic knowledge sub-systems, the technical support, system software and the capital-embodied technology (hardware). This perspective of technology recognizes the need to identify the different elements of a particular country's technology that are complementary and mutually reinforcing.

ROLE OF TECHNOLOGY

The impact of technology in an organization cannot be overemphasized. The effects of technology over the course of human history are well documented (Beniger 1986, Bradley & Nolan 1998, Bradley et al. 2016). The growth and advancement of civilization can be divided into three eras according to their respective core technological infrastructures: the agricultural era, the industrial era, and the digital era. Each of these eras has been profoundly affected by the ability to acquire new information and knowledge. However, they have all required and enabled new economic structures, social revolutions, cultural transformations, and work models. The journey of change from conventional devices to modern devices with super speed data has helped managers manage their business and equally help organizational goal. With the help of technology marketer can be connected with the consumer whether the consumers are online or offline. Technology makes the whole world a one community and that helped the company to reach all consumers easily and quickly. In olden times, if a consumer wants to buy a product, he needs to reach shop within the working hours of that shop. Otherwise he won't be able to buy that product. But with the emergence of e-commerce, customers can buy products at any time. If they want to buy a product or get any information about the product, he can get it at another time. Now, every consumer knows that he is the king of the market and that have much more power than the marketer. Consumers level of expectation is also changed a lot when these is smart devices got a place in our life. So all business should be careful in updating with the changes, or they will be thrown out of market. The attitude of marketer is greatly influenced by social media. Customer services were provided by companies through emails and phone calls. But with the popularity of the social media and live chats, if an enquiry from a customer is not answered within seconds, the brand reputation of the company will be affected and there

is no place for the company in the minds of whole world. In short, with technology consumers are more connected, their expectations become high and more sophisticated tools are being used for getting the needs satisfied. In the industrial era, people concentrated on the application of industrial power, the procurement of traditional physical resources, and mass production operating in accordance with the law of increasing costs. That is, once all production factors (land, labor, capital) are at maximum output and efficiency, producing an extra unit will cost more than average. Vapor and steam engines, as well as fuel, comprised the core infrastructures. During this era, the richness of material civilization was amplified by increasing the productivity of the physical space—building factories and establishing industrial complexes. The relationships among manufacturers, distributors, and consumers; improved productivity; process efficiency; and attention to transaction costs were all critically important to the success of industrial societies. Also, in the digital era, people are focusing on the generation and trading of products and services via digitalized data, information, and knowledge. This era is based on an infrastructure comprising information and communication technologies. This new infrastructure is not just helping people do things better and faster than in previous eras, but it is enabling new ways of control, coordination, and collaboration on activities more readily, at lower costs, governed by the law of diminishing costs. That is, because of the properties of digital goods, the cost per unit of marginal or additional output incrementally decreases, whereas the amount of all other factors of production stays constant. As digital resources become accessible, processed, transferred and stored regardless of location or time, borders and geographical distances are no longer as critical as they once were, and wholly new, invisible electronic spaces are now available. Because the digital era began with the development of computers and communication technologies, we must appreciate that these technologies are also evolving. Indeed, the continuous advances of information and communication technology have enabled the scope of human activity to expand continuously in the electronic space and to create a variety of changes in the ways that economic activity is conducted. In computerized work environments, high levels of human information processing skills should be getting more valuable. In part, this reflects the potential of present-day computers to substitute more effectively for routine information processing tasks than for complex or ill-structured cognitive tasks. It also reflects potential complementarities between some of the strengths of computers storing, communicating and executing instructions on a flood of data -- and many types of human judgement and decision-making.

If all managers fully understood the potential complementarities among IT, workplace organization and human capital, if their decisions always reflected the profit maximizing strategies for their firms, and if there were no lags, adjustment costs or mistakes in implementing these strategies, then the demand equations IT and for HK would fully reflect the optimal relationships among these factors. Furthermore, under these assumptions, we would not expect to observe any firms that were not implementing the optimal combinations of these practices. Of course, one of the reasons that we think studying these relationships is interesting is that we believe that they are not fully understood. With the benefit of hindsight, it is clear that many firms make significant mistakes in their IT investments, organizational strategies or human capital policies. Furthermore, a large number of firms actively experiment with these policy levers in a conscious effort to understand the how to best use every cheaper processing, storage and communications power delivered by IT. As with any important general-purpose technology, a tremendous amount of organizational and strategic co-invention must accompany technological advances in computing and most managers are fully aware of this need.

MANAGEMENT TECHNOLOGY NEXUS

As already highlighted, like other strategic professional systems, management benefits from application of technology in improving the system, in terms of strategies, planning, control and implementation. This relationship has been broadly illustrated in Figure 1.

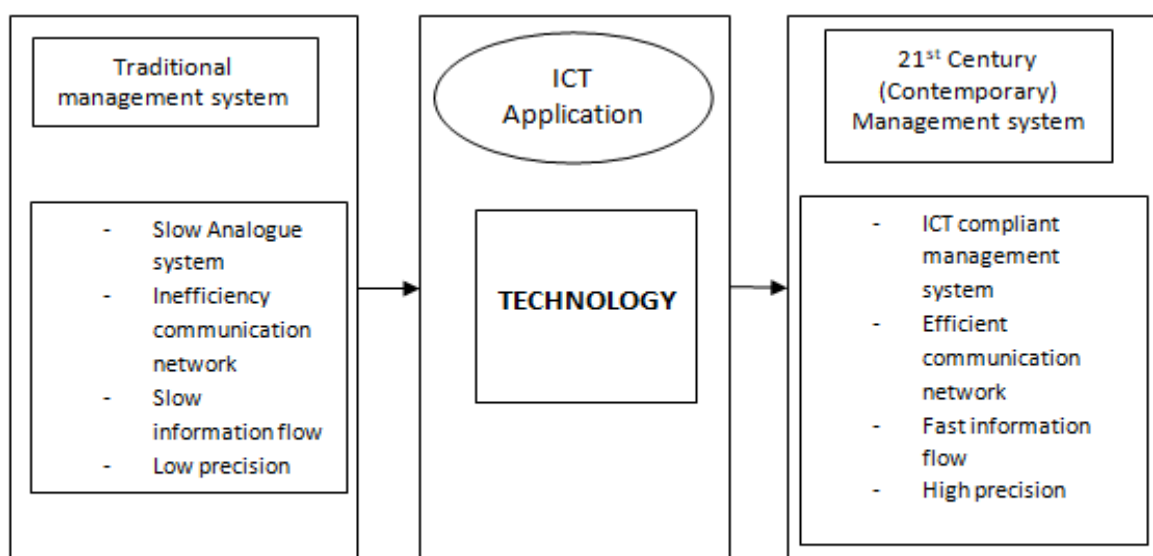

Figure 1. Management-Technology nexus

CONCLUSION

For the purpose of this paper presentation we want to conclude that Technology is a powerful tool in influencing and changing Management systems in recent years. Unless, companies, organizations and institutions go along with technology, they will be thrown out of business. It is expected that management, over a period of time may be completely influenced by information that is primarily processed through the digitalization.

Managers make decisions, that is, decides what to do when given a choice and also plan, organize, commands, coordinate, control, delegate and motivate. You would want to agree that all these duties and responsibilities of the manager are affected by the impact of technology.

ABSTRACT

Simply said, technology is a tool created via the application of scientific knowledge to help produce goods and services and aid in problem-solving for humans. Examples of technology include the Internet, phones, automobiles, airplanes, children's toys, and other devices. The society has been tremendously touched by these pieces of technology. They have speed up and simplified the flow of people and products. People may now connect and share information more easily thanks to the Internet and mobile devices. It is impossible to survive without technology in the modern world. Today, technology is ingrained in daily life. The effects of technology on society and the environment will be thoroughly covered in this review paper.

Keywords: Technology, Society, Environment

OBJECTIVES:

1. To study about the present technological advancement
2. To study the effect of technology on society
3. To study the negative and positive effect of technology on environment.

INTRODUCTION

Technology is the term refers to the actual application of scientific knowledge, as well as the apparatus and instruments that follow. We are now living in an era of fast transition, in which technology advancements are revolutionizing the way we live while also driving us deeper into disaster in the form of climate change and resource shortages.

Technology nowadays has significantly impacted into changed society. People used to live in temporary homes in rural areas before the development of advanced technology; the majority of these rural residents were based on hunters and gatherers. Major economic activity was non-existent at the period. Agriculture technology brought forth some of the major developments. This happens when people first discovered knowhow to cultivate and get their fields ready to grow food. Because there was more food available, more people began to live in cities and companies that produced vast quantities of products, leaving their rural dwellings.

Technology development has been essential in the production of more wholesome food, improving people's health. Nowadays, people eat cheaper, healthier food that is also easy to farm. Some individuals no longer go to hotels to eat their favourite foods since they can order them over the phone or via the Internet. Food has now started delivered to consumes homes or workplaces once they place an order. All individuals have a selection to choose from since goods like clothing, footwear, and bedding are manufactured in big quantities and at a range of prices.

Environmental Impact of Technology:

The industrial revolution gave birth to new technologies with enormous power. From roughly 1760 to 1840, this was the shift to new industrial methods in Europe and the United States. This has been followed by increased industrialisation and technical breakthroughs in industrialized nations across the world, with the environmental consequence of this technology including the exploitation and devastation of our natural planet.

This type of technological advancement may have harmed our planet in two ways: pollution and natural resource depletion.

Pollution of the air and water:

When dangerous or excessive amounts of gases such as carbon dioxide, carbon monoxide, sulfur dioxide, nitric oxide, and methane are injected into the earth's atmosphere, air pollution develops. The primary sources are all related to technology that arose during the industrial revolution, such as the use of fossil fuels, industries, power plants, mass agriculture, and automobiles. Air pollution has a significant influence on human and animal health, as well as global warming, because rising levels of greenhouse gases in the atmosphere trap thermal energy and cause the global temperature to rise.

Technologies affect our life:

In 2023, technology will have an impact on practically every area of daily living, including productivity, socializing, food and healthcare availability, and the safety and efficiency of transportation. It has facilitated learning, made knowledge more accessible, and allowed for the emergence of worldwide online communities.

Positive Effects of Technology on Society:

The following are some of the good consequences of technology that have helped society considerably as a result of technological growth.

- Increasing the human lifetime. People were treated with herbal remedies created from untamed plants before modern technology was developed. Because there were no equipment and it was difficult to identify illnesses, many people died as a result. Major tools like microscopes and scanners have been important in saving lives and detecting diseases since the advent of technology. Cancers, typhoid, malaria, and other illnesses that put people's lives in danger are treated by well-researched medications, medical facilities, and pharmacies. The use of technology in the treatment of diseases has extended life expectancy and expanded global population.
- Time savings. People place a lot of value on time. A life can be saved, as well as money. Before the invention of locomotives, transporting people and commodities was challenging and painfully slow. The means of transport were both people and animals. The roads would become muddy and inaccessible during wet seasons. People would frequently come under attack from wild animals and other adversaries. The technology of locomotives was used to resolve these issues. Since that time, it has been simpler to move big things across vast distances. The development of automobiles, aircraft, motorcycles, and ships has sped up and improved travel.

- An increase in output. Productivity gains are yet another advantage of technology. This was first seen during the Industrial Revolution, when devices like the spinning jenny were developed, increasing the output of clothing. Other tools and machines have since been developed. Computers can swiftly do complicated computations, transmit emails, and preserve data. People are readily and pleasantly transported to their workstations by vehicles, which improves their focus and productivity.
- Showing improved informational accessibility. The ease of access to computers, phones, and the Internet benefits society. People have access to and can learn a lot of knowledge through the Internet. Online distance learning makes it possible to learn and obtain a degree today. As evidenced by the coronavirus outbreak, people may now work from home.

Negative Impact of Technology on Society & Environment:

Although technology provides many benefits for society, it also has drawbacks. Few negative impacts are listed below. The development of technology causes quicker fossil fuel use, resource pollution, and deforestation. Humans now need to dig deeper to get additional resources because it is easier to abuse minerals.

DISCUSSION

Technology may have both good and bad effects on the environment. Recycling garbage, lowering carbon dioxide emissions, and generating renewable energy are all beneficial impacts. Natural resource depletion, air pollution, and trash build-up are some of the detrimental outcomes.

CONCLUSION

Even while technology may not be able to solve every environmental problem, when used properly, it may always help to make things better. The improper use and use of technology is to blame for the state of the environment. The mishandling of technology, rather than the use of it, is what influences climate changes, global warming, and pollution. Conclusion: Unauthorized and out-of-control use of technology has a harmful influence on the environment, but it also has the potential to improve it if it is properly focused. Therefore, the application of technology affects whether it has a good or bad influence, therefore the goal should be to place technology in a way that will effectively treat the present state of the world around us.

ABSTRACT

Digital banking is now showing enormous potential after internet banking's breakthrough (Brown et al., 2003; Kwateng et al., 2019). Digital banking is not only seen as a normal development of net banking but is also believed to be a superior digital choice when compared to other traditional banking channels like ATMs, physical branches, and internet banking. Banks using electronic channels encourage higher customer satisfaction and aid in growing their clientele and efficiency (Karjaluo et al., 2010). The banks in India are attempting to lower their operational costs and expand their consumer base by utilizing this most recent technology (Peterson, 2011; Foroughi et al., 2019). The key features of digital banking that draw clients in the most are its ease of use and availability 24 hours a day.

Keywords: Digital Banking, Banking, Seamless Banking, Adoption

INTRODUCTION

However, the majority of clients still opt to bank traditionally; therefore there is still a long way to go for digital banking (Ashta, 2010; Wang et al., 2003). Despite all the advantages listed above, there are certain barriers to the adoption of digital banking (Karjaluo et al., 2002; Merhi et al., 2019; Jamshidi et al., 2018; Black et al., 2002; Gan et al., 2006; Thaker et al., 2019; Lee et al., 2005).

Even potential customers are not utilizing electronic services, and reports on the utilization of digital banking indicate that very little funding has been allocated to its development thus far (Luarn and Lin, 2005). Customers are concerned about security and privacy issues, and they also perceive digital banking as unsafe because they worry that their financial information may be compromised. As a result of this fear, customers find this form of banking to be less appealing (Howcroft et al., 2002). According to a 2007 Gartner research, just 1 to 5% of the target users have adopted digital banking. Therefore, determining the reasons why consumers are not utilizing this is of utmost importance.

Uses of Digital Banking

To Bank	To customers
Service provided is twenty-four seven	Transaction security is provided
Helps in expanding the consumer base	Speed factor is found in every transaction
Provide services with full swiftness	Ease of access
Increase the efficiency of banking process	Ease of use and trust

REVIEW OF LITERATURE

Many researchers have examined the applications of digital banking and discovered that these services are the newest and most sophisticated innovations in the banking industry. These services were made possible by the most recent developments in the telecommunications industry (Barnes and Scornavacca, 2004; Barnes and Corbitt, 2003). Customers and the bank

are the only two parties who can communicate with one another using a digital device or Personal Digital Assistant (PDA).

According to (Karjaluoto et al., 2002; Rugimbana, 1995), digital banking has given clients the opportunity to conduct their banking almost whenever and wherever they choose, which has created a significant business opportunity. Numerous researchers (Dasgupta, 2002; and Vyas, 2009) have discovered that a number of nonadopters of online banking who were not using the internet for their banking needs were the main target group for the banks. Some of these researchers also attempted to prove that digital banking has a brilliant future in India in their studies.

According to (Mas, 2008 and Lyman et al., 2008), there appear to be an excessive number of digital devices with disparate capabilities. As a result, giving a solution in the form of digital banking on any type of device presents a significant issue for banks. As many of these devices support J2ME but few also support WAP browser or SMS, this presents a significant obstacle and hinders adoption.

As mentioned by (Aslam, 2009; Alonso-Dos-Santos et al., 2020), there is a need to provide and ensure economic stability, a suitable level of safeguard connected to consumer transactions, and an assurance of safety and security of transactions must be applied to digital payments. Additionally, it is crucial for a financial agency regulator to adhere to the Know-Your-Customer (KYC) philosophy.

According to (Sharma and Singh, 2009), security concerns and privacy issues are the main obstacles facing Indians who use digital banking services. Particular problems include frauds, the misuse of account information, and user-unfriendly applications that make it difficult to remember passwords and require frequent updates.

According to (Banzal, 2010), this problem is a further major concern for the hotel and travel businesses, vendors, banks, aggregators, and other service providers of digital services.

According to (Bamoriya and Singh, 2011), there are a number of difficulties with digital banking, including difficulties operating digital handsets, downloading applications, and

security, safety, and privacy concerns. The banks are expanding their business by using consistent techniques to connect with clients at all phases of the buying cycle.

In addition to online banking, ATMs, and other technology-enabled services, banks also provide their clients with digital banking (Bamoriya and Singh, 2011; Asongu, 2018; Goyal et al., 2012; Devadevan, 2013; Foroughi et al., 2019; Saini, 2014). Several banks in India are starting to provide their clients digital banking services, including State Bank of India, ICICI, Axis Bank, HDFC, Punjab National Bank, Union Bank of India, etc.

Characteristics of Digital Banking

- **Anytime access:** The users can purchase the goods anytime, and this feature helps it in using it without a wait and is striking due to its anytime feature.
- **Localization:** Users are being offered goods and services as per their current location with the help of technologies like GPS (Global Positioning Services) and it permits companies to do their business more comfortably because users do not need to go far off places to buy things.
- **Instant Connectivity:** This allows convenience to the users and the GPRS (General Packet Radio Service) helps the digital users to remain online in remote areas.
- **Pro-Active Functionality:** SMS and other ‘Opt-in advertising’ can be done which can act as push marketing strategies and it also brings opportunities for the companies involved in digital commerce, where users are informed about new products and services through messages.

Customer-experienced risks and obstacles are also present in digital banking; these include issues with transaction safety and security, the usability of mobile devices, and network availability issues across a variety of digital networks. (Porteous, 2006; Jamshidi et al., 2018) described the difficulties that banks face, including the adoption of these services, network issues, the threat of substitute products—financial products from other banks—problems with this service's reliability and consistency, the combination of additional systems and their transmission levels, and various dictatorial difficulties.

As a result, a situation is established in which any advancement in technology and ease of use of electronic services would not indicate a path toward adoption by its users or the use of third-generation technologies. The acceptance and usage of digital banking are influenced by the

consumers' opinion of its usability and convenience of use, according to (Karjaluoto et al., 2010). Its framework covers the periphery of potential aspects, such as business, technology, law, equity, and social and cultural concerns.

Online transactions carry some risks, such as concerns about privacy and product or service security, as well as the potential for money loss, occasion loss, functional loss, and time loss. Therefore, after taking into account the full spectrum of variables, it is necessary to develop predictions about the actual behavior of users, their attitudes, and their intents. (2011) Kadui et al. Sociological questions might take into account a number of dimensions. The first dimension is user acceptance, the second is user attitude, and the third is risk awareness.

CONCLUSION

Technology has gradually been incorporated into service companies to enhance the standardization of core service offerings, save costs, and enhance the quality and delivery of customer service. The organizations involved in service businesses, industries, and other center hubs are attempting to use the services of experts in the electronic communication area to create applications to use this technology to facilitate the dealings so they will be able to connect with their customers and become liberated from time and location restrictions.

This is how they are able to market and sell their goods and services. Offering financial and banking services is one of the most popular things to perform online or through a digital phone, making it one of the trendiest electronic mediums. Digital technologies are being quickly embraced for internet access, communication, and digital commercial activities. Therefore, throughout the past few years, the consumer product that has been most quickly accepted has been digital gadgets (Al-Dmour et al., 2020).

ABSTRACT

Modern society is facing serious environmental problems that require appropriate measures to be taken to protect the environment. These measures include the development and implementation of environmental law and order. This scientific article discusses the subjects of this legal order and their role in the creation and implementation of the environmental legal order, a sustainable and environmentally responsible social system. The subjects of environmental law and order include state bodies, international organizations, non-governmental organizations and individuals. This study was prepared as part of the implementation of the grant funding research project by the Science Committee of the Ministry of Science and Higher Education of the Republic of Kazakhstan (Grant No. AP14872548 Modern environmental Law and order: Kazakhstan case).

Keywords: subjects, environmental law and order, environmental protection, non-profit organizations, public associations.

INTRODUCTION

Currently, the critical environmental situation around the world has become one of the most important problems that need to be addressed. Our existence on the planet is inextricably linked with nature, and any disturbance of the ecological balance can lead to serious consequences for our life and health. One of the ways to protect the environment is the acceptable use of natural resources and the use of environmentally friendly technologies. It is important to understand that environmental protection is the task not only of the state, but also of the subject in society. We should all take an active part in the protection of nature and environmental safety and the maintenance of environmental law and order. We must be responsible for our actions and try to reduce our negative contribution to the environmental situation.

Thus, the critical environmental situation around the world is a serious problem that needs to be addressed. But with the right approach and efforts of each of the subjects, it is possible to preserve biodiversity, ensure the maintenance of ecological law and order and ensure a healthy life for future generations.

Violation of environmental law and order has a negative impact, and the violation of environmental law and order has a negative impact on nature, human health and sustainable development of society. It is more important than ever to understand that each subject of the environmental order has its own role in its maintenance and is responsible for certain aspects of it. Therefore, it is necessary to identify and study the subjects of environmental law and order, including State bodies and institutions, political parties, international organizations, public environmental organizations, enterprises and civil societies. and nature, human health and sustainable development of society. It is more important than ever to understand that each subject of the environmental order has its own role in its maintenance and is responsible for certain aspects of it. Therefore, it is necessary to identify and study the subjects of environmental law and order, including State bodies and institutions, political parties, international organizations, public environmental organizations, enterprises and civil societies.

MATERIALS and METHODS

To achieve this goal, various scientific sources were used, including scientific research, legislative acts and other official documents, publications. Unfortunately, domestic scientists have recently drawn attention to the need for fundamental scientific development of the problems of environmental law and order and its subjects. Therefore, foreign sources, the experience of other countries and international norms in the field of environmental law were

analyzed. Methods of analysis and synthesis, as well as comparative analysis were used to identify common trends and features of the role of subjects of environmental law and order.

FINDINGS and DISCUSSION

The issues of sustainable environmental development and environmental protection, ensuring environmental law and order are becoming increasingly relevant in the modern world. Kazakhstan cannot stay away from the trends that are taking place in the world. The ecological legal order is a system based on legal norms and relations between society and nature, and its theoretical and practical significance lies in the formation and improvement of environmental legislation and the practice of its implementation. This legal order is the basis for the formation and regulation of environmental relations. In modern legal science, environmental law and order is considered as an area of interaction between society and nature, which is based on legal norms that ensure the environmental safety of citizens (Pchel'nikov M.V.2017).

A review of the reforms carried out in Kazakhstan in the field of human rights in recent years, conducted by the Ministry of Justice of the Republic of Kazakhstan (Postanovlenie Pravitel'stva RK,2020) showed that today environmental protection and environmental development are again coming to the forefront of Kazakhstan's agenda.

Since the beginning of July 2021, a new Environmental Code has entered into force, which is aimed at improving environmental standards in accordance with the OECD (Pyts V.M.,2013). Its purpose is to ensure a high level of environmental protection through state regulation, prevention of environmental damage in any form, elimination of the consequences of such damage, tightening responsibility for violation of environmental legislation, ensuring environmental safety and other tasks. The principles of "the polluter pays and corrects" have been introduced.

The Government is carrying out systemic reforms to apply the best international practices in the field of environmental protection.

Since July 29, 2020, a plan for the transition to a "green economy" for the period 2021-2030 has been implemented, which is aimed at careful use of water, stimulating the development of renewable energy and the introduction of appropriate technologies (Pyts V.M.,2013).

Memoranda were also signed with 16 large enterprises to reduce emissions by 20-30% in the 10 most polluted cities, in order to reduce atmospheric pollution.

Kazakhstan, as a party to the Paris Agreement on Climate Change, aims to reduce greenhouse gas emissions by 15% by 2030. In April 2021, Kazakhstan proposed to create a Regional Hub in Central Asia, which will be aimed at combining efforts in ensuring "green" economic growth

in the region and solving climate problems. At the initiative of President K.K. Tokayev, the country is developing a Strategy to achieve carbon neutrality by 2060. A single environmental portal was created to centralize all announcements on public hearings on environmental impact (www.zakon.kz).

All these and other measures taken in Kazakhstan contribute to achieving the goals of ensuring environmental law and order. At the same time, not the last role in ensuring environmental law and order belongs to the subjects of environmental law and order.

One of the key subjects of environmental law and order, of course, is the state. It plays the role of a legislator, controller and executor in the field of environmental protection. At the same time, the state acts in the person of state bodies that are responsible for the development and implementation of environmental laws and regulations, control over the implementation and response to environmental offenses. State bodies must ensure that citizens' rights to a healthy and safe environment are respected.

State bodies have an important role in the development and implementation of environmental legislation, monitoring its compliance, and also take measures to prevent and punish violators of environmental law and order. In addition to the State, non-governmental organizations play a significant role in ensuring environmental law and order. This may include non-governmental organizations, environmental societies and activist groups that carry out monitoring, education and awareness, as well as participate in the development and implementation of projects and programs for the preservation of the environment. Non-governmental organizations play an important role in ensuring environmental law and order. They actively participate in public monitoring of compliance with environmental laws, conduct educational activities and carry out projects on nature protection.

International organizations play an important role in maintaining environmental law and order and cooperation between States. They develop international agreements, monitor the ecological state, support the development of environmentally friendly technologies and the acceptable use of natural resources. Political parties and international organizations can also influence the development of environmental policy and legislation.

In many countries, non-governmental environmental organizations play an active role in ensuring environmental law and order, participate in the development of environmental legislation, in conducting campaigns and involving the public in environmental movements (Osipova I. V., 2021). Non-governmental organizations play the role of monitoring and monitoring compliance with environmental standards. Scientific and educational institutes are

engaged in research and development of new technologies and methods in the field of ecology. Enterprises should use environmentally friendly technologies and reduce emissions of harmful substances. In this context, public organizations play an important role in the formation and implementation of environmental law and order, environmental policy in general, as well as in the practical implementation of environmental protection measures. Such organizations can file complaints and claims in the courts to protect the interests of the environment and society. They monitor the activities of enterprises and organizations, monitor environmental pollution and inform the public about violations. Their active participation and partnership with government agencies, business and the public are necessary conditions for achieving environmental sustainability and preserving the environment for future generations.

Public environmental organizations play an important role in mobilizing public opinion, exercising public control and influencing public authorities to take the necessary measures to protect the environment. Public organizations can also provide legal support to citizens affected by environmental offenses. They represent the interests of citizens and the community, express their opinions and suggestions regarding the environment, actively participate in the discussion of draft laws, submit environmental initiatives and recommendations to state bodies.

Public and environmental organizations are actively involved in maintaining environmental law and order, protecting the interests of society, and forming public opinion on environmental problems.

It should be noted that until now, environmental issues in Kazakhstan continue to occupy far from the first places in the activities of public organizations. In the 90s, at the very beginning of Kazakhstan's independence, the environmental movement was popular (you can recall the Nevada-Semipalatinsk movement), the nuclear test site was closed, attention was paid to the problem of the Aral Sea. At the beginning of the noughties, several non-governmental organizations appeared, a striking example of which was the ecological union of associations and enterprises of Kazakhstan "Tabigat".

There were approximately 400 non-governmental environmental organizations in the Republic of Kazakhstan in 2019 (Kapickij V., 2018).

The media note that the growth of the number of non-governmental organizations has slowed down in Kazakhstan. By the end of 2020, the number of such organizations has reached 27 thousand. However, only 63% of them, that is, about 17 thousand, are considered active. These data on the number and dynamics of civil sector organizations were published in the collection of the Bureau of National Statistics of the Republic of Kazakhstan. According to this

information, in the last five years there has been a dynamic growth in the number of NGOs working on state or social orders at the level of 9-12% annually. Although the number of NGOs increased by the end of 2020, this increase was insignificant (only 5%), that is, this is a very low growth rate since 2016. At the same time, only 3% of NGOs deal with environmental problems, and their main activity is associated with long-term and not always successful negotiations with the authorities and one-time initiatives, including, for example, garbage collection (Configurational analysis).

Meanwhile, environmental incidents in the country occur regularly: fish die in rivers, yellow snow falls, then, as happened in the spring of 2019, the metropolis of Almaty was enveloped in toxic smog from a burning landfill.

Today, in many developed countries, environmental public formations (public associations) are used to solve environmental problems, maintain environmental law and order, as a way for citizens to collectively exercise environmental rights. In this connection, the issue of the rights granted by the state to a public association has become relevant. There are three main types of environmental public associations: international, global non-governmental organizations and local communities. They play an important role in preventing depletion, pollution and destruction of natural objects. They are also actively working to develop new technologies and production methods that do not harm the environment.

As we can see, the goal is the same, but the directions and role of associations are different and are revealed in different ways in the legal literature. Basically, their role is considered in the context of interaction with the state within the framework of solving environmental problems. But literally all the authors emphasize their huge role in the preservation and protection of the environment (Wang W., 2023).

In order to effectively protect the environment, it is necessary to actively develop state support for environmental public associations and strengthen partnerships between them and public authorities. This is the only way to achieve significant results in maintaining ecological law and order and preserving the biodiversity and ecosystems of our planet for future generations

One of the most important functions of public associations is to perform an important function of monitoring the ecological state and identifying violations of environmental law and order. They actively participate in environmental expertise, conduct independent research and detect cases of violations of legislation in the field of environmental protection.

Public associations contribute to raising environmental awareness of society. They conduct various programs, regularly inform the public about environmental problems and possible solutions, and also support environmental campaigns and actions.

Environmental public associations are one of the key actors in this area. They not only protect the interests of citizens and the public, but also actively participate in monitoring and suppression of violations of environmental legislation. In addition, they perform an important function of informing and educating society on environmental issues.

They play an important role in monitoring environmental legislation and its implementation, as well as in conducting public control over environmental projects and the activities of enterprises. Their role is important not only in monitoring environmental legislation, but also in environmental awareness of society and education of citizens on environmental issues. They organize environmental events, training seminars and campaigns to draw attention to the importance of preserving the environment. Their active participation in monitoring environmental legislation, as well as in raising environmental awareness of society, contributes to the creation of a sustainable and environmentally responsible public system.

In many advanced countries, public associations are actively involved in environmental protection and put pressure on the authorities to monitor and ensure compliance with environmental legislation. There are numerous environmental organizations that actively put issues of green development and sustainable use of natural resources on the agenda. They also play an important role in monitoring and controlling the activities of heavy industry and identifying cases of violations of environmental legislation.

The results of the study showed that in addition to the state, environmental public organizations have become important players in solving environmental problems around the world. These organizations play a significant role in promoting the improvement of human health by solving the problem of environmental pollution. Accordingly, researchers studying the impact of these organizations on improving the quality of health should pay attention to this issue, since almost all countries of the world have faced serious problems of air and water pollution due to industrialization and urbanization.

CONCLUSION and RECOMMENDATIONS

The study revealed that the subjects of environmental law and order play a key role in environmental protection, in the formation and maintenance of environmental law and order. These entities include government agencies, non-governmental organizations, scientific and

educational institutions, enterprises and society as a whole. Each entity has its own responsibilities and tasks that are aimed at achieving common goals in the field of environmental protection. The subjects of environmental law and order play an important role in creating a sustainable and environmentally responsible public system. Their cooperation and coordination of actions are necessary for the effective protection of the environment. State bodies, non-governmental organizations, scientific and educational institutions, enterprises and society should actively cooperate in order to achieve a common goal - to preserve and improve the state of the environment.

The subjects of environmental law and order are important players in the creation of a sustainable and environmentally responsible public system. State bodies, public organizations and individual citizens have different functions and roles in the pre-solution and solution of environmental problems. Interaction and cooperation between these entities are necessary for the successful implementation of environmental law and order. The subjects of environmental law and order play an important role in creating and maintaining a sustainable and environmentally responsible public system. State bodies, international organizations, non-governmental organizations and individuals should interact and cooperate to solve environmental problems and develop effective mechanisms for environmental protection. Each of the subjects has its own role and responsibility in creating and maintaining environmental law and order.

Thus, the subjects of environmental law and order are an integral part of creating a sustainable and environmentally responsible public system. Each entity contributes to the development, compliance and application of environmental legislation. Interaction between the subjects of environmental law and order is a key element in achieving sustainable development and preserving nature for future generations.

ABSTRACT

This paper intends to ascertain the level of information literacy skills (ILS) possessed by academic staff, and to examine their effect on academic staff performance of academic staff of Colleges of Education in Southeast Nigeria. Information literacy have recently received much interest and is being regarded as critical strategic organisational resources and skills that employees need to obtain to function at their workplaces. Yet, the role of employees' literacy seems to be neglected in current literature. The study uses a quantitative survey method with 344 representative sample of 3200 as population of the study. Pilot tests through survey have been conducted with 39 academic staff. Statistical Package for the Social Sciences (SPSS) was used to analyze the data. From the pilot test, the results show that the skills for locating information has the lowest value of 0.531, and the skills for evaluating information has the highest value of 0.897 and that all items above 0.6 except for need skills and locate skills with 0.566, and 0.531 value. The findings reveal that academic staff' level of job performance and information literacy skills were high, and that ILS have a presumed direct impact on service delivery of academic personnel in colleges of education in Southeast Nigeria. The study recommends that Management of colleges of education should pay attention to the literacies of their staff, for better ILS will likely improve work performance. It also recommends that academic staff should get regular training to acquire new skills in their job, to meet the demands of the challenging work environment.

Keywords: Information Literacy, Information Literacy Skills, Individual Work Performance, Academic Staff.

1. INTRODUCTION

Everyone needs and relies on information every day. Daily, we are exposed to a vast and diversified information through the Internet, mainstream media, and published works. Information is accessible via an infinite number of formats and sources – from printed sources (magazines, books, reports, newspapers), from a digital source such as a database, a search engine or a e-book accessed through a computer, or it may come from any other form of media: film, video, DVD, radio, television, etc. There is a considerable variation in quality between the numerous available information sources, and this has to be checked. During a typical Internet search, a user can access and receive authoritative, up-to-date, and trustworthy information sources and biased, out-of-date, misleading, or inaccurate ones. In addition, a single online search is likely to yield more results than you might anticipate. Amazing too, is the growth of electronic resources which has changed the entire scenario of education and information industry. With widespread use of the Internet, it is crystal clear that skills required of information users are how to solve problems and how to create values with the help of others through information networks, instead of just knowing how to use computers or how to get information. In this changing information environment, skills and ability of locating, evaluating, analyzing the information and using it for making proper decision has become significant. Therefore, users require numerous and diverse information searching skills. There is a need to train users in locating, evaluating, and using the required information meaningfully. In the information society today, the ability to function as independent lifelong learners, is the most important learning outcome for all learners. To achieve this goal, one must become information literate. Information literacy refers to the abilities to know when there is a need for information, and to be able to identify, locate and effectively use that information for the issue or problem at hand. In a world in which information is expanding at an astronomical rate, and the technology, which provides access to much of that information is rapidly changing, such abilities are fundamental to lifelong learning. Today's world is overloaded with various information; information is everywhere, and people perceive it in different ways. Modern media offer an overwhelming amount of news, facts, and opinions which are not always trustworthy and, therefore, should be checked. That is why information literacy (IL) is very important in the forming of people's horizons and forms the basis for lifelong learning. It is common to all disciplines, to all learning environments, and to all levels of education. It enables learners to master content and expend their investigations, become more self-directed, and assume greater control over their own learning. (Tamilchelvi and Senthilnathan, 2013)

Information literacy is essential for personal, professional, and academic success. These skills are helpful in the school's administrative offices for research papers, projects, and presentations. Academics often need new information to make sound decisions. At home, we are continually pressed to make consumer and social/political judgments. (Research Foundations – Information Literacy, 2021). Information Literacy requires active participation in information society. We should always strive to improve our hard and soft skills, notably information literacy. By promoting our skills, we may become valuable assets to an organization.

Information literacy is a tool for individual empowerment. This empowerment can be seen in a person's skill in analyzing and making research decisions or his independence in searching for the truth (Farokh & Shah Talabi, 2018). Information literacy is the set of skills necessary to search, retrieve and effectively use different information sources (Lee, Lee, & Lee-Geiller, 2020). People with these skills can correctly identify their information needs, identify the resources necessary to meet this need, and search, identify and select information by formulating appropriate strategies in these sources, that is, they are able to critically evaluate the results of this search, choose the most suitable options, and recognize the information value of the sources to meet their information needs. Such people are said to be information literate.

Information Literacy is key to knowledge development and learning. Information literacy is the use of information in creating new knowledge and participating ethically in communities of learning. (ACRL, 2016). If this is indeed the case, then Information Literacy can be seen as an aspect of the learning process. In the context of the workplace, it can be regarded as a means through which employees not only develop both their own and their team's knowledge, but also learn in ways which help them contribute to the objectives of the institution.

Despite the different different viewpoints, the principal point of IL is being competent and confident in an ever-changing information environment. This competence and confidence will help individuals become independent and lifelong earners. Therefore, understanding the relationships between information literacy, and work performance could help institutions to recognize both the importance of information literacy and its influence on the workplace, and also provide educators with guidance for planning related training programs. This empirical study explores the relationships between self-efficacy in information literacy, and work performance.

2. LITERATURE REVIEW

In this study, we shall review related literature on information literacy and work performance as it pertains academic staff of colleges of education.

2.1. Information Literacy

Information Literacy (IL) is a key to lifelong learning and achieving educational goals. It is crucial for lifelong learning, especially in education, where knowledge must be transferred to creative, critical thinkers and lifelong learners (Durodolu, & Ochalla, 2017). Information literacy improves learning, skills, values, beliefs, and cultural awareness (Ashiver, Agoh & Ihongo, 2018). Information literacy encourages people to think critically about the information they receive and to generate new knowledge

In today's environment of rapid technological change and the explosive proliferation of information resources, information literacy is becoming increasingly important; Because of the increasing complexity of this environment, individuals in different work environments are faced with a variety of information options. In such situations, reliance on information literacy allows the use of inherent opportunities in the information society (Sharkey 2006, cited by Toroghy, Sanatjoo, & Tajafari, 2022). There is need to consider the environmental context of information use when discussing IL because there is an interactive relationship between the individual and the environment in which he operates. Therefore, he must have sufficient information ability, that is. the skill in acquiring and using information, in order to respond to people and exchange information with other colleagues. The experience of information literacy in the workplace is the ability to search, retrieve and use different types of information resources and information technologies by employees in different job environments to perform work tasks, respond to clients and interact and exchange information with colleagues (Bruce, cited by cited by Toroghy, Sanatjoo, & Tajafari, 2022). The experience of information literacy enables administrators and employees to adapt themselves with increasing changes in work environments, and causes the survival and development of the organisation. Information literacy can be defined as one's ability to identify information needs, evaluate and use information resources and effectively use information resources. In the workplaces, employees need information to execute their tasks. There is a common misconception about information literacy, which has been mistakenly linked to abilities and competencies required to work with computers and use information technology, rather than information literacy skills (Bruce, cited by Toroghy, Sanatjoo, & Tajafari, 2022).

In fact, Information Literacy experience appears to involve the development of knowledge that is meaningful in specific contexts. In the workplace, Information Literacy experiences generate the knowledge that contributes to a greater understanding, and to the successful undertaking, of designated roles and tasks (Forster 2017). Such experiences include an awareness of the

information needed in each workplace context, and the varying sources, processes and co-participatory practices needed to develop knowledge as the context varies.

The idea that Information Literacy is key to knowledge development and learning is increasingly becoming acceptable. ACRL, in its framework (2016) stated that Information literacy is the use of information in creating new knowledge and participating ethically in communities of learning. In this regard, Information Literacy can be seen as an aspect of the learning process. In the workplace environment, it can be regarded as a means through which employees develop both their own and their team's knowledge, and learn in ways which help them contribute to the aims and objectives of the establishment. Within learning, IL is described as using information to learn, that is, knowing about the kinds of information we are using, how we are using information and how different forms of information come together to inform and transform our work. (Bruce, Hughes and Somerville 2012).

In a study of information literacy education among faculty and students of Laz Otti Memorial Library, Babcock University, Nigeria, John, Eti and Ukangwa (2015) revealed that library users within an academic environment have limited skills in the area of information literacy, as it is not discussed extensively in the academic course curriculum which has prompted library users with the challenge of searching, identifying, recognizing, evaluating, using, and applying the knowledge gained from the array of information to improve research output and productivity. Anyaoku, Anunobi and Eze (2015) examined the perceptions and ILS of librarians in Colleges of Education in Nigeria to determine the challenges to effective ILS acquisition and services in these institutions. The instrument for data collection were questionnaire distributed to librarians in 39 Colleges of Education in the six geopolitical zones of Nigeria. 87 usable questionnaires were returned. Findings shows that generally librarians' respondents have a positive view of their roles and capabilities in IL services. They scored their skills highest in locating skills in the use of library catalogues, encyclopedia, indexes, and abstracts to find information and lowest on ability to carry out search using Boolean operators and ability to use appropriate presentation software to present information. Some of the challenges that impede the acquisition of Information Literacy Skills (ILS) and programme developments in Colleges of Education in Nigeria identified, namely lack of facilities needed to apply ILS and no regulation of curriculum on IL by the regulatory bodies on Library and Information Science. Therefore, there is need for IL standards to guide IL developments in Colleges of Education in Nigeria. Odede and Nsibirwa (2018) conducted a study to determine the relationship between ILS and the use of electronic information resources. A descriptive survey approach was adopted for data

collection and data was analyzed using SPSS. The population was 115 postgraduate students (Masters and Ph.D) and Kuhlthau's information search process model guided the study. The results indicated that use of electronic information resources is determined by competency in the various dimensional constructs of information literacy. The study's findings suggest a link between ILS and the use of electronic information resources.

Rafique (2019) examined the information literacy skills of faculty members of the University of Lahore, Pakistan. The study showed that majority of the faculty members possessed skills needed to determine the existence of needed information and to organize, analyse, evaluate and fully understand the found information. The analysis further showed that very few faculty members had the ability to identify and define information, to find needed information, to communicate and present the information and to evaluate the reliability of information resources, whereas few had skills to utilize, dispose, and realize the need and to create information which they had needed. Tyagi (2017) also investigated the information literacy skills of librarians working in Indian universities. The study resulted in inadequate information literacy skills of the cohort and reported the obstacles to their deficient information literacy skills, such as lack of personal motivation, incentives, training sessions, and regular information literacy instructions.

Academic professors at Nigerian institutes of education are primarily responsible for teaching, research, and community service. To fulfil these obligations effectively and efficiently, they require the most up-to-date informational resources to supplement their knowledge

2.2. Individual Work Performance (IWP)

In line with the digital era, information literacy skills still need to be basic to support their work performance. Job performance consists of a set of employees' behaviours that are perceived to agree with organizational goals that can be measured, monitored, and assessed as an achievement at an individual level (Nwokike, and Unegbu, 2019). The academic personnel's job performance is that aspect of work behaviour that is of relevance to the institution's success. Work performance comprises behaviours that workers demonstrate in their jobs that are relevant to the establishment's goals. Job performance is of interest to organizational behaviour, and the result is an important factor for individual work effectiveness evaluation. Thus, an organization's success or failure depends on the job performance of the individuals in that organization (Popoola & Tabuke, 2021).

Job performance is crucial for the overall performance in a dynamic environment such as the college of education system. Job performance, also known as task performance which is the

extent to which personnel performs core job responsibility is important for overall success of the institution. Oyedipe and Popoola (2018) describe task performance as the outcome of personnel input in terms of actions and behaviours that enables the achievement of overall organization goals and objectives. The ability and capability of academic personnel to perform functions competently is essential for the overall effectiveness of the institution of higher learning.

Employees will be encouraged to increase their work performance level to boost the institution's performance and productivity and to increase the chances of surviving any possible re-organization with a reduction in personnel. Therefore, it becomes paramount that management maintains, improves, and optimizes individual work performance. In view of this, this study focuses on the effect of information literacy skills on individual work performance, with reference to research productivity and online teaching of the academic staff of colleges of education in Nigeria.

2.2.1. Research Productivity

Globally, higher institutions of learning are recognised as centres for the production, accumulation and transfer of knowledge. The core functions of academic staff are teaching, research and community service, aiming to produce trained manpower for various areas of national development. Nirman (2007, cited by Olakunle & Olanrewaju, 2019) avers that the mission of higher education is to advance knowledge, create knowledge, disseminate knowledge through research and provide service to the community. Research is critical in promoting the prosperity of a nation and the well - being of her citizens. In institutions of higher learning, recognition and advancement of individual academic staff members depends largely on the quantity and quality of research productivity.

Furthermore, it also provides important background for academic staff to become successful, as they are from documented studies that other researchers have done. Research productivity plays a major role in defining success in academic circles, as it is related to promotion, tenure, and salary of academic staff (Okonedo, 2015). Creswell (2014) states that the most frequently used measure for the quantity or amount of research productivity is a numerical publication count over a certain period. Most studies measure productivity by calculating a composite indicator derived by summing the number of finished research reports, published reports, and utilized research reports.

Yusuf (2012) observed that despite Nigeria having several policy documents highlighting the importance of research as a catalyst for national development, Nigerian

scholars are not performing up to expectation in terms of research and innovation. Okonedo (2015) and Tsafe, Basaka and Mohammed (2016) conducted independent studies on research productivity in South West and Northern Nigeria respectively which revealed that scholars in Nigerian universities published an average of one research paper per year. Ifijeh, Ogbomo, & Ifijeh (2018) deplored the low rate of research publication is when compared to scholars in developed countries. Okiki & Mabawonku (2013) averred that access to relevant information resources is essential in conducting any type of research. Iroaganachi and Izuagbe (2018) supports this, stating that research productivity is highly dependent on effective utilisation of quality information resources, and so academic libraries must be well stocked with relevant information resources in diverse formats and equipped with adequate facilities which will ensure that researchers and other library users are able to utilise the available resources effectively and maximally. The availability of information resources to the researcher encourages the researcher to conduct research and help to situate his/her own work in the context of available literature. It is therefore imperative, when measuring the relationship between information availability and research productivity also to measure information literacy level of the targeted group because it often happens that the available information is underutilised due to lack of information literacy skills. This is acknowledged in studies such as Nwosu, Obiamalu and Udem (2015) who examined the relationship between ILS and research output of academic staff of Nnamdi Azikiwe University, Awka, Nigeria and found amongst others, a positive correlation between ILS possessed by the academic staff and research output. This finding was corroborated by studies of Madu & Dike (2012); Okiki & Mabawonku (2013); Udem & Anaehobi, 2020) in different environments which found correlation between ILS and research productivity. Bhukuvhani, Chiparausha, and Zuvalinyenga (2012) measured the impact of information literacy on the utilisation of electronic resources among Indian scholars and noted that the understanding of academics on the influence of improved access to digital information resources in general is limited and a similar trend is noticeable regarding the mechanisms that mediate between the increased provision of digital material and its use for scholarly work. It is obvious that informed users of today, including academic staff, need to be equipped with ILS to effectively feel the need, access and use information that abounds in this information age. The uncertainty of quality and increasing volume of information poses a great challenge for any information user. It is obvious from the literature that information literacy can greatly improve academics' research productivity. Olakunle and Olanrewaju (2019) investigated the relationship between ILS and research productivity of researchers in Nigeria,

using socioeconomic factors as the mediator. The study used a questionnaire for data collection; out of 782 academic staff in research institutes in Southwest, Nigeria, 610 respondents completed the questionnaire. Descriptive correlation analysis was used to analyse the data. The study reveals a significant relationship among every component of ILS and research productivity of academic faculty of research institutes in Nigeria. Anekwe and Uzoamaka (2018) investigated the impact of web-based information literacy skills on academic research productivity in Nigerian Federal Universities. The study's findings indicated that the possession web-based information literacy skills have greatly improved research productivity among academic staff in federal universities in the country. In view of this, this study focuses on the influence of information literacy skills on individual work performance, with reference to research productivity, of the academic staff of colleges of education in Nigeria. Based on the review of related literature, a 30-item questionnaire was constructed. The study is a quantitative survey method with 344 representative sample of 3200 as population of the study. The sample was got from Raosoft Calculator Inc. and stratified random sampling technique. To ensure the validity, reliability, and normality of data, the research instrument was pre-tested by experts/scholars. A pilot test was also carried out through survey and thirty-nine (39) academic staff participated. Copies of the questionnaire were distributed physically by the researcher to academic staff of colleges of education in southeast Nigeria. Data was processed using SPSS.

2.2.2. Online Teaching and Learning

Online learning refers to open education and instruction delivered through the Internet. It has been described in numerous ways by authors, scholars, and academics in their respective fields. Albrahim (2020), citing Ally (2008), defines online learning as an educational experience that allows students to develop personally, acquire knowledge, and construct their learning by providing access to learning materials via the Internet, interacting with the content instructor and other students, and receiving support while acquiring new information. Moreover, it is a learning experience that occurs in synchronous or asynchronous environments using various Internet-connected devices (such as PCs, laptops, smartphones, etc). (Zalat, Hamed & Bolba, 2021). It is a technique of training that requires academic professionals to practical information literacy skills. In today's digital world, online education is a critical right that promotes the social integration of all nations. Online or remote education implies that students are physically distant from the instructors and require a delivery method (Wilde & Hsu, 2019). The interaction between students and teachers is mediated by technology, and the design of learning

environments (e.g., the space where learning occurs) can considerably influence learning outcomes (Bower, 2019; Gonzalez et al., 2020). Technology, if used effectively, allows students and teachers to engage mutually and collaborate (Bower, 2019; Gonzalez et al., 2020). Effective online teaching results from careful instructional design and planning (Hodges et al., 2020)

Online instruction demands a commitment to online learning principles to develop and maintain a teaching, social, and cognitive presence. Effective online instructors encourage and facilitate students' active communication, contact, collaboration, and course involvement (Palloff & Prout, 2011). Martin et al. (2019) identified online instructor roles as aligned with various parts of the teaching process, such as course design, facilitation, and assessment, and identifying roles such as facilitator, course designer, content manager, subject matter expert, and mentor. The usage of emerging technologies by educators is vital to their job performance, and the improvement of the effectiveness of the teaching and learning process, vis-a-vis the quality of Education(Edeh,2019). Integration of ETs in the teaching and learning process assists educators in adapting to the changing trends in education. Parry and Battista (2019) opined that emerging technologies help employees to update their skills to compete in the future world of work. This means that academicians and other professionals should be prepared to innovate by embracing emerging or cutting edge technologies continually to flourish in their careers and fit into the new world of work. Nevertheless, despite the perceived positive effects of emerging technologies, its integration in the teaching and learning process is still being hindered by several factors, such as epileptic power supply, insufficient skills, availability and accessibility issues, funding, inadequate professional development, and poor internet connectivity (Edeh,2019). Most of the research efforts were made to investigate teachers' digital competence in secondary schools and universities. However, little attention has been paid to analysing the digital teaching competence of academic staff in higher education institutions, especially colleges of education in Nigeria. Grunwald, Pfaffenberger, Melniova, Zascerinska & Ahrens (2016) researched the digital teaching competence of academic staff in Lithuania and Latvia, underpinning the elaboration of a research question on the online training of university teachers. The data reveals the overall digital teaching competence of academic staff who participated in the empirical study is of a low level. The findings of Guess, et al.(2020) on the inter-relationships between competence, experience, digital competence of university teachers and professional digital competence of teachers serve as a source of determination of what digital teaching competence of university teachers is. The empirical findings of the research allow the

conclusion that the digital teaching competence of academic staff who participated in the empirical study is of a low level. Although, academics are occasionally slow to adopt e-learning, they must embrace technological advancements (Flawell, Harris, Price & Peterson, 2019). The study concluded that educators at all levels of education should continue to update their knowledge and skills on how best to integrate emerging technologies in the teaching and learning process.(Edeh, 2019).

3.0. METHODOLOGY

A survey method is used to collect data from a predefined group of respondents to gain information and insights into various topics of interest. In this study, the data was collected from academic staff of 7 out of 9 public colleges of education in southeast Nigeria through a personally administered structured questionnaire. In this survey, only one method of survey will be conducted, which is a written survey. All of the participants are academic staff of 7 out of 9 public colleges of education in southeast Nigeria. Two of the public colleges were newly established and have not started functioning properly as academic institutions. Hence, they were not included in the pilot test survey. The questionnaire collected the demographic profile of the participants in Part A. required respondents to determine the source of information. Part B required respondents to rank the usage of IL. Section C required respondents to rank the aspects of their work performance- research productivity and online teaching.

The questionnaire was then validated in a pilot study, which allowed for the investigative questions to be answered, and the verification of collected data could be performed accordingly (Aithal, & Aithal, 2020). The pilot study was conducted to ensure that respondents understood the questionnaire items and that there were no ambiguous questions (Fraser, Fahlman, Arscott, & Guillot, 2018). This initial study included 39 participants, and the data were analyzed using SPSS version 22. Reliability and validity of measurement play important roles in generalizing. Finally, Cronbach's alpha was used to determine the scale reliability of the questionnaire and how closely related a group of questions was. Five parts were included in the questionnaire. Data was analyzed and presented in tables.

4.0. RELIABILITY ANALYSIS RESULTS

As revealed in Table 1 below, Cronbach's alpha coefficients determine the reliability and internal consistency of the scales exercised in the study. All factors had Cronbach's alpha values greater than 0.6, suggesting that the reliability level is appropriate and acceptable, except for in

the dimension of locating information and need skills where the value of Cronbach's alpha are below 0.6, which is unsatisfactory. According to the SPSS analysis results, the overall consistency, or Cronbach's alpha values, of all 30 items for each dimension contained in the instrument was between 0.531 and 0.897. Skills for evaluating information show the highest value of 0.897, while the skill for locating information shows the lowest value of 0.531, followed by need skills with low value of 0.566; this means that there is room for refining the instruments in this study. According to Tavakol & Dennick (2011), cited by Jain, & Angural, (2017], a value of Cronbach's alpha of less than 0.6 will affect the validity of the data. Two possibilities happen in this scenario: either the number of items in the locate skills dimension are not enough or the items are partly correlated with each other, or there is diversity in the construction of the instrument. Therefore, there is the need to revise or remove items. The value of Cronbach's alpha can be refined by adding more related items to test the same concept. This result implies that, particularly at this point in the investigation, the overall index of the scale's internal consistency within the instrument is reliable with no unexpected abnormalities found in the data. The pilot test has been conducted with 39 academic staff of colleges of education in Nigeria and the result of the pilot test is summarised below in Table 1.

Table 1. Cronbach's Alpha Analysis Result.

Variables	Measures	Number of Items	Cronbach's Alpha
1. Individual work performance	1.1 Research Productivity	5	0.779
	1.2 Teaching Output	5	0.852
	Overall	10	0.853
2. Information Literacy Skills	2.1 Need Skill	5	0.566
	2.2 Locate Skill	6	0.531
	2.3 Evaluate Skill	4	0.897
	2.4 Use Skill	5	0.780
	Overall	20	0.850
3. Media Literacy Skills	3.1 Access Skill	5	0.701
	3.2 Analyze Skill	5	0.545
	3.3 Evaluate Skill	5	0.897
	3.4 Communicate Skill	5	0.795
	Overall	20	0.907
	Overall Reliability of Instruments	50	0.891

5.0. FINDINGS and DISCUSSION

The analysis of results of the collected data suggests that the overall index of the scale's internal consistency within the instrument is reliable, with Cronbach's Alpha of 0.891. According to the reliability test of the pilot study, information literacy skills have a Cronbach's Alpha reliability of 0.850, and individual work performance have a Cronbach's Alpha of 0.853 respectively. In the individual work performance variable, the findings show that teaching output dimension has a higher Cronbach's Alpha of 0.852 than research productivity which has 0.779. In the information literacy skills variable, Need skill and Locate skill have a lower Cronbach's Alpha of 0.566 and 0.531 respectively. Evaluate skill and Use skill has a high Cronbach's Alpha of 0.897 and 0.780 respectively.

This article aims to present the summary of an ongoing research project on level of ILS possessed by academic personnel of colleges of education in southeast Nigeria and its effect on individual work performance. A review of related literature and preliminary studies has been conducted. Preceding the actual research, the instrument underwent pre-testing with six experts to ensure the reliability of each question and understandability of the items. A pilot study was also carried out and was participated by 39 respondents among academic staff of public colleges of education in southeast Nigeria. The analysis results of the collected data suggest that the overall index of the scale's internal consistency within the instrument is reliable. With the Cronbach's Alpha reliability of 0.850 for information literacy skills, and 0.853 for individual work performance respectively, it shows that the academic personnel have a high level of both information literacy skills which had impact on their high work performance. This indicates that a presumed relationship exists between information literacy skills, and work performance of the academic staff. In the individual work performance variable, findings show that teaching output dimension has a higher Cronbach's Alpha of 0.852 than research productivity which has 0.779. Traditionally, teacher education colleges were established as teaching institutions with an emphasis on teaching rather than on research. Reforms introduced into these institutions included a research focus as well, and the role of teacher educators as researchers. Teaching includes formal classroom instruction, advising, informal instruction, and training students to conduct research. Therefore, it is reasonable to assume that experienced teacher educators are more research productive than their less experienced peers. Simon, Vlado, & Maja (2017) found that research productivity is not related to teaching quality, whereas research quality is positively related to teaching quality.

The outcomes from this research provide valuable insights for the College of Education Management, Government, and policymakers to the relevance of possessing literacy skills in higher education institution in Nigeria.

The implication of the findings is that management of colleges of education should pay close attention to the literacy levels of their staff. This is because literacies are such an important skillset in the digital era and management should by identifying which work groups or individuals require literacy training and instruction and provide specific and relevant training or literacy interventions to increase their literacy level.

6.0. RECOMMENDATION and CONCLUSION

Academics must be able to identify when information is needed, know the sources of information that can meet their needs, understand how to access information to fill the knowledge gap, and be able to minimize the barriers that obstruct their access to information to carry out their primary functions of teaching and research effectively. Only then will they be able to fulfil their jobs as instructors and researchers effectively. In addition to filling knowledge gaps, this study aims to provide a solution by providing a deeper understanding of current academic staff's online learning and their use of information resources regarding the information literacy skills possessed or not possessed, to meet the most recent teaching and research demands.

The outcomes from this research provide valuable insights for the College of Education Management, Government, and policymakers to the relevance of possessing literacy skills in higher education institution in Nigeria. This study contributes to the body of knowledge by increasing research on academic staff's media and information literacy and individual work performance. In addition, because of the better ILS possession, this study will boost and improve the individual work performance of College of Education academic professionals. This study will add to the scant past research on the influence of information literacy skills on academic staff's individual work performance.

It is therefore recommended that academic staff must ensure that they possess the requisite IL skills that will enhance effective job performance, for better ILS will likely improve work performance. Also, as literacies are such an important skillset in the digital age, the management of colleges of education should provide specific and relevant training to help staff acquire new skills in their job, to meet the demands of the challenging work environment.

Acknowledgments: The researchers would like to extend their gratitude to Universiti Teknologi MARA (UiTM)–Faculty of Information Management Puncak Perdana for providing the necessary funding for publication, particularly the supervisors, for their assistance and guidance, as well as the event secretariat for the opportunities provided. The researchers also would like to thank Colleges of Education academic staff, and respondents who provided feedback and participated in this study.

Conflicts of Interest: The authors declare no conflict of interest.

BIODATA: Godwin Nwachukwu Arua is a Ph.D. scholar at Universi Teknologi Mara (UiTM), Dr Ijeoma Ibegbulam is a Deputy University Librarian and Assoc. Professor while Helen Obioma Ukwuaba is a Senior Librarian

ÖZET

Kirlilik kaynakları olarak bünyesinde, yoğun miktarda hayvansal gübre ve işletme içi atık bulunan hayvancılık sektörü atıklarını belirli bir atık yönetimi olmadan kullandığında bu durum doğal çevreye telafisi imkânsız olan zararlar verebilmektedir. Bu çalışmada Şırnak ilinde oluşan hayvansal kaynaklı zararın izlenmesi amacıyla, çalışma alanı için büyükbaş- küçükbaş hayvanlardan ve kanatlılardan elde edilebilecek hayvansal atık potansiyelini somut ve güncel verilerle belirlemek ve sıklıkla ihmal edilmiş olan hayvan gübresinin kirlilik risklerine dikkat çekmek amaçlanmıştır. Büyükbaş, küçükbaş ve kanatlı hayvan verileri TÜİK'ten ve Şırnak İl Tarım ve Orman Müdürlüğünden alınmıştır. Bu çalışmada, hayvancılık faaliyetleri kaynaklı yayılı kirlilik yükünün Şırnak ilinde oluşumu araştırılmış hayvan sayılarına bağlı olarak oluşabilecek toplam azot ve toplam fosfor yayılı kirlilik yük miktarları hesaplanmıştır. Kirlilik yükü hesabında Şırnak ili mevcut 2022 yılı, büyükbaş, küçükbaş ve kanatlı hayvanı sayıları kullanılmıştır. Sonuç olarak, Şırnak ili ve ilçelerinde toplam azot kaynaklı oluşabilecek toplam yayılı kirlilik yükü 2.105.434 ton TN/yıl, toplam fosfor kaynaklı oluşabilecek yayılı kirlilik yükünün 140.365 ton TP/yıl olduğu tespit edilmiştir.

Anahtar Kelimeler: Hayvansal kirlilik yükü, Yayılı kirleticiler, Kirletici parametreler, Şırnak

CALCULATION OF ANIMAL SOURCE POLLUTION LOAD OF ŞIRNAK CENTER AND DISTRICTS

ABSTRACT

When the livestock sector, which has a large amount of animal manure and in-house waste as pollution sources, uses its wastes without a specific waste management, this situation can cause irreparable damage to the natural environment. In this study, it was aimed to monitor the animal-related damage occurring in Şırnak province, to determine the animal waste potential that can be obtained from cattle and poultry for the study area with concrete and up-to-date data, and to draw attention to the pollution risks of animal manure, which is often neglected. Cattle, sheep and poultry data were taken from TÜİK and Şırnak Provincial Directorate of Agriculture and Forestry. In this study, the occurrence of diffuse pollution load originating from livestock activities in Şırnak province was investigated and the total nitrogen and total phosphorus diffuse pollution load amounts that may occur depending on the number of animals were calculated. In the pollution load calculation, the current 2022 numbers of cattle, sheep and poultry in Şırnak province were used. As a result, it has been determined that the total diffuse pollution load that may occur due to nitrogen in Şırnak province and its districts is 1711572 tons TN/year, and the total diffuse pollution load that may occur due to phosphorus is 164751.7 tons TP/year.

Keywords: Animal pollution load, diffuse pollution, total nitrogen, total phosphorus, Şırnak

1. GİRİŞ

Dünya genelinde yaşanan hızlı nüfus artışı, kentleşme, teknolojik gelişmeler beraberinde çeşitli çevre sorunlarını da gündeme getirmiştir (Xiaoyan, 2005). Yaşanan bu gelişmelerin yanı sıra hızlı nüfus artışı ile birlikte hayvansal ürünlere talep ve hayvancılık faaliyetlerinde de artış gözlenmiştir (Karaman, 2006).

Kirliliğinin tanımı, yaşamın sürdürülmesi için gerekli olan ortamın bozulması şeklinde yapılabilir. Çevre kirliliğinde ilk akla gelen; hava, su ve toprak kirliliğidir. Çerçeve biraz daha genişletildiğinde; katı atıklar sorunu, pestisid sorunu, gürültü kirliliği, enerji üretim kaynaklarının ortaya çıkardığı kirlilik çevre kirliliği etmenleri arasında sayılabilmektedir

Kirlilik oluşturan kaynaklar noktasal ve yayılı baskılar olmak üzere iki ana başlık altında toplanmaktadır. Su havzasında belirli bir noktadaki atıklardan kaynaklanan kirleticiler noktasal kirleticiler olup, belirli ve tek bir kaynağı olmayan, yayılmış durumdaki atıklardan kaynaklananlar ise yayılı kirleticiler olarak değerlendirilmektedir. Noktasal kirleticiler, evsel atıksular (kanalizasyon şebekesine bağlı olanlar), endüstriyel kirleticiler ve katı atıklar (düzenli depolama tesisleri sızıntı suları) dır. Yayılı kirleticiler ise arazi kullanımı, tarım ve hayvancılık faaliyetleri, atmosferik taşınım, foseptiklerden ve düzensiz (vahşi) katı atık sahalarından kaynaklanan kirleticilerdir (Yetiş ve ark. 2018).

Kirlilik kaynakları genel olarak ölçülebilir, kontrol edilebilir ve takip edilebilirken yayılı kirlilik kaynakları dağınık olmasından dolayı hareket mekanizmasının ve kirlilik kaynağının kesin olarak belirlenememesinden tahmin yürütülememesi ve ölçümünün yapılamamasından son derece tehlikeli bir kirlilik kaynağıdır. Bununla beraber yayılı kirlilik kaynakları tek tek değerlendirildiğinde etkileri ve büyüklükleri önemsiz görülse de ortaklaşa etkileri göz önüne alındığı zaman çevre için büyük tahribatlara yol açmaktadır (Yontar, 2009; Biçer, 2011; Yetiş ve ark. 2018).

Yayılı kirlilik kaynaklarından olan hayvansal atıklar kontrolsüz atık yönetimi sonucu, yüzey ve yer altı su kaynaklarını kirletebilmektedir. Bu olay; hayvanların doğrudan bir su kaynağına ulaşması, gübre yığınlarından, barınaklardan ve açık yemleme alanlarından gelen yüzeysel su akışları, gübre depolama alanlarından oluşan sızıntı suları, depolama alanlarının sular altında kalması, gübre uygulanan alanlardan gelen yüzeysel su akışları etkisiyle gerçekleşir (Polat ve Olgun, 2009).

Hayvan gübreleri katı (%15–30 kuru madde) ve sıvı (%4–8 kuru madde) kısımlardan oluşmaktadır. Ayrılan katı faz kompostlaştırmada, ahır zeminini oluşturmada ve gübre olarak değerlendirilmektedir (Uğurluoğlu, A.; 2009). Hayvan gübrelerinin sebep olduğu toplam azot

ve toplam fosfor birim yüklerinin bir alanda yayılması hayvanların kategorisine, türüne, beslenme imkânlarına, kütlelerine ve gübreleme özelliklerine bağlı olarak yüksek oranda farklılık içerir (Akdoğan ve ark. 2015).

Bu çalışmada temel geçim kaynağı tarım ve hayvancılık olan, il ekonomisi ve halkın gelir kaynağı hayvancılık ve hayvan ürünleri üzerine olan ve sanayisi yok denecek kadar az olan Şırnak (ili ve ilçeleri) için yayılı kirletici kaynaklar arasında sayılan hayvancılık faaliyetleri ile oluşan toplam azot (TN) ve toplam fosfor (TP) kirletici yükleri hesaplanmış, çevresel kirlilik açısından değerlendirilmiştir.

2. MATERYAL ve METOT

2.1. Materyal

Çalışmada Şırnak ve ilçelerindeki hayvancılık faaliyetlerinden kaynaklanan, yayılı kirliliğe sebep olan atık miktarlarının belirlenmesi amaçlanmıştır. Bu amaçla, Türkiye İstatistik Kurumu (TÜİK) ve Şırnak Tarım Orman İl Müdürlüğü'nün, 2022 yılı büyükbaş (BBH), küçükbaş (KBH) ve kümes hayvanı (KH) sayısı verilerinden yararlanılarak gerekli hesaplamalar yapılmıştır. Hayvan türlerine göre oluşabilecek toplam azot (TN) ve toplam fosfor (TP) yayılı kirlilik yükleri hesaplanmıştır.

2.2. Çalışma Alanı

Şırnak ili nüfusu: 557.605'dur. Bu nüfusun % 75,45'i şehirlerde yaşamaktadır. İlin yüzölçümü 7.078 km²'dir. İlde km²'ye 79 kişi düşmektedir (Anonim2022). Şırnak ili, 37°31' kuzey enlemleri ve 42°28' doğu boylamları arasında yer almaktadır. İlin toplam alanı 7.151, 57 km² dir. Şırnak İli yüzölçümünün $\frac{3}{4}$ 'ünü kaplayan batı kesimi, Güneydoğu Anadolu Bölgesinde yer alırken, geri kalan yüzölçümünün $\frac{1}{4}$ 'ü ise Doğu Anadolu Bölgesi içinde kalır. İl batıda Mardin, kuzeyde Siirt ve Van, doğuda Hakkari illeri ile güneyde Irak ve Suriye devletleriyle çevrilidir. İlin yer aldığı Güneydoğu Anadolu Bölgesi jeolojik olarak kenar kıvrımları kuşağı olarak adlandırılan kuşak içinde yer alır. Bu kuşaktaki jeolojik özellikler ülkemizde yer alan diğer kuşaklardan farklı bir özellik taşır. Anadoludaki Alpin Jeosenklinealinin ön çukuru durumunda olan bölge, jura tipinde gelişmiş kıvrım şeritleri içerir. Burası Eo-Kambriyenden (birinci zaman) başlayarak Pliyosen (üçüncü zaman) dahil, bütün devirler boyunca devamlı bir sedimantasyon (tortulanma) havzası olarak gelişmiştir. Kambriyenden itibaren bütün formasyonlar sığ deniz (kıta kenarı, şelf) fasiyesinde gelişmiş, metamorfizme (başkalaşım) ve

magma yer kabuğu içindeki tabakalar arasına sokularak şekil oluşturmuştur (Üren ve Baran, 2023).

İlin güneyinde Suriye ve Irak sınırına yakın kesimleri hariç hemen hemen tamamı dağlarla kaplıdır. Dağlık kesimlerde Güneydoğu Toroslar sistemine bağlı yüksek kütleler vardır. İlin önemli dağları; Cudi dağı (2114 mt), Küpeli Dağı, Kelmehmet dağı (3231 mt.), Tanintanin dağı (3055 mt), Namaz dağı (1990 mt.) ve Altın dağlarıdır. İlin en önemli akarsuyu, Kızılsu, Hezil ve Habur çaylarının beslediği Dicle nehridir. Şırnak için en yüksek sıcaklık 40.3° C derece ile Ağustos ayı, en düşük sıcaklık -12.2° C ile Ocak ayıdır. Şırnak ilinde ortalama yıllık yağış miktarı 857.1 mm. dir. En az yağışlı ay Ağustos 1.4 mm., en çok yağış alan ay ise Mart 143.3 mm.'dir. Günlük en çok yağış miktarı Nisan (95.8 mm. dir.) Yağışlar ≥ 10 mm. dolayında olup, yağış alan gün sayısı, ortalama 31.2 gündür. Şırnak iline bağlı ilçeler bulunmaktadır. Şırnak (il merkezi) Güçlükonak, İdil, Cizre, Silopi Uludere ve Beytüşşebap'tır (Şekil 1).

Şekil 1. Şırnak İli haritası (Anonim 2023)

2.2.1 Tarım Alanlarının Yapısal Özellikleri

Şırnak ilinin 7.152 kilometrekare arazi varlığının 2.796.630 dekarı ormandır. Bu da Şırnak arazi varlığının %39'sına tekabül etmektedir. Ancak bu ormanın % 30' u normal nitelikte, geriye kalan kısmı yani % 70 i bozuk ve çok bozuk nitelikte ormanlardır. Baltalık ormanlarının tamamen tabii mescere, genelde ağaç türleri meşe palamut, mazı vb. olup görülen diğer ağaç

türleri ise badem, erguvan, yabani incir, karaçam, menengiç, mahlep, alıç, çitlenbik, akçaağaç, fıstık, nadir olarak da zeytin ağaçlarıdır. Bölgede hali hazırda armut, elma, kayısı, antep fıstığı, ceviz ağaçları gibi ağaçlar da yetiştirilmektedir. Mevcut arazilerin kullanım özelliklerinin belirlenmesi, arazi kullanım değişiminin ortaya konması ve değişimin devam edeceği düşünülerek tahmin hesaplarının yapılmasıyla hangi arazinin hangi kullanım için uygun olabileceği tarımsal üretim teknolojileri ve ekonomisi açısından önemli bir olgudur (Çelik ve Baran, 2018). Şırnak ili arazi varlığı ve kullanışlarına göre dağılımı Çizelge 1’de gösterilmiştir.

Tablo 1. Şırnak İli Arazi Varlığı ve Dağılımı (2022)

2.3 Metot

Hayvansal kaynaklı yayılı kirlilik yükleri hesabında, Şırnak ilinin hayvan sayısı dağılımları analiz edilmiş ve literatürde verilen bazı kabuller ile oluşabilecek yayılı kirletici yük miktarları hesaplanmıştır. Hayvansal kaynaklı yayılı kirlilik yüklerinin hesaplanmasında hayvan başına birim yükün ölçülebilirliği mümkün olmadığından bazı kabuller yapılması gerekmektedir. Bu bağlamda tahmini birim yükler literatürde öngörülen değerler doğrultusunda Tablo 3’de

verilmiştir (Üren ve Baran, 2023, Hacısalihoğlu 2022; Gürsoy Haksevenler ve Ayaz 2021, Derin ve ark. 2019, Yetiş ve ark. 2018, Biçer 2011, Tanık ve ark. 2010).

Tablo 3. Hayvansal kaynaklı yayılı kirlilik yük katsayıları

Kirletici Türü	Yayılı Yük Katsayıları	BBH	KBH	KH
TN	Q _{NYK} (kg/ton hayvan/gün)	0.3	0.42	0.52
	Y _N (%)	15	15	15
TP	Q _{PYK} (kg/ton hayvan/gün)	0.1	0.06	0.22
	Y _P (%)	5	5	5

BBH: Büyükbaş Hayvan, KBH: Küçükbaş Hayvan, KH: Kümes Hayvanı

Tablo 3 incelendiğinde, Q_{NYK}; günlük azot yüküne göre değişen yayılı kirletici yükünü, Y_N; yayılı azot kirliliğinin alıcı ortama ulaşma yüzdesini, Q_{PYK}; günlük fosfor yüküne göre değişen yayılı kirletici yükünü, Y_P; yayılı fosfor kirliliğinin alıcı ortama ulaşma yüzdesini ifade etmektedir. Hayvansal kaynaklı yayılı kirlilik yükü hesaplamasında, yıllık oluşacak toplam yayılı kirlilik yüklerinin hesaplanması gerekmektedir. Azot kaynaklı yıllık oluşacak yayılı kirlilik yükleri Eşitlik 1’de, fosfor kaynaklı yıllık oluşacak yayılı kirlilik yükleri Eşitlik 2’de belirtildiği şekilde hesaplanır.

$$Q_{TN} = Q_{NYK} * A_{CH} * Y_N * 365/1000 \quad (1)$$

$$Q_{TP} = Q_{PYK} * A_{CH} * Y_P * 365/1000 \quad (2)$$

Eşitlik 1’ de, Q_{TN} yıllık azot kaynaklı oluşacak yayılı kirletici yükünü (kg/hayvan sayısı/yıl), Eşitlik 2’de, Q_{TP} yıllık fosfor kaynaklı oluşacak yayılı kirletici yükünü (kg/hayvan sayısı/yıl), A_{CH} hayvan türüne göre canlı hayvan ağırlığını (kg) ifade etmektedir. Literatür değerlendirmelerine göre, A_{CH} değeri BBH için 500 kg, KBH için 45 kg ve KH için ise 2 kg olarak kabul edilmektedir. Tablo 1’de verilen yayılı kirlilik yük katsayıları, bu canlı ağırlıkları kullanılarak belirlenmiş kabullerdir. Y_N ve Y_P değerleri kirleticilerin alıcı ortama ulaşma yüzdesini ifade etmektedir. Azot ve fosforun taşınım prosesleri ile bir miktarının kaybolacağı öngörüsü ile bu değerlerin azot için % 15, fosfor için ise % 5’inin alıcı ortama ulaşabileceği varsayılarak hesaplamalar yapılmıştır (Hacısalihoğlu 2022). Eşitlik 1 ve 2 ile hesaplanacak yayılı kirlilik yüklerinin (ton/yıl) yük birimine dönüşümü Eşitlik 3 ve Eşitlik 4 de belirtildiği şekilde hesaplanır.

$$Q_{TN'} = Q_{TN} * N_{CH} / 1000 \quad (3)$$

$$Q_{TP'} = Q_{TP} * N_{CH} / 1000 \quad (4)$$

Eşitlik 3’de $Q_{TN'}$ yıllık oluşacak TN yayılı kirlilik yükünü (ton/yıl), Eşitlik 4’de $Q_{TP'}$ yıllık oluşacak TP kaynaklı yayılı kirlilik yükünü (ton/yıl), N_{CH} ise türe göre canlı hayvan sayılarını ifade etmektedir.

3. ARAŞTIRMA BULGULARI ve TARTIŞMA

Tablo 4. Şırnak ili ve ilçeleri 2022 yılı hayvan sayıları

ŞIRNAK İLİ	HAYVAN SAYILARI		
	BBH	KBH	KH
	75.508	1.427.812	138.041

Tablo 4’e baktığımızda Şırnak il ve ilçe genelinde toplam hayvan sayıları 75.508 adet büyükbaş hayvan, 1.427.812 adet küçükbaş hayvan, 138.041 adet de kanatlı hayvanı bulunduğu belirlenmiştir.

Tablo 4’te verilen Şırnak ili hayvan sayısı dağılımları ve yukarıda verilen eşitliklerden yararlanılarak, Şırnak ili hayvancılık faaliyetleri kaynaklı yayılı kirlilik yükleri hesaplanmış ve Tablo 5’te verilmiştir.

Tablo 5. Şırnak ili ve ilçelerinde hayvan türlerine göre oluşan TN ve TP yayılı kirletici yük miktarları

İl	Hayvan Türü	Q_{TN} (ton/yıl)	Toplam (ton/yıl)	Q_{TP} (ton/yıl)	Toplam (ton/yıl)
ŞIRNAK	BBH	620.109	2.105.434	68901	140.365
	KBH	1.477.464		70355	
	KH	7860		1108	

Şırnak genelinde azot kaynaklı oluşabilecek toplam yayılı kirlilik yükü 2.105.434 ton TN/yıl, toplam fosfor kaynaklı oluşabilecek yayılı kirlilik yükünün 140365 ton/yıl olduğu belirlenmiştir (Tablo 5) . Hayvancılık faaliyetleri sonucunda azot ve fosfor kaynaklı yayılı kirlilik jeolojik, meteorolojik ve coğrafik özelliklere bağlı olarak çeşitli dönüşüm reaksiyonları ile alıcı ortamlara ulaşmaktadır (Hacısalıhoğlu, 2022). Hayvansal kaynaklı yayılı kirlilik yüklerinin hesaplanmasında Tırınk (2021), Iğdır ilinde gerçekleştirdiği çalışmada büyükbaş hayvan, küçükbaş hayvan ve kümes hayvan sayılarının sırasıyla 159926, 1149668 ve 116916 adet olduğu belirlenmiştir. Bu hayvanların yıllık oluşturduğu yayılı kirletici yükleri toplam azot miktarının 2509,697 ton/yıl ve toplam fosfor miktarı ise 203,521 ton/ yıl olarak hesaplanmıştır.

Yetiş ve ark., (2018), Muş İli ve ilçelerinde büyükbaş, küçükbaş ve kümes hayvanı sayıları, hayvancılık faaliyetlerinden kaynaklanan yayılı yük katsayıları kullanılarak TN ve TP yüklerini hesaplamıştır. Bu hesaplama sonuçlarına göre TN ve TP yüklerinin sırasıyla % 29 ve % 32 ile en fazla olduğu ilçenin Bulanık ilçesi olduğu tespit edilmiştir. TN ve TP yüklerinin en az olduğu ilçeler ise sırasıyla % 7 ile Hasköy ve Korkut ilçeleridir. Muş genelinde TN yükü 543,412 ton/yıl ve TP 16,918 ton/yıl olarak hesaplanmıştır. Hacısalihoğlu, (2022) , Bursa ve ilçelerinde yayılı kirletici kaynakların baskısını değerlendirmek için hayvansal kaynaklı kirlilik yükü hesabında Bursa genelinde toplam azot kaynaklı oluşabilecek toplam yayılı kirlilik yükü 3241,944 ton TN/yıl, toplam fosfor kaynaklı oluşabilecek yayılı kirlilik yükünün 341,327 ton TP/yıl olduğu belirlenmiştir. Derin ve ark. (2019)'nın Mardin de yürüttükleri çalışmalarında hayvansal kaynaklı TN yükünün il genelinde 270626 ton/yıl, TP yükünün ise 7,89 ton/yıl olduğu hesaplanmıştır (Derin ve ark. 2019).

4. SONUÇ ve ÖNERİLER

Yayılı kirlilik kaynaklarından olan hayvansal atıklar kontrolsüz atık yönetimi sonucu, yüzey ve yer altı su kaynaklarını kirletebilmektedir. Hayvancılık özellikle Güneydoğu Anadolu Bölgesi'nde ön plana çıkmaktadır. Bu kapsamda hayvancılık faaliyetlerinden kaynaklanan kirletici yüklerinin hesaplanması çevre sağlığı açısından önem arz etmektedir. Bu çalışmada, hayvancılık faaliyetleri kaynaklı yayılı kirlilik yükünün Şırnak ilinde oluşumu araştırılmış hayvan sayılarına bağlı olarak oluşabilecek toplam azot ve toplam fosfor yayılı kirlilik yük miktarları hesaplanmıştır. Kirlilik yükü hesabında Şırnak ili mevcut 2022 yılı, büyükbaş, küçükbaş ve kanatlı hayvanı sayıları kullanılmıştır. Sonuç olarak, Şırnak genelinde toplam azot kaynaklı oluşabilecek toplam yayılı kirlilik yükü 2.105.434 ton TN/yıl, toplam fosfor kaynaklı oluşabilecek yayılı kirlilik yükünün 140365 ton TP/yıl olduğu tespit edilmiştir. Şırnak ilinde hayvancılık i sektöründe oluşan ve çevre sorunlarına neden olan hayvansal atıklar aslında önemli bir hammadde potansiyelidir. Bu atıkların gübre, biyogaz ve yem üretimi gibi alanlarda kullanılması mümkündür. Bu nedenle hayvancılık sektöründe etkin atık yönetim planlaması yapılması, oluşan atıkların çevresel sorun yaratmadan, ekonomik bir kaynak olarak görülmesi ve değerlendirilmesi önerilmektedir.

ABSTRACT

3D printing technology transcends conventional boundaries and opens new perspectives in the field of antenna technology. This study looks at harnessing the potential of 3D printing for the design and manufacture of complicated antennas, coupled with increased efficiency in terms of cost and time. The methodology involves the fabrication of complicated antenna structures using 3D printing, followed by the strategic application of conductive tape to enhance their capabilities. In addition, the antenna's functionality is enhanced by integrating a dedicated port for connecting an analyzer. To illustrate this approach, a detailed pawn antenna was developed. The antenna has undergone a sophisticated finishing process involving successive layers of copper tape, culminating in seamless integration with an SMA port. Critical to the study is the evaluation of antenna performance, which is determined by careful measurement of the S11 parameter. The Nano VNA measurement device served as an indispensable tool for this purpose. The results of this study serve as a key illustration that highlights the intricacies of a streamlined antenna design and production process. By merging 3D printing technology with antenna engineering, this study not only highlights the feasibility of complicated antenna configurations but also shows a way to optimize resource allocation. The meaningful fusion of advanced manufacturing techniques and antenna design principles holds great potential for the future of wireless communication systems. By bridging the gap between advanced manufacturing techniques and antenna engineering principles, this research illustrates the promising path of wireless communication systems. Its findings highlight the transformative potential of combining 3D printing and antenna technology, setting the stage for advances in both research and practical applications. Ultimately, this research contributes to the ongoing development of antenna design paradigms and additive manufacturing methods.

Keywords: 3D antenna printing, VNA S11 measurement, additive manufacturing.

INTRODUCTION

With the use of 3D printing technology, it is possible to produce antennas with complex structures and geometries that take time with traditional methods.(Gu, 2020) Employing traditional manufacturing methods translates to higher costs and prolonged timelines when transforming a prototype into a finished product.(Attaran, 2017) Thus, using 3D printing technology shortens the production time, reduces complexity, and offers designers faster turnaround times for prototype development and mass production. In addition, 3D printing allows multiple components to be seamlessly integrated into a single antenna structure while reducing size, weight, and cost.

There are two types of approaches in 3D printing, polymer/dielectric and all-metal.(Muhammad, 2023) In this study, the focus is on rapid prototyping and testing of designs that would take too much time when using traditional methods using additive manufacturing technology and coating processes. Among the two approaches mentioned above, the polymer/dielectric approach was chosen. The main factor in choosing this approach is the equipment capacity. The study consists of 3 procedures. These procedures are design, production, and testing. The procedures in the design phase include designing the pawn in the computer environment and testing it by running it in simulation programs. In the production phase, the designed antenna is printed on a 3D printer and coated with copper tape. The last stage, the "Test" stage, consists of the connection controls of the antenna, the measurement of the antenna with the VNA (Vector Network Analyser) device, and the comparison of the results with the results in the simulation.

MATERIALS and METHODS

3D printer and PLA (Polylactic Acid) were used for 3D printing. Polylactic Acid is a polymeric bioplastic and is a material often used for 3D printing. PLA is produced from plant materials obtained from renewable resources.(Rezvani, 2021) Afterward, the copper tape was used to cover the print removed from the 3D printer. Then the SMA port was soldered and made ready for Nano VNA measurement.

SolidWorks 2021 program was used for the design of the print, which will be removed from the 3D printer and then covered with copper tape. It was decided to have a pawn shape for the designed print. The main factor in choosing the design as a pawn is that its outer surface is smoother than other chess pieces. Thus, it is thought that the working structure of the antenna will be more effective and give results close to expectations. The design on the GrabCAD website was used as a reference for the pawn shape.(<https://grabcad.com/library/white-pawn->

3) The technical drawing and visualization of the design are shown in Figure 1.

Figure 1. Technical drawing and 3D version of the design

The dimensions of the technical drawing in Figure 1 are the dimensions of the reference design. The dimensions of the tested shape were half of the reference design. Therefore, the dimensions of the design are 15mm x 15mm x 30mm.

CST Studio Suite 2019 program was used in the simulation process of the antenna. The design file was transferred into the CST Studio program and the copper plating process was carried out through the program. The final image of the design in the simulation environment is shown in Figure 2.

Figure 2. Antenna designed in simulation environment

The specifications of the SMA port integrated into the print run in Figure 2 are as shown in Table 1.

Table 1. Specifications of the SMA connector

Feature	Value
Impedance	50 Ω
Maximum Operating Frequency	12.4 GHz
Contact Socket	Gold
Body	Gold
Height	13.5mm
Width	6.08mm

The SMA connector was designed according to the parameters in Table 1. After the final design was completed, the simulation process was started and is shown in Figure 6 (a).

Figure 3. Printed design and covered with copper tape

As seen in Figure 3, it is seen that the design was created quickly and as expected. The surface of the plastic printout from the printer was coated with copper tape. After the research, the port addition process was placed on the top of the pawn as shown in Figure 5 (a) to make it more similar to the horn antenna structure (Balanis, 2016) and to increase its efficiency. Thus, the final stage of the antenna design was started.

(a)

(b)

Figure 4. (a) SMA port soldered antenna (b) Nano VNA connection form

As can be seen in Figure 4 (b), the antenna was directly connected to the Nano VNA device for the measurement of the antenna and the measurement processes were performed.

Figure 5. Frequency dependent S11 Graph of simulated result (a), frequency dependent S11 Graph of measured frequency with NanoVNA (b)

In Figure 5 (a), measurements were made between 0 GHz to 20 GHz for the S11 parameter of the simulation.

FINDINGS and DISCUSSION

According to the measurement results of the 3D printed pawn antenna connected as shown in Figure 4 (a), it is concluded that the antenna can operate at 656 MHz frequency. Other parameter results of the antenna are shown in Figure 6. The fact that the voltage standing wave ratio is close to 1 at 656 MHz (1.312), the quality factor is close to 0 (0.273) and the impedance value is close to 50 ohms in terms of compliance ($49.7-j13.6\Omega$) indicates that the antenna is working properly.

Marker 1		Marker 2	
Frequency: 656.591 MHz	VSWR: 1.312	Frequency: 4.00000 GHz	VSWR: 2.078
Impedance: $49.7-j13.6\Omega$	Return loss: -17.392 dB	Impedance: $28.3-j18\Omega$	Return loss: -9.112 dB
Series L: -3.2936 nH	Quality factor: 0.273	Series L: -716.08 pH	Quality factor: 0.635
Series C: 17.839 pF	S11 Phase: -83.37°	Series C: 2.2109 pF	S11 Phase: -127.33°
Parallel R: 53.446 Ω	S21 Gain: -97.561 dB	Parallel R: 39.772 Ω	S21 Gain: -49.430 dB
Parallel X: 1.2391 pF	S21 Phase: 43.67°	Parallel X: 635.21 fF	S21 Phase: -145.50°

Figure 6. S11 Parameter Results

Since the limit value of the Nano VNA V2 Plus4 Vector Network Analyser is 4 GHz, higher frequencies could not be measured. The measurement tests were first tested by coating the 3D printing with aluminum tape. When it was understood that the results obtained did not meet the antenna measurement parameters, it was decided to cover it with copper tape.

CONCLUSION and RECOMMENDATIONS

In this study, 3D-printed 3D objects were coated with conductive tape, and the SMA port was integrated and tested to be measured in a VNA device. In this way, complex antenna systems

were tried to be obtained by saving cost and time. As a result, an antenna that can work in 656 MHz frequency bands is proposed as an example of 3D antenna design and realization.

ÖZET

Piezoelektrik fanlar çeşitli endüstriyel alanlarda kullanım imkânı sağlaması ve bu alandaki yenilikçi termal yönetim sistemlerinin dünya çapındaki enerji tüketimini azaltması bakımından büyük bir potansiyele sahiptir. Alternatif hava hareketi teknolojisine olan talep, son on yılda piezoelektrik fanlarla ilgili yayınlanmış literatürde bir artışa yol açmıştır. Ayrıca, hesaplamalı ve sayısal modellemedeki önemli gelişmeler bu konuda daha önce mümkün olandan çok daha ayrıntılı ve geniş kapsamlı çalışmaların ortaya konmasına imkân sağlamıştır. Piezoelektrik fanların (PF) soğutma performansının artırılması amacıyla yapılan deneysel çalışmalarda etkin parametrelerin detaylı incelenmesi önemli bir konu başlığıdır. Tasarım yönünden radyal fanlardan farklı bir yapıya sahip olan PF'larda hava akış karakteristiği de farklı bir şekilde oluşmaktadır. Bu çalışmada Piezoelektrik fanlar sabit yüzey sıcaklığında tutulan bir alüminyum levha üzerinde dikey pozisyonda konumlandırılmıştır. Yüzeydeki sıcaklık dağılımları piezoelektrik fan kanat normalinin izdüşümü (X eksen) ve kanat izdüşümü (Y eksen) yönünde olmak üzere iki eksenle ayrı ayrı incelenmiştir. Çoğu elektrikli cihaz için kabul edilebilir çalışma sıcaklığı 40 °C veya biraz daha fazladır. Buna bağlı olarak test elemanı olarak yüzeyi iki farklı sabit sıcaklıkta tutulan (40 ve 45 °C) alüminyum dikdörtgen plaka PE fan ile soğutulmuş X ve Y eksenleri üzerindeki sıcaklık dağılımlarındaki farklılıklar ortaya konmuştur. Elde edilen bu sıcaklık dağılımı bilgisi kullanılarak piezoelektrik fan ile soğutulan bir yüzeydeki ısı geçişinin dağılımı yorumlanmıştır.

Anahtar Kelimeler: Piezoelektrik Fan, Isı transfer parametreleri, Yüzey sıcaklık dağılımı

PIEZOELECTRIC FAN COOLING PARAMETERS INVESTIGATION

ABSTRACT

Piezoelectric fans have great potential for use in various industrial areas and innovative thermal management systems in this area to reduce energy consumption worldwide. The demand for alternative air motion technology has led to an increase in the published literature on piezoelectric fans over the last decade. In addition, important developments in computational and numerical modeling have enabled much more detailed and comprehensive studies on this subject than was possible before. Detailed examination of effective parameters is an important topic in experimental studies to increase the cooling performance of piezoelectric fans (PF). The air flow characteristics of PFs, which have a different structure from radial fans in terms of design, also occur in a different way. In this study, piezo electric fans are positioned vertically on an aluminum plate kept at constant surface temperature. The temperature distributions on the surface were investigated separately in two axes, namely the projection of the piezoelectric fan blade normal (X-axis) and the blade projection (Y-axis). The acceptable operating temperature for most electrical appliances is 40 °C or slightly higher. Accordingly, as the test element, the aluminum rectangular plate whose surface is kept at two different constant temperatures (40 and 45 °C) was cooled by a PE fan, and the differences in temperature distributions on the X and Y axes were revealed. Using this temperature distribution information obtained, the distribution of heat transfers on a surface cooled by a piezoelectric fan has been interpreted.

Keywords: Piezoelectric Fan, Heat Transfer Parameters, Surface temperature distribution

GİRİŞ

Elektronik aygıtlarda elektrikli mahfaza soğutma üniteleri için optimum sıcaklık ayar noktası yaklaşık 35 °C'dir. Çoğu elektrikli cihaz için kabul edilebilir çalışma sıcaklığı 40 °C veya biraz daha fazladır. Bu sıcaklık çok fazla aşıldığında maliyet, bakım yükü artar ve operasyonel tehditler oluşabilir. Elektronik sistemlerin soğutma gereksinimleri karşılanırken, göz önüne alınması gereken önemli bir husus, soğutma sisteminde harcanan güç tüketimidir. Örnek vermek gerekirse bir veri işleme merkezindeki enerji tüketiminin 1/3 kadar kısmı soğutma işlemleri için harcanmaktadır (1-Garmella 2013). Bu sebeple düşük güç tüketimine sahip alternatif yeni soğutma teknolojilerinin araştırılması ve geliştirilmesi gerekmektedir. Elektronik aygıtların soğutulması enerji tüketimi bakımından ideal bir termal strateji uygulanmasını gerekli kılarken, bu bileşenlerin soğutma işleminde büyük oranda hava akışından faydalanılmaktadır (1-2). Hava akışı içeren yenilikçi uygulamalarda soğutma etkisinin yanı sıra enerji tüketimi hakkında bir bilgiye soğutma performans katsayısı (COP) ile ulaşılabilmektedir. Bu yenilikçi uygulamalardan sentetik jetlerde doğal taşınım etkisi altındaki ısı transferi katsayısının çok üzerine çıkılabilmektedir. Öyle ki COP değeri 400'ün üzerine çıkabilmekte fakat, bu yüksek performans altında atılan ısı yetersiz kalabilmektedir. ref. Radyal fan soğutmasından farklı olarak karşımıza çıkan diğer bir uygulamada Piezoelektrik fan kullanımı literatürde yer almaktadır. Piezoelektrik fanlarla ilgili araştırmalarının sayısının ve öneminin artmasındaki başlıca faktörler, düşük güç tüketimi değerleri, etkili soğutma performans katsayısına sahip olmaları, yüksek güvenilirlik ve uzun kullanım ömrü, basit yapısı gereği düşük üretim maliyetine sahip olması ve düşük gürültü özelliklerine sahip olmasıdır. Bu özellikler göz önüne alındığında piezoelektrik fanlar güç elektroniği alanındaki soğutma ihtiyacını karşılamada ağırlıklı olarak tercih edilen ısı alıcı ve radyal fan çifti için uyumlu bir alternatif seçenektir. Piezoelektrik fanların yapısına ait bir şematik resim Şekil 1'de gösterilmiştir. Bu yapıda destek plakasına tutturulmuş bir piezoelektrik bant bulunmaktadır. Bant yüzeyine alternatif bir voltaj uygulandığında, piezoelektrik malzeme yapısı gereği genişleme ve daralma eğilimindedir. Bu etkiden dolayı, piezoelektrik bant her iki ucundan etkili bir şekilde bükülme momenti uygular. Bu momentler fan kantçığının esnek bir şekilde salınmasına neden olur. Giriş voltajı fanın rezonans frekansında banda uygulandığında salınım genliği en üst düzeye çıkmakta ve soğutma amaçlı kullanılabilir hava akışı meydana gelmektedir.

Şekil 1. Piezoelektrik fan yapısının şematik görünümü

Literatürde sistem soğutmasında piezoelektrik prensibinden faydalanılarak tasarlanan fanların kullanıldığı çok sayıda çalışmaya rastlanmaktadır. Toda ve Osaka (1979 & 1981), bir televizyon alıcısının güç transistör panelinin her iki tarafına bir piezoelektrik fan yerleştirmenin, panel yüzeyinde ve iç boşlukta sırasıyla 17°C ve 5°C'lik sıcaklık düşüşleriyle sonuçlandığını bulmuşlardır. Açıkalin ve Garimella (2009), ısıtılmış bir yüzeye yakın titreşen piezoelektrikle çalıştırılan bir konsolun çalışmasını analiz etmek için sayısal bir model geliştirilmiştir. Piezofanın uzunluğunun ve frekansının ısı transfer özelliklerini değiştirebileceğini bulmuşlardır. Yoo ve arkadaşları (2000), çeşitli piezofanlar üretmiş ve elektronik soğutma aparatına uygulama için indüklenen akışı karakterize etmiştir. En etkili fanın, bir 220 V, 60Hz güç kaynağı tarafından tahrik edilen 35.5 mm'lik bir uç yer değiştirmesi ve 3.1 m/s'lik bir rüzgar hızı gösterdiği bimorf konfigürasyonda PZT ile fosfor bronz şimden yapılan fan olduğu bulunmuştur. Kwon ve arkadaşları (2005), piezoelektrik titreşim aktüatörünün titreşim karakteristiğini incelemiştir. Titreşim cihazının geometrik boyutu, enerji dönüşüm verimliliğinin maksimum olabileceği titreşim cihazının uzunluk, genişlik, kalınlık ve kukla ağırlığının değişimine göre rezonans frekansı bağımlılığına karar vermiştir. Daha yüksek rezonans modlarında çalışan piezofanın performansı Wait ve arkadaşları (2007), yüksek rezonans modlarında piezofan çalışmasının belirli avantajlarının artan güç tüketimi ve azalan sıvı akışı ile dengelendiğini göstermiştir. Abdullah ve arkadaşları (2008, 2009) piezofan yüksekliğinin piezofanın performansı üzerindeki etkisini hem sayısal hem de deneysel olarak araştırmışlardır. Piezofanın ısı kaynağından yüksekliğinin ısı transfer katsayısını önemli ölçüde etkilediğini bulmuşlardır. Piezofan salınımının kararsız bir fenomen olduğu ve ısı kaynağı yüzeyindeki akış davranışını etkilediği gözlemlenmiştir. Liu ve arkadaşları (2009), piezoelektrik fanların yatay ve dikey düzenlemelerinin etkisini incelemiş ve piezofanın ısı transferindeki artışı, her salınım döngüsü sırasında sürüklenen hava akışından ve fan ucundaki jet benzeri hava akışından kaynaklandığını bulmuştur. Dikey düzenleme için ısı transfer

performansı simetrik bir dağılım gösterdi ve merkez bölgede zirve yaptı, yatay düzenleme ise asimetrik bir dağılıma sahipti ve $x/L = 0.25$ 'te erken bir zirve göstermiştir. Ayrıca yatay düzenleme için ısı transfer performansının dikey olandan daha düşük olmadığı da bulunmuştur.

MATERYAL ve METOD

Bu çalışmada film ısıtıcı ile ısıtılan bir alüminyum levha üzerindeki piezo elektrik fanın soğutma etkisi iki farklı sabit yüzey sıcaklığı altında incelenmiştir. Fan kanadının levha üzerindeki izdüşümü ve kanat normalinin izdüşümü olmak üzere iki eksenle meydana gelen sıcaklık dağılımları incelenmiştir.

Deney Sistemi

Deneyel çalışmada ısıtma amacıyla olarak karbon film ısıtıcı kullanılmıştır. Film ısıtıcı üzerine yerleştirilen (80x200) cm boyutlarında alüminyum levha çalışmadaki sıcak yüzeyi oluşturmaktadır. Piezo elektrik fan deney şasisi üzerindeki tutamlara sabitlenmiş yüksekliği ayarlanabilir bir destek parçasını sabitlenmiştir. Bu şekilde sıcak yüzeyden 1 cm yükseklikte dikey konumlandırılan fanın farklı eksenlerdeki soğutma etkileri incelenmiştir.

Şekil 2. Deney Düzenegi Görünümü

Yapılan çalışmada karbon film ısıtıcı ile ısıtılan levhada istenilen sabit sıcaklık koşullarını elde etmek için sıcaklık probundan faydalanılmıştır. Sıcaklık probu piezo elektrik fanın çalışma

esnasında oluşturduğu hava akışı ve soğutma yükünden etkilenmemesi için yeterince uzak bir noktada konumlandırılmıştır. Yüzey sıcaklığı(Tset) için 40 ve 45 olmak üzere iki farklı sıcaklık değeri elde edilirken sıcaklık kontrolöründen faydalanılmıştır. On/Off çalışma prensibi ile çalıştırılan sistemde yüzey sıcaklığının ± 0.1 C hassasiyetle kontrol edildiği gözlenmiştir. Oluşturulan deney düzeneğinin görseli, deney düzeneğinde kullanılan ekipmanlar ve deney düzeneğinin şeması sırasıyla Şekil 2,3,4'te verilmiştir.

Şekil 3. Piezoelektrik Fan , Karbon Fiber Isıtıcı ve Sıcaklık Kontrolörü

Kullanılan piezoelektrik fan şebeke voltajı olan 220 V alternatif akımla (AC) çalıştırılmıştır. Piezo elektrik fanla ilgili detaylı teknik özellikler Tablo 1'de verilmiştir.

Tablo 1. Piezo elektrik fanın teknik özellikleri

Özellikler	Değeri
Marka/Üretici	EKULİT
Model	UPF-76Q-220
Genlik	20 ± 3 mm(220 V/50Hz)'de
Statik elektrik kapasitesi	9 nF $\pm 20\%$
Çalışma frekansı	50 ± 2 Hz
Çalışma voltaj	220 ± 10 V
Maks. Çalışma voltajı	250 V (AC)
Sıcaklık aralığı	-20/+80 C
Net kanat uzunluğu	21.7 ± 0.5 mm
Toplam uzunluk	76.5 ± 0.5 mm
Genişlik	12.7 ± 0.5 mm
Kanatçık kalınlığı	0.18 ± 0.05 mm
Toplam kalınlık	2.6 ± 0.2 mm

Şekil 4. Tasarlanan Piezoelektrik Fan ile Soğutma deney düzeneği şematik resmi

Sıcaklık Ölçümlerinin Alınması

Meydana gelen soğutma etkisi incelemek adına yüzey sıcaklık dağılımından faydalanılmıştır. Yüzeydeki sıcaklık ölçümleri için öncelikli olarak düşük emissivite katsayısına sahip alüminyum levha mat siyah boyaya boyanmıştır. Deney ölçümlerini almadan önce sıcaklık probu ile aynı değeri veren emissivite değeri belirlenerek kızılötesi sıcaklık ölçer için kalibrasyon işlemi gerçekleştirilmiştir. Uygun emissivite değeri 0.96 olarak bulunan kızılötesi sıcaklık ölçerde bu değer kullanılarak sıcaklık ölçümleri 0.1 C hassasiyet ile gerçekleştirilmiştir.

Şekil 5. Deney düzeneğindeki Sıcaklık Ölçüm Noktaları

Karbon Fiber Isıtıcı ile yüzeyin ısıtılıp kararlı sıcaklık elde edildikten sonra piezoelektrik fanlarla soğutma işlemi başlatılmış tekrar kararlı koşullar elde edildikten sonra sıcaklık değerleri alınmıştır. Sıcaklık ölçümleri yapılan noktalar koordinat eksenlerinin levha üzerindeki izdüşüm eksenlerinde ve 1.25 cm aralıklarla yapılmıştır. X¹ ve Y¹ eksenleri üzerinde 6 farklı noktada ölçüm alınmıştır(bkz. Şekil 5).

SONUÇLAR

Bu çalışma kapsamında piezoelektrik fanlar ile yüzeyin soğutulması için kurulan deney düzeneğinde alüminyum yüzey karbon fiber ısıtıcı ile yüzey ısıtıldıktan sonra sıcaklık ölçüm işlemine geçilmiştir. Yüzey sıcaklığı sıcaklık kontrolöründen faydalanılarak sabit sıcaklıkta tutulurken ölçümler kızılötesi sıcaklık sensörü kullanılarak not edilmiştir. Elektronik bileşen soğutmasında karşılaşılan sıcaklık aralığındaki 40 °C ve 45 °C olmak üzere iki farklı sabit yüzey sıcaklık değerinde fan kanatçığı doğrultusu ile bu eksene dik yönlerdeki sıcaklık değişimleri incelenmiştir. Seçilen ölçüm noktaları P(x,y) konumlarına karşılık gelmek üzere x ekseninde P(0,0), P(1.25,0), P(2.5,0), P(3.75,0),P(5,0) ve P(6,25,0) iken Y ekseninde P(0,0), P(0,1.25), P(0,2.5), P(0,3.75),P(0,5) ve P(0,6,25) olarak seçilmiştir. Bu noktadaki sıcaklık ölçüm değerleri sonuçları 45 °C ve 40 °C yüzey sıcaklıkları sırasıyla Şekil 6 ve Şekil.7 de verilmiştir.

Şekil 6. 45 °C yüzey sıcaklığında farklı eksenlerdeki ölçüm noktalarında okunan sıcaklık değerleri

Şekil 7. 40 °C yüzey sıcaklığında farklı eksenlerdeki ölçüm noktalarında okunan sıcaklık değerleri

Farklı eksenlerdeki yüzey sıcaklık değerleri incelendiğinde piezoelektrik fanın üzerine konumlandırıldığı merkez veya orjin (P(0,0)) noktasında sıcaklık değerinin minimum değer aldığı görülmektedir. Her iki eksen de merkez noktasından uzaklaştıkça yüzey sıcaklığında bir artış meydana gelmektedir. Bu durum piezo elektrik fanın soğutma etkisinin artan mesafe ile azaldığının bir göstergesidir. Piezo elektrik fan çalışma esnasında fan kanatçığına en yakın yüzey bölgesinde oluşan hava hareketleri bu bölgedeki taşınım katsayısını olumlu yönde etkilerken etkin bir soğutma işlemi gerçekleşmektedir. Fakat piezo elektrik fan kanatçığının yüzeydeki hava akışındaki etkisi uzaklığa bağlı olarak azaldığı için beraberinde soğutma etkisi de bu yönde azalmaktadır. Sıcaklık değerlerinin farklı eksenler için karşılaştırması yapıldığında ise çarpıcı bir sonuçla karşılaşılmıştır. Kanatçığın salınım doğrultusuna tekabül eden yöndeki (X) sıcaklık değerleri y eksenindeki sıcaklık değerlerinden daha düşük seviyede kalmıştır. Aynı mesafeden ölçüm alınan X noktası ile Y noktası ölçüm sonuçları arasındaki farkın mesafeye bağlı olarak arttığı gözlenmiştir. Çalışılan her iki yüzey sıcaklığı için de bu durum gözlenmiş ve Piezo elektrik fan soğutmasında ortaya çıkan ortak bir davranış olarak değerlendirilmiştir. Sonuç olarak piezo elektrik fanın yüzeydeki soğutma etkisinin radyal yönde homojen bir yapıda olmadığı ve kanat salınımı doğrultusunda arttığı gözlenmiştir. Bu durum Piezo elektrik fanın ve kanatçığının fiziksel yapısı ve oluşan salınımın karakteristiği ile açıklamak mümkündür. Bu durumu daha detaylandırmak ve açıklığa kavuşturmak adına model tabanlı sayısal analizler yapılabilir. Aynı zamanda Piezoelektrik fanın yüzeyden farklı yüksekliklerde iken bu eksenlerdeki sıcaklık dağılımındaki karşılaştırmaları incelenmesi gereken diğer konular arasındadır.

ABSTRACT

In the traffic environment, incidents of road rage containing anger and aggression commonly occur, primarily among drivers and between drivers and other vulnerable road users (such as pedestrians, cyclists, etc.). It is argued that with technological advancements, autonomous vehicles (AVs) will lead to significant societal changes and bring about a transition. In the literature, autonomous vehicles, also known as driverless vehicles, are defined as a type of automobile that can perceive its surroundings on its own and move with very little or no human input, despite having different technical aspects. Recently, Transportation Engineers and Traffic Psychologists have been discussing whether autonomous vehicles will have a positive impact on road users' aggressive behaviour. This study aims to examine whether autonomous vehicles will have an impact on reducing road rage behaviours by evaluating research findings from the literature on this topic. Autonomous vehicles hold the promise of creating a safer traffic landscape in the years to come. Some findings suggest that these self-driving cars could potentially influence the occurrence of road rage incidents. However, the impact of autonomous vehicles on road rage remains uncertain. Anticipating how human drivers might respond to situations involving self-driving cars, such as accidents or abrupt lane changes, presents a challenge. Although not fully realized today, it can be anticipated that autonomous vehicles, which have started to be used by some advanced countries, will also find a significant place in Türkiye's future. With the increasing population growth, traffic safety has become a significant issue today, and after the integration of autonomous vehicles into our lives, this problem will likely become even more complex, especially in the initial stages. To facilitate the adoption of this change by individuals, it is important to conduct necessary research beforehand and determine the steps required to ease the adaptation to this transformation.

Keywords: road rage; autonomous vehicles; traffic psychology

INTRODUCTION

It is argued that with technological advancements, autonomous vehicles (AVs) will lead to significant societal changes and bring about a transition. In the literature, autonomous vehicles, also known as driverless vehicles, are defined as a type of automobile that can perceive its surroundings on its own and move with very little or no human input, despite having different technical aspects. This study aims to examine whether autonomous vehicles (AVs) will have an impact on reducing road rage behaviours by evaluating research findings from the literature on this topic.

1. Road Rage Behaviours

The frequency of traffic accidents on roadways is impacted to differing extents by elements related to automobiles, road design, traffic conditions, the environment, and human activity (Briz-Redón, Martínez-Ruiz and Montes, 2019; Papadimitriou et al., 2019). One of the main ways that road accidents can be predicted is aggressive driving (Zhang and Chan, 2016; Herrero-Fernández and Fonseca-Baeza, 2017). The concept of "road rage" is believed to have originated from the United States (Joint, 1997). In the literature, various definitions of this concept have been proposed within different scopes. Whitlock (1971) defined road rage as the situation in which drivers use their vehicles aggressively with the intention of expressing their hostility in a way that could lead to violence in the traffic environment. Another definition describes it as an emotional, cognitive, and behavioral system where individuals deliberately put others at risk or threaten them when perceiving any threat or provocation while driving (Carpenter, 2020). Hennessy and Wiesenthal (2002) defined this concept as "any behavior in the traffic environment that aims to cause physical, psychological, or emotional harm to another, including drivers, pedestrians, and passengers." Road rage behaviors are a human factor that contributes to reduced traffic safety, impacting not only drivers but also cyclists, pedestrians, passengers, and anyone who regularly navigates through traffic (Aktaş and Akgür, 2023). Prior research has established a notable association between road rage and the likelihood of accidents (Wells-Parker et al., 2002; Mann et al., 2007). Furthermore, driving anger has been connected to several crash-related situations, such as near misses, confusion, tailgating, and loss of vehicle control (Underwood et al., 1999; Deffenbacher et al., 2002, 2003; Sullman et al., 2007). According to the existing literature, a multitude of studies focusing on aggressive driving have aimed to investigate its interaction with individual, sociocultural, and situational factors (Berdoulat, Deninotti and Vavassori, 2021). Furthermore, a substantial body of research

demonstrates a connection between personality characteristics and aggressive driving behavior (Sümer, Lajunen and Özkan, 2005; Jovanović et al., 2011).

2. Autonomous Vehicles (AVs)

It is known that recent developments in certain technology fields, especially information and communication, software, and hardware, have contributed to the gradual advancement of AVs used in the automotive sector (Litman, 2023). AVs, also known as driverless, self-driving or robotic, are defined as a type of automobile that can perceive its surroundings on its own and move with very little or no human input, despite having different technical aspects. These vehicles use many measurement units such as radar, Lidar, sonar, GPS. They also contain various sensors that enable them to perceive their environment (Gürtaş, 2020). Navigating through mixed traffic requires numerous engagements with a variety of pedestrians, animals, cyclists, and vehicles, making it more intricate compared to piloting an airplane (Litman, 2023).

Table 1. AVs Potential Benefits and Costs (Litman, 2023)

	Benefits	Costs / Problems
Internal (user impacts)	<ul style="list-style-type: none"> -Alleviated stress for drivers and enhanced productivity. Individuals behind the wheel can take a break, play games, and even work during their travels. -Enhanced mobility options for individuals who don't drive. Providing greater independent mobility for non-drivers can alleviate the need for extensive chauffeuring by motorists and reduce the demand for transit subsidies. -Reduced paid driver costs. Results in lowered expenditures for taxi services and drivers in commercial transportation sectors. 	<ul style="list-style-type: none"> -Elevated expenses associated with vehicles. Necessitates added investments in vehicle accessories, services, and charges. -Additional user risks. More accidents result from system malfunctions, platooning, elevated traffic speeds, increased risk-taking propensity, and overall vehicle travel-related hazards. -Diminished levels of security and privacy. Susceptibility to information misuse (hacking) is a concern, and functionalities like location tracking and data sharing could compromise personal privacy.
External (impacts on others)	<ul style="list-style-type: none"> -Enhanced safety. Potential to lower the likelihood of accidents and decrease insurance expenses. This might lead to a decrease in precarious driving behaviors. -Expanded road through put and financial savings. Improved traffic efficiency could result in reduced congestion and decreased expenses related to road infrastructure. -Diminished parking expenses. Decreases the need for parking spaces at various destinations. -Lowered energy usage and environmental pollution. Could enhance fuel efficiency and decrease the discharge of pollutants. -Promotes vehicle sharing. Might enable the expansion of carpooling and ride-hailing services, leading to a decrease in overall vehicle ownership, travel, and related expenditures. 	<ul style="list-style-type: none"> -Elevated infrastructure expenses. This could necessitate elevated standards for the design and upkeep of roadways. -Added potential hazards. Could elevate risks for other individuals on the road and might be exploited for illicit purposes. -Increased problems. Heightened vehicle usage might lead to more congestion, pollution, and expenses linked to urban sprawl. -Concerns about social fairness. Might limit accessible and budget-friendly mobility choices, such as walking, cycling, and public transportation services. -Diminished employment opportunities. Positions for drivers could decrease. -Decreased backing for alternative solutions. Overly positive forecasts about self-driving technology might deter the pursuit of other transportation enhancements and strategies for traffic management.

Numerous forecasts presume that the majority of AVs will be electric, offering lower fuel expenses but necessitating expensive batteries, and currently, they are exempt from fuel taxes. Factoring in expenses for battery replacement and implementing effective road user fees elevates the operational costs of electric vehicles to levels comparable to those of fossil fuel vehicles (Litman, 2023). Optimistic predictions frequently disregard substantial challenges and expenses. Numerous technical issues need to be resolved prior to achieving reliable operation of AVs under all typical conditions (Norton, 2021; Chafkin, 2022). In summary, AVs can provide various benefits and costs, including internal and external impacts. The benefits and costs are explained in Table 1 (Litman, 2023).

Those with an optimistic perspective argue that since approximately 90% of accidents are caused by human errors, self-driving vehicles will lead to a 90% reduction in crash rates (Kok et al., 2017). However, this viewpoint is believed to overlook the risks that the technology could bring (Kockelman et al., 2016; Hsu, 2017). When individuals perceive increased safety, they often engage in more risk-taking behaviours, a phenomenon known as offsetting behaviour or risk compensation. For instance, passengers in AVs might be less inclined to use seatbelts, and other road participants could exhibit reduced caution due to excessive reliance on technology, often referred to as "over-trusting" the technology (Ackerman, 2017). However, following an examination of risk factors in traffic accidents, Mueller, Cicchino, and Zuby (2020) arrived at the conclusion that self-driving vehicles have the potential to avert around 34% of accidents.

Some optimistic views suggest that autonomous vehicles will become widespread by 2030, creating safer traffic environments. However, most proponents of this view are individuals with financial interests in the industry, drawing from experiences with disruptive technologies like smartphones, digital cameras, and personal computers. It can be argued that they tend to overlook significant barriers to autonomous vehicle development and exaggerate future benefits. The introduction of autonomous driving can lead to novel challenges. While camera, phone, or computer malfunctions can be bothersome, they rarely result in fatalities. On the other hand, failures in motor vehicle systems can cause both frustration and fatal consequences for passengers and other road users. Consequently, the development of AVs will likely require more time and may yield fewer overall benefits than what optimists anticipate (Litman, 2023). Attaining peak performance in human-machine systems, like highly automated vehicles, depends to some extent on how individuals accept and utilize the system. This, in turn,

is influenced by their level of satisfaction and enjoyment when interacting with or using the system (Hajiseyedjavadi et al., 2022).

CONCLUSION and RECOMMENDATIONS

Autonomous vehicles (AVs) hold the potential to greatly enhance road safety through the reduction of human errors, easing traffic congestion, decreasing the demand for parking spaces, enabling the emergence of novel mobility services, and offering more eco-friendly transportation solutions (Fagnant and Kockelman, 2015). Moreover, the rollout of AVs on the road is expected to occur incrementally.

The initial integration of AVs into road transportation systems raises inquiries regarding how they will interact with human drivers, particularly in the early stages of their deployment (Paschalidis and Chen, 2022). Volvo (Connor, 2016) announced their intention to keep their initial AVs fleet unidentifiable to prevent potential confrontational reactions from human drivers. Similarly, the CEO of Mercedes-Benz USA has stated that unless AVs are programmed to exhibit a more assertive driving style, human drivers may attempt to intimidate them (Mitchell, 2016). Furthermore, AVs might not adhere to informal traffic norms and could be targets of intimidating actions from both pedestrians and human drivers. Several experts have already voiced concerns about an elevated likelihood of pedestrians engaging in jaywalking when they encounter AVs, as they tend to anticipate these vehicles stopping for them (Tabone et al., 2021). Similar worries have also been expressed by Ackermann and Schubert (2019).

In their 2020 study, Liu and Wang conducted a survey using questionnaires to explore people's inclination to exhibit aggressive behavior toward both autonomous and traditional vehicles. The findings revealed a somewhat elevated inclination, although the overall scores remained relatively low, to display aggression specifically toward AVs. Additionally, variations in these tendencies were observed across different countries (Liu et al., 2020). According to the results of an analysis, it is projected that by at least 2045, half of new vehicles will have autonomous capabilities, and by 2060, half of the entire vehicle fleet will be autonomous. Achieving a much faster implementation would involve decommissioning many fully functional vehicles that lack self-driving capabilities (Litman, 2023). Policy makers must determine whether to construct dedicated lanes for autonomous vehicles, establish pricing strategies for these lanes, and create regulatory frameworks to govern their operation, all aimed at maximizing the overall advantages (Zipper, 2021).

Another crucial aspect in terms of traffic safety is the road users other than drivers. Self-driving vehicles might encounter challenges in detecting and accommodating pedestrians, cyclists, and motorcyclists. Overall, the anticipation of AVs might lead to a decrease in future endeavours to enhance driver safety. At this point, there could be a reduction in resource allocation towards conventional safety approaches. **"The trolley problem"** encompasses different situations that ethicists employ to contemplate whom an uncontrollable vehicle should prioritize for protection. For instance, it raises questions about whether the vehicle should be steered to harm fewer individuals rather than more, older individuals rather than younger ones, or those who are more socially responsible rather than less. As an illustration, should self-driving vehicles adhere strictly to legal speed limits or adjust their speed to match the average flow of traffic on a given road? How ought they to weigh the safety of their occupants against that of other road participants? What actions should an AV take in response to unforeseen circumstances? To safeguard other road users and mitigate additional external expenses, expert bodies should offer recommendations on how AVs must be programmed to balance costs and risks, while governments should institute regulations to ensure the appropriate programming of self-driving vehicles (Litman, 2023).

Recently, Transportation Engineers and Traffic Psychologists have been discussing whether AVs will have a positive impact on road users' aggressive behaviour. Due to the ongoing uncertainty regarding how human drivers will behave when encountering highly AVs, there is a pressing need for additional research into these interactions (Paschalidis and Chen, 2022). Besides that, the issue of road rage towards AVs is not hypothetical, as similar cases have already been reported (Wong, 2018) and naturalistic studies have suggested that events involving the "testing" of AV behaviour occur (Moore et al., 2020). In the future, it is possible that AVs could utilize the understanding of factors influencing driving behavior to develop algorithms that tailor the driving experience to individual drivers' preferences. Additionally, when evaluating people's perceptions and experiences with AVs, previous studies have highlighted the significance of personality traits such as locus of control and sensation seeking. These traits can play a crucial role in customizing the driving experience offered by future AVs (Bellem et al., 2018). Nonetheless, there exists a research gap in investigating whether these traits also impact how drivers perceive and prefer the various driving styles exhibited by AVs (Hajiseyedjavadi et al., 2022). Given the current state of traffic, the issue of how incidents of road rage will manifest in AVs is an area of significant importance for both engineering and

psychology disciplines. Scientific research is required to explore how these new vehicles can contribute to enhancing traffic safety and how humans can adapt to this situation.

In conclusion, with the increasing population growth, traffic safety has become a significant issue today, and after the integration of AVs into our lives, this problem will likely become even more complex, especially in the initial stages. To facilitate the adoption of this change by individuals, it is important to conduct necessary research beforehand and determine the steps required to ease the adaptation to this transformation. Although not fully realized today, it can be anticipated that AVs, which have started to be used by some advanced countries, will also find a significant place in Türkiye's future.

ABSTRACT

The study investigated the effect of ownership structure on performance of listed banks in Nigeria using agency theory as an analytical framework. Specifically, the study ascertains the effect of managerial ownership on market value. Structured questionnaire was used to elicit vital information from the respondents. Reliability of data was tested using Cronbach's Alpha, while validity of the instrument was tested using content and construct. Simple regression was used to analyze the data. The result revealed that managerial ownership has significant effect on market value of listed banks in Nigeria. The study concluded that ownership structure plays a key role in firm performance and provides policy makers within sights for enhancing corporate governance system. It recommended that Owners of banking institutions should practice a managerial system of ownership, linking compensation to performance.

Keywords: managerial ownership, ownership structure, market value, firm performance

Background of the Study

The ownership and control in Modern Corporation introduced by Berle and Means (1932) retains a central position in the economic theory of the firm. They claim that separation of ownership from control produces a condition where the interest of owner and ultimate manager may conflict (Saidu & Gidado, 2018). Ownership structure is the distribution of equity capital as well as the identity of the equity owners. These structures are of major importance in corporate governance because they determine the incentives of managers and there by the economic efficiency of the corporations they manage (Jensen & Meckling, 1976). Furthermore, Fazlzadeh, Hendi and Mahboubi (2011) claimed that ownership structure plays a key role in firm performance and provides policy makers within sights for enhancing corporate governance system. In the majority of developed countries, ownership structure is significantly dispersed. On the contrary, in the developing countries characterized by a weak legal system safeguarding the investors' interests, the ownership structure is concentrated (Ehikioya, 2009).

The corporate governance debate has largely centered on the powers of the Board of Directors vis-à-vis the discretion of top management in decision making processes. The traditional approach to corporate governance has typically ignored the unique influence that firm owners exert on the board, and by extension, the top management, to behave or make decisions in a particular way. Despite the existence of many corporate governance mechanisms a lot of corporate failures and scandals were perpetrated by the management of both financial and non-financial firms in Nigeria. This raises a question on the credibility and reliability of financial reporting and firm performance. Corporate bankruptcies, scandals, failures and stock market crashes, all over the world in the early 2000, has contributed to a dysfunctional corporate culture and categorized firms as myopic, paranoid, bureaucratic and depressive.

1.1 Objective of the Study

The study examines the effect of ownership structure on firm performance as broad objective but specifically seeks to:

- 1) Ascertain the effect of managerial ownership on market value of listed banks in Nigeria

1.2 Research Question

- 1) To what extent does managerial ownership affect market value of listed banks in Nigeria

1.3 Research Hypothesis

- 1) Managerial ownership has a significant effect on marker value of listed banks in Nigeria

2.0 REVIEW OF RELATED LITERATURE

2.1 Conceptual Clarification

Ownership structure:

Ownership structure refers to the percentage of equity capital held by different parties (Manna et al., 2016). The power of stockholders to affect managerial actions and decisions is measured by ownership concentration (Thomsen & Pedersen, 2000). Davies, Hillier and McColgan (2005) argue that a high ownership stakes by those that are also top managers can reduce the effectiveness of outside monitoring since it lowers the probability of managerial turnover or successful takeover bids when the firm is performing poorly. ownership structure is endogenous. Persistent diffuseness of a firm's ownership structure plausibly serves the firm's shareholders better than would a concentrated ownership structure, even if more diffuseness of ownership does allow professional management to divert more of the firm's resources to serve its own narrow interests. The finding that ownership structure is endogenous and plausibly determined, among other factors, by firm performance itself, implies that this endogeneity must be taken into account when seeking to ascertain the relation between ownership and performance (Harold and Belen, 2001). Ownership structure is a way to minimize the asymmetric information disclosure within capital markets among insiders and outsiders (Wahla et al., 2012). Ownership structure can be categorized into widely held firms and firms having controlling owners/concentrated ownership where the former category of firms' owners does not have substantial control rights (Haslindar & Fazilah, 2011). In the context of this study the ownership structure will be proxy with managerial ownership.

Managerial ownership: The managerial ownership is represented as the proportion of shared owned in the firm by insiders and board members or insider ownership (Liang et al., 2011; Mandacı & Gumus, 2010; Wahla et al., 2012). While insider ownership appears to act as an effective corporate mechanism, managerial ownership is considered by Jensen and Meckling (1976) as a signal to align the shareholders' interests with that of the manager's. On a similar note to the latter contention, Khan et al. (2011) and Shleifer and Vishny (1988) revealed that high managerial ownership may lead to management entrenchment as they have less BOD governance and market discipline for corporate control. According to Saidu & Gidado, (2018) Managerial ownership is a situation where the manager owns shares in the firm they manage, in other words they serve as managers of the firm and as well as the company's shareholders. This implies that, managerial ownership means the amount of share either in naira amount or

units of shares held by those who manage the affairs of the business where they act as an agent of the public (shareholders).

Market value:

Market Value is considered as a possible variable and it represents the external assessment and expectation of future performance of firms. market value of a firm is thus a key concern and it is the ability to predict stock trends, based on publicly disclosed information. Information relevant to stock returns is important for both general investors and stakeholders of publicly listed corporations. Market value is used to describe how an asset or company is worth in a financial market. Market value is also useful in targeting specific markets. With higher valued products, that are recognized for improved quality, the target market is likely to be customers with higher incomes. Firm value is defined as a function of ownership structure as the latter is linked to corporate governance and it can have positive as well as negative impact upon corporate governance (Jiang, 2004).

2.2 Theoretical Framework

The study is anchored on Agency theory propounded Alchian and Demsetz (1972) and Jensen and Meckling (1976) but was later developed and modernized by Jensen and Meckling (1976). Agency theory describes managers as agents and shareholders as principals. The theory argues that the value of a firm cannot be maximized if appropriate incentives or adequate monitoring are not effective enough to restrain firm managers from using their own discretion to maximize their own benefits. This can be further explained when looked at like this: first, the interests of principals and agents need to be matched to overcome their different preferences regarding firm activity and different attitudes towards risk exposure. Second, since information asymmetry argues that the principal and agent hold different amounts of information (normally the agent has access to more information than the principal), it is difficult and expensive for the principal to monitor the agent's behaviour.

Agency theory plays as an important link between the ownership structure and firm performance. It contributed significantly to understanding the mechanism involved in the working of firms. Arrow (1986) argues that the importance of incentives and the self-interest in organizational thinking were re-established by agency theory. Furthermore, Eisenhardt (1989) suggests that the main contribution of agency theory lies in the fact that it identifies how to treat information and risk in the operation of a firm. On the other hand, there are quite a few limitations to agency theory. It makes the assumption that human beings are "individualistic"

and “self-interested”. However, Doucouliagos (1994) states that this assumption is not in line with the nature of complexity of human action. Moran and Ghoshal (1996) argue that the assumption made by this theory has a significant and negative impact on human behaviour. In other words, the assumption of this theory encourages human beings to be individualistic and self-interested. According to Shleifer and Vishny (1986), agency cost is one of the critical factors that affects a firm’s financial and nonfinancial performance. Jensen and Meckling (1976) argue that greater equity ownership by insiders (management and/ or directors) improves corporate performance because it aligns the monetary incentives of the manager with other shareholders, thereby mitigating the standard principal-agency problem.

2.3 Empirical Review

The relationship between ownership structure and performance has been an important subject and ongoing debate in the finance literature. Prior studies show that governance mechanisms enhance firm value to a certain degree (Weir, Laing & McKnight, 2002). Similarly, the distinction between ownership and management is common in today’s contemporary public corporations. Some of them make use of performance-based incentive contracts to align owners’ interests with that of managers while others depend on the markets for managerial expertise and corporate control to stop managers from manipulating investments to their own interests (Sing & Sirmans, 2008). In Berger and Udell (2000) stated the ownership structure of a firm should be considered when examining empirically financing issues. This is because differences in ownership structures impact on efficiency of aligning the objectives of insiders (manager) with those of providers of finance (shareholders). Firm value is defined as a function of ownership structure as the latter is linked to corporate governance and it can have positive as well as negative impact upon corporate governance (Jiang, 2004). Consistent to the above are the findings of Lemmon and Lins (2001), who examined the relationship between the two variables through (Tobin-Q) and involved over 800 firms in eight East Asian countries. Their study found a positive relationship between ownership structure and firm performance.

Concentrated ownership can have a negative effect on performance through entrenchment effect. Stulz (1988), Barclay and Holderness (1989) and Schulze, Lubatkin, Dino and Buchholtz (2001) submit that managers or controlling shareholders may pursue actions that maximize their personal utility but lead to sub-optimal policies for the firm. Examples of such actions are consumption of perquisites, paying themselves excessive salaries or appointing family members to management positions over better qualified external candidates (King and Santor,

2007). There are theoretical and empirical evidence that examined the relationship between managerial ownership and firm's performance and revealed mixed findings. This inconclusive finding will be reviewed in the following discussion. First of all, the agency theory perspective is discussed - Jensen and Meckling (1976) stated that managerial ownership leads to the improvement of manager-owner agency conflict as managers are also the owners of a majority of firm shares and hence they are encouraged to maximize job performance to realize superior performance. Ahla et al. (2012) stated that high managerial stake on firm ownership can act as a mechanism that influences the alignment of interests between managers and owners and eventually affect firm market value. Sanda, Mika'ilu and Garba (2005) posited that director's shareholding is significantly negatively related to firm performance. This compares with outside directors and ownership concentration, which are not significant in all cases. Managerial ownership has negative and strong impact on firm performance of study with 8 sample firms (Faruk & Mailafia 2013).

Empirically, the relationship between ownership structure and firm financial performance has received a considerable attention in the recent times. Welch (2003) examines the relationship between ownership structure and corporate performance in Australian listed companies. The study not only confirms the existence of negative relationship between the two variables, it also provides limited evidence of a nonlinear relationship between the variables. Abosede and, Kajola (2011) examines the relationship between firms' ownership structure and financial performance in Nigeria. The findings revealed a negative and significant relationship between ownership structure (director shareholding) and firm financial performance (ROE). Fauzi & Locke (2012) investigated Board Structure, Ownership Structure and Firm Performance: A Study of New Zealand Listed-Firms. The result disclosed that board of directors, board committees, and managerial ownership significantly impact positively on organisational performance. Ongore (2011) investigated the impacts of ownership structure on performance of Kenya's listed firms with agency theory as an analytical framework. found significant negative relationships between ownership concentration and government ownership with firm performance. On the other hand, significant positive relationships were found between firm performance and foreign ownership; diffuse ownership; corporation ownership; and managerial ownership. Mueller and Spitz (2006), analyze the relationship between managerial ownership and performance of German SMEs. The findings show that performance of companies with managerial ownership percentage, above 40 percent, is being improved. Hasnain (2010) studied

the relation between ownership and dividend policy of Karachi stock exchange. Data of the companies was obtained for the period of 2002 to 2006. They measured ownership structure as percentage of shares held by directors (only). The result shows that there is a positive and significant relationship of ownership structure and dividend policy. Lina, Suzan, Ola, and Imad (2012) investigated the effect of ownership structure on dividend pay-out policy of Jordanian industrial public companies for the period 2005-2007. The statistical result consistently supports a significant positive impact of foreign ownership on dividend pay-out policy. Ibrahim, (2016) Investigated the impact of ownership structure on dividend policy of listed Deposit Money Banks (DMBs) in Nigeria for the period 2010-2014. The study found that managerial ownership and ownership concentration are likely to have significant negative impact on dividend policy of listed DMBs in Nigeria.

3.1 Methodology

The study adopted descriptive design, this research design entails gathering information regarding perceptions through the use of questionnaire from a sample of respondents. The population of the is 152 these include Zenith bank, Diamond bank, First bank, and Guarantee Trust bank. The researcher used complete enumeration. The data was collected using a self-constructed questionnaire. The questionnaire was designed in the Likert-type scale statements. The questionnaire comprised of two sections: Section A, to obtain personal information of the respondent and, Section B to obtain information on items related to the study objectives. The response options were Strongly Agree (SA), Agree (A), Indifferent (I), Disagree (D), and Strongly Disagree (SD). The scores were weighted as follows (SA: 5), (A: 4), (I: 3), (D: 2), and (SD: 1) respectively. Out of the 152 copies of questionnaire distributed to the respondent. 148 copies were found to be useful for the study. The data were analysed using descriptive and inferential statistics. Descriptive statistics comprised the mean and standard deviation. The inferential statistics was performed using simple regression.

4.1 Data analyses and presentation

Descriptive statistics of managerial ownership

S/n		Min	Max	Mean	Std. Deviation
1	Delegating the responsibility of monitoring management to the board of directors may lead to another agency conflict between the board of directors and shareholders	1	5	4.82	.497
2	Managerial ownership provides a direct economic incentive for managers to engage in active monitoring and also align ownership and control through meaningful directors' stock ownership.	1	5	4.17	.590
3	Concentrated ownership directs a firms' management effectively and mitigates agency problem	2	5	4.64	.597
4	Ownership structure plays a key role in firm performance and provides policy makers within sights for enhancing corporate governance system	1	5	4.25	.626

Descriptive statistics of market value

S/n		Min	Max	Mean	Std. Deviation
1	An increase in a company's market share can allow the company to operate on a greater scale and increase profitability	1	5	4.59	.772
2	Market value enhance the reputation of a company and in turn, boost sales and broaden the customer base.	1	5	4.34	.670
3	Market value is used to describe how an asset or company is worth in a financial market.	2	5	4.28	.824
4	Market value provides a concrete method that eliminates ambiguity or uncertainty for determining what an asset is worth.	1	5	4.25	.536

Test of Hypothesis: Managerial Ownership has significant effect on Market value

Model Summary

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.764	1.088		3.461	.001
	MANAGERIAL OWNERSHIP	.871	.053	.905	16.430	.000

a. Dependent Variable: MARKET VALUE

This table provides the *R* and *R*² values. The *R*-value represents the simple correlation and is 0.905 (the "R" Column), which indicates a high degree of correlation. The *R*² value (the "R Square" column) indicates how much of the total variation in the dependent variable, market value can be explained by the independent variable, managerial ownership. In this case, 81.8% can be explained, which is very large.

The managerial ownership coefficient of 0.905 indicates a positive significance between market value, which is statistically significant with (t = 16.430). Therefore, the null hypothesis is rejected and the alternate hypothesis is firmly accepted, thus managerial ownership has a positive effect on market value. This connotes that with the increase of managerial ownership, market value also increases.

4.2 DISCUSSIONS OF THE FINDING

Prior research has found significant links between ownership structure and firm performance. Managerial ownership is seen as the most controversial where its overall effect depends on the relative strengths of the incentive alignment and entrenchment effects (Cho et al., 1998). A

diffusely owned firms have been shown in previous studies to have poor performers in part due to the fact that diverse/diffuse shareholders lack the wherewithal and motivation to monitor, control and ratify management decisions. The apologists of strict monitoring and control however, fail to clearly appreciate the fact that ultimately, the shareholders rely on the managers' creativity and innovation to deliver the desired superior corporate performance, and inordinate interference of shareholders in the management processes will certainly undermine corporate outcomes (Ongore, 2011). Sanda, Mika'ilu and Garba (2005) posited that director's shareholding is significantly negatively related to firm performance. This compares with outside directors and ownership concentration, which are not significant in all cases. This finding also does not support Anderson et al., (2000), who saw no significant relationship between firm performance and insider ownership. Managerial ownership has negative and strong impact on firm performance of study with 8 sample firms (Faruk & Mailafia 2013). Managerial ownership has negatively, strongly, significantly and statistically impacted on the performance of listed manufacturing firms in Nigeria (Saidu & Gidado, 2018).

5.1 CONCLUSION ve POLICY RECOMMENDATIONS

Ownership structure plays a key role in firm performance and provides policy makers within sights for enhancing corporate governance system. The ownership structure that emerges, whether concentrated or diffuse, ought to be influenced by the profit-maximizing interests of shareholders, so that, as a result, there should be no systematic relation between variations in ownership structure and variations in firm performance. Managerial ownership can provide a direct economic incentive for managers to engage in active monitoring and also align ownership and control through meaningful directors' stock ownership. There should be a lack of systematic association between ownership structures and performance as the existence of such a relationship would reflect the potential for performance enhancement stemming from reshuffling of ownership structure. Owners of banking institutions should practice a managerial system of ownership, linking compensation to performance, managers with a shareholding in an organization will strive to improve the performance of an organization in other to earn them a high return inform of dividend, and bonus issue.

ABSTRACT

The rapid expansion of wireless communication technology has generated a growing demand for efficient routing protocols, particularly in environments characterized by dynamically changing network topologies. Such scenarios include mobile ad-hoc networks (MANETs) and Internet of Things (IoT) applications. This paper revolves around the execution and appraisal of an on-demand routing protocol within a wireless network setting. This wireless network comprises a dynamic array of nodes that possess the capability to enter or exit the network at any given moment. This dynamic nature renders traditional static routing protocols less suitable. On-demand routing protocols, on the other hand, are designed to establish routes exclusively when required, thereby enhancing network efficiency in dynamic scenarios. We employ QualNet to construct and simulate this wireless network scenario, enabling us to conduct a comprehensive examination of the on-demand routing protocol's performance across diverse conditions. We systematically scrutinize critical parameters, including network scale, node mobility, traffic patterns, and protocol configurations, to gain a profound understanding of their influence on performance metrics such as end-to-end delay, throughput, and packet delivery ratio. This paper contributes to the refinement of routing protocol design in dynamic wireless network environments, facilitating more efficient and dependable communication across a wide spectrum of applications, ranging from emergency response systems to IoT deployments. The integration of QualNet guarantees the precision and trustworthiness of our simulation findings, thereby fostering advancements in on-demand routing protocols within the wireless communication domain.

Keywords: Wireless Networks, On-Demand Routing Protocol, Performance Metrics, Qualnet Tool.

1. INTRODUCTION

The continuous growth and complexity of wireless networks necessitate efficient and adaptive routing mechanisms to ensure seamless data transmission and optimal resource utilization. One such vital aspect in this domain is the utilization of on-demand routing protocols, which dynamically establish routes as needed, minimizing overhead and enhancing network performance. In this paper, focuses on the design and evaluation of a wireless network scenario using the QualNet simulation platform, a powerful tool for simulating network behaviors and protocols. The primary objective of this paper is to conceptualize and construct a wireless network scenario that emulates real-world conditions, considering factors such as network topology, node distribution, mobility patterns, traffic loads, and environmental elements. By leveraging QualNet, a comprehensive simulation environment, we aim to simulate the behavior of an on-demand routing protocol within this scenario. The chosen on-demand routing protocol will be analyzed in terms of its efficiency, throughput, latency, and scalability under varying network conditions. Through thorough evaluation and performance analysis, we intend to gain valuable insights into the protocol's strengths, weaknesses, and applicability to specific network environments. This paper significance lies in its potential to contribute to the advancement of wireless network technologies by providing a deeper understanding of the behavior and performance of on-demand routing protocols in diverse and dynamic wireless network scenarios. The insights gained from this study can be used to enhance existing protocols, inform the design of new ones, and ultimately contribute to the development of more efficient and reliable wireless communication systems[1-5][7][12].

DYMO (Dynamic MANET On-demand)	On-demand routing designed for mobile ad hoc networks	"Dynamic MANET On-demand (DYMO) Routing" by Clausen et al.[9]	Performance evaluation, energy efficiency, security enhancements, QoS provisioning, interoperability with other protocols

3. ROUTING PROTOCOLS IN WIRELESS NETWORKS

- **AODV (Ad Hoc On-Demand Distance Vector):** AODV is an on-demand routing protocol designed for mobile ad hoc networks (MANETs). It establishes routes between nodes only when needed, reducing the overhead of constantly maintaining routes. Research related to AODV often focuses on its performance evaluation, enhancements, security, and integration into various applications. Studies compare AODV with other routing protocols to assess its efficiency, reliability, and scalability in diverse network scenarios[1-4].
- **DSR (Dynamic Source Routing):** DSR is a reactive on-demand routing protocol that allows nodes to dynamically discover routes. Research on DSR often explores its route discovery and maintenance mechanisms, caching strategies, optimization techniques, and adaptability to changing network conditions. Comparative studies with other routing protocols like AODV and OLSR (Optimized Link State Routing) help in understanding the strengths and weaknesses of DSR[7-9].
- **DYMO (Dynamic MANET On-demand):** DYMO is an on-demand routing protocol specifically designed for mobile ad hoc networks. Research related to DYMO focuses on its performance evaluation, energy efficiency, security, and QoS (Quality of Service) provisioning. Studies also examine DYMO's suitability for various applications and its interoperability with other protocols[4-8].
- **ZRP (Zone Routing Protocol):** ZRP is a hybrid routing protocol that combines aspects of both proactive and reactive routing. Research on ZRP often explores its zone-based routing mechanism, optimization strategies, fault tolerance, and adaptability to network dynamics. Evaluations may compare ZRP with purely reactive or proactive protocols to determine its advantages in terms of routing overhead, latency, and scalability[16-18].

4. SIMULATION SETUP AND PERFORMANCE METRICS

a. Simulation Setup

Parameters	Values
Area	900m x 900m
Channel Frequency	2.4 GHz
Fading Model	Rayleigh
Mica Motes Battery Model	Simple Linear Model
No. of Nodes	20 Nodes
Node Placement Model	Random Waypoint Model
Routing Protocols	AODV, DSR, DYMO and ZRP
Shadowing Model	Constant Energy Model
Simulation Time	600 seconds
Terrain File	Digital Elevation Model (DEM)
Traffic Source	Constant Bit Rate (CBR) traffic load

Table 1 Simulation Parameters List

b. Performance Metrics

- **802.11 DFC Broadcast Sent:** 802.11 Directed Forwarding Control (DFC) Broadcast Sent refers to the process of sending broadcast packets using Directed Forwarding

Control in an 802.11 wireless network. DFC allows for efficient broadcasting by directing the transmission to specific nodes within the network.

- **802.11 DFC Broadcast Received:** 802.11 Directed Forwarding Control (DFC) Broadcast Received pertains to the reception of broadcast packets using Directed Forwarding Control in an 802.11 wireless network. The receiver processes these broadcast packets based on the DFC mechanism.
- **Unicast Packets Sent:** Unicast Packets Sent represents the number of individual data packets sent from one device to another within the network. Unicast communication is a one-to-one type of communication where a packet is sent from a source to a specific destination.
- **Unicast Packets Received:** Unicast Packets Received denotes the count of individual data packets received by a device from a specific sender within the network. It indicates successful reception of unicast packets targeted at that device.
- **CTS (Clear To Send) Packets Sent:** CTS (Clear To Send) Packets Sent signifies the number of Clear To Send packets sent by a device to explicitly grant permission for the sender to transmit data over the wireless medium.
- **RTS (Request To Send) Packets Sent:** RTS (Request To Send) Packets Sent denotes the quantity of Request To Send packets transmitted by a device to request permission for sending data to a receiver over the wireless channel.
- **Packets Dropped Due to the Retransmission Limit:** Packets Dropped Due to the Retransmission Limit refers to the packets that were not successfully transmitted within the allowed retransmission limit. When the retransmission limit is exceeded, packets are dropped, often due to persistent transmission issues or congestion.
- **ACK (Acknowledgment) Packets Sent:** ACK (Acknowledgment) Packets Sent represents the number of acknowledgment packets sent by a receiver to confirm successful receipt of data packets from the sender. ACKs are crucial for reliable data transmission.
- **RTS Retransmissions Due to Timeout:** RTS Retransmissions Due to Timeout refers to the instances where the sender retransmits the Request To Send (RTS) packets because a timeout occurred, indicating a delay or lack of response in the acknowledgment process.

- **ACK Retransmissions Due to Timeout:** ACK Retransmissions Due to Timeout refers to cases where the sender retransmits the acknowledgment (ACK) packets due to a timeout, typically occurring when the expected acknowledgment isn't received within a specified time period. This retransmission helps ensure reliable communication.

5. RESULTS and DISCUSSION

Figure 1 Broadcasts Sent

Figure 2 Broadcasts Received

Figure 3 CTS Packets sent

Figure 4 Packets drop due to retransmission limit

Figure 5 RTS Packets sent

Figure 6 ACK Packets sent

Figure 7 RTS retransmission due to timeout

Figure 8 Unicasts sent

Figure 8 Unicasts Received

Figure 9 Packets retransmission due to ACK timeout

802.11 DFC Broadcast Received: AODV and DYMO exhibit a tendency to minimize the use of broadcast messages, as they are designed to be on-demand routing protocols. In contrast, DSR and ZRP may make more frequent use of broadcast messages due to their respective routing mechanisms.

Unicast Packets Sent/Received: AODV and DYMO are optimized for efficient unicast packet forwarding. DSR relies on source routing, which can result in unique unicast packet handling, and ZRP uses zone-based routing for unicast delivery.

CTS/RTS Packets Sent: AODV and DYMO may occasionally involve Clear-to-Send (CTS) and Request-to-Send (RTS) packets, whereas DSR and ZRP utilize them as needed, reflecting the differences in their routing approaches.

Packets Dropped Due to Retransmission Limit: AODV and DYMO emphasize efficient route discovery and maintenance, aiming to minimize retransmissions and packet drops. These protocols make proactive efforts to ensure reliable packet delivery.

ACK Packets Sent: All four routing protocols use acknowledgment packets to confirm successful data delivery. This commonality is crucial for maintaining data reliability in wireless networks.

Retransmissions Due to Timeout: Each of the routing protocols may experience retransmissions due to timeouts, but their specific behaviors vary based on their unique design principles and mechanisms. These differences result in distinct network performance profiles.

6. CONCLUSIONS

In conclusion, the choice of routing protocol in a wireless network depends on the specific network requirements, mobility patterns, and application characteristics. AODV and DYMO's on-demand nature lends itself to efficient unicast communication and reduced broadcast traffic, while DSR and ZRP have distinct advantages and trade-offs based on their source routing and zone-based routing approaches. Understanding these protocol-specific behaviors is essential for selecting the most suitable routing solution for a given network scenario.

ABSTRACT

Cities around the world are grappling with the significant issue of traffic congestion, which leads to longer travel times, increased fuel consumption, and environmental pollution. Addressing this problem requires effective traffic management and congestion reduction strategies, wherein accurate traffic forecasting plays a crucial role. The objective of this research was to develop a machine learning-based approach for predicting traffic flow by leveraging historical traffic data and other relevant factors. Various machine learning algorithms, such as regression modeling, time series analysis, and deep learning techniques, were explored and compared to determine the most effective method. To accomplish this, a comprehensive dataset comprising historical data on traffic volumes, weather conditions, road infrastructure, and other pertinent features was collected. Preprocessing techniques were employed to clean and transform the dataset into a suitable format for analysis. Feature selection methods were utilized to identify the factors that exert the greatest influence on traffic flow. Multiple machine learning models were trained and evaluated using the collected dataset. These models were then tested on unpublished data to assess their accuracy and predictive capabilities. Performance metrics, including mean absolute error (MAE), root mean square error (RMSE), and R-squared, were employed to evaluate and compare the models' performance. The results underscore the importance of utilizing historical data and relevant features to enhance prediction accuracy. The models developed and the insights gained from this research can be leveraged to create intelligent traffic management systems that optimize traffic signal timing and aid in planning efficient transportation networks to alleviate congestion and enhance the overall urban mobility experience.

Keywords: Traffic congestion, traffic forecasting, machine learning approach, regression modeling, traffic volumes, weather conditions, feature selection.

1. INTRODUCTION

Artificial Intelligence (AI) [1-2] has achieved remarkable progress across multiple domains, including machine learning, data mining, computer vision, natural language processing, expert systems, robotics, and other cutting-edge areas. Within AI, machine learning techniques such as probabilistic models, deep learning, artificial neural networks, and game theory have gained considerable attention. Particularly in metropolitan areas, traffic congestion has become a pressing concern for urban planners, policymakers, and designers. The negative impacts of congestion, including significant costs to the community and increased transportation expenses, have prompted major cities worldwide to seek effective solutions. These challenges have led to the development and utilization of various tools and techniques across a wide range of industries.

To address the issue of traffic congestion, it is crucial to accurately evaluate congestion costs. This evaluation serves as a valuable resource in identifying potential strategies and solutions, contributing to broader aspects of policy and urban planning. Traffic congestion not only imposes individual-level effects such as time loss, mental stress, and pollution but also hampers a nation's economic growth and affects the comfort of road users. Therefore, monitoring traffic congestion has become increasingly important with the growth of the transportation sector and the availability of traffic information [2-5].

In this paper, our primary focus is on the application of machine learning techniques for traffic flow prediction. We aim to utilize historical traffic data to develop precise models capable of forecasting traffic patterns. The proposed models will undergo extensive training and evaluation, encompassing a wide range of machine learning algorithms, regression models, and time series analysis. Thorough testing and performance analysis will help us identify the most effective model for traffic flow prediction, utilizing evaluation metrics such as accuracy score, root mean square error (RMSE)[6], and R-squared[7]. Machine learning, a subset of artificial intelligence (AI), revolves around creating algorithms and models that can learn and make predictions or decisions from data without explicit programming. This computational approach allows computers to learn from experience, perform tasks, and make accurate predictions or decisions based on patterns and examples found in the data. At its core, machine learning relies on mathematical and statistical techniques to extract meaningful patterns, relationships, and insights from vast and complex datasets. These patterns serve as the basis for training machine learning models, which act as mathematical representations of the underlying structures and

patterns within the data. The models are designed to generalize from the training data, enabling them to make precise predictions or decisions on new, unseen data. Each category addresses different aspects of learning from data, contributing to the versatility and effectiveness of machine learning techniques across various domains.

Table 1. Machine Learning Approach

	Supervised Learning	Unsupervised Learning	Reinforcement Learning
Key Features	Requires labeled training data	Deals with unlabeled data	Focuses on sequential decision-making in an environment
	Learns from input-output pairs	Focuses on finding patterns and structures in the data	
Learning Method	Minimizes error between predicted and actual outputs	Clusters similar data points or reduces dimensionality	Interacts with the environment through trial and error
Examples of Algorithms	Support Vector Machine (SVM) [1]	K-Means Clustering [2], Principal Component Analysis (PCA) [3]	Q-Learning [4], Monte Carlo Tree Search [5]

3. TECHNIQUES ARE USED

The data acquisition phase is a crucial step in machine learning for traffic flow prediction. It involves loading data stored in a comma-separated values (CSV) file into a DataFrame using the pandas library. This allows for efficient organization and manipulation of the data to facilitate further analysis. To gain insights and visualize data patterns, the matplotlib and seaborn libraries are utilized. These powerful visualization tools enable the generation of informative plots, charts, and graphs, aiding in the exploration and understanding of the data's characteristics. Visualizations help identify trends, correlations, and outliers, providing valuable insights into the underlying patterns of the data. Feature engineering techniques are then employed to extract and enhance the relevant information embedded within the dataset. The process involves the transformation and selection of the most informative features to enhance the predictive performance of machine learning models. By engineering meaningful features, these models can effectively capture the key factors influencing traffic flow, leading to more accurate predictions. To evaluate the performance of predictive models, the dataset is split into training and test subsets, adhering to the standard 70:30 ratio. This division ensures that the models are trained on a substantial portion of the data, allowing them to learn from the underlying patterns and relationships. The separate test set is reserved for unbiased evaluation, enabling an assessment of the models' ability to generalize to new data. Once trained on the training dataset, the models' performance is assessed using the testing data. Accuracy and predictive power are measured by analyzing the residuals, representing the differences between the predicted values and the actual values in the testing dataset. This analysis provides insights into the models' capacity to capture true underlying patterns and make accurate predictions. To quantify the efficiency of the models, various evaluation metrics are utilized, including the accuracy score, R-squared (R²) score, and root mean squared error (RMSE). The accuracy score provides an overall measure of correctness in predicting the target variable, indicating how well the models match the actual values. The R² score represents the proportion of the target variable's variance that can be explained by the models, indicating their explanatory power. On the other hand, the RMSE measures the average deviation between the predicted and actual values, offering an indication of the models' predictive accuracy[8-13].

5. CONCLUSIONS

In conclusion, the data acquisition phase involves loading the data, visualizing the patterns, performing feature engineering, and evaluating model performance. This process sets the foundation for effective traffic flow prediction using machine learning, ensuring accurate and reliable predictions that can contribute to improved traffic management and congestion mitigation efforts.

ÖZET

Geçmişten günümüze başkalaşım geçiren sanat; düşünce süreçlerimizi, tutum, değer, varsayım, önyargı ve sıradan eylemlerimizi sorgulamak için strateji geliştirmek, başkalarıyla ilgili karmaşık rollerimizi anlamaya çalışmak olarak tanımlanan refleksif ifadenin güçlü temsillerinden biridir. Sanat eserleri her ne kadar estetik bilimi ile sorgulansa da kavramsal ya da enstalasyon ürünlerinin yalnızca bu bağlamda incelenmesi mümkün değildir. Sanat eseri, yaratıcı sürecinde dünyayı sorgulayarak; estetik değerlerin yanında bilişsel olarak da izleyenle diyalog kurmaktadır. Sanatçılar tarafından üretilen fikir ya da yaratılan yeni nesnelere, izleyenle sosyal, psikolojik ve kültürel olarak bağlaştırılmaktadır. Sanatçı, ifade ettiği gerçekliğin bu yönlerini refleksif bir şekilde analiz etmek için adım attığında, sanatıyla, dünyayla ve başkalarıyla olan ilişkileri hakkında kişisel bir dönüşüm aracı olmaktadır. Araştırma kapsamında kişinin kendi varsayımlarını sorgulaması anlamında refleksivite kavramı performans ve enstalasyon sanatının önde gelen isimlerinden biri olan Mona Hatoum'un Corps Étranger eseri bağlamında incelenmiştir. Nitel araştırma yöntemlerinden literatür taranarak yapılan araştırmada eser, psikanalitik eleştiri yöntemi ile analiz edilmiştir. Araştırmanın sonucunda izleyeni kuşatan bu eserin, klostrofobik bir etki yaratarak; vücudun içinden gelen; organ, mukoza zarı, saç, diş, vücut sıvıları gibi görüntüler ve seslerle izleyenle refleksif bir bağlantı kurduğu sonucuna ulaşılmıştır. Sanatçı tarafından yaratılmaya çalışılan refleksif ifade Mona Hatoum'un "Corps Étranger" eserinde etkin bir biçimde kullanılmıştır. Eser, kişisel alanların işgali, ihlal, için dışa çevrilmesi, bilinmeyenin açığa çıkarılması gibi kavramları gündeme getirerek izleyende; korku, hayranlık, iğrenme ve tedirginlik gibi duygularla etkileşim kurmaktadır.

Anahtar kelimeler: Enstalasyon, Refleksivite, Mona Hatoum.

AN ANALYSIS OF MONA HATOUM'S CORPS ÉTRANGER IN THE CONTEXT OF REFLEXIVITY

ABSTRACT

Art, which has undergone a metamorphosis from past to present, is one of the powerful representations of reflexive expression, which is defined as developing strategies to question our thought processes, attitudes, values, assumptions, prejudices and ordinary actions, and trying to understand our complex roles in relation to others. Although artworks are questioned through the science of aesthetics, it is not possible to examine conceptual or installation works only in this context. By questioning the world in its creative process, the work of art establishes a dialog with the viewer cognitively as well as aesthetically. The ideas or new objects created by artists are socially, psychologically and culturally contextualized with the viewer. When the artist takes steps to reflexively analyze these aspects of the reality they are expressing, it becomes a means of personal transformation about their relationship to their art, the world and others. Within the scope of the research, the concept of Reflexivity in the sense of questioning one's own assumptions is examined in the context of Mona Hatoum's "Corps Étranger", one of the leading names in performance and installation art. The work was analyzed with the psychoanalytic criticism method in the research conducted by reviewing the literature from qualitative research methods. As a result of the research, it was concluded that this work, which surrounds the viewer, creates a claustrophobic effect and establishes a reflexive connection with the viewer with images and sounds coming from inside the body such as organs, mucous membranes, hair, teeth, body fluids. The reflexive expression created by the artist is used effectively in Mona Hatoum's Corps Étranger. The work brings up concepts such as the invasion of personal spaces, violation, turning inward, revealing the unknown, and interacts with the viewer with emotions such as fear, admiration, disgust and uneasiness.

Keywords: Installation, Reflexivity, Mona Hatoum.

GİRİŞ

Sanatın bir özelliği, insan deneyiminin ve duygularının temsil edilmesidir. Yaratıcı ve sanatsal çalışmanın bağlam içindeki sosyal ve kültürel işlevleri, sanatın yaratıcısı ve algılayıcı tarafından ön plana çıkarılan göstergebilimsel öğelerin ve yaşam deneyimlerinin şekillenmesine yardımcı olmaktadır. Sanatın anlaşılabilmesi onun için insan deneyimlerinden ayrı düşünülmemesi gerekmektedir. “Sanatçıların yapıt ve kendileri için oluşturdukları sistem, dünyayı gördükleri gibi gösteren kişisel denklikler sistemidir: "bu, sanatçının hala dağınık olanı yoğunlaştırmasını sağlayan ‘tutarlı deformasyon’un evrensel göstergesidir. Sanatçı eserlerinde kişisel algısını ortaya koymakta ve anlamlı bir şekilde var olmasını sağlamaktadır” (Haworth, 2022: 12). Bu var olma her zaman bir oluş halindedir. Yaşayan bir süreç haline gelen sanat, Bourriaud’un da belirttiği gibi sanatla etkileşime giren insanların cansız nesnelere sesini duyabildiği yerdir. Sanat, iki yönlü döngülerde cansız nesnelere bir ses atfetmeye kadar ‘canlıdan bir şeye’ sembolik dönüşüm noktaları arasında hareket etmektedir. Sanat kavram ya da teoriye ve onları doğrulama yollarına ihtiyaç duymamaktadır. Aksine sanat, bir şeyi algılanabilir kılan ve bunu yaparken yeni içgörüler üreten pratiklere dayanmaktadır. Bu nedenle, sanatsal biliş ve tanıma, mantığa değil, belirli söylemsel olmayan çelişkilerin belirginleştiği yerde algılanabilirliği sınırlarına kadar zorlamak için temele aykırı eylemler, performanslar, görüntüler, maddi nesnelere, kompozisyonlar, montaj veya multimedya enstalasyonları kullanarak kendi yapıları ve sınırlamaları üzerinde önermesel olmayan yansımalara izin veren bir dile dayanmaktadır.

Düşüncenin ötesinde olan sanat, bilgiyi yapılandıran bir bilgi üretim biçimi değil, bunun yerine bir açıdır. Sanatın düşünümelliği yeni perspektifler açabilmekte, gizli fenomenleri ortaya çıkarabilmekte ve gerçeğin gizli, yerinden edilmiş veya bastırılmış kısımlarını ifşa ederek izleyici ile arasında (Mersch, 2017: 36) refleksif bir etkinin ortaya çıkmasına sebep olabilmektedir. Sanatın ilgili olduğu tek bilgi süreci, gizli olanı açma, ifşa etme veya açığa çıkarma olarak bizi dünyadaki yeni düşünme ve eylem üretme biçimlerine teşvik etmenin bir yoludur. Yeni düşünme ve eylem üretme biçimleri yirminci yüzyılın sonlarına doğru artmış, bu süreçte sanat, sanatçı ve tüketici arasında kurulan bağın sınırları ortadan kalkmıştır. “Beden bütünlük, kapanma ve ontolojik bir temel çağrıştırmaktan vazgeçtiğinde, maddenin amansız ve kontrol edilemez gücünün kanıtları olarak bedensel parçalara ve fiziksel kalıntılara dikkat yoğunlaşmıştır. Sanatçılar tarafından vücudun maddeselliğinin deneyimlenmesi, normatif sınırlar içinde yer alması mümkün olmayan bedensel sunumlar arayışında bedenin temsil sınırlarının ötesine itilmesini gündeme getirmiştir” (Martinez, Arévalo, Gomariz & Suzzi, 2021: 489). Temsil sınırlarının ötesine geçme düşünme ve eylem üretme sürecinde sanatçı, eser ve tüketici arasındaki

mesafenin sınırlarını ortadan kaldırarak; eser ve tüketici arasındaki sorgulama mekanizmasını daha etkin hale getirmiştir. Mesafe sınırlarının kaldırıldığı en iyi örneklerden biri Mona Hatoum'un Corps Étranger adlı eseridir.

Bu araştırmada; Mona Hatoum'un Corps Étranger adlı eseri; düşünce süreci, tutum, değer, varsayım, önyargı ve sıradan eylemlerimizi sorgulamak, karmaşık rollerimizi tanımlamak anlamında kullandığımız refleksivite kavramı ile psikanalitik eleştiri yöntemi kullanılarak açıklanmaya çalışılmıştır.

YÖNTEM

Bu araştırmanın amacı; enstelasyon sanatçısı olan Mona Hatoum'un Corps Étranger eserini refleksivite kavramı bağlamında psikanalitik eleştiri yöntemi ile incelemektir. Psikanalitik eleştiri “sanatçıların bilinçaltılarında bastırılmış olanı ifade ettikleri sanat eserlerinin anlaşılmasını sağlayan geniş çaplı bir bilgi alanıdır” (Barrett, 2021, s. 64).

Araştırmada, amaca uygun olarak nitel araştırma yöntemlerinden biri olan literatür tarama modeli kullanılmıştır. “Genel olarak nitel analiz, literatürde yer alan bilgilerin sınıflandırılması, yeniden düzenlenmesi için tipik örneklerin seçilmesi ve nitel betimleme temelinde sonuçlar çıkarılmasıdır. Literatürün nitel analizi, geçmiş eğilimleri ayırt etmede ve gelecekteki kalıpları tahmin etmede özel değerlere sahiptir” (Lin, 2009, s.179). Literatür taraması, birçok ampirik çalışmadan elde edilen bulguları ve bakış açılarını entegre ederek, araştırma sorularını tek bir çalışmanın sahip olmadığı bir güçle ele alabilmektedir.

Refleksivite

Refleksivite, düşünce süreçlerimizi, tutum, değer, varsayım, önyargı ve sıradan eylemlerimizi sorgulamak için strateji geliştirmek, başkalarıyla ilgili karmaşık rollerimizi anlamaya çalışmaktır. **Refleksivite**, kişinin kendi kabul ettiği varsayımları sorgulamasını içermektedir ve “değişime yol açabilecek önemli bir mekanizmadır” (Dieleman, 2008, s. 4). Archer (2007) refleksiviteyi, kişinin herhangi bir durumda ilgili faktörleri göz önünde bulundurarak ve herhangi bir durumda nasıl tepki vereceğine karar verecek şekilde, bir fikir veya düşüncenin kendi üzerine zihinsel ve öz-göndermeli ‘geriye eğilmesi’ olarak tanımlamaktadır. Archer’a (2007) göre, bireyler ve sosyal yapılar arasındaki karşılıklı etkileşim ve bağlantı, bireylerin refleksivite yoluyla ürettiği eylem ve/veya tepki biçimlerini anlamak için önemlidir. Bu şekilde, bireyler, öznel veya kişisel kaygılarına ve nesnel- sosyal koşullarına aracılık eden aktif failler olarak görülmektedir. Güçlerimiz ve eylemlerimiz sosyal yapılar tarafından şartlandırılırken, bu yapılar

Archer tarafından “kuvvetler” olarak değil, “belirli şekillerde hareket etmenin nedenleri” olarak kabul edilmektedir (Archer, 1995 s. 209). Örneğin sanatta, sanatçı, eser ve eserin sunulduğu sosyal yapı döngüsü birbirini aktif olarak etkilemektedir. Bazen eylemsel, bazen provakatif, bazen duygusal, bazen de daha düşünsel etkileşimler sayesinde sanat, yeni düşünme biçimleriyle sunulduğu kitle üzerinde zihinsel ve öz-göndergeli bir anlam oluşturmaktadır. “Sanatçı yeni düşünme biçimleri ortaya koyduğundan, sosyal ve kültürel normlara sıklıkla meydan okunmaktadır” (Ryan, 2014, s.8).

Farklı perspektif ve disiplinlerde çeşitli şekillerde tanımlanmış olsa da genel anlamda **refleksiviteyi**; “deneyimin benlik, başkaları ve bağlamsal koşullarla ilgili olarak anlamlandırılması daha da önemlisi, kişisel ve sosyal fayda için gelecekteki deneyimi yeniden tasarlamak ve/veya planlamak” (Ryan, 2014, s.7) olarak tanımlamak mümkündür. Refleksivite, yaşam deneyimlerini daha iyi algılamamıza, onların sanatsal ifade ve estetik sorgulamaya açılmasına aracılık etmektedir. Refleksivite teorileri, yaşantı ve deneyimleri anlamlandırma sürecinde mercek rolü üstlenmektedir. “Kökleri insan deneyimi ve hissine dayanan sanat eserlerini, yaratıldığı koşulları ve gerçek yaşam deneyiminde yarattığı insani sonuçları kabul etmeden düşünmek imkânsızdır” (Dewey, 1934). Bu insani koşullar ve deneyimler, hem eserlerin algılanmasında hem de yaratıcı çıktılarının ifade edilmesinde öz-farkındalık ve kimlik oluşumu için önemlidir (Ryan, 2014).

Sanatta Refleksivite

“Sanatçı ile izleyici arasındaki mesafe çöktüğünde... seyirci rolünde aktif hale gelir”. “İzleyici, her sanat eserinin ortak yaratıcısıdır” (Graham, 2002)

Sanatta refleksivite, beyinden gelen fikre veya dürtüye estetik bir tepki üretmektir. Felsefe gibi, sanat da anlamının bir parçası olarak sürekli kendi doğasını sorgulamaktadır. Stanley Cavell ya da Merleau-Ponty gibi pek çok filozof modernist sanat yapıtlarının “felsefenin koşulunu” üstlendiğini ve refleksivitenin sanat yapıtlarının ontolojik tanımı haline geldiğini ifade etmektedir. Yirminci yüzyılda görsel sanat dünyasında önemli ve etkili olan refleksivite kavramı, sanatı sorgulayan entelektüel ve kurumsal koşulları tanımlayan bir alan olarak ortaya çıkmıştır. Sanatla ilgili pek çok teori geliştirilmiş olsa da Graham’ın ifade ettiği gibi, “hiçbiri kendi başına sanatın özel değerini açıklayamaz” (Graham, 2005, s. 52). Sanatın değeri hedonik, estetik veya duygusal değil, bilişsel yani bir bilgi ve anlayış kaynağı olarak değerlendirilmektedir. Baumberger’in de belirttiği gibi sanat eserleri genelde “duygusal etkileri ve estetik değerleri açısından eleştirilmektedir. Bunlar, aynı zamanda bilişsel değerlendirmeler gibi görünen sanatsal

değerlendirmelerdir. Estetik bilişselcilik, sanat yapıtlarına ilişkin değerlendirmelerimizin bu tür özelliklerini sorgulamaktadır. Bu epistemik (sanat yapıtlarının bilişsel işlevleri vardır) ve estetik (sanat yapıtlarının bilişsel işlevleri, sanatsal değerlerini kısmen belirler) bir iddianın birleşimidir” (Baumberger, 2011, s. 1). Bu yaklaşım özellikle postmodernist sanat eserleri için daha aktif kullanılabilir bir bakış açısının göstergesidir. Sanat eserleri her ne kadar estetik bilimi ile sorgulansa da kavramsal ya da enstalasyon ürünlerinin yalnızca bu bağlamda incelenmesi mümkün değildir.

Doğası gereği sanat eseri, dünyayı sorgulayıp tartışarak ve yaratıcı sürecin bir parçasını oluşturan benlikle ve başkalarıyla zihinsel diyalog kurarak şekillenmektedir (Hilton, 2006, s. 10). Sanat dünyaya yeni bir bakış açısı ile bakabilmemizi, tanıdık şeyleri alışılmadık şekillerde görmemizi, olgu ve nesnel arasındaki yeni bağlantıları algılamamızı sağlayabilmekte ve bizi gerçeklik deneyimlerimizi yeniden düzenlemeye yönlendirebilmektedir. “Kendini sanat yoluyla ifade etmek, kendini keşfetmenin güçlü bir biçimi olabilmekte, kişinin fikirlerini ve derin düşüncelerini izleyici kitlesine sunarak açık hale getirmekte ve böylece izleyiciyi diyaloga davet etmektedir” (Ryan, 2014, s. 12). Sanatçı eser ve izleyen arasındaki bu diyalogu ne kadar güçlü aktarırsa refleksif etki de o kadar derin ve anlamlı olabilmektedir.

Bilgi, eylem, etkileşim ve/veya tepkiyi tasvir etmek için kullanılan göstergebilimsel sistemler ve malzemeler, sanatın farklı alanlarında, çeşitli sosyal ve kültürel amaçlara ulaşmak için sanatçılar tarafından sürekli olarak yeniden yapılmakta ve yeniden bağlamlaştırılmaktadır (Bernstein, 2000). Malzeme ve işaretler bilinse de, sanatçı onları duygu ve deneyim yoluyla kendine özgü bir şekilde özümseyip yeni bir nesne yaratarak dünyaya yeniden sunmaktadır. Refleksif ifade, yaratımı, performansı aynı zamanda da kişinin fikir ve yaşam kaygılarını değiştirme potansiyeline sahip olabilmektedir. “Yeni yaşam rotaları hakkında düşünmek için; kişi fikir, endişe ve inançlarını referans alarak, sanat eserine yansıtabilmektedir” (Archer, 2007). Yaratıcı bir ürünü ortaya çıkarmak, bir benlik parçasını soyutlamaya ve incelemeye açık tutmaya benzerdir. Bu öz denetim, en yüksek öz-bilinç düzeyi, yani kişinin kendi insani amaç ve taahhütlerinin farkındalığıdır. Sanatçı, ifade ettiği gerçekliğin bu yönlerini refleksif bir şekilde analiz etmek için adım attığında, sanatıyla, dünyayla ve başkalarıyla olan ilişkileri hakkında kişisel bir dönüşüm aracı olmaktadır.

İnsani koşul ve deneyimler, sanatsal ifadenin ve estetik sorgulamanın temelini oluşturmaktadır. Eleştirel düşünme ve refleksivite, soyutlanmış insanlık durumuna ilişkin bilgiyi ve kişinin dünyayla, insanlar ve içindeki şeylerle olan ilişkisinin öz bilincini bir araya getirebileceğimiz araçlardır. Sanat, toplumun nesnel yapıları ve normları ile öznel veya kişisel anlayışlarımıza

aracılık ederken, yaşamla ilgili kaygılar ve eylemler hakkındaki içsel tartışmalarımızı görünür ve sesli hale getirmek için güçlü bir platform sağlamaktadır (Rylan, 2014: 16). En güçlü platformlardan biri olan performans ve enstalasyon sanatında sanatçı ile izleyici arasındaki mesafe kavramsal ve fiziksel yönler birleşerek daralmakta, izleyici kendi bağlantı ve deneyimlerini esere yansıtarak rolünde aktif hale gelmektedir. En pasif rolleri üstlenirken bile, izleyici duygusal tepkileri ve toplumsal çağrışımları aracılığıyla anlamla etkileşime girerek kendi sanatını deneyimlemektedir.

BULGULAR ve TARTIŞMA

Mona Hatoum'un Corps Étranger Eseri ve Refleksivite

Sanatçı, izleyici ve eser arasındaki refleksif bağlantının gözlenebileceği en etkili eserlerden biri “İngiliz-Filistinli sanatçı Mona Hatoum'un, “Corps Étranger” (1994) adlı eseridir. “Corps Étranger” “sanatçının dünyanın düşünsel ve fiziksel dokusuyla sürekli etkileşimi yoluyla ortaya çıkardığı” (Haworth, 2022: 137) en bilindik eseridir. Eser, silindirik bir kabinin cam zemininin altından yansıtılan, sanatçının kendi vücudunun iç kısmının endoskopi ve kolonoskopi görüntülerinden oluşan bir video enstalasyonudur” (Martinez, Arévalo, Gomariz & Suzzi, 2021: 493). Eser, iki dikdörtgen açıklığı olan, 3,5 metre yüksekliğinde ve 3 metre çapında bir mimari silindirden oluşmaktadır. İzleyici eserin eşiğine yaklaştığında, zemine ya silindirin duvarına yaslanacak ya da üzerine basılacak çapta kurgulanmış bir video ile karşılaşmaktadır. Silindirin içinde, ultrason cihazı ile kaydedilen sesler dört hoparlör tarafından yeniden üretilmekte ve video 30 dakikada bir döngüye girmektedir (Latry, 2021). Hatoum'un vücudunun çeşitli iç özelliklerinin yakın plan video görüntüleri, izleyicinin kendi vücudunun yüksekliğine eşdeğer bir mesafeden yukarı doğru yansıtıldığı dairesel bir cam plakadır. Bu görüntüler izleyenin ayaklarının hemen altından dökülerek gözleri ve kulakları işgal edip; izleyicinin görüntülerle dokunsal temasını sağlamaktadır (Martinez, Arévalo, Gomariz & Suzzi, 2021: 493). Bu eserle sanatçı, silindirik bir hücrenin zemininde kendi vücuduna endoskopik bir yolculuk sunarak sanat tarihinin en sıra dışı otoportrelerinden birini yansıtmaktadır. Silindirin neredeyse kloströfobik darlığına adım atan izleyici, tanımlanamayan sesleri duymakta ve insan vücudunun içinden gelen; mukoza zarı, saç, diş, vücut sıvıları gibi görüntülerle refleksif bir bağlantı kurmaktadır. “Görüntü, odanın kloströfobik alanıyla birleştiğinde, izleyicide Hatoum'un en kişisel alanlarını işgal ettiği hissiyle rahatsız edici bir izlenim bırakmaktadır (Timpano, 2017). Tıbbi cihazlar ile oluşturulan bu video kaydı, zeminde bir daire şeklinde yansıtılan görüntülere bakıldığında, parıldayan, titreşen boşluklara derinlemesine dalmadan önce vücudunun görünüşte devasa

yüzeyini tararken izleyeni refleksif olarak etkileyen bir görüntü sağlamaktadır. Eseri izlerken hissedilen istila ve davetin karışık duygusu hem rahatsız edici hem de zorlayıcıdır (Coxhead, 2016). Hatoum bizi bir dizi endoskopik görüntünün izleyicisi yaparak; beden normatif temsilinin ötesinde, pozitifleştirilemeyen, kavranabilir bir figürle özdeşleştirilemeyen veya dille bütünleştirilemeyen, saf olumsuzluk boyutunun ötesine götürmektedir (Martinez, Arévalo, Gomariz & Suzzi, 2021: 492). Corps Étranger'daki en rahatsız edici görüntüler iç organlara ait olanlardır. Kendi iç yolculuğuna çıkan sanatçı; içi dışa çevirerek, görünmezi görünür kılmaktadır. Nefes alma, kalp atışı ve iç organların kendine özgü sesleri, vücudun içinde olma duygusunun rahatsızlığını yoğunlaştırmaktadır.

Corps Étranger'da modern batı logolarının rasyonel ışığından uzak, derin ve karanlık yer altı mezarları gibi, vücudun boşlukları, labirentli bir arayış içinde kamera tarafından araştırılmaktadır. Derin yerlere bu inişte, iç organ tünellerinin hiçbir yere gitmediği gözlenmektedir. Bir korku filmi sahnesi gibi, gözlemci kendini karanlık bir odada, kamera aracılığıyla dolaşırken bulmaktadır. Bu gezintinin sonu, çok güven verici, aydınlık ve oksijenli bir dışa dönüş gibi görünse de izleyicinin sanatçının vücudunun içini gezdiğini fark etmesi rahatlama hissini korkuya dönüşmektedir. Aynı zamanda, bu içsel iniş deneyimi izleyeni unutulmuş ve potansiyel olarak bertaraf edilmiş bir nesnenin yerine koymaktadır (Martinez, Arévalo, Gomariz & Suzzi, 2021: 493). Hatoum bize, temsilin sınırlarının ötesinde, beden bazen öngörülemeyen şekillerde hareket ettiğini göstermektedir. İzleyeni maddenin sessiz ve canlı iç kısmına çeken korku ve hayranlık; iğrençle rahatsız edici bir özdeşleşmeyle yüzleşmeye zorlamakta ve böylece korku kaynağı olan bedeni temsilden çıkarma sürecini kesintiye uğratmaktadır. Hatoum, izleyiciyi bedenin simgesel ve idealize edilmiş imgesini bozmak için semiyotik potansiyelin barındığı sefil alanla karşı karşıya getirmektedir (Martinez, Arévalo, Gomariz & Suzzi, 2021: 494). Bu video kaydı aynı zamanda izleyiciye özel bir dünyayı gözlemlediği yanılsamasını hissettirmektedir.

Mona Hatoum, sinemanınkinden ve anlatı kullanımlarından oldukça farklı bir araçla izleyiciye konumunu sorgulatmaktadır. Eseri izlerken dâhil olunan ve hücre gibi hissettiren alandan çıkabilmek tek özgürlük sınırı gibi görünmektedir. Sanatçının bedenine tüm açıklıklarından görsel olarak girme olgusu, bilindik uzamsal sınırları aşmaktadır (Latry, 2021). İzleyiciyi refleksif etkiye sürükleyen eser; bilindik sınırların aşılmasıyla kaygı, korku, tedirginlik ve iğrenme boyutunda bir deneyim yaşatmaktadır.

Beden, son derece iç içe geçmiş ancak farklı sosyal, politik, normatif ve maddi güçlerin müdahale ettiği karmaşık bir yapıdır. Corps Étranger, anlaşılabilir bir beden imajına bütünüyle entegre

edilemeyen yönleri sahnelemektedir. Hatoum'un performansı, izleyeni temsil kapsamına indirgenemeyecek bir boyutla karşı karşıya getirmektedir. Bu boyut, radikal ötekiliği, tüm temsillerin ötesinde olumlanan yabancı bir niteliği, gerçek bir yabancı cismi oluşturmaktadır (Martinez, Arévalo, Gomariz & Suzzi, 2021: 492). İzleyenin kendi bedenini, kimliğini sorgulama boyutu ile karşı karşıya kalması; aynı zamanda insanlığın, başkalarının rızası veya bilgisi olmadan, saldırgan bir şekilde gizliliğini araştırma eğilimini sorgulayarak hem mağdur hem de fail olduğumuz (Timpano, 2017) düşüncesine atıfta bulunmaktadır. Dolaylı da olsa ihlalin sorgulanması bir kadının vücuduna erkek bakışının atılması varsayımını tersine çevirmektedir. Videoyu kaydeden, gözlemleyen, temsil eden, aktif olan Hatoum, yani kadının kendisidir. Kamera yalnızca bedenin izin verdiği ölçüde görüntü kaydedebilmektedir. Hatoum, "Corps Étranger" eseriyle izleyici ile olan refleksif ilişkisini oldukça geniş bir yelpazede konumlandırmayı başarmıştır. İçi dışa çevirme eylemi kadın bedeni üzerindeki cinsiyetçi beklentilerin sorgulanmasına da katkıda bulunmaktadır.

SONUÇ

Sanat, sanatçının hayatına, hayal gücüne hitap ederek onun dünyadaki varlığını, anlama, düşünme ve hareket etme biçimini dönüştürmeye çalışmaktadır (Mersch, 2017: 37). Bu dönüşüm sürecinde eserlerin estetik değerlerinin yanında bilişsel değerlerinin önemi tartışılmazdır. Bu değerlerin algılanabilir olması ve izleyenle etkileşime geçebilmek için çeşitli göstergebilimsel sistem ve malzemeler kullanılmaktadır. Sanatçılar tarafından üretilen fikir ya da yaratılan yeni nesnelere, izleyenle sosyal, psikolojik ve kültürel olarak bağlaştırılmaktadır. Sanatçı tarafından yaratılmaya çalışılan bu refleksif ifade Mona Hatoum'un "Corps Étranger" eserinde etkin bir biçimde kullanılmıştır. İzleyeni kuşatarak kloströfobik bir etki yaratan eser, sanatçı ile mesafeyi ortadan kaldırarak ihlal sınırını aşmakta ve izleyeni tedirgin eden pek çok duygu ile baş başa bırakmaktadır. Eser, vücudun içinden gelen; organ, mukoza zarı, saç, diş, vücut sıvıları gibi görüntüler ve seslerle izleyenle refleksif bir bağlantı kurmaktadır. Eser, kişisel alanların işgali, ihlal, için dışa çevrilmesi, bilinmeyenin açığa çıkarılması gibi kavramları gündeme getirerek izleyende; korku, hayranlık, iğrenme ve tedirginlik gibi duygularla etkileşime geçmektedir.

ABSTRACT

The aircraft touchdown is one of the most critical moments during flight. In this paper, the dynamic behavior of the aircraft has been examined as the ground contact of the nose landing gear is made during the landing process. To this aim, the aircraft is modeled both mathematically and using multibody dynamics software. The mathematical model is used to create the model-based LQR control structure. The Simpack-generated multi-body dynamics model has been utilized to create a lifelike landing scenario, incorporating the impacts of the wheels into the aircraft dynamics. This aims to simulate a realistic landing experience. This generated model has been transferred to the MATLAB/Simulink environment using the FMU Co-Simulation tool, with its outputs in the same state space format as the mathematical model. In this paper, the LQR control force is obtained with the Q, N and R matrices which are obtained with a cost function. Also, another LQR control force is obtained with diagonal elements of Q matrix and it is named Di-LQR. The purpose of this is to see the effect of non-diagonal elements on the system. Under the zero volt to the MR damper and voltages derived from LQR, Di-LQR, and Hybrid controllers, the operational range of the MR damper, aircraft body accelerations, and the efficiency of the MR damper during landing have been compared with the passive case. As a result, the LQR control approach obtained through the cost function improved the landing efficiency from 80.95% to 88.45% against passive case, and improved the RMS values in the aircraft's pitch and vertical accelerations 15.01% and 16.54%, respectively.

Keywords: Co-simulation, LQR control, Semi active control, UAV

INTRODUCTION

Touchdown of an aircraft with high speed from high altitude causes significant impact force between the nose landing gear and ground. To avoid damage to the aircraft caused by the impact force, it should be absorbed effectively. To absorb impact force, passive landing gear systems such as oleo-pneumatic shock absorbers are used in aircraft generally. However, there are some disadvantages to using passive landing gears. The conventional passive landing gears may not perform well in different road conditions. However, they can only perform well when the landing gear parameters are adjusted according to the road profile. In other words, they cannot provide good vibration damping because the passive landing gear system is not designed for every different kind of runway type separately (Zapateiro et al. 2011). To address this issue, researchers have been working on controlling the landing gear performance by using active and semi-active control structures.

After NASA developed the active landing gear system to overcome the limitations of the passive suspension system (McGehee and Carden 1976, active vibration control of the landing gears has become attractive for many studies (Pirooz, Mirmahdi, and Moafi 2020; Sivaprakasam 2015; Toloie, Aghamirbaha, and Zarchi 2016; Yazici and Sever 2016). Although these studies have shown that active-controlled landing gears have more advantages than passive landing gears, the active system may bring many problems. For example, adding an active control system to passive landing gear increases weight. Also, a sensor failing may cause deadly accidents. Last but not least, active control system cost increases the total cost of the aircraft. For these reasons, a lot of semi-active systems starting to be researched for landing gear systems. In many of this studies, MR dampers are used for semi-active landing gear systems because MR dampers do not require a large power supply and enhanced reliability (Lee et al. 2009). Also, MR dampers react to magnetic field changes quickly. In this way, the suspension system is instantly adjustable to adapt to the road surface (Zhu, Jing, and Cheng 2012). Another specification of the MR damper is when no current is applied to it, it behaves like a passive suspension system (Sateesh and Maiti 2010).

In the literature, the touchdown movement of an aircraft that has landing gear equipped with the MR damper has been studied by more researchers. In some of these studies, the aircraft was modelled as a mass-damper system. For example, in (Luong, Jang, and Hwang 2020), the researchers have proposed new controllers in which sliding mode control and adaptive hybrid control are used together to improve the effectiveness of absorbing landing impact energy. In the results of this study, it was observed that the proposed controller provided better energy absorber

efficiency than the other controllers. In (Viet and Hwang 2019), to decrease the vibration of touchdown movement, a skyhook controller and a force control combined. This hybrid control was compared with off-state, and results showed that the hybrid controller increased the efficiency of shock absorber.

In some other studies, the landing gear has been prototyped, and the landing motion has been tested in a physical environment. For instance, in (Jo et al. 2021), the researchers used a prototype MR damper which was equipped with landing gear. To increase the absorbed energy of the MR damper at the touchdown, they applied the Skyhook and Hybrid controllers. As the results of this study, with a Hybrid controller, the landing gear achieved high impact damping performance in different landing conditions. In (Luong et al. 2022), an intelligent controller depended on supervised neural network control has been tested to minimizing the impact energy during the landing of an aircraft. According to the results, the proposed controller outperformed without using any information about the aircraft mass or force inputs.

An article which is composed of two parts (Kang et al. 2021a, 2021b), presented a six-degree-of-freedom aircraft model equipped with the MR damper. In the first part, the researchers modelled the aircraft mathematically. Then, they worked on the efficiency of landing gears. Under the different landing scenarios such as different roll and pitch angles, performances of the basic skyhook controller and modified skyhook controller were compared for left and right landing gears. The results show that the modified skyhook controller increased the stability of the aircraft more effectively at the touchdown movement than the basic one.

Motivated by these papers, in this study, an aircraft model representing a lightweight aircraft or UAV (Unmanned Aerial Vehicle) was modelled in two ways. Firstly, the aircraft is modelled with the SIMPACK multibody software environment. Here the goal is to model the aircraft more realistic and observe the effects of the wheels on the aircraft dynamics. In the second one, aircraft was modelled numerically with Newton's 2nd Law approximation. This model was used for calculating the desired force of the LQR controller.

The SIMPACK model was transferred to the MATLAB/Simulink environment. The aim here is to investigate the dynamic behavior of the aircraft which is actuating with the MR (Magneto-Rheological) damper which is equipped with nose landing gear. The MR damper was controlled by the LQR (Linear Quadratic Regulator) and Hybrid (Skyhook and Ground-hook) control approaches. Effects of these controllers compared in landing efficiency, body acceleration, operating range of MR damper and pitch motion of the aircraft.

MATERIAL and METHOD

MR Damper Model

In this study, a mathematical model of the MR damper was taken from (Yıldız 2022). Here, the force produced from the MR damper has been obtained by using the LuGre model. The LuGre model is given in Equation 1.

$$f = \begin{bmatrix} z & \nu z & -|\dot{x}_{mr}|z \end{bmatrix} \underbrace{\begin{bmatrix} \sigma_a \\ \sigma_0 \\ \sigma_1 a_0 \end{bmatrix}}_{\theta_1} + \begin{bmatrix} \dot{x}_{mr} & \dot{x}_{mr}\nu \end{bmatrix} \underbrace{\begin{bmatrix} \sigma_1 + \sigma_2 \\ \sigma_b \end{bmatrix}}_{\theta_2} \quad (1)$$

Here, θ_1 and θ_2 represent parameters that need to be defined, z is the internal dynamic variables, \dot{x}_{mr} represents velocity change of the MR damper, and ν represents control voltage of the MR damper. To determine the control voltage that will produce the desired force that is obtained by using a voltage control system that is given in Equation 2, which can be named as inverse LuGre model.

$$\nu = \frac{f_c - [\sigma_a z - \sigma_1 a_0 |\dot{x}|z + (\sigma_1 + \sigma_2)\dot{x}]}{\underbrace{\sigma_0 z - \sigma_b \dot{x}}_{\beta}} \quad (2)$$

The semi-active control structure is summarized in Figure 1 to schematize the working principle of the closed-loop system

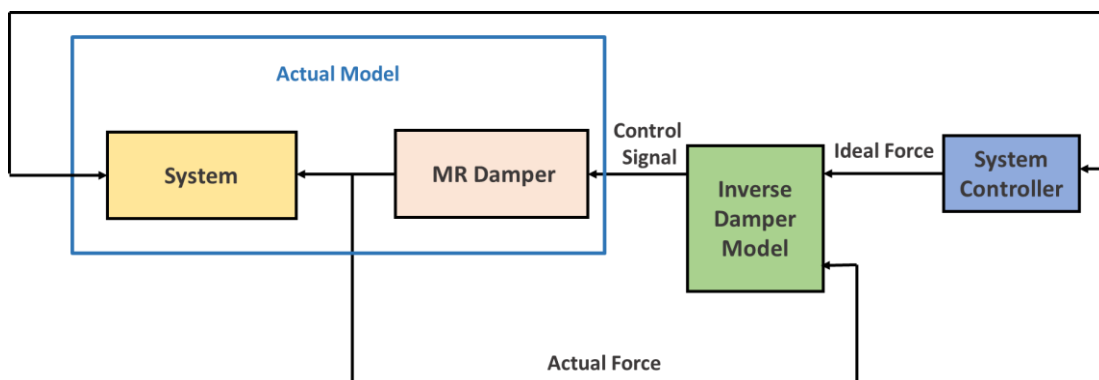

Figure 1. Schematic representation of the controlled system.

Mathematical Model of Aircraft

In this part, equations of motion of the aircraft were obtained by using Newton’s 2nd Law. The model has six-degree-of-freedom which are shown in Figure 2, these are displacement of the body, roll and pitch motions and vertical displacements of the nose and main landing gears.

Figure 2. The aircraft model.

The operating ranges of the suspensions shown in the figure can be written as below:

$$\begin{aligned} z_{sf} &= (z + \theta_y L_f - z_f) \\ z_{sl} &= (z - \theta_y L_b - \theta_x L_l - z_l) \\ z_{sr} &= (z - \theta_y L_b + \theta_x L_r - z_r) \end{aligned} \quad (3)$$

Here, z represents the displacement of the center of gravity, z_{sf} , z_{sl} , and z_{sr} represents operating ranges of front, left and right landing gears, respectively. Equations of motion of the aircraft are given between equations 4 and 9.

$$M_b \ddot{z}_b = -k_{sf} z_{sf} - k_{sl} z_{sl} - k_{sr} z_{sr} - c_{sf} \dot{z}_{sf} - c_{sl} \dot{z}_{sl} - c_{sr} \dot{z}_{sr} - F_{MR} \quad (4)$$

$$I_y \ddot{\theta}_y = -L_f k_{sf} z_{sf} + L_b k_{sl} z_{sl} + L_b k_{sr} z_{sr} - L_f c_{sf} \dot{z}_{sf} + L_b c_{sl} \dot{z}_{sl} + L_b c_{sr} \dot{z}_{sr} - L_f F_{MR} \quad (5)$$

$$I_x \ddot{\theta}_x = h k_{sf} z_{sf} + L_l k_{sl} z_{sl} - L_r k_{sr} z_{sr} + h c_{sf} \dot{z}_{sf} + L_l c_{sl} \dot{z}_{sl} - L_r c_{sr} \dot{z}_{sr} \quad (6)$$

$$m_f \ddot{z}_f = k_{sf} z_{sf} + c_{sf} \dot{z}_{sf} - k_{tf} (z_f - z_{rf}) - c_{tf} (\dot{z}_f - \dot{z}_{rf}) + F_{MR} \quad (7)$$

$$m_l \ddot{z}_l = k_{sl} z_{sl} + c_{sl} \dot{z}_{sl} - k_{tl} (z_l - z_{rl}) - c_{tl} (\dot{z}_l - \dot{z}_{rl}) \quad (8)$$

$$m_r \ddot{z}_r = k_{sr} z_{sr} + c_{sr} \dot{z}_{sr} - k_{tr} (z_r - z_{rr}) - c_{tr} (\dot{z}_r - \dot{z}_{rr}) \quad (9)$$

The equations from eq. (4) to (9) can be written in a matrix form as given in Equation 10.

$$M\ddot{x}_s = C\dot{x}_s + Kx_s + Hf_{act} + E_1d + E_2\dot{d} \quad (10)$$

$$x_s = [z \quad \theta_x \quad \theta_y \quad z_f \quad z_l \quad z_r]^T \quad (11)$$

In eq. (10), M , C , K are represent mass, damping, and stiffness matrices, respectively. H points the location of the control input, E_1 and E_2 represents the location of the force resulting from tire-road interaction. Here damper force is referred by F_{MR} ,

The inputs to the system from the runway surface are denoted by d and \dot{d} as given in equations (12) and (13)

$$d = [z_{rf} \quad z_{rl} \quad z_{rr}]^T \quad (12)$$

$$\dot{d} = [\dot{z}_{rf} \quad \dot{z}_{rl} \quad \dot{z}_{rr}]^T \quad (13)$$

By using equations (10) and (11), the system can be written in state space format as,

$$\begin{bmatrix} \dot{x}_s \\ \ddot{x}_s \end{bmatrix} = \underbrace{\begin{bmatrix} 0_{6 \times 6} & I_{6 \times 6} \\ M^{-1}K & M^{-1}C \end{bmatrix}}_A \underbrace{\begin{bmatrix} x_s \\ \dot{x}_s \end{bmatrix}}_x + \underbrace{\begin{bmatrix} 0_{6 \times 1} & 0_{6 \times 3} & 0_{6 \times 3} \\ M^{-1}H & M^{-1}E_1 & M^{-1}E_2 \end{bmatrix}}_B \underbrace{\begin{bmatrix} F_{MR} \\ d \\ \dot{d} \end{bmatrix}}_u \quad (14)$$

The expanded definitions matrices are given in Appendix A.1.

Control Structures

Linear Quadratic Regulator Control

The control structure of the LQR control is shown in Figure 3. Here, $x(t)$ represents state variables, $z(t)$ represents state variables to be minimized as soon as possible, and $u(t)$ represents control input.

Figure 3. Structure of LQR controller

Equation 15 can be obtained when the transfer function is formed from input to output with the help of the Laplace operator

$$\frac{X(s)}{U(s)} = -K(s) \quad (15)$$

Here the desired situation is, to obtain the transfer matrix $K(s)$ that will minimize the cost function given in Equation 16.

$$J_{LQR} = \int_0^{\infty} \rho_1 \|\ddot{z}(t)\|^2 + \rho_2 \|z_{sf}(t)\|^2 + \rho_3 \|\theta(t)\|^2 + \rho_4 \|F_{MR}(t)\|^2 dt \quad (16)$$

The constant coefficients ρ_1, ρ_2, ρ_3 and ρ_4 provide the trade-off between the terms of the cost function. The MATLAB computes the continuous time cost function as the form of Equation 17.

$$J_{LQR} = \int_0^{\infty} \left\{ x(t)' Q x(t) + u(t)' R u(t) + 2x(t)' N u(t) \right\} dt \quad (17)$$

By utilizing a Matlab code that allows to generate Q, N and R matrices automatically, cost functions given in (16) and (17) are set equal to each other. Here, ρ_1, ρ_2, ρ_3 and ρ_4 are selected as $\rho_{i=1,4} = [0.1 \quad 10 \quad 3 \times 10^5 \quad 1 \times 10^{-6}]$ the Q and N matrices are given in Appendix A.2. One of the primary objectives of the article is also to investigate the effect of the non-diagonal terms of the Q matrix on the vehicle dynamic response. Therefore, a Q" matrix was obtained from the diagonal elements of the Q. The desired forces obtained from these two matrices were fed back into the system. The Q" matrix is the diagonal elements of the Q matrix which is also given in Appendix A.2. In the rest of the study, the control approach designed with the Q" matrix using the linear quadratic regulator is referred as Diagonal LQR (Di-LQR).

Hybrid Control

Similarly, in the Groundhook control method, the principle is the same for the lower mass. Here, in this case, damping is not considered for the upper mass. The method in which these two control approaches are used together is called the hybrid controller. The conditions for producing the desired force of a hybrid control are given in Equation 18 (Yıldız 2022).

In the Skyhook controller, it is assumed that the vehicle's sprung mass is hooked to the sky by an ideal damper, and the force produced by this damper will be considered as a desired force.

$$\begin{aligned}
 F_{sky} &= \begin{cases} c_{sky} \dot{x}_s & (\dot{x}_s - \dot{x}_u) \dot{x}_s > 0 \\ 0 & (\dot{x}_s - \dot{x}_u) \dot{x}_s \leq 0 \end{cases} \\
 F_{gnd} &= \begin{cases} -c_{gnd} \dot{x}_u & (\dot{x}_s - \dot{x}_u) \dot{x}_u < 0 \\ 0 & (\dot{x}_s - \dot{x}_u) \dot{x}_u \geq 0 \end{cases} \\
 F_{hybrid} &= \alpha_h F_{sky} + (1 - \alpha_h) F_{gnd}
 \end{aligned} \tag{18}$$

Here, the Hybrid control works as a Skyhook controller if α_h is selected as 1, and it works as a Groundhook controller if α_h is selected as zero. The Simulink diagram of the Hybrid controller is given in Figure 4. The c_{sky} , c_{gnd} and α_h values selected as 2500, 2000 and 0.65, respectively.

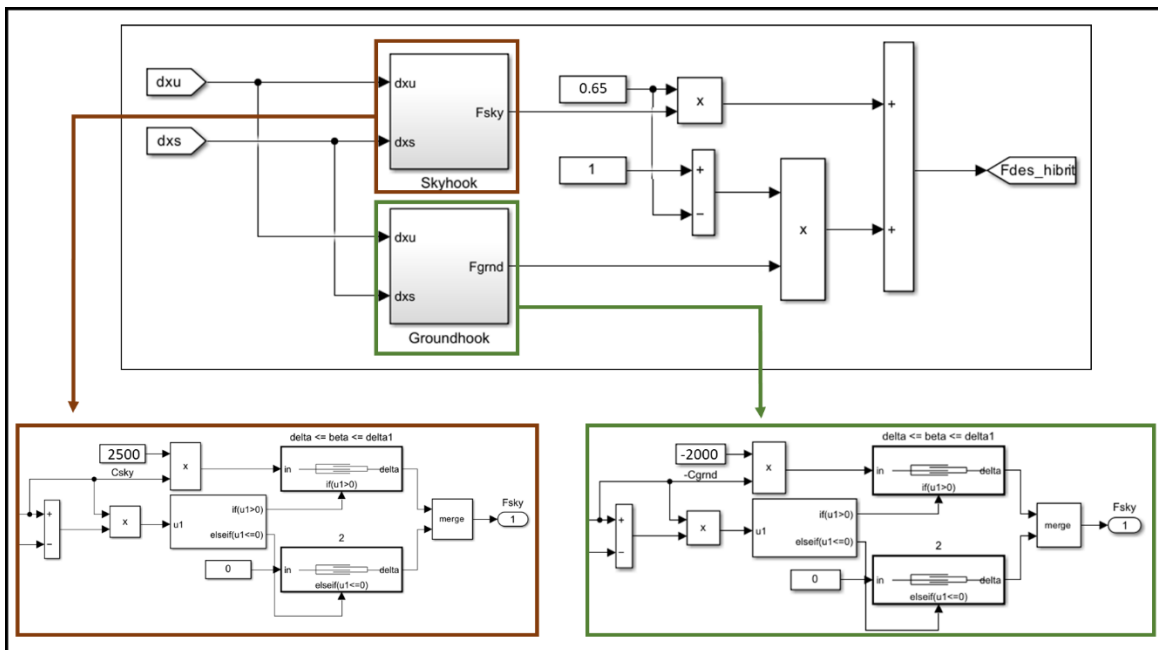

Figure 4. Simulink diagram of the Hybrid control.

Aircraft model based on multibody software

The aircraft model was created in SIMPACK multibody dynamics software and consists of main and nose landing gears which are connected to the fuselage with uniaxial springs and damping elements. The model has a single MR damper which is equipped on the nose landing gear. Axis

transformations of the aircraft are $\phi-\theta-\varphi$ (roll, pitch, and yaw) respectively. The modelled aircraft is shown in Figure 5.

Figure 5. The aircraft model in the SIMPACK

In the aircraft model, the initial conditions are expressed in Figure 6. The drag and lift forces were neglected. It was assumed that the runway length was sufficiently long for the landing maneuver. When the wheels touch the ground, the speed of the aircraft is assumed to be approximately 1.15 times the stall speed (Raymer 1999). Here, stall speed refers to the lowest speed at which the aircraft can fly stably without losing lift from its wings (Raymer 1999).

Figure 6. Initial conditions of the aircraft at the beginning of the simulation.

To create the co-simulation structure in the MATLAB-Simulink environment, the aircraft model which was created in SIMPACK was exported by using the FMU block.

To construct the model in the same state space format with mathematical aircraft model which was given in eq. (14) output and input ports were adjusted to be similar. The Simulink layout can

be seen in Figure 7. The MR damper parameters used in equations 1 and 2 are taken from (Yıldız 2022) are also given in Table 1. The parameters of the aircraft model used in the simulation studies are given in Table 2.

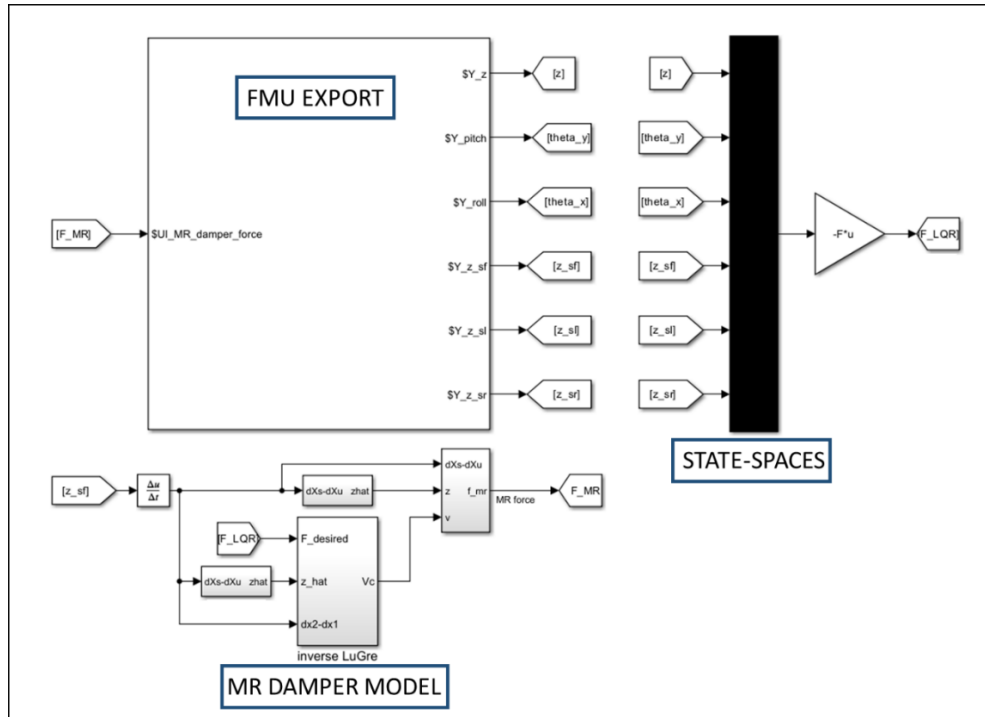

Figure 7. Simulink diagram of the aircraft model

Table 1. MR damper parameters

Symbol	Definition of Model Constants	Value	Unit
σ_0	Stiffness of Z varying with voltage	654.06×10^3	N/(m.V)
σ_1	Damping coefficient of internal variable	4.0307×10^3	N.s/m
σ_2	Viscous damping coefficient	1.156×10^3	N.s/m
σ_a	Stiffness of the internal variable Z	360.48×10^3	N/m
σ_b	Viscous damping coefficient depending on voltage	1.2056×10^3	N.s/(m.V)
a_0	Constant coefficient	6.5546×10^3	1/m

Table 2. Parameters of the considered aircraft model.

Parameter	Symbol	Value/Unit
Initial velocity of the aircraft.	V_0	57 km/h
Initial pitch angle of the aircraft.	θ_0	3 degree
Mass of the aircraft.	M_b	1218 kg
Mass of the nose landing gear.	m_f	120 kg
Mass of each main landing gear.	m_l, m_r	60 kg
Inertia moment of the aircraft to axle x.	I_x	390 kg.m ²
Inertia moment of the aircraft to axle y.	I_y	2110 kg.m ²
Inertia moment of the aircraft to axle z.	I_z	2350 kg.m ²
y-axis distance of each main landing gear to gravity center.	L_l, L_r	1.81 m
x-axis distance between nose landing gear and the gravity center.	L_f	1.5 m
x-axis distance of main landing gears to the gravity center.	L_b	1.5 m
z-axis distance between main wheels to gravity center.	h_f	1.7 m
z-axis distance between nose wheel to gravity center.	h_l, h_r	1.7 m

Vertical stiffness of wheels.	k_{fl}, k_{tl}, k_{tr}	190000 N/m
Vertical stiffness of the main wheel.	c_{il}, c_{tr}	1500 N.s/m

FINDINGS and DISCUSSION

Under the landing conditions, the operating range of the MR damper is an important criterion for understanding the effect of the applied controllers on the aircraft's dynamic behavior. The operating range of the MR damper under the different control inputs can be seen in Figure 8. As it can be seen in Figure 8, the displacement of the MR damper is decreased when compared to the uncontrolled case with the given voltages to the MR damper. MR damper used in the study can operate within the range of its operating limit. This limit is not exceeded under landing conditions.

Figure 8. Operating range of MR damper

Figure 9 shows the voltage supplied to the MR damper in cases of LQR, Di-LQR and Hybrid controllers. As one can see in Figure 9, after the MR damper stops the oscillating movement the Hybrid controller cuts the voltage to the MR damper.

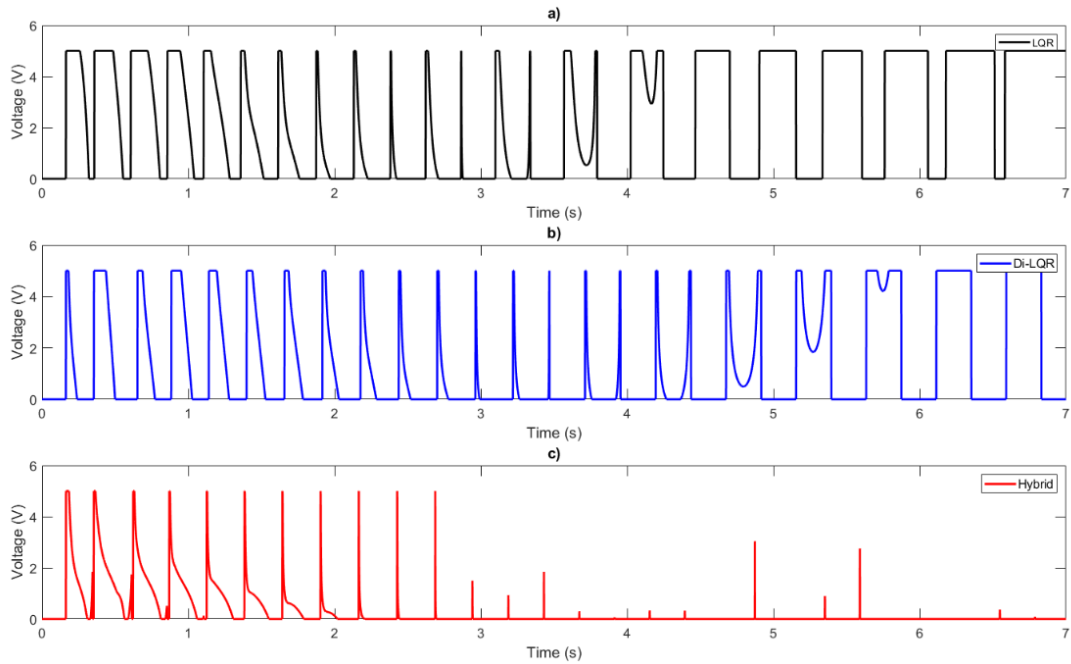

Figure 9. Voltage to MR damper

The reaction force of ground during the landing motion is one of the commonly used performance criteria for aircraft landing gear. This criterion can be calculated with the efficiency of the shock absorber. The efficiency of the shock absorber is determined by the ratio between the energy absorbed by the damper during the initial stroke and the multiplication of the maximum reaction force of ground and the maximum stroke (Luong et al. 2022). The efficiency formula is given in Equation 19.

$$\eta = \frac{\int F_d ds}{F_{\max} s_{\max}} \quad (19)$$

In this study, MR damper has been used as a shock absorber in addition to spring and damper elements of the nose landing gear. The efficiency values of the applied control approaches during landing movement can be seen in Table 3. As clearly shown in the table, it can be observed that the aircraft achieved an 80.95% efficiency in landing motion under the designated landing conditions with a passive damping system without MR damper. However, the inclusion of a semi-active damping system in the landing gear improved the aircraft's landing efficiency. When LQR control was applied to the semi-active MR damper, it attained an efficiency of 88.45%.

Table 3. Comparison efficiency of MR damper in different conditions

	Maximum stroke of MR damper (m)	Maximum tire reaction force (kN)	MR shock absorbing efficiency (%)
Passive	0.0745	20.180	80.95
LQR	0.0663	20.438	88.45
Di-LQR	0.0704	19.608	87.76
Hybrid control	0.0698	19.854	87.18
Zero voltage	0.0725	20.135	82.92

Another performance criterion involves the RMS (Root Mean Square) values of aircraft body accelerations during the landing. The improvement percentages obtained by comparing these values shed light on how the applied controllers influence the system. The RMS values and improvement percentage of the RMS when compared to the pitch and vertical body accelerations of the passive system are given in Table 4. As seen in the table, about the vibration of suppression the applied LQR controller to the MR damper was more effective than the others.

Table 4. RMS values

	Passive	LQR	Di-LQR	Hybrid Control	Zero Voltage
RMS $\ddot{\theta}$	1.3176	1.12	1.1216	1.1649	1.2596
improvement %		15.01	14.87	11.59	4.4
RMS \ddot{z}	1.8084	1.5094	1.5281	1.5886	1.7261
improvement %		16.54	15.5	12.15	4.5

CONCLUSION and RECOMMENDATIONS

In this study, the aircraft was modelled both mathematically and in a multi-body dynamics software to evaluate the nose landing gear suspension control performance. With the applied control approaches, the aircraft in touchdown state; body accelerations, landing efficiency and MR damper operating range were compared. Simulation results show that the LQR controller which is obtained with cost function more effective than other control structures.

ABSTRACT

Effective leadership in the agro-industry is crucial for maximizing productivity, promoting innovation, and ensuring the well-being of employees. Agro-industry is a sector of the economy that encompasses various agricultural activities, from production and processing to distribution and marketing of agricultural products. It involves adding value to raw materials derived from the agricultural sector, thereby contributing to economic growth, rural development, and food security. This paper examines leadership strategies through the lens of counselling psychology, highlighting key principles and approaches that can enhance leadership effectiveness. It offers practical guidance for leaders in the agro-industry, emphasizing the importance of self-awareness, emotional intelligence, effective communication, fostering a positive work environment, and promoting employee growth and development. The paper recommend Stress Management techniques by integrating counselling psychology principles into their leadership practices, agro-industry leaders can cultivate a thriving organizational culture that drives success and sustainability.

Keywords: Agro-industry, Leadership strategies and counselling psychology.

INTRODUCTION

Agro-industry refers to a sector of the economy that encompasses various agricultural activities, from production and processing to distribution and marketing of agricultural products. It involves adding value to raw materials derived from the agricultural sector, thereby contributing to economic growth, rural development, and food security (Thutupalli, & Shepard, 2005).

It is a multifaceted sector that encompasses various activities involved in the production, processing, and distribution of agricultural products. It involves adding value to raw agricultural materials through transformation, manufacturing, and marketing processes. The primary goal of agro-industry is to create products with higher economic value, improved shelf life, and increased consumer appeal, thus contributing to the overall development of both rural and urban economies (Dolan, & Humphrey, 2004).

Agro-industrial activities can include food and beverage processing, textiles and clothing manufacturing, wood and paper production, biofuel processing, and more. These activities bridge the gap between agricultural production and consumer demand, promoting economic growth, job creation, and technological advancement within the agricultural sector (Dolan, & Humphrey, 2004).

The food processing industry involves transforming raw agricultural products into processed food and beverages. This includes activities like canning, freezing, packaging, and adding value to agricultural products (Reardon, Timmer, Barrett, & Berdegue, 2003). The agrochemical industry produces fertilizers, pesticides, and other chemicals used to enhance crop growth and protect plants from pests and diseases (Pretty, 2008). Agribusiness and Marketing involves various business activities related to agriculture, including production, processing, distribution, and marketing. This industry plays a crucial role in linking farmers and consumers (Key, & Runsten, 1999). Livestock and Dairy Industry includes the rearing, breeding, and processing of animals for meat, milk, and other products. It's a significant source of protein and income for many communities (Delgado, Rosegrant, Steinfeld, Ehui, & Courbois, 1999). The biofuels and biomass industry focuses on producing renewable energy sources from organic materials, such as agricultural residues, to reduce reliance on fossil fuels (Searchinger, Heimlich, Houghton, Dong, Elobeid, Fabiosa, & Yu, 2008). Horticulture and Floriculture involves cultivating and growing fruits, vegetables, and ornamental plants, while floriculture specifically focuses on cultivating flowers and ornamental plants for commercial purposes (Kader, 2008). Aquaculture is the farming of aquatic organisms like fish, shrimp, and mollusks. It addresses the growing demand for seafood while aiming to manage aquatic resources sustainably (Delgado, Wada,

Rosegrant, Meijer, & Ahmed, (2003). Agroforestry combines agriculture and forestry practices, integrating trees or shrubs with crops or livestock. It helps improve soil fertility, biodiversity, and overall ecosystem health (Nair, 1993). Agro-processing involves adding value to agricultural products through processing and manufacturing. It can include activities like milling, canning, and creating processed foods (Haggblade, & Diallo, 2003). The seed industry focuses on producing, developing, and distributing high-quality seeds for crops, contributing to improved agricultural productivity and sustainability (Morris, Tripp, & Dankyi, 1999).

It represents the integration of agricultural production, processing, and distribution within a comprehensive value chain. This sector transforms raw agricultural materials into value-added products, meeting the demands of both consumers and industrial buyers. Agro-industry encompasses various activities, including cultivation, harvesting, post-harvest processing, packaging, transportation, and marketing. The aim is to enhance the economic value of agricultural commodities and contribute to overall economic growth and development (Cadilhon, Moustier, & Poole, 2006).

Agro-industrial activities can vary widely based on the type of products, resources, and technologies available in a particular region. This sector not only contributes to food supply but also creates employment opportunities, improves rural livelihoods, and supports trade at local, national, and international levels. Additionally, agro-industry can stimulate the development of related industries, such as packaging, equipment manufacturing, and transportation. It plays a crucial role in feeding the world's population and driving economic growth in many countries. According to the World Bank, agriculture accounts for approximately 30% of the world's GDP and employs over 40% of the global workforce (World Bank, 2021).

Effective leadership plays a pivotal role in the success and growth of the agro-industry. In an ever-evolving and challenging business environment, leaders need to leverage psychological insights to guide their teams effectively. Leadership strategies informed by counselling psychology, focusing on key principles and approaches that foster organizational well-being and productivity.

Counselling psychology is a field of psychology that focuses on helping individuals address emotional, social, vocational, and educational issues. It is a collaborative process between the counsellor and client that involves identifying problems, setting goals, and developing strategies to overcome challenges.

THEORETICAL FRAMEWORK

1. Transformational Leadership Theory:

Transformational Leadership, as proposed by Bass and Avolio (1994), emphasizes how leaders inspire and motivate their team members to achieve higher levels of performance through individualized consideration, intellectual stimulation, inspirational motivation, and idealized influence. This theory is particularly relevant to Agro-Industry, where leaders can encourage innovation and growth by fostering a sense of purpose and shared vision. In the context of Agro-Industry, leaders who exhibit transformational leadership traits can foster innovation, teamwork, and employee well-being, leading to improved productivity and sustainable growth. This leadership style can be especially effective in times of uncertainty, such as when navigating volatile market conditions or adopting new agricultural technologies.

2. Positive Psychology and Resilience:

Positive Psychology, pioneered by Martin Seligman (2002), focuses on cultivating strengths, well-being, and resilience. In the Agro-Industry, leaders can apply positive psychology principles to enhance team members' psychological resilience, especially in the face of challenges such as weather fluctuations, market volatility, or resource constraints. By encouraging a growth mindset, emphasizing strengths, and promoting work-life balance, leaders can contribute to the overall mental health and success of their teams.

3. Transactional Leadership Theory:

Transactional Leadership, as introduced by Burns (1978), focuses on the exchange between leaders and followers, emphasizing rewards and punishments for performance. In the Agro-Industry, leaders can use transactional leadership strategies to establish clear expectations, goals, and performance metrics. By offering rewards such as incentives for achieving agricultural targets or implementing sustainable practices, leaders can motivate teams to achieve desired outcomes.

4. Ecological Systems Theory and Leadership:

Ecological Systems Theory, developed by Bronfenbrenner (1979), examines how individuals are influenced by various systems within their environment. In the context of Agro-Industry, leaders can draw from this theory to understand how ecological factors, such as market trends, regulatory policies, and community relationships, impact their leadership strategies. By adapting their approach to these external factors, leaders can effectively navigate complex agricultural landscapes.

5. Solution-Focused Brief Therapy (SFBT):

Solution-Focused Brief Therapy, developed by de Shazer and Berg (1993), is a counselling approach that focuses on identifying solutions and setting achievable goals. Leaders in the Agro-Industry can incorporate SFBT principles to address challenges and conflicts within their teams. By emphasizing strengths, solutions, and collaboration, leaders can create a positive and proactive work environment that fosters innovation and problem-solving.

6. Self-Determination Theory (SDT):

Self-Determination Theory, proposed by Deci and Ryan (1985), highlights the importance of intrinsic motivation and autonomy in driving human behavior. In Agro-Industry leadership, applying SDT principles involves providing employees with a sense of autonomy and opportunities for skill development. This can lead to higher job satisfaction, greater engagement, and a stronger commitment to the organization's goals.

7. Person-Centered Approach:

One of the most influential figures in counselling psychology is Carl Rogers. His humanistic approach emphasizes the importance of empathy, unconditional positive regard, and genuineness in the therapeutic relationship. Rogers believed that individuals have the capacity for self-growth and self-actualization, and that the role of the counsellor is to facilitate this process (Rogers, 1957).

The Person-Centered Approach, developed by Carl Rogers (1951), emphasizes the importance of empathy, active listening, and unconditional positive regard in promoting individual growth and self-actualization. In the context of Agro-Industry leadership, this approach can contribute to building strong relationships between leaders and team members. By adopting empathetic communication and active listening, leaders can create an environment that values the well-being and mental health of employees. This, in turn, can lead to improved job satisfaction, reduced turnover, and increased overall productivity. In Agro-Industry leadership, applying this approach can enhance communication, trust, and psychological safety among team members, leading to increased job satisfaction and reduced stress.

8. Behaviour therapy (REBT) approach:

Another important contributor to counselling psychology is Albert Ellis. He developed the rational emotive behavior therapy (REBT) approach, which focuses on identifying and challenging irrational beliefs that lead to negative emotions and behaviours. Ellis believed that individuals can learn to think and behave in more productive ways by changing their thought patterns (Ellis, 1962).

9. Cognitive-behavioural therapy (CBT):

In recent years, cognitive-behavioural therapy (CBT) has become a popular approach in counselling psychology. CBT emphasizes the role of thoughts and behaviours in shaping emotions, and involves identifying and challenging negative thought patterns and developing more adaptive behaviors (Beck, 1976).

Therefore, it is advisable to tailoring the approach based on these theories can help create a comprehensive strategy that fosters growth, productivity, and well-being within the agricultural context.

LEADERSHIP STRATEGIES

Leadership is a key element in the success of agro-industry. Effective leadership promotes greater productivity, employee engagement, and overall success of the organization.

1. Transformational Leadership

One effective strategy is transformational leadership. According to Bass and Riggio (2006), transformational leaders inspire and motivate their followers to achieve beyond their expected capabilities. They focus on the development of their employees and create a positive organizational culture. Transformational leaders in agro-industry can inspire their employees to adopt sustainable practices, increase yields, and improve the overall quality of their products.

2. Servant Leadership

Another effective strategy is servant leadership. Spears (2002) defined servant leadership as a leadership philosophy where the leader prioritizes the needs of their employees above their own. Servant leaders in agro-industry can create a positive work environment where employees feel valued, leading to increased productivity and employee retention.

3. Authentic Leadership

Additionally, authentic leadership is another effective strategy. Avolio and Gardner (2005), defined authentic leadership as a leadership style where the leader is self-aware, transparent, and genuine in their interactions with their employees. Authentic leaders in agro-industry can build trust with their employees, leading to increased engagement and loyalty.

4. Emotionally intelligent leadership

Emotionally intelligent leadership involves the ability to understand and manage one's own emotions, as well as the emotions of others, in order to create a positive and productive work environment. It emphasizes empathy, self-awareness, and effective communication (Goleman, Boyatzis, & McKee, 2002). Empathy is a cornerstone of emotional intelligence. Leaders who demonstrate empathy can understand and share the feelings of their team members, creating a

sense of belonging and support. This contributes to higher job satisfaction and overall well-being among employees (Bass & Riggio, 2006). Incorporating emotional intelligence into leadership practices has been found to enhance team dynamics, decision-making, and conflict resolution. By considering the emotional needs and perspectives of others, leaders can foster an inclusive and collaborative environment (Cherniss & Goleman, 2001).

Thus, effective leadership strategies in agro-industry can be improved by utilizing transformational, servant, authentic, and emotionally intelligent leadership. These leadership strategies can lead to greater productivity, employee engagement, and overall success of the organization.

Counselling psychology principles

Counselling psychology principles offer valuable insights and approaches that can enhance leadership strategies in the agro-industry. By integrating these principles, leaders can foster a supportive work environment, promote employee well-being, and drive organizational success. These can inform and enhance leadership strategies in the agro-industry as follows:

1. Self-Awareness and Authentic Leadership

Self-awareness, a core principle of counselling psychology, enables leaders to understand their own strengths, weaknesses, and values. By cultivating self-awareness, leaders in the agro-industry can engage in authentic leadership practices. Authentic leaders who are genuine, transparent, and consistent can build trust, inspire their teams, and make ethical decisions (Avolio & Gardner, 2005). Self-reflection, mindfulness practices, and seeking feedback from others are effective tools for developing self-awareness.

2. Emotional Intelligence and Relationship Building

Emotional intelligence (EI) is an essential attribute for leaders in the agro-industry. Leaders with high EI possess the ability to recognize and manage their own emotions as well as those of their team members. This enables them to create a supportive work environment, build strong relationships, and effectively resolve conflicts. Developing empathy, active listening skills, and emotional regulation techniques enhances a leader's ability to motivate and engage employees (Goleman, 1998).

3. Effective Communication

Clear and open communication is vital for effective leadership in the agro-industry. Counselling psychology emphasizes the importance of active listening, using appropriate body language, and providing constructive feedback. Effective communication ensures that messages are

understood, intentions are transparent, and employee concerns are addressed promptly. By fostering open communication, leaders can create a culture of trust, collaboration, and shared understanding (Hargie, 2016).

4. Positive Work Environment

Creating a positive work environment is essential for employee well-being and productivity. Agro-industry leaders can foster positivity by recognizing and celebrating achievements, promoting work-life balance, and encouraging a supportive and inclusive organizational culture. By prioritizing employee engagement, leaders can enhance job satisfaction and reduce turnover rates (Bakker et al., 2017).

5. Employee Growth and Development

Leadership in the agro-industry involves nurturing employee growth and development. Supporting ongoing training and professional development opportunities encourages employees to expand their skills and knowledge. Effective leaders also provide mentoring and coaching, offering guidance and feedback to help employees reach their full potential. These strategies promote loyalty, motivation, and commitment within the organization (Tims et al., 2011).

In addition, in fostering effective leadership within agro-industrial organizations relies on other factors, including conflict resolution skills and stress management techniques.

a. Conflict Resolution

Conflict is inevitable in any organizational setting, including the agro-industry. Effective leaders possess conflict resolution skills that help them address conflicts in a constructive manner. Counselling psychology provides techniques for resolving conflicts, such as active listening, empathy, and problem-solving. By promoting open communication, encouraging dialogue, and facilitating win-win solutions, leaders can manage conflicts, maintain team cohesion, and promote a healthy work environment (Hargie, 2016).

b. Stress Management Techniques

Leaders in the agro-industry often face high levels of stress due to the demanding nature of their roles. Effective leadership involves implementing stress management techniques to cope with these pressures. Counselling psychology principles offer strategies for stress management, including promoting work-life balance, providing resources for stress reduction, and fostering a supportive organizational culture (Avolio & Gardner, 2005). By prioritizing employee well-being and implementing stress management practices, leaders can mitigate stress levels, enhance employee satisfaction, and promote a healthier work environment.

CONCLUSION

This sector plays a pivotal role in transforming primary agricultural products into marketable goods, which can include food, beverages, textiles, biofuels, and more. Agro-industry often integrates elements of processing, manufacturing, packaging, distribution, and marketing to meet consumer demand and enhance the value of agricultural commodities. It contributes to employment opportunities, income generation, and overall economic development, particularly in rural areas where agriculture is a dominant activity.

Leadership in the agro-industry can benefit greatly from integrating counselling psychology principles and strategies. By prioritizing self-awareness, emotional intelligence, effective communication, fostering a positive work environment, and promoting employee growth and development, leaders can create a thriving organizational culture that drives success and sustainability.

Emotional intelligence, conflict resolution skills, and stress management techniques play vital roles in fostering effective leadership within agro-industrial organizations. By developing emotional intelligence, leaders can create a supportive work environment and build strong relationships. Additionally, conflict resolution skills enable leaders to address conflicts constructively and maintain team cohesion. Moreover, implementing stress management techniques promotes employee well-being and productivity. By integrating these elements into their leadership practices, leaders in the agro-industry can enhance their effectiveness and contribute to the success of their organizations.

RECOMMENDATIONS

- Leaders in the agro-industry face significant pressures and challenges. Counselling psychology principles can help leaders develop stress management and well-being techniques to cope with these demands.
- Prioritizing employee well-being and implementing strategies such as promoting work-life balance, offering stress management programs, and providing supportive resources, leaders can mitigate stress levels, enhance employee satisfaction, and foster a healthier work environment.

**APPLICATION OF LEAST SQUARE DUMMY VARIABLE (LSDV) IN ESTIMATION
OF INEQUALITY ADJUSTED HDI**

ABSTRACT

The effects of inequality-adjusted indexes for education, income and life expectancy on inequality-adjusted human development index were observed using panel data for periods 2010 to 2019 in Benin, Cameroun, Ghana, Niger and Nigeria via Least squares dummy variable (LSDV) model that varies non-stochastically over time series (t) and individual level (i) observations. ADF test revealed unit root process for the series skating around their variances, centered dependent time with infinite persistence shocks. VIF test indicated moderately correlations of the variables in the LSDV model regression. Breusch-Godfrey/Wooldridge test predicted no serial correlation in idiosyncratic errors of the LSDV model. Again, Breusch-Pagan LM and Pasaran CD test indicated insignificant cross-sectional dependence in the panels. Likewise, the Breusch-Pagan test predicted that the regression disturbances of LSDV model are homoskedastic with the same variance across time and individuals. Consequently; for a given country, as inequality-adjusted indexes for education, income and life expectancy fluctuates across time by one unit, the inequality-adjusted human development index increases by 33.32%, 33.40% and 33.23% discretely.

Keywords: Homoskedastic, Inequality-adjusted, LSDV model, Panel data, Unit root

INTRODUCTION

The geometric mean of inequity-adjusted dimensional indices that is based on a distribution-sensitive class of composite indices, replicates the inequality-adjusted human development index (IHDI). It regulates the human development index (HDI) for variation in the distribution of each dimension across the population inside the same country and measures the level of human development when difference is accounted for. IHDI accounts for inequalities in HDI measurements by overlooking each dimension's average value according to its level of disparity. The IHDI value equals the HDI value when there is no inequality across people but falls below the HDI value as inequality rises (UNDP, 2022, 2015, Gorobets, 2011, Foster et al., 2005, Atkinson, 1970). IHDI estimated for 5 countries (Benin, Cameroun, Ghana, Niger and Nigeria) captures the losses in human development due to disproportion in education, health and income. Inequality-adjusted education index considered based on inequality in education and the HDI education index, estimates the HDI education index value adjusted for variation in distribution of years of schooling based on data from household surveys listed in main data sources. Inequality-adjusted life expectancy index (proxy health) evaluates the HDI life expectancy index value adjusted for inequality in distribution of expected length of life based on data from life tables listed in main data sources. Inequality-adjusted income index evaluates the HDI income index value adjusted for inequality in income circulation based on data from family surveys listed in main data sources (UNDP, 2022, 2015, Zhang and Cai, 2014).

This article estimates the Least squares dummy variable (LSDV) model that takes into account the individuality of the countries from periods 2010 to 2019 in Benin, Cameroun, Ghana, Niger and Nigeria in order to assess the weight of inequality-adjusted indexes for education, income and life expectancy data on the inequality-adjusted human development.

MATERIALS and METHODS

Panel data are more explanatory cross-sections that permits trailing discrete times past, replicates changing aspects and Granger causality thru variables. The behavior of individuals can be observed across time and individual heterogeneity can be orderly. Variables at different levels of analysis suitable for multilevel or hierarchical modeling can be included in a panel data. Although; data collection issues (i.e. sampling design, treatment), non-response in the case of micro-panels ($N \geq T$) or cross-country dependency in the case of macro-panels (i.e. association between countries, $T \geq N$) are major deficiencies in panel data (Baltagi, 2015, 2014, Hakim and

Bujang, 2012, Gujarati and Porter, 2009, Stock and Watson, 2006, Baltagi, 2005, Arellano, 2004, Gujarati, 2003, Hsiao, 2003, Hsiao and Kamil, 1997, Gujarati, 1996, Anderson and Hsiao, 1982). The Least squares dummy variable (LSDV) model fulfills all conditions of the Gauss-Markov Theorem. Therefore, OLS for this regression is called LSDV (least-squares dummy variables), the within, or the FE estimator. Assuming that X as non-stochastic, LSDV is unbiased, consistent and linear efficient (BLUE). LSDV imposes time independent effects for each country that are possibly correlated with regressors (Gujarati, 2006). The regression model for T time series observations and N individual-level observations is given as: (Stock and Watson, 2007, Bruno, 2005, Baltagi et al., 2003, Baltagi, et al., 2000, Mundlak, 1978):

$$y_{it} = \alpha_i + \beta_i'x_{it} + \mu'Z_{\mu,it} + \varepsilon_{it}, \quad i = 1, \dots, N, \quad t = 1, \dots, T \quad (1)$$

$\alpha_i (i = 1, \dots, n)$ are the unknown intercept for each country (n country-specific intercepts). y_{it} is the dependent variable for $i =$ country and $t =$ time, x_{it} represents the independent variables, β is the estimated coefficient for that independent variables, the error term ε_{it} are individual unit specific time invariant effects. $Z_{\mu,it}^{(j)}$ denotes the dummy variable that is 0 for all observations (it) with $i \neq j$ and 1 for $i = j$; $Z_{\mu,it} = (Z_{\mu,it}^{(1)}, \dots, Z_{\mu,it}^{(N)})'$ and $\mu = (\mu_1, \dots, \mu_N)'$. In the dummy-variable trap LSDV; If $\sum_{j=1}^N Z_{\mu,it}^{(j)} = 1$; then, inhomogeneous LSDV regression would be multi-collinear; thus,

the restricted OLS imposes $\sum_{j=1}^N \mu_j = 0$. The homogeneous regression with free μ_i^* coefficients;

then, $\hat{\sigma}$ is recovered from $\sum_{j=1}^N \hat{\mu}_i^*$ and $\hat{\mu}_i = \hat{\mu}_i^* - \hat{\alpha}$. The compact form of equation (1) stacks all NT

observations as (Baltagi, et al., 2000, Arellano, 2004, Baltagi and Griffin, 1997, Nickel, 1981):

$$y = \alpha t_{NT} + X\beta + \mu Z_{\mu} + \varepsilon \quad (2)$$

Where, t_{NT} , y , and ε are NT-vectors. t_T are T-vector of ones. By convention, is that i is the slow index and t is the fast index, such that the first T observations belong to $i = 1$. X is an $NT \times K$ matrix, β is a K-vector, μ is an N-vector. $Z_{\mu} = y - (\bar{y}_1, \dots, \bar{y}_N)'$ is an $NT \times N$ -matrix such that, all observations are adjusted for their individual time averages (Baltagi and Griffin, 1997).

Applying Frisch-Waugh to LSDV involves regressing y and all regressors in X on Z_{μ} and the residuals are formed, i.e. the observations corrected for their individual time averages; also, the

purged y observations are regressed on the purged covariates; then, $\hat{\beta}$ is obtained and is identical to the one obtained from the original regression. The procedure fails for time-constant variables. An OLS estimate of $\hat{\mu}$ follows from regressing the residuals $y - X\hat{\beta}$ on dummies. The purging (or sweep-out) operation is defined by the matrix: $Q = I_{NT} - T^{-1}(I_N - J_T)$ with a $(T \times T)$ purging matrix $J_T = l_T l_T'$ of elements with ones; thus, $\tilde{y} = y - (\bar{y}_1, \dots, \bar{y}_N)' \otimes l_T = Qy$. The FE estimator can be written compactly as (Okeke and Okeke, 2016, Hahn and Kuersteiner, 2002):

$$\hat{\beta}_{FE} = (X'Q'QX)^{-1} X'Q'QX = (X'QX)^{-1} X'Qy \quad (3)$$

The LSDV estimator looks like a GLS estimator, and the algebra for its variance follows the GLS variance, $\text{var}(\hat{\beta}_{FE}) = \sigma_\varepsilon^2 (X'QX)^{-1}$. If $E(\hat{\beta}_{FE}) = \beta$ and $\text{var}(\hat{\beta}_{FE}) \rightarrow 0$; then, $\hat{\beta}_{FE}$ will be consistent. If $T \rightarrow \infty$, $(X'Q_2X)^{-1}$ converges to 0, assuming that all covariates show constant or increasing variation around their individual means, i.e., it allows the retrieval of consistent estimates of all μ_i effects, but excludes time-constant covariates; and also, if $N \rightarrow \infty$, $(X'Q_2X)^{-1}$ converges to 0, assuming that covariates vary across individuals, but excludes covariates indicative of time points (Kiviet, 1999). For the feasible GLS estimator, this variance is attained asymptotically for $N \rightarrow \infty$ and $T \rightarrow \infty$. $\hat{\beta}_{FE,2\text{-way}}$ is consistent for $T \rightarrow \infty$ and for $N \rightarrow \infty$; $\hat{\mu}$ is consistent for $T \rightarrow \infty$, and $\hat{\lambda}$ is consistent for $N \rightarrow \infty$. (Baltagi, 2015, 2014, 2005).

Plugging in a sensible estimator $\hat{\sigma}_\varepsilon^2$ for σ_ε^2 in $\sum_{FE} = \sigma_\varepsilon^2 (X'QX)^{-1}$ which returns $\hat{\Sigma}_{FE} = [\hat{\sigma}_{FE,jk}^2]_j$ for $j = k = 1, \dots, K$ and permits to create t-values for the vector β

$$\Rightarrow t_\beta = \text{diag}(\hat{\sigma}_{FE,11}^{-1/2}, \dots, \hat{\sigma}_{FE,NN}^{-1/2}) \hat{\beta}_{FE} \quad \forall T \rightarrow \infty \quad (4)$$

where $\hat{\sigma}_\varepsilon^2 = (NT - N - K)^{-1} \sum_{i=1}^N \sum_{t=1}^T \hat{\varepsilon}_{it}^2$. The t-statistics on μ_i and σ are obtained by evaluating the full model in an equivalent way. These t-values under their null are asymptotically $N(0, 1)$. The GLS estimator for the two-way model for random effect is linear efficient with variance matrix (Gujarati, 2006, 2003, Hahn and Kuersteiner, 2002):

$$\Omega = E(\varepsilon\varepsilon') = \sigma_\mu^2 (I_N \otimes J_T) + \sigma_\lambda^2 (J_N \otimes I_T) + \sigma_\varepsilon^2 I_{NT} \text{ and } \Omega^{-1} = a_1 (I_N \otimes J_T) + a_2 (J_N \otimes I_T) + a_3 I_{NT} + a_4 J_{NT}$$

where $a_1 = -\frac{\sigma_\mu^2}{(\sigma_\varepsilon^2 + T\sigma_\mu^2)\sigma_\varepsilon^2}$, $a_2 = -\frac{\sigma_\lambda^2}{(\sigma_\varepsilon^2 + T\sigma_\lambda^2)\sigma_\varepsilon^2}$, $a_3 = \frac{1}{\sigma_\varepsilon^2}$, $a_4 = \frac{\sigma_\mu^2\sigma_\lambda^2}{\sigma_\varepsilon^2(\sigma_\varepsilon^2 + T\sigma_\mu^2)(\sigma_\varepsilon^2 + N\sigma_\lambda^2)} \frac{2\sigma_\varepsilon^2 + T\sigma_\mu^2 + N\sigma_\lambda^2}{\sigma_\varepsilon^2 + T\sigma_\mu^2 + N\sigma_\lambda^2}$,

σ_ε^2 , σ_μ^2 and σ_λ^2 are unknown variance parameter. The GLS estimator for the random effect model is: $\hat{\beta}_{RE, 2-way} = \{X'_\# \Omega^{-1} X_\#\}^{-1} X'_\# \Omega^{-1} y$ is linear efficient (BLUE) and its GLS variance is given by: $\text{var}(\hat{\beta}_{\#, RE}) = \{X_\# \Omega^{-1} X_\#\}^{-1}$, $X_\#$ denotes the X matrix extended by the intercept column. If $N \rightarrow \infty$, $T \rightarrow \infty$ and $N/T \rightarrow c \neq 0$; then, $\Omega^{-1} \rightarrow Q$ and the RE estimator becomes the FE estimator. Thus, FE and RE have similar properties for time-series panels (Okeke and Okeke, 2016, Baltagi, 2015, 2014, Gujarati and Porter, 2009, Baltagi, 2005). The crucial distinction between fixed and random effects is whether the unobserved individual effect embodies elements that are correlated with the regressors in the model, not whether these effects are stochastic or not (Pesaran, 2015, Wooldridge, 2010, Green, 2008, Hsiao, 2003, Kiviet, 1999).

FINDINGS and DISCUSSION

The balanced panel: $n = 5$, $T = 10$, $N = 50$ data points from United Nations Development Program (UNDP) database for Benin, Cameroun, Ghana, Niger and Nigeria that replicates the inequality-adjusted indexes for education, human development, income and life expectancy for periods 2010 to 2019. The variety of these countries was based on the availability of data. The graphics, probabilities and consistent measures of the regression were acquired by fitting the imprinting of R programming.

The time series plots for individual countries in figure 1 showed some volatile oscillations in their mean and variances. The auto-covariances are time dependent. It would be typical to say that the series are not covariance stationary by concept; since, they are fluctuating over time and non-uniform spontaneity in the time series continues. Thus, it is essential to validate the unit root structure of the series.

Figure 1. Time series plot for individual countries

All countries, $n=5$ have the same number of observations for all the years in figure 2; thus, data is balanced and the 95% confidence interval around the means of the series that replicates the heterogeneity across years (fixed effects). It reflects the true differences in effect sizes related to intrinsic factors of the study. Similarly, the time periods, $n=10$ years for all countries in figure 3.

Figure 2. Time series plot for heterogeneity across years

Figure 3. Time series plot for heterogeineity across countries

The Argument Dickey Fuller (ADF) test in table 1 revealed unit root process in the log levels of the series for lag order 3; thus, persistence of shocks will be infinite for the series.

Table 1. Augmented Dickey-Fuller Unit Root Test

variable	LH1	LE1	LC1	LL1
test stat.	-2.2385	-1.9639	-2.2277	-2.4479
p-value	0.4786	0.5888	0.4829	0.3946

The slope estimates for the independent variables in table 2 are seen to be statistically significance; thus, all the coefficients in the model are different than zero. The dummy variables denoted by n specific countries effects are not significant at 95% benchmark; thus, the model is not affect n specific country effect. Again, the independent variables are highly correlated with the dependent variable. The p-value for the F-statistics is less than 0.05 significance benchmark of 0.05; but, the LSDV model ought to be tested for serial correlation in the idiosyncratic errors, heteroscedasticity. There’s need to check for multicollinearity, serial correlation, and homoscedasticity to determine the adequacy of the LSDV model.

Table 2: LSDV Model Estimates

Coefficients	Estimate	Std. Error	t-value	Pr(> t)

F-statistic: 8.514e+06 on 8 and 42 DF, p-value: < 2.2e-16					

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

The effect of the independent variables on the dependent variable was examined via the variance inflation factor (VIF) in table 3. The result showed $VIF \approx 5$ for the independent variables and ≈ 3 for the dummy variables (factor); hence, the level of collinearity in the regressors of the LSDV are moderately correlated; thus, the model is fittingly specified and functioning appropriately.

Table 3. Testing for Multicollinearity

	GVIFF	df	GVIFF ^{1/(2*Df)}
x	16968.6	3	5.069218
factor(country)	16968.6	5	2.648284

The Breusch-Godfrey/Wooldridge test for serial correlation in residuals of the LSDV model as shown in table 4 accepted no serial correlation in the idiosyncratic errors of the LSDV model.

Table 4. Testing for Serial Correlation

Chisq.	df	p-value
15.999	10	0.09967

The null hypothesis of homoskedasticity for the Breusch-Pagan test in table 5 cannot be rejected for p-value greater than 0.05. Thus, the LSDV model is well-defined for making prediction since all its modelling errors will have the same finite variance. Again, looking at the ratio between the largest and smaller variance of the residuals in table 1 is less than 1.5 ($9.074e-04 / -7.226e-04 \approx -1.26$), which advocated homoskedascity of variance in the residuals.

Table 5. Testing for Heteroscedasticity

BP test.	df	p-value
5.2968	7	0.6238

Breusch-Pagan LM test of independence and Pasaran CD test in table 6 revealed that no cross-sectional dependence/contemporaneous correlation in the panels; thus, the residuals of LSDV model are no correlated across countries for p-values greater than 0.05.

Table 6. Testing for Cross-sectional Dependence/Contemporaneous Correlation

	p-value	0.1003

CONCLUSION and RECOMMENDATIONS

The effects of inequality-adjusted indexes for education, income and life expectancy on inequality-adjusted human development index were observed using panel data for periods 2010 to 2019 in Benin, Cameroun, Ghana, Niger and Nigeria via Least squares dummy variable (LSDV) model that varies non-stochastically over time series (t) and individual level (i) observations. The time series plots for individual countries showed some volatile oscillations in their mean and variances. It would be distinctive to say that the series are not covariance stationary by concept; since, they are fluctuating over time and non-uniform spontaneity in the time series continues. All countries, n=5 have the same number of observations for all the years in figure 2; thus, data is balanced and the 95% confidence interval around the means of the series that replicates the heterogeneity across years (fixed effects) and this reflects the true differences in effect sizes related to intrinsic factors of the study. Similarly, the time periods, n=10 years for all countries in figure 3, suggested a balanced panel data. The ADF test points to strong evidence in favour of unit root process in the log levels of the series skating around their variances, centered dependent time with infinite persistence shocks. The variance inflation factor test revealed that the variables are moderately correlated in the LSDV model regression; thus, the model is properly quantified and functioning appropriately. Breusch-Godfrey/Wooldridge test predicted no serial correlation in idiosyncratic errors of the LSDV model. Again, Breusch-Pagan LM and Pasaran CD test indicated insignificant cross-sectional dependence in the panels.

Likewise, the Breusch-Pagan test predicted that the regression disturbances of LSDV model are homoskedastic with the same variance across time and individuals. Consequently; for a given country, as inequality-adjusted indexes for education, income and life expectancy fluctuates across time by one unit, the inequality-adjusted human development index increases by 33.32%, 33.40% and 33.23% individually.

LSDV model is appropriate when allowing for heterogeneity among each country to have its own different intercept value. These differences may be due to policies, programs or managerial styles.

Sofia, Bulgaria

Email: trizova@nbu.bg

ABSTRACT

The article discusses the concept of a smart or intelligent city and whether there are similar cities and technologies in Bulgaria. It also presents how smart cities respond to climate change and changes in the environment we live in, what challenges face smart cities, what their main purpose is and what are the effects of smart cities, what and how they will manage to improve. Sofia is ranked 107th out of a total of 118 ranked smart cities according to the “Smart City Index 2022”¹ of the Management Development Institute at the Singapore University of Technology and Design. In order to turn Sofia into a smart, sustainable and easily adaptable to climate change city, it is necessary to work both structurally and technologically in the areas of health care and security, recycling, mobility, utilization of green areas, as well as in the management sector. It is necessary to build and strengthen innovative ecosystems and new technologies, promote interaction between education, science and innovation.

Keywords: smart city, climate change, innovative technologies

¹ Institute for Management Development, and Singapore University for Technology and Design (SUTD). 2022. Smart City Index [online]. Available from: <https://imd.cld.bz/Smart-City-Index-2022> [accessed 01 January 2023].

In recent years, the concept of a smart or intelligent city has entered more and more into our daily life and work, in the media and scientific circles. Smart technologies that have a positive impact on lifestyle are increasingly being adopted in major cities around the world. Numerous studies on smart cities and technology have also appeared.

A smart city can be both the whole city and a certain territory of it, where electronic and technological infrastructure, such as information and communication technologies, are used to collect data and make real-time analysis, provide certain important services to solve urban problems. With the growing need for sustainable cities in the global context of climate change, the concept of a smart city places the environment and surrounding climate, including the interaction between technology and nature, promoting the integration of climate strategies and citizen participation in order to adapt from climate impacts.

The main goal of a smart city is to improve well-being and adapt to climate change by providing services that support each and every resident. Smart cities improve the daily activities of the city, such as public transport and mobility, electricity and water supply, sewage systems, etc. Using this data, local governments can extract useful information and provide effective solutions to correct prevailing urban problems.

According to the Smart City Guidebook² of the Ministry of Economy, Trade and Industry of Japan, its effects vary widely, and examples of expected results are described below:

- Society: realization of a safe, high-quality life for the residents

Effect of realizing social inclusion that allows all residents to live equally, by providing more efficient city services in all areas, including administrative procedures, purchases, transport, medical care, health and tourism, as well as providing services that meet individual characteristics and preferences.

- Economy: implementation of sustainable and creative urban management and economy

This direction would have a positive effect in several directions:

Creating an environment in which different services for residents and companies are implemented one after the other, using different data and new technologies that revitalize the regional economy,

Driving the regional economy through the consumption and purchase of services by residents and visitors who come and go in a safe, convenient and comfortable city, as well as creating

² Ministry of Internal Affairs and Communications Ministry of Economy, Trade and Industry of Japan, Ministry of Land, Infrastructure, Transport and Tourism of Japan, Smart City Public-Private Partnership Platform Secretariat. 2022. Smart City Guidebook [online]. Available from: https://www8.cao.go.jp/cstp/society5_0/smartcity/01_scguide_eng_1.pdf [accessed 01 January 2023]

diverse innovations through interactions, increasing the efficiency of systems in companies and governments and improving productivity.

- Environment: implementation of ecologically clean cities and regions

Effect of optimizing the use of energy/resources in accordance with the actual travel of people and goods in all situations, such as business operations, daily life and travel behavior, realizing a decarbonized society.

One of the main expectations is to improve overall services by collecting and using different data from a diverse range of sectors. Another expectation is to solve the challenges with new frameworks through the participation of scientific institutions, industry and government, as well as involving residents from many cities.

A smart city can change our way of life by ensuring fairness and inclusion of residents to enjoy smart services equally, protecting privacy in the use of personal data, including personal information, from the perspective of providing high-quality services that comply with the needs of individual citizens and consumers. Ensuring interoperability, openness and transparency by implementing the data platform interoperable with other regions and systems for nationally effective smart city promotion. Ensuring safety of the services provided, continuity of the system in emergencies, including during disasters, etc. Ensuring operational and financial sustainability that is carried out by a core organization. An example would be a local government on the one hand. On the other, it is public, private and academic entities that cooperate appropriately, play their roles to be functional and flexible and bear the costs of maintaining the system and providing services.

There are numerous examples and applications of smart technologies. These can be in the form of software decision-making, smart technologies connected to other devices via the Internet or applications that allow the user to control their devices easily and conveniently, and can be connected to an external service provider. It is important to mention here that smart technologies help to reduce energy and thus have a beneficial and long-term impact on climate change adaptation.

Smart home technology has become very common in recent years. They cover a wide range of applications such as security systems, lighting systems, smart cameras, remote controllers, sockets and plugs. These technologies can provide remote access to the home owner as well as allow the user to perform various home automation tasks such as turning off lights, applying door locks, monitoring around the home, and more.

Devices such as smart thermostats, for example, can show how much energy is being used when changing the temperature in our homes, resulting in much less energy being wasted.

On the other hand, smart lighting can reduce electricity consumption by using dimming lights on streets without pedestrians or traffic. Such lighting systems are often also equipped with central management software that monitors usage and drives maintenance efficiency.

An example of smart management could be a waste initiative. A city that implements innovative waste management solutions can reduce costs by emptying waste containers by using sensors installed in the containers. Sensors are able to monitor the individual waste level and thus the containers are only emptied when they are full, rather than on a standardized schedule. Thus, the traffic is also reduced, since there are fewer specialized vehicles for waste on the streets, which in turn contributes to the reduction of greenhouse gas emissions, improving the air and climatic conditions in the cities.

In Bulgaria, in recent decades, we have witnessed an increase in the use of electricity, the transport network is becoming increasingly congested due to the excessive use of private cars, and we are observing inefficient use of public transport. The temperature in the city increases and air quality deteriorates, as a result of global and local climate changes and human activity, the carbon footprint on the environment increases and many other urban problems that lead to the search for solutions for the development and implementation of innovative, energy-saving and low-carbon technologies.

An example is the WiFi4EU³ initiative through which the European Commission promotes free Wi-Fi for citizens and visitors in public spaces such as parks, squares, public buildings, libraries, health centers and museums throughout Europe. In this way, everyone can be connected regardless of where they live. According to the European Commission, 232 out of a total of 265 municipalities in Bulgaria have received a voucher for WiFi4EU.

Another example is the entry of radio networks on the Bulgarian market, which are intended for the implementation of the Internet of Things (IoT) - solutions related to air monitoring, garbage disposal, agriculture, management of the support networks for water supply and the energy sector.

In Sofia, the service for shared trips with electric scooters is now available with the idea of freeing up and reducing traffic in the central parts of the capital, which allows the use of fewer private cars, which in turn would improve the environment and the urban way in the long term of life.

³ European Commission. WiFi4EU. Free Wi-Fi for Europeans. Available from: <https://wifi4eu.ec.europa.eu/#/home> [accessed 01 January 2023]

In less populated areas, the process of implementing smart and innovative technologies is at an early stage.

It is necessary to work in the direction of improving the infrastructure, the use of innovative and low-carbon technologies and improving the knowledge and awareness of citizens about smart decisions and how to be sympathetic to the improvement of the areas and neighborhoods where they live.

Out of a total of 118 ranked cities, Sofia is only in 107th place, according to the annual report prepared by the Institute for Management Development at the Singapore University of Technology and Design (SUTD). Smart cities are ranked based on economic and technological data, along with their citizens' perceptions of how “smart“ their cities are. Every year more and more cities are added to the survey. In 2022, the first places are headed by Singapore, Zurich and Oslo. The list also included cities such as Leeds and Glasgow in the UK, Bordeaux and Lille in France, Kiel in Germany, Medina in Saudi Arabia, Istanbul in Turkey and San Jose in Costa Rica.

According to the results of the Smart City Index 2022⁴ ranking, there is much to work on in Sofia, both structurally and technologically, in the areas described below:

Health and safety: The sanitary conditions in the poorest areas, the provision of medical services, the cleanliness of the air, etc. are rated low by the local population. A major problem here is the lack of online reporting of problems in the city to ensure quick solutions. There is a lack of platform and website to allow residents to easily get rid of used and unwanted items. Public safety is also rated low.

Recycling: Services related to recycling are also rated low.

Mobility: main problems are traffic jams, unsatisfactory public transport, lack of applications for traffic flow awareness to reduce congestion, as well as pointing to free parking spaces to save time.

Activities related to the utilization of green areas are still in their initial stages.

Government sector: the city receives a very low score for the criterion “easily accessible information about local government decisions“. Residents contributing to local government decision-making and providing feedback on local government projects are also rated low. Online

⁴ Institute for Management Development, and Singapore University for Technology and Design (SUTD). 2022. Sofia, Smart city ranking [online]. Available from: <https://www.imd.org/smart-city-profile/Sofia/2022> [accessed 01 January 2023]

public access to city finances and platforms where residents can offer ideas to improve city life are also rated low.

It is also important to note that national and local governments have a crucial role in the development of smart cities, and the role of each individual resident is paramount in solving urban problems and adapting to climate change. An example of this could be the voluntary participation of residents in smart city and technology initiatives, encouraging friends, family and colleagues to use bicycles, playing sports, participating in landscaping and tree planting initiatives, promoting urban vegetable gardens, cleaning and maintaining inter-block spaces, supporting and creating local art, production or business related to bio- and natural products, etc.

ABSTRACT

This paper explores the important advancements and implications that artificial intelligence (AI) has on e-learning. AI has the potential to greatly increase the quality of learning outcomes due to its capacity to provide individualized instruction, adaptive learning, and intelligent feedback. Despite its many advantages, AI-powered e-learning platforms must address concerns of equity, bias, and ethics to be genuinely inclusive and effective. The successful integration of AI into e-learning will require educators, policymakers, and technology developers to collaborate to ensure that the technology promotes quality education for all students. Thus, continuous professional development and training are required to equip educators with the abilities required to utilize these platforms effectively. Moreover, constant research and development is necessary to advance the state of the art in AI-powered e-learning.

Keywords: Artificial Intelligence, Online learning, Quality teaching, Technology, Learning analytic

INTRODUCTION

In recent years, the extensive usage of technological breakthroughs has significantly altered the educational scene. Artificial intelligence is one such innovation with proven potential. Instructors increasingly rely on AI as a means of improving student learning results. By integrating AI into e-learning systems, education can become more adaptable, efficient, and user-friendly, resulting in substantial enhancements to the quality of education provided to students. However, despite the obvious advantages of AI in education, there are other obstacles to consider. This paper examines the different applications of AI in online education, including its benefits and drawbacks, as well as the influence its widespread use could have on the quality of education given. To ensure that AI is utilized in a manner that supports equitable and effective learning outcomes for all students, it is essential to carefully address these consequences. By doing so, we can harness the power of AI to better education and prepare future generations for success in a fast changing world.

Artificial Intelligence (AI)

Artificial Intelligence refers to the subfield of computer science and engineering concerned with developing intelligent machines or software. Intelligent agents are computer programs that can think, learn, and act independently (Jia et al., 2022). The goal of research in artificial intelligence is to develop computer systems capable of reasoning and problem-solving.

Machine learning, natural language processing, robotics, and predictive analytics are just a few of the many real-world uses for AI today. Both machine learning and natural language processing aim to train computers to understand and appropriately respond to human language without requiring any predetermined rules or instructions to do so. Robotics is the employment of machines to carry out activities that humans find challenging or impossible, while predictive analytics is the application of artificial intelligence to the task of forecasting likely outcomes.

Overview of AI in E-Learning : Artificial intelligence is a subfield of computer science that focuses on the creation of algorithms and systems that can do tasks that traditionally require human intelligence, such as problem-solving, decision-making, and learning (Baker et al., 2019). AI has the ability to alter the e-learning experience by enabling, among other features, individualized education, adaptive learning, and intelligent feedback (Celik et al., 2022). For example, AI can analyze student performance data and make individualized recommendations for learning activities based on each student's strengths and shortcomings. Similarly, chatbots powered by AI can provide rapid assistance to students in need, without requiring human participation.

Innovations in AI-Powered E-Learning: As artificial intelligence (AI) has been applied to online education, new methods of instruction have emerged. For instance, intelligent tutoring systems driven by AI have been demonstrated to boost student achievement across the range, from mathematics and science to language acquisition (MacLellan, 2017; Weitekamp et al., 2020). Also promising in this regard are adaptive learning platforms that employ AI to tailor education to each individual student. Additionally, AI can be utilized to automate administrative activities like grading and feedback, allowing teachers more time to focus on more strategic endeavors like curriculum development and evaluation.

Benefits of AI in E-Learning: Using AI into e-learning has various advantages for students, teachers, and institutions. E-learning platforms driven by AI offer students individualized training, adaptive learning, and intelligent feedback, enabling them to learn at their own pace and in their own manner. Thus, engagement, motivation, and retention are enhanced. AI can help instructors minimize their workload by automating administrative functions such as grading and evaluation (Ahmad et al., 2021). This enables teachers to concentrate on more complex duties, such as curriculum design and pedagogy. Moreover, AI-powered e-learning platforms give instructors with vital data insights, enabling them to discover areas in which students struggle and alter their teaching techniques accordingly (Schiff, 2021). AI-powered e-learning platforms provide various benefits for institutions, including enhanced student results, higher efficiency, and cost savings. In addition, universities can employ AI to acquire insight into student preferences and behavior, enabling them to make informed decisions regarding program design, marketing, and recruitment.

Challenges with AI in E-Learning: Integrating artificial intelligence (AI) into e-learning has the potential to significantly enhance the quality of learning outcomes. However, this integration also presents a number of challenges that must be addressed. One of the key challenges is ensuring that AI-powered e-learning platforms are accessible and equitable for all learners. There is a risk that AI may perpetuate existing inequalities in access to quality education, especially in regions where technology access is limited. The lack of human interaction in AI-powered learning environments can also lead to a sense of isolation and disengagement for some students (Ahmad et al., 2021). Additionally, AI-powered e-learning platforms may reinforce biases and stereotypes, particularly regarding gender, race, and ethnicity. To mitigate these risks, AI-powered e-learning platforms must be designed with inclusivity and cultural responsiveness in mind. Another challenge associated with AI in e-learning is ensuring that educators are properly trained to use these platforms effectively. While AI can automate

certain tasks, it cannot replace human expertise and judgment. Therefore, educators need to be able to design, implement, and evaluate AI-powered e-learning platforms to maximize their potential for improving student learning outcomes. This requires ongoing professional development and training to keep pace with advancements in AI and e-learning. Additional problems include the possible loss of creativity and critical thinking skills if students become overly reliant on AI-powered tools, as well as worries regarding the privacy of student data shared with third parties. Additionally, learning environments powered by AI must be accessible and secure for all students, including those with impairments or special needs. AI-powered grading systems have the ability to be hacked or manipulated, and AI-powered learning environments require continuous maintenance and updates. Lastly, ensuring that educators and administrators have the skills and knowledge necessary to properly use and integrate AI in education is another key obstacle.

Ethical and Policy Considerations: The use of AI into e-learning also presents crucial ethical and policy issues. In the creation and deployment of AI-powered e-learning systems, for example, it is necessary to ensure that student data is safeguarded and used ethically. This encompasses data privacy, security, and ownership considerations. In addition, e-learning platforms powered by artificial intelligence must be transparent, explicable, and accountable. This implies that instructors and students should be able to comprehend how AI algorithms function and how judgments are made regarding their education.

The potential for bias and discrimination is a further ethical problem pertaining to AI in e-learning. Existing biases or stereotypes may be reinforced by AI algorithms, especially if the data used to train the algorithms is prejudiced or incomplete. For example, if an AI-powered e-learning platform is trained on data that primarily consists of male students, it may not be beneficial for female students. Therefore, it is essential to ensure that the data utilized to train AI algorithms is diverse, representative, and bias-free.

Implications for the Future of Learning: Artificial intelligence (AI) integration in e-learning has the potential to revolutionize the future of education. This integration has various and extensive implications. One of the most significant is personalized learning, which can give learning experiences that are linked with the particular requirements and preferences of each learner. Educators may deliver adaptable learning environments that are tailored to each student's speed, content, and level of difficulty by utilizing AI-powered technologies (Schiff, 2021). This can aid in enhancing overall learning results and decreasing student dropout rates. In addition, AI can boost the accessibility and inclusiveness of education by providing technologies such as

speech recognition, natural language processing, and translation services that can benefit students with disabilities or impairments.

Moreover, AI integration in e-learning can automate administrative operations such as grading, scheduling, and content distribution. This frees up educators' time so they may focus on more individualized and interactive teaching approaches, which can improve teacher-student connection and result in more accurate and efficient evaluation. In addition to monitoring student progress and performance, AI may provide invaluable insight on learning patterns and behaviors. This information can be utilized to identify areas in which pupils are underperforming and to provide individualized assistance to enhance their performance.

By offering access to educational resources and possibilities beyond traditional classrooms, AI can facilitate lifelong learning. This can assist to address the issue of skills gaps and guarantee that individuals have the information and abilities necessary to compete in a labor market that is continually altering. By combining game-like aspects like rewards, immersive surroundings, and challenges, AI-powered gamification and virtual reality can make learning more engaging and participatory. This can promote student engagement, motivation, and learning outcomes.

In addition, AI can enable collaborative learning by connecting students with their peers and global experts. This can help develop a feeling of community and provide students with the opportunity to learn from a variety of perspectives and life experiences. AI can also facilitate continual education improvement by offering ongoing feedback and insights into teaching methods and curriculum design. Moreover, AI can facilitate data-driven decision making in education, allowing educators to utilize data and analytics to make educated decisions on teaching methods, curriculum design, and resource allocation (Hrastinski et al., 2019). Lastly, predictive modeling allows educators to forecast student results and highlight areas where further support may be required. By incorporating AI into e-learning, we can create a more individualized, efficient, and productive learning environment.

The far-reaching possibilities of integrating AI in e-learning and its impact on the provision of quality education are substantial. Through the utilization of AI, there exists an opportunity to establish a more comprehensive and interactive educational system, which is inclusive and efficient, enabling individuals to reach their maximum potential.

CONCLUSION

The incorporation of AI in e-learning presents a promising opportunity to enhance the quality of educational outcomes. However, it will require a collaborative effort among educators, policymakers, and technology developers to achieve successful integration. It is essential to ensure that AI-powered e-learning platforms are equitable, accessible, and culturally sensitive to provide an inclusive, transparent, and effective learning experience for students. Educators need ongoing training and professional development to effectively use these platforms. Additionally, continued research and development are necessary to advance the state of AI-powered e-learning. Looking to the future, it is clear that AI will play a crucial role in shaping the way we teach and learn. Therefore, it is our responsibility to ensure that this technology is used to support quality education for all learners. By combining AI's power, educators' expertise, and students' creativity, we can create a future of e-learning and quality education that is engaging, empowering, and inclusive for all.

ABSTRACT

The integration of Artificial Intelligence (AI) into marketing has ushered in a transformative era marked by enhanced customer experiences, streamlined processes, and data-driven decision-making. This abstract explores the diverse applications of AI in marketing, including personalized recommendations, virtual assistants, predictive analytics, customer segmentation, content generation, sentiment analysis, image recognition, A/B testing, voice search optimization, fraud detection, social media analysis, marketing automation, dynamic pricing, and location-based marketing. By leveraging AI's capabilities, marketers can tailor campaigns, optimize strategies, and engage customers with unprecedented precision, ushering in a new paradigm of data-driven marketing excellence.

Keywords: Artificial Intelligence, Marketing, Image Recognition, Virtual Assistants

INTRODUCTION

In the ever-evolving landscape of modern business, the convergence of technology and marketing has led to the emergence of innovative strategies that redefine how brands engage with their audiences. At the forefront of this transformation stands Artificial Intelligence (AI), a revolutionary force that has reshaped the dynamics of the marketing industry. AI's ability to process vast amounts of data, identify patterns, and make intelligent predictions has opened doors to new avenues of customer interaction, campaign optimization, and strategic decision-making. This introduction delves into the pivotal role of AI in marketing, highlighting its applications across various domains to enhance personalization, streamline operations, and drive impactful outcomes in an increasingly competitive digital marketplace. As AI continues to weave its influence into the fabric of marketing practices, its potential to reshape customer experiences and redefine marketing paradigms is becoming increasingly evident.

Artificial Intelligence (AI) has significantly transformed the field of marketing, offering innovative solutions to enhance customer experiences, streamline processes, and improve decision-making. Here are some key AI applications in marketing.

Objectives of the Study

The objectives of the study on AI applications in marketing encompass a comprehensive exploration and analysis of the various ways in which Artificial Intelligence impacts and transforms the field of marketing. These objectives serve as guiding principles to uncover insights, make informed conclusions, and contribute to the body of knowledge surrounding this dynamic intersection:

Examine AI Applications: The study aims to identify and categorize the diverse applications of AI within marketing, ranging from personalization and recommendation systems to chatbots, predictive analytics, and beyond. This objective seeks to provide a comprehensive overview of how AI is integrated into various marketing aspects.

Evaluate Impact on Customer Experience: The study seeks to assess how AI-driven strategies enhance customer experiences. By analyzing case studies and real-world examples, it aims to understand how personalized interactions, chatbots, and recommendation systems contribute to improved customer engagement and satisfaction.

Analyze Efficiency and Optimization: This objective aims to investigate how AI streamlines marketing processes and contributes to operational efficiency. It seeks to understand how AI

tools such as marketing automation, A/B testing, and dynamic pricing optimize resource allocation and campaign performance.

Explore Decision-Making and Insights: The study endeavors to explore how AI aids marketing professionals in making data-driven decisions. By delving into predictive analytics, sentiment analysis, and social media insights, it aims to showcase how AI-generated insights influence strategic planning.

Address Challenges and Ethical Considerations: The study aims to highlight the challenges and ethical considerations associated with AI in marketing. It aims to delve into issues related to data privacy, bias, transparency, and the need for responsible AI adoption in marketing strategies.

Forecast Future Trends: By analyzing current trends and technological advancements, the study aims to project how AI's role in marketing is likely to evolve in the coming years. This objective aims to provide insights into the future of AI-driven marketing strategies and their potential impact.

Provide Recommendations and Best Practices: Based on the analysis conducted, the study aims to offer practical recommendations and best practices for marketers looking to effectively integrate AI into their strategies. These recommendations may address implementation challenges, strategic considerations, and ways to ensure ethical AI usage.

Contribute to Knowledge Base: Ultimately, the study aims to contribute to the existing body of knowledge surrounding AI's applications in marketing. By synthesizing research findings, insights, and practical recommendations, it aims to provide valuable insights that can inform both academia and industry practitioners.

Applications of AI in Marketing

Artificial Intelligence (AI) has revolutionized the field of marketing by offering a wide range of applications that enhance efficiency, personalization, and decision-making. Here are some prominent applications of AI in marketing:

Personalized Recommendations: AI-powered recommendation systems analyze user behavior and historical data to suggest products, services, or content that match individual preferences. This increases customer engagement and drives sales.

Chatbots and Virtual Assistants: AI-driven chatbots provide real-time customer support, answer queries, and guide users through purchasing processes. Virtual assistants enhance user experience by offering personalized assistance 24/7.

Predictive Analytics: AI algorithms analyze large datasets to forecast future trends, customer behaviors, and market demands. This enables businesses to make informed decisions about marketing strategies and resource allocation.

Customer Segmentation: AI helps segment customers based on demographics, behaviors, and preferences. This allows marketers to tailor campaigns for specific audience segments, improving relevance and engagement.

Content Generation: AI-powered tools can produce written content, such as product descriptions and blog posts, using natural language processing. These speeds up content creation and distribution.

Sentiment Analysis: AI analyzes social media posts, reviews, and comments to gauge public sentiment about brands, products, or campaigns. This provides insights into customer perceptions and feedback.

Image and Video Recognition: AI can identify objects, logos, and emotions in images and videos, helping brands monitor their online presence and gather insights from visual content.

A/B Testing and Optimization: AI conducts continuous A/B testing to determine which elements of marketing campaigns (e.g., headlines, visuals) are most effective, leading to improved campaign performance.

Voice Search Optimization: With the rise of voice-activated devices, AI optimizes content for voice search queries, ensuring brands remain visible in voice search results.

Fraud Detection and Prevention: AI analyzes transaction data to detect fraudulent activities and protect businesses from financial losses.

Social Media Analysis: AI tools analyze social media data to provide insights into customer sentiment, competitor analysis, and overall social media performance. This informs marketing strategies and identifies trends.

Marketing Automation: AI-driven automation platforms streamline tasks such as email marketing, lead nurturing, and customer segmentation, enabling marketers to focus on strategic planning.

Dynamic Pricing: AI adjusts prices in real-time based on factors like demand, competition, and customer behavior, maximizing revenue and profit margins.

Location-Based Marketing: AI uses geolocation data to deliver location-specific offers and recommendations to customers, enhancing engagement when near physical stores.

Emotion Analysis: AI can detect emotions from text and visual content, helping marketers gauge customer reactions and tailor messaging accordingly.

Behavioral Analysis: AI analyzes user behavior to understand preferences and habits, enabling more effective targeting and personalized marketing campaigns.

Marketing Attribution: AI helps attribute conversions to the most impactful touchpoints in the customer journey, providing insights into the effectiveness of different marketing channels. These applications collectively demonstrate how AI is reshaping marketing strategies, making them more efficient, data-driven, and customer-centric. As AI technology continues to advance, its influence on marketing is expected to grow, leading to even more innovative and impactful applications.

The Importance of Marketing in an AI-Driven World

In today's AI-driven world, marketing holds a crucial role that goes beyond mere promotion; it becomes a strategic cornerstone that shapes how businesses connect with customers, adapt to trends, and succeed in a dynamic digital landscape. The importance of marketing in this AI-driven era is multifaceted and pivotal for several reasons:

Personalization and Customer Experience Enhancement: AI enables businesses to gather and analyze vast amounts of data, offering insights into individual preferences and behaviors. Marketing harnesses this information to deliver personalized experiences, tailoring content, products, and recommendations to each customer. This heightened level of personalization enhances customer satisfaction and fosters loyalty.

Data-Driven Decision-Making: AI-powered analytics provide marketers with deep insights into consumer behavior, market trends, and campaign performance. This data-driven approach enables marketers to make informed decisions, refine strategies, and allocate resources more effectively for better results.

Optimized Campaigns and Efficiency: AI automates repetitive tasks, such as data analysis, reporting, and even content creation. This frees up marketers to focus on creativity and strategy, leading to more efficient and effective campaigns that resonate with the target audience.

Customer Engagement and Interaction: AI-driven chatbots and virtual assistants offer instant and personalized customer support, enhancing engagement and providing round-the-clock service. This improves customer satisfaction and helps in building stronger brand-customer relationships.

Adaptation to Emerging Technologies: In an AI-driven world, new technologies and platforms emerge rapidly. Effective marketing strategies leverage AI to stay ahead of these trends, ensuring brands remain relevant and accessible across various channels and devices.

Competitive Edge and Innovation: Businesses that embrace AI for marketing gain a competitive advantage by delivering innovative and engaging experiences. Whether it's through interactive content, augmented reality, or predictive analytics, AI empowers marketers to stand out in a crowded marketplace.

Hyper-Personalized Content Creation: AI-driven content generation tools can produce a wide array of content, from articles and social media posts to videos. This allows brands to maintain a consistent presence, share valuable information, and engage audiences without the need for constant manual effort.

Real-Time Adaptation: AI's ability to process data in real-time allows marketers to adjust strategies on the fly. For instance, real-time sentiment analysis on social media enables brands to respond to customer feedback promptly, maintaining a positive brand image.

Ethical Considerations and Trust Building: As AI becomes more integrated into marketing, businesses must maintain transparency and ethical practices. Marketing campaigns that prioritize data privacy and ethical AI usage build trust with customers, fostering long-term relationships.

Informed Innovation: AI-driven insights into customer preferences and behaviors guide product development and innovation. Businesses can create products that align with market demands, reducing the risk of launching products that may not resonate with customers.

Challenges of AI in Marketing

While Artificial Intelligence (AI) offers significant advantages in marketing, it also presents several challenges that marketers and businesses need to navigate. These challenges highlight the need for careful planning, ethical considerations, and ongoing adaptation. Here are some key challenges associated with AI in marketing:

Data Privacy and Security: AI-driven marketing relies heavily on data collection and analysis. Ensuring the privacy and security of customer data is crucial to maintain trust and comply with regulations like GDPR. Mishandling data can result in breaches, legal issues, and reputational damage.

Algorithm Bias and Fairness: AI algorithms can inadvertently reflect biases present in the training data, leading to biased recommendations, targeting, and decisions. Ensuring fairness and addressing bias is essential to avoid discriminatory practices and maintain ethical AI usage.

Lack of Human Touch: As AI-powered chatbots and virtual assistants become more prevalent, there is a risk of losing the personal touch that human interactions offer. Striking a balance

between automation and human interaction is vital to provide empathetic and satisfying customer experiences.

Algorithmic Complexity and Interpretability: Many AI algorithms, such as deep neural networks, can be complex and difficult to interpret. This lack of transparency can be a challenge when trying to understand why certain recommendations or decisions are made, especially in highly regulated industries.

Technology Integration and Complexity: Integrating AI technologies into existing marketing systems can be challenging and resource-intensive. It requires a cohesive strategy and technical expertise to ensure seamless implementation and compatibility.

Resource Allocation and Costs: Implementing AI in marketing requires investments in technology, training, and talent. Small and medium-sized businesses may find it challenging to allocate resources for AI initiatives, impacting their ability to compete effectively.

Skill Gap and Training: AI implementation demands a skilled workforce capable of understanding AI technologies and leveraging them effectively. Organizations need to invest in training or hiring professionals with AI expertise.

Over-Reliance on Data: While data-driven decision-making is valuable, an over-reliance on AI-generated insights can lead to missing out on human intuition and creativity. Striking the right balance between data and human judgment is critical.

Constant Technological Evolution: AI technologies evolve rapidly, requiring marketers to stay updated on the latest developments. This continuous learning curve can be demanding for marketing professionals.

Resistance to Change: Introducing AI-powered processes and tools can be met with resistance from employees who fear job displacement or find it challenging to adapt to new technologies.

Loss of Authenticity: Over-automation through AI can lead to generic, templated content and interactions that lack the authentic human touch. Building and maintaining brand authenticity becomes crucial.

Measurement and Accountability: Measuring the direct impact of AI on marketing efforts can be challenging, especially when attributing results to specific AI-driven actions within a complex customer journey.

Unintended Outcomes: AI systems can sometimes produce unexpected results due to their complexity and reliance on patterns. Marketers need to monitor AI-generated content and interactions to ensure alignment with brand values.

Benefits of AI in Marketing

Implementing Artificial Intelligence (AI) in marketing offers a plethora of benefits that can transform how businesses connect with customers, optimize strategies, and drive growth. These benefits span various aspects of marketing and contribute to more effective, efficient, and customer-centric practices. Here are some key benefits of using AI in marketing:

Personalization at Scale: AI enables hyper-personalized marketing by analyzing vast amounts of customer data. This leads to tailored content, recommendations, and offers that resonate with individual preferences, increasing customer engagement and conversions.

Data-Driven Insights: AI-powered analytics provide actionable insights into customer behavior, market trends, and campaign performance. This data-driven approach guides decision-making and strategy formulation, leading to more effective marketing efforts.

Enhanced Customer Experience: AI-driven chatbots and virtual assistants offer instant support, answering customer queries 24/7. This improves customer experience by providing timely assistance and information, leading to higher satisfaction levels.

Optimized Campaigns: AI can automate campaign optimization by analyzing performance data in real-time. This ensures that campaigns are continuously adjusted for maximum impact, reducing the need for manual intervention.

Efficiency and Resource Allocation: Automation through AI streamlines repetitive tasks like data analysis, content generation, and lead scoring. This frees up marketing teams to focus on strategic thinking and creative efforts.

Improved Customer Engagement: AI-powered tools enable marketers to engage customers through various channels, such as personalized emails, chatbots, and interactive content. This enhances engagement and keeps customers connected with the brand.

Real-Time Decision-Making: AI processes data rapidly, allowing marketers to make real-time decisions based on current trends and customer behavior. This agility is vital in a fast-paced digital landscape.

Predictive Analytics: AI algorithms forecast future trends, enabling marketers to anticipate market demands, identify emerging opportunities, and adjust strategies proactively.

Segmentation and Targeting: AI helps segment customers into distinct groups based on behavior and preferences. This facilitates targeted marketing efforts that increase relevance and engagement.

Cost Savings: Automation reduces manual workloads, leading to operational cost savings over time. Additionally, AI optimizes resource allocation, ensuring efficient budget utilization.

Competitive Advantage: Businesses that embrace AI-driven marketing gain a competitive edge by delivering innovative and customized experiences. This positions them as forward-thinking brands in the eyes of customers.

Continuous Learning: AI systems learn from data over time, continuously improving their performance and accuracy. This adaptive learning process enhances the effectiveness of AI-powered strategies.

Scalability: AI-driven processes can be scaled easily to accommodate growing customer bases and expanding markets, without a proportional increase in resource allocation.

Strategic Insights: AI-driven insights inform long-term strategic planning, enabling businesses to align their marketing efforts with broader organizational goals.

ROI Optimization: AI-driven optimization improves return on investment (ROI) by ensuring that resources are allocated to the most effective marketing activities.

In essence, the benefits of AI in marketing empower businesses to deliver exceptional customer experiences, make data-driven decisions, and stay agile in an evolving landscape. By harnessing the power of AI, marketing becomes more efficient, effective, and customer-centric, ultimately driving business growth and success.

CONCLUSION

The fusion of Artificial Intelligence (AI) with the realm of marketing has ushered in a new era marked by unprecedented possibilities and outcomes. Through a comprehensive array of applications, AI has transcended traditional marketing methodologies, enabling brands to connect with their audiences in profound ways. The ability to decipher complex data, anticipate trends, and customize interactions has elevated customer engagement to new heights, fostering loyalty and satisfaction. As marketing professionals harness AI-driven insights, campaigns are tailored with precision, resonating with individual preferences, and maximizing impact. Moreover, AI's role in automating repetitive tasks and optimizing strategies empowers marketers to allocate resources judiciously, focusing on strategic thinking and creativity.

However, the rapid integration of AI into marketing is not without its challenges. Ethical considerations, data privacy concerns, and the need for human oversight in critical decision-making processes underscore the importance of responsible AI adoption. Striking a balance between leveraging AI's capabilities and upholding ethical standards remains an ongoing endeavor for marketers and technologists alike. Looking ahead, the trajectory of AI in marketing points toward an era of continued innovation and refinement. The evolution of AI algorithms, coupled with advancements in machine learning and natural language processing,

promises even deeper personalization and seamless customer interactions. Embracing AI as a catalyst for transformation, marketing professionals are poised to adapt, learn, and redefine strategies in a landscape that is perpetually evolving. In conclusion, the integration of AI within marketing has redefined the very essence of how brands connect, engage, and thrive in a digital world. Its applications, from predictive analytics to chatbots, have reshaped the customer journey and reimagined marketing campaigns. The journey is ongoing, with AI continually shaping and reshaping the marketing landscape, opening doors to innovation that will propel brands forward into a future marked by data-driven creativity and unparalleled customer experiences.

ÖZET

Diyabet, metabolik sorunların bir dizisine işaret eden ve uzun bir dönem boyunca yüksek kan şekeri seviyeleri ile karakterize edilen bir durumdur. Vücut, insülin üretimini yeterince gerçekleştiremediği veya pankreas tarafından üretilen insülini etkili bir şekilde kullanamadığı zaman, bu durum ortaya çıkar. Diyabetle ilgili başlıca sorun, zamanında teşhis eksikliği veya doktorların yanlış teşhis koymasındır. Bu sebeple, diyabetin erken evrelerinde doğru bir şekilde teşhis edilmesine katkı sağlayacak bir teknik uygulanması, hastalığın önlenmesi ve kontrol edilebilmesi için son derece kritik bir adım olacaktır. Bu çalışmada diyabet hastalığının tahmini için Pima Indians Diabetes Database veri seti kullanılarak derin öğrenmeye dayalı bir sınıflandırıcı mimarisi tanıtılmıştır. Elde edilen sonuçlara göre bu çalışmada önerilen yöntem literatürdeki çalışmalardan daha üstün bir başarıya ulaşmıştır.

Keywords: Diyabet, veri seti balanslama, derin öğrenme

A DEEP LEARNING-BASED CLASSIFICATION ARCHITECTURE FOR DETECTION OF DIABETES

ABSTRACT

Diabetes is a set of metabolic problems defined by high blood sugar levels over a long period of time. It occurs when the body cannot produce enough insulin or cannot effectively use the insulin produced by the pancreas. If diabetes is not treated on time, it can lead to lifelong complications such as cardiovascular disease, cerebral palsy, kidney failure, and eye complications. The biggest problem with diabetes arises from not being diagnosed on time or misdiagnosed by physicians. Therefore, the application of a technique that contributes to the correct diagnosis of diabetes, especially in its early stages, will be a very important step for the prevention and control of the disease. To overcome this, researchers have tried to predict diabetes symptoms by applying different approaches such as machine learning and data mining. Pima Indians Diabetes Database (PIDDD) data set was used in this study. There are a total of 768 samples in the data set. 500 samples have diabetes diagnosis. The parameters for each sample in the data set are named as age, pregnancies, glucose, blood pressure, skin thickness, insulin, body mass index and diabetes pedigree function and include numerical values. The proposed classifier architecture is implemented using Python language on Visual Studio Community 2017 platform. In the study, firstly, the Generative Adversarial Networks model was designed and the balance problem of the data set was solved, and data augmentation was carried out at the same time. Then, a deep convolutional neural network was designed and trained to predict diabetes. The classifier architecture based on deep learning proposed in this study has shown a superior performance against the studies in the literature. At the same time, with the proposed architecture, the problem of insufficient and unbalanced data set that researchers in the biomedical field often encounter can be eliminated.

Keywords: Deep Learning, Diabetes Disease, Data Augmentation, Convolutional Neural Network

GİRİŞ

Diyabet, uzun bir süre boyunca yüksek kan şekeri seviyesi ile tanımlanan bir dizi metabolik sorundur. Vücut yeterli insülin üretmediğinde veya pankreas tarafından üretilen insülini etkili bir şekilde kullanamadığında ortaya çıkar (Egan ve Dinneen, 2004,s.679). Diyabetin nedenleri, türüne göre değişir. Tip 1 diyabet, bağışıklık sisteminin insülin üreten pankreas hücrelerine saldırması sonucu ortaya çıkar. Bu durumun nedeni tam olarak bilinmemektedir ancak genetik ve çevresel faktörler rol oynayabilir (Atkinson vd., 2014). Tip 2 diyabet, vücudun insüline karşı direnç geliştirmesi sonucu ortaya çıkar. Bu durumun nedenleri arasında obezite, yaşlılık, fiziksel aktivite eksikliği sayılabilir (Hu, 2011). Gebelik diyabeti, hamilelik sırasında hormonal değişiklikler nedeniyle ortaya çıkar. Bu durumun nedenleri arasında kilolu olmak, ileri yaşta hamile kalmak sayılabilir (Metzger vd., 2010). Yüksek kan şekeri belirtileri arasında aşırı idrara çıkma, her zaman susuzluk hissi ve artan açlık vardır (Ramachandran, A. 2014, s.579). Diyabet zamanında tedavi edilmezse kardiyovasküler rahatsızlık, beyin felci, böbrek yetmezliği, ve göz komplikasyonları gibi ömür boyu sürecek komplikasyonlara yol açabilir (Anjana vd., 2011,s.3022-3027). Aşağıda belirtilen sağlık özelliklerine sahip bireyler diyabet hastalığı için yüksek risk grubundadır. Pek çok farklı etnik gruplar için 45 yaş üstü, uzun süreli hipertansiyon, 25'ten büyük bir Vücut Kitle İndeksi, diyabet hastası olan aile üyelerine sahip olmak ve hareketsiz bir yaşam tarzını benimsemek (Tigga ve Garg, 2020, s.707).

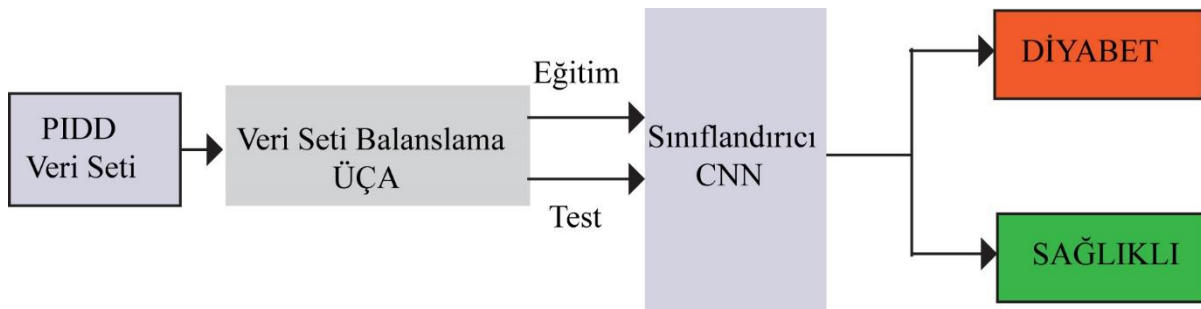

Diyabetle ilgili en büyük sorun, zamanında teşhis konulmaması veya hekimlerin yanlış teşhis koymasından kaynaklanmaktadır. Bu nedenle, diyabetin özellikle erken evrelerinde doğru teşhisine katkı sağlayan bir tekniğin uygulanması, hastalığın önlenmesi ve kontrolü için çok önemli bir adım olacaktır (Kamel ve Yaghoubzadeh, 2021, s.2). Bunun üstesinden gelebilmek için araştırmacılar makine öğrenimi ve veri madenciliği gibi farklı yaklaşımlar uygulayarak diyabet semptomlarını tahmin etmeye çalışmışlardır (Kavakiotis vd. 2017 s.104).

Sisodia ve Sisodia Pima Indians Diabetes Database (PIDD) veri setini kullanarak gerçekleştirdikleri çalışmada, diyabetin erken bir aşamada tespit edilmesi için Karar Ağacı, SVM ve Naive Bayes olmak üzere üç makine öğrenimi sınıflandırma algoritması kullanılmıştır. En yüksek sınıflandırma performansını Naive Bayes kullanarak 76,30% değerinde elde etmişlerdir (Sisodia ve Sisodia, 2018,s.1580). Yang ve arkadaşları, PIDD veri seti kullanarak gerçekleştirdikleri çalışmada K-ortalamar algoritması ve Lojistik Regresyon (LR) algoritması olmak üzere iki bölümden oluşan bir model önermişlerdir. Yazarlar önerdikleri bu model ile diyabet tespitini 95.42% başarıyla yapmışlardır (Yang vd. 2018. s.100-107). Choubey ve Paul diyabet hastalığının tespiti için iki aşamalı bir yöntem önermişlerdir. Yazarlar Genetik

algoritma kullanarak öznelik seçme işlemi yapmışlar ardından Radyal Temel Fonksiyonlu Sinir Ağı (RTF SA) ile diyabet tespiti gerçekleştirmişlerdir. Yazarlar PIDD veri seti üzerindeki bu çalışma ile 76.087% başarımla elde etmişlerdir (Choubey ve Paul, 2017,s.71-93). Zou ve arkadaşları Sinir Ağı (SA) sınıflandırıcı ile diyabet hastalığını tespit etmek için PIDD veri seti kullanarak 76,67% doğruluk başarımla elde etmişlerdir (Zou vd.2018). Tigga ve Garg PIDD veri seti kullanarak diyabet hastalığını tahmin etmek için çeşitli makine öğrenme tekniklerini sınıflandırıcı olarak kullanmışlardır. Rastgele Orman (RO) sınıflandırıcı ile en yüksek 75% doğruluk başarımla elde etmişlerdir (Tigga ve Garg, 2020, s.707). Kamel ve Yaghouzadeh PIDD veri seti kullanarak yaptıkları çalışmada Destek Vektör Makinesi (DVM) kullanmışlar ve diyabet hastalığını 97% doğrulukla tespit etmişlerdir (Kamel ve Yaghouzadeh, 2021, s.2).

MATERYAL ve YÖNTEM

Bu çalışmada Pima Indians Diabetes Database (PIDD) veri seti kullanılmıştır. Veri setinde toplam 768 örnek yer almaktadır. 500 örnek diyabet tanısına sahiptir. Veri setinde her bir örnek için yer alan parametreler yaş, hamilelikler, glikoz, kan basıncı, cilt kalınlığı, insülin, vücut kitle indeksi ve diyabet soyağacı fonksiyonu şeklinde isimlendirilmiş ve nümerik değerler içermektedir. Önerilen sınıflandırıcı mimarisi Visual Studio Community 2017 platformunda Python dili kullanılarak gerçekleştirilmiştir. Önerilen mimariye ilişkin blok diyagram Şekil 1 ile verilmiştir.

Şekil 1. Önerilen mimariye ait blok diyagram

Biyomedikal alanda yapılan çalışmalarda araştırmacıların sıklıkla karşılaştıkları bir olumsuzluk sınırlı sayıda veya yetersiz örnek içeren veri setleridir (Chen ve Cao, 2019).

Üretken Çekişmeli Ağ (ÜÇA), sentetik veri üretmek için kullanılan bir derin öğrenme yöntemidir (Goodfellow, vd. 204:27). Sentetik veri üretme teknikleri kullanılarak dengesiz sınıflı (balanssız) veri setlerinde azınlık sınıfını artırmak için kullanılan bir yöntemdir (Chawla vd. 2002:16). Bu çalışmada 268 adet sağlıklı sınıfına ait örnek ÜÇA tekniği ile artırılarak 500 adete yükseltilmiştir. Bu sayede hem veri seti büyütülmüş hem de veri seti balanslanmıştır.

Evrişimsel Sinir Ağı (Convolutional Neural Network, CNN) özellikle görüntü işleme uygulamaları için tasarlanmış derin öğrenme modeli türüdür. Evrişimli katmanları, havuzlama katmanlarını, tam bağlantılı katmanları ve bir sınıflandırma katmanını içerir (Alakuş ve Türkoglu, 2020 s.2). Önerilen mimari Şekil 2 ile verilmiştir.

Layer (type)	Output Shape	Param #
conv1d (Conv1D)	(None, 8, 512)	1024
activation (Activation)	(None, 8, 512)	0
max_pooling1d (MaxPooling1D)	(None, 4, 512)	0
dropout (Dropout)	(None, 4, 512)	0
batch_normalization (Batch Normalization)	(None, 4, 512)	2048
flatten (Flatten)	(None, 2048)	0
dense (Dense)	(None, 2048)	4196352
dense_1 (Dense)	(None, 1024)	2098176
dense_2 (Dense)	(None, 512)	524800
dense_3 (Dense)	(None, 2)	1026

Şekil 2. Önerilen CNN mimarisi

Medikal klinik uygulamalarda çapraz doğrulama tekniği daha az net sonuçlar vermektedir (Alakuş ve Türkoglu, 2020). Bu nedenle bu çalışmada eğitim-test bölme yaklaşımı kullanılmıştır. Bölme oranı 20 olarak belirlenmiştir.

Bulgular ve Tartışma

Önerilen mimarinin başarımı aşağıda Eşitlik 1 ve Eşitlik 4 arasında matematiksel ifadeleri verilen metrikler kullanılarak değerlendirilmiştir. Eşitliklerdeki TP doğru olarak sınıflandırılan hasta sayısını, TN doğru olarak sınıflandırılan sağlıklı sayısını, FP sağlıklı ile hasta olarak sınıflandırılan sayısını FN ise hasta iken sağlıklı olarak sınıflandırılanların sayısını ifade etmektedir. AUC (eğri altındaki alan) değerini hesaplamak için alıcı işletim karakteristiği (ROC) eğrisi kullanılır. AUC, rastgele bir hasta ve rastgele bir sağlıklı birey arasında yapılan bir tıbbi test sonucunun doğruluğunu değerlendiren bir ölçüdür. Bu, test sonuçlarının hasta ve sağlıklı bireyler arasında ayırma yeteneğini ölçer. AUC değeri, bu ayırma yeteneğinin ne kadar güçlü olduğunu gösterir; yani, ne kadar yüksekse, testin doğruluğu o kadar iyidir. (Safari,2016:111-113).

$$\text{Doğruluk} = (TP + TN) / (TP + TN + FP + FN) \quad (1)$$

$$\text{Duyarlılık} = TP / (TP + FN) \quad (2)$$

$$\text{Hassasiyet} = TP / (TP + FP) \quad (3)$$

$$\text{F1-skor} = 2 \times \text{Hassasiyet} \times \text{Duyarlılık} / (\text{Duyarlılık} + \text{Hassasiyet}) \quad (4)$$

Bu metriklere göre önerilen derin öğrenmeye dayalı mimarinin ortalama sonuçları Tablo 1 ile verilmiştir.

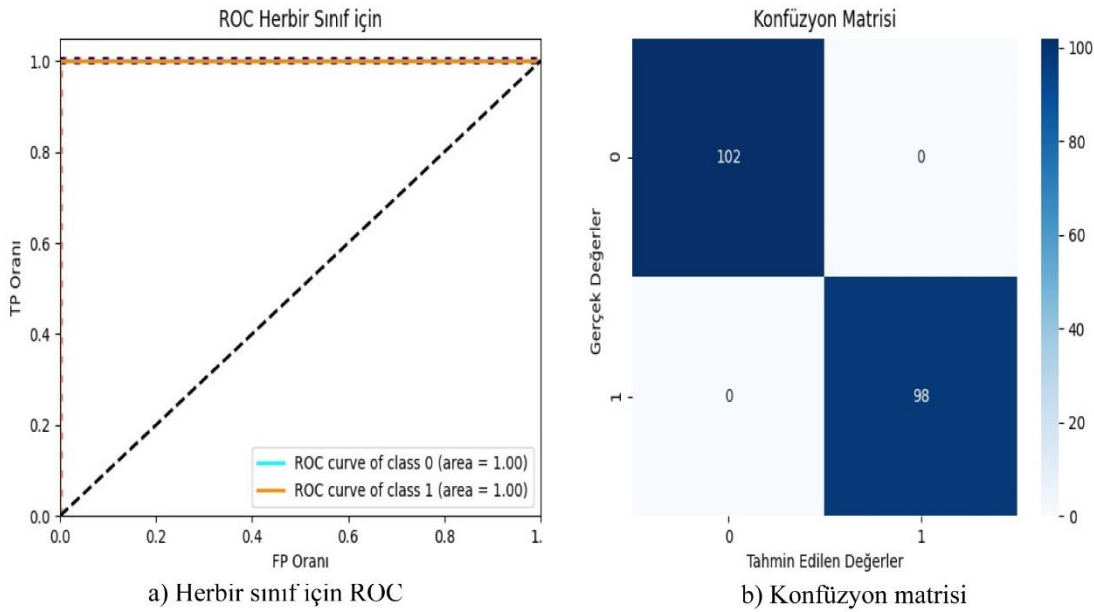

Tablo 1. Önerilen mimariden elde edilen performans sonuçları

Doğruluk	Duyarlılık	Hassasiyet	F1-skor	AUC
0,9972	0,9975	0,9975	0,9975	1,0000

Önerilen mimariye ait elde edilen grafiksel sonuçlar Şekil 2 ve Şekil 3 ile verilmiştir.

Şekil 2. a) Model doğruluk grafiği b) ROC grafiği

Şekil 3. a) Her bir sınıf için ROC b) Konfüzyon matrisi

Literatürdeki bu çalışmanın konusu ile ilgili yapılan çalışmalardan elde edilen performanslar bu çalışma sonucu ile karşılaştırılarak Tablo 2 ile verilmiştir.

Tablo 2. Literatür karşılaştırması

Referans	Yöntem	Doğruluk %
Sisodia	Naive Bayes	76,30
Yang	K-ortalama/ LR	95,42
Choubey	RTF SA	76,087
Zou	SA	76,67
Tigga	RO	75
Kamel	DVM	97
Bu Çalışma	CNN	99,72

SONUÇ ve ÖNERİLER

Tablo 2 ile verilen sonuçlar göz önüne alındığında diyabet hastalığının tahmininde bu çalışmada önerilen derin öğrenmeye dayalı sınıflandırıcı mimarisi literatürdeki çalışmalara karşı daha üstün bir başarıya ortaya koymuştur. Önerilen mimari ile biyomedikal alandaki araştırmacıların sıklıkla karşılaştıkları yetersiz ve balansız veri seti problemi giderilebilir. Aynı zamanda derin öğrenmeye dayalı teknikleri kullanacak araştırmacılar için derin öğrenme sistemlerinin başarımının yükseltilmesinde de önemli bir rol oynayabilir. Diyabetle ilgili en büyük zorluk, erken teşhis eksikliği veya hekimlerin yanlış teşhis koyma riskidir. Bu yüzden, özellikle

diyabetin başlangıç aşamalarında doğru bir teşhis sağlayan bir yöntemin uygulanması, hastalığın kontrol altına alınması ve önlenmesi için kritik bir adım olarak öne çıkmaktadır. Bu çalışmada önerdiğimiz yöntemin yüksek doğruluk değerlerine sahip olması nedeniyle bu hastalığın erken teşhisi ve kontrol altına alınmasında hekimlere karar aşamasında yardımcı olabilir. Aynı zamanda diğer yöntemlere göre hem zaman hem de maliyet açısından bir avantaj sağlayabilir.

ÖZET

Görünüşte basit killer, tebeşirler ve kireçtaşlarından nadir toprak manyetik tozlarına kadar değişen çok çeşitli taneli malzeme, polimer uygulamalarında dolgu maddesi olarak kullanılır. Mineral dolgu maddeleri, daha pahalı içerik maddelerinin yerini alarak ve ürün matrisinde yer kaplayarak ürün maliyetlerini kontrol etmeye yardımcı olur. Dolgu maddelerinin kullanım nedenleri, kullanılan türleri ve etkileri, çeşitli polimer türleri arasında oldukça önemli farklılıklar göstermektedir. Bu derlemede, mineral dolgu maddeleri ve farklı polimer tiplerinde mineral dolgu maddelerinin kullanımı hakkında bilgi verilmektedir.

Anahtar Kelimeler: Mineral dolgu malzemeleri, kompozit, polimer, ürün matrisi

MINERAL FILLERS AND THEIR USE IN POLYMERS

ABSTRACT

A wide variety of granular materials, ranging from seemingly simple clays, chalks and limestones to rare earth magnetic powders, are used as fillers in polymer applications. Mineral fillers help control product costs by replacing more expensive ingredients and taking up space in the product matrix. The reasons for the use of fillers, the types used and their effects show significant differences between various polymer types. In this review, information is given about mineral fillers and the use of mineral fillers in different polymer types.

Keywords: Mineral fillers, composite, polymer, product matrix

GİRİŞ

Bilim ve teknolojinin ilerlemesi ile insanoğlu bugün mineralleri en ince ayrıntılarına kadar inceleyebilmekte onlardan yararlanma yollarını aramaktadır. Bir mineral, belirli bir kimyasal bileşime sahip, saf, genellikle kristal, doğal olarak oluşan bir malzemedir. Mineraller genellikle doğada nispeten saf minerallerden karmaşık karışımlara kadar değişebilen kayalar veya cevherler olarak bulunur. Dolgu maddeleri, madencilik yoluyla bu doğal mineral kaynaklarından üretilir ve bunu ufalama (kuru veya yaş), saflaştırma (zenginleştirme), sınıflandırma, kalsinasyon, yüzey kaplama ve kurutma gibi çeşitli işlemler takip eder.

Bir polimer kompozit veya polimer matris kompozit, güçlendirici dolgu maddelerinin bir polimer matris ile entegre edildiği ve her iki bileşenle tek başına elde edilemeyen sinerjistik mekanik özelliklerle sonuçlanan çok fazlı bir malzemedir. Polimer matris kompozitler, mekanik, termal ve elektriksel özellikleri ve reolojik davranışları gibi benzersiz özellikleri nedeniyle hem akademi hem de endüstride ilgi görmektedir. Polimer kompozitlerin üretimi üzerine katkı ve dolgu maddelerinin dâhil edilmesi, hem ekonomik karlılık hem de performans açısından geniş bir uygulama yelpazesine izin vermiştir. Dolgu maddelerinin kullanım nedenleri, kullanılan türleri ve etkileri, çeşitli polimer türleri arasında oldukça önemli farklılıklar göstermektedir. Bu bölümde mineral dolgu malzemeleri özet olarak verilmiştir. Tablo 1 mineral dolgu malzemelerinin özelliklerini kısaca özetlemektedir.

Tablo 1. Dolgu Özellikleri ve kullanımları

	Tane şekli	Parlaklık	Yağ emme	Ortalama tane boyutu,µm	Hegman İnceliği	Yoğunluk g/cm ³	Refraktif indeks	Sertlik

Mineral Dolgu Malzemeleri

Kalsiyum Karbonat (CaCO₃)

Kalsiyum karbonat doğada yaygın olarak bulunur ve birçok uygun özelliğe sahip olduğundan yaygın olarak dolgu maddesi olarak kullanılır (Katircioglu-Bayel ve diğ. 2019). Kuru öğütülmüş kalsiyum karbonatlar, mevcut en ucuz beyaz dolgu maddeleri arasındadır. Yaş öğütülmüş ürünler daha ince tane boyutu aralıklarında üretilir. Yaş öğütülmüş ince ve ultra ince ürünler ayrıca yüksek hacimli boya ve kâğıt uygulamaları için %75 katı bulamaç formunda satılmaktadır. Çöktürülmüş kalsiyum karbonat (PCC), daha yüksek parlaklık, daha iyi TiO₂ yayılımı, daha küçük tane boyutu, daha büyük yüzey alanı, daha düşük aşındırıcılık veya daha yüksek saflık gerektiren uygulamalar için üretilir. Kalsiyum karbonat, düşük maliyeti, TiO₂ yayılımı için yüksek parlaklığı, yüksek saflığı, düşük aşındırıcılığı ve hava koşullarına karşı direnci nedeniyle boyalarda kullanılan beyaz dolgu maddesidir. Kalsiyum karbonat ayrıca yapıştırıcılarda ve sızdırmazlık maddelerinde de en yaygın kullanılan dolgu maddesidir. En iri tane boyutları, alçıpan derz çimentolarında ve ağır duvar karosu için hazır yapıştırıcılarda yüksek oranlarda kullanılır. İnce öğütülmüş ürünler, akışı olumsuz etkilemeden ekonomik olarak yüksek yüklere izin verdikleri için çoğu yapıştırıcı, sızdırmazlık maddesi ve boşluk doldurucu türünde genel amaçlı dolgu maddeleri olarak kullanılır. Yüksek performanslı polimer bazlı yapıştırıcılar ve dolgu macunları, uygulamada akışı ve çökmeyi kontrol etmek ve kürlenmiş durumda iyi yırtılma ve gerilme özellikleri ile düşük modül sağlamak için stearat kaplı PCC ve ultra ince doğal ürünler kullanır. PCC, plastiklerde bozulma ve darbe direncini, yüzey parlaklığını, hava koşullarına dayanıklılığını, büzülme kontrolünü, düşük ve yüksek sıcaklık özelliklerini ve dielektrik özelliklerini iyileştirmek, plastikleştirici göçünü ve kalıplanmış parçaların çatlamasını azaltmak için kullanılır.

Öğütülmüş kalsiyum karbonat, düşük maliyeti, düşük aşınması, düşük yağ emmesi, düşük nemi, yüksek parlaklığı ve kolay dağılması nedeniyle plastiklerde en yaygın kullanılan dolgu maddesidir.

Kil

Kil, granitin ayrışmasıyla üretilen, yaygın olarak oluşan çeşitli sulu alüminosilikat minerallerini tanımlamak için kullanılan bir terimdir. Polimer endüstrisinde kullanılan ana kil minerali, genellikle kaolin veya çin kili olarak bilinen kaolinittir (Al₂O₃.2SiO₂.2H₂O). Kaplamalarda kaolinin başlıca kullanımı bir TiO₂ dolgu maddesidir. Suyla yıkanmış ve katmanlara ayrılmış killer, su bazlı kaplamalarda parlaklığı, film bütünlüğünü, dayanıklılığını, ovalama direncini, kaplama gücünü, süspansiyon kabiliyetini, akışı ve tesviyeyi kontrol etmek için kullanılır.

Plastiklerde kaolin, elektrik direncini iyileştirmek için PVC tel yalıtımında kullanılmaktadır. Kâğıt dolgu maddesi olarak yüksek parlaklıkta, düşük aşınmalı, su ile yıkanmış kaolinler kullanılmaktadır. Asit pH kâğıtlarında da tercih edilen dolgu maddesi kaolindir.

Yapıştırıcılarda ve sızdırmazlık maddelerinde kaolin, uygulama sırasında akış, penetrasyon ve yapışmanın yanı sıra kürleşmeden sonra yapışma mukavemeti, yırtılma mukavemeti, çekme mukavemeti ve uzamayı kontrol etmek için kullanılır.

Mika

İnce öğütülmüş ve mikronize mika, süspansiyon stabilitesini iyileştirmek, büzülme ve kabarmayı kontrol etmek, hava koşullarına, kimyasallara ve su penetrasyonuna karşı direnci artırmak ve çoğu yüzeye yapışmayı iyileştirmek için boyada kullanılır. Mika, plastiklerde bükülme azaltmak, sertliği ve ısı eğilme sıcaklığını artırmak için en etkili mineral olarak kabul edilir. İnce ve mikronize öğütülmüş ürünler ayrıca elektriksel, termal ve yalıtım özelliklerini iyileştirmek için kullanılır.

Üretim süreçleri, yüksek en-boy oranlı taneler üretirken saflaştırma ve boyut küçültme elde etmeyi amaçlar. Polimerlerdeki ana kullanımları, iyi takviyeye yol açan yüksek en-boy oranlı plakalar üretme yeteneklerine ve mükemmel elektriksel özelliklerine dayanmaktadır. Yüzey modifikasyonu, yaygın olarak birçok uygulamada kullanılan organosilanlarla birlikte yapılmaktadır.

Talk

Talk, hidratlı bir magnezyum silikatu temsil eder ve kimyasal formülü $Mg_3Si_4O_{10}(OH)_2$ 'dir (Katircioglu-Bayel, 2020). Saf mineral, iki silis tabakası arasına sıkıştırılmış magnezyum hidroksit tabakalarından oluşur. Ortaya çıkan bu tabakalar arasında sadece zayıf bir bağ vardır ve bu nedenle saf talk, Mohs ölçeğinde 1 değeriyle bilinen en yumuşak mineraldir (Sanchez-Soto ve diğ. 1997). Talkın bazı özellikleri, elde edildiği yatağa ve kullanılan işleme göre büyük ölçüde değişir. Böylece kristal form katmanlı, yapraklı, lifli veya masif olabilir. Talk genellikle dolgu maddesi olarak kullanılır ve böylece nihai malzeme maliyetini düşürür (Katz ve Milewski, 1987).

Yassı talklar, dolgu uygulamaları için en çok kullanılan formdur ve yapıları genellikle ince bir boyut ve yüksek bir en boy oranı elde etmeye yatkındır. Talk'ın kaplamalarda başlıca kullanımı parlaklık kontrolü içindir. Ayrıca TiO_2 genişlemesine, süspansiyon stabilitesine, yassılaşmaya, kimyasal dirence, film bütünlüğüne ve hava koşullarına karşı dayanıklılığa da katkıda bulunur. Mikronize talk, düşük aşınması ve tercihen su mevcudiyetinde yağlı malzemeleri ıslatma kabiliyeti nedeniyle kâğıt hamuru ve kâğıt fabrikalarında zift adsorpsiyonu için kullanılır. Talk,

hem termosetleri hem de termoplastikleri güçlendirmek ve/veya doldurmak için kullanılır, ancak esas olarak eriyik akışını kontrol etmek, kalıplanmış parçalarda kaymayı azaltmak, kalıplama döngülerini artırmak, ısı saptırma sıcaklığını artırmak ve boyutsal kararlılığı iyileştirmek için kullanılır.

Vollastonit

Magmatik kayalarla karbonatların kontaktlarında termal metamorfizma ürünü olarak oluşur. Vollastonit, kaplamalarda dolgu pigmenti olarak kullanılır, parlama ve erken paslanmaya karşı direnç sağlar. İnce öğütülmüş ve mikronize boyutlu ürünler, epoksi toz boyalarda düzgün akış, su direnci, geliştirilmiş ıslak yapışma ve iyi parlaklık sağlar.

Vollastonit, düşük yağ ve nem emilimi, yüksek parlaklığı, iğnemsiz yapısı ve çeşitli yüzey işlemleriyle kullanılabilirliği nedeniyle plastiklerde takviye dolgu maddesi olarak kullanılır. Yüksek en-boy oranlı vollastonit, hem termoplastikler hem de termosetler için kısa sürede öğütülmüş cam elyaflarına daha düşük maliyetli bir alternatif veya tamamlayıcıdır. Fren balataları ve fren pistonları gibi sürtünme ürünleri için asbest içermeyen formülasyonlarda organik ve metalik elyaflarla birlikte kullanılır. Aynı zamanda fenolik kalıplama bileşiklerinde asbest yerine ve naylonlarda, özellikle yüksek darbeye dayanıklı ve kaplanabilir bileşiklerde takviye edici dolgu maddesi olarak da kullanılır. Vollastonit, yapıştırıcılarda ve sızdırmazlık ürünlerinde yüksek oranlarda kullanılabilen beyaz bir takviye dolgu maddesidir (Rothon, 2002).

Silika

Boya genişletici pigmentler olarak öğütülmüş kuvars ve novakülit, maliyeti arttırmadan karışımın hacmini artırır. Yassı novakülit, şekil bozukluğuna, aşınma ve hava koşullarına dayanıklılık kazandırır. Çöktürülmüş silisler düzleşme, bozulma direnci ve aşınma direnci sağlamak için kullanılır.

İnce çökeltilmiş silika, genel kauçuk bileşimi için karbon siyahına tamamen güçlendirici tek alternatiftir. Matris uyumluluğunu iyileştirmek için genellikle silan birleştirme ajanlarıyla birlikte kullanılır. Füme silika, silikon elastomerlerde yaygın olarak kullanılan takviye edici dolgu maddesidir.

Alçı Taşı

Sulu sülfatlar grubunda yer alan alçı taşı, dihidrat formda olup tabiatta 6 şekilde bulunur. Bunlar; anhidrit, bassanit, jips, albatr, ipek jipsi ve selenittir. Jips doğada bol miktarda bulunur. Kontrollü kalsinasyon ile hemihidrat ve susuz form elde etmek mümkündür. Dihidrat, polimer uygulamaları için en yaygın kullanılan formdur.

Barit

Boyalar ve astarlar, dolgu sınıfı baritin (baryum sülfat) en büyük kullanımını temsil eder (Katircioglu-Bayel ve diğ. 2018). Yüksek parlaklıkta mikronize barit, müşterilerin kaliteyle eş tuttuğu ağırlığı sağlamak için ve yüksek yüklemeler için düşük bağlayıcı talebi nedeniyle bir dolgu maddesi olarak kullanılır.

Çöktürülmüş baryum sülfat (blanc fixe), birinci sınıf metal astarlarda olduğu gibi boya filminin daha yoğun bir şekilde paketlenmesi için daha ince tane boyutunun gerekli olduğu, asitler ve alkaliler tarafından korozyona karşı direnç sağlamak için kullanılır. Kırılma indeksleri bağlayıcılarınkine yakın olduğu için, barit ve çöktürülmüş baryum sülfat boyada zayıf örtücülük ve renklendirme gücüne sahiptir. Bunun yerine genişleticiler ve ayırıcılar olarak işlev görürler. Kauçukta, ince öğütülmüş baritin sertleşme, sertlik, rijitlik veya eskime üzerinde çok az etkisi vardır. Blanc fixe, benzer bileşik yumuşaklığı ve esnekliği sağlamak için kullanılır, ancak daha iyi gerilme mukavemeti ve yırtılma direnci sağlar.

Barit, halı ve levha döşeme için PVC ve poliüretan köpük desteklerinde yoğun kaplamalar oluşturmak için kullanılırken ince öğütülmüş barit, fren balatalarında ve debriyaj plakalarında inert dolgu maddesi olarak kullanılır. Mikronize barit ve blanc fixe, öncelikle bristol tahta, oyun kartları ve ağır baskı kâğıtlarına ağırlık eklemek için kullanılır.

Feldispat

Feldispat, cam yapımında, seramikte, boya, plastik kauçukta dolgu ve genişletici olarak kullanılan yaygın bir hammaddedir. Cam yapımında, feldispat kaynaklı alümina, ürün sertliğini, dayanıklılığını ve kimyasal korozyona karşı direncini artırır. Seramikte, feldispattaki alkaliler (kalsiyum oksit, potasyum oksit ve sodyum oksit), karışımın erime sıcaklığını düşürerek bir bariyer görevi görür. Kaplamalarda ayrıca iyi film dayanıklılığı, tebeşirlenmeye ve donmaya karşı yüksek direnç sağlar.

Farklı Polimer Tiplerinde Mineral Dolgu Maddelerinin Kullanımı

Dolgu maddelerinin kullanım nedenleri, kullanılan türleri ve etkileri, çeşitli polimer türleri arasında oldukça önemli farklılıklar göstermektedir.

Elastomerler

Dolgu maddelerinin ana kullanımları, maliyetin düşürülmesi veya modül, gerilme ve yırtılma mukavemeti ve aşınma direnci gibi özelliklerin artırılması içindir (Rong ve diğ. 2001). Elastomerler, iyi yalıtım sağlayan, kolay deforme olmayan, farklı şekiller halinde kalıplanabilen bir bükülebilir plastik malzeme kategorisidir. Doğal ve suni kauçuk malzemeler,

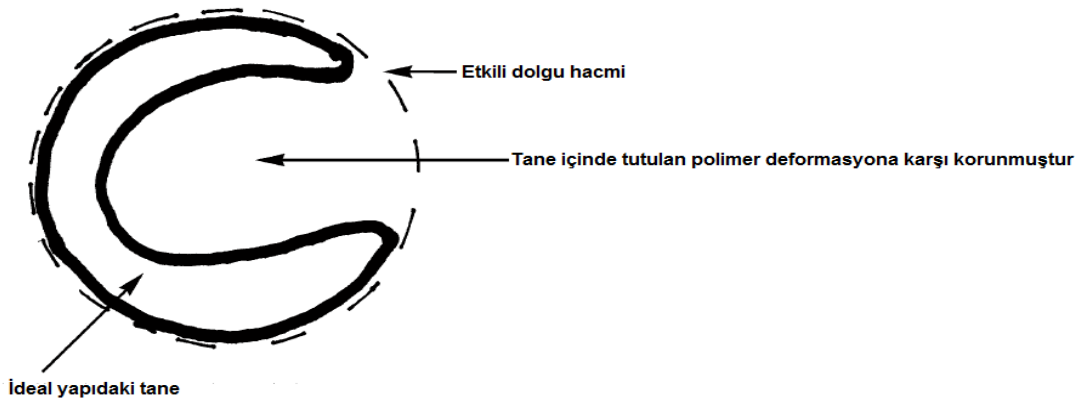

özel bir polimer türü olan elastomerler arasındadır. Kullanılan ana mineral dolgu maddeleri şunlardır:

- Killer
- Doğal kalsiyum karbonatlar
- Çöktürülmüş kalsiyum karbonatlar
- Çöktürülmüş silikalar

Elastomerler dinamik uygulamalarda sıklıkla kullanıldığından, histerezis ve yorulma direnci gibi özellikler de genellikle büyük önem taşır. Partikül dolgu maddelerinin etkilerinin belirlenmesinde kauçuğun yapısı çok önemli bir faktördür. Birincisi, boyutları çapraz bağ yoğunluğuna göre değişen bir kafes yapısı oluşturduğu kabaca düşünülebilecek çapraz bağların varlığıdır. Dolgu partiküllerinin takviye edici niteliklere sahip olması ve ağı bozmaması için bu kafes boyutundan daha küçük olması gerektiği düşünülmektedir. İkincisi, kauçuk kristalleşmesi sorunu var. Bazı kauçuklar, özellikle doğal kauçuk, uzama üzerine geri dönüşümlü olarak polimer kristalitler oluşturur ve bunlar, mukavemette önemli bir artışa yol açan ekstra çapraz bağlar görevi görür. Stiren-bütadien (SBR) gibi çoğu hacimli sentetik kauçuk, bu tür bir kristalleşmeye uğramaz ve doğası gereği çok daha zayıftır. İki tip kauçukta dolgu maddelerinin rolü biraz farklıdır. Gerinim kristalleşen kauçuklar doğal olarak güçlüdür ve dolgu maddesinin kristalleşme süreçlerine müdahale etmemesi önemlidir. Diğer kauçuklar doğası gereği çok daha zayıftır ve burada doğru seçilmiş dolgu maddeleri (en önemlisi kauçuğa güçlü bir dolgu maddesi ekleyenler) kristalitlerin yerini alabilir ve mukavemette büyük bir artış sağlayabilir.

Tane boyutu, şekli ve polimer matrisi ile bağlanma yeteneği, dolgu performansının belirlenmesinde önemli faktörlerdir. Dolgu genellikle 1 mikron boyutundan daha küçük tanelerle yapılır. Birçok mineral dolgu maddesinin kauçuklarla etkileşiminin gücü, kauçuk olmayan türlerin varlığından önemli ölçüde etkilenmiştir.

Tane şekli bir başka çok önemli faktördür, ancak diğer polimer uygulamalarında çok öne çıkmayan bazı özel hususlara sahiptir. Bu bağlamda yapı, bir tanenin polimer matrisin bir kısmını deformasyon kuvvetlerinden kısmen korumasına izin veren şekil faktörlerini ifade eder. Bu, dolgu maddesinin bazı durumlarda daha yüksek bir yüke sahipmiş gibi davranmasına izin verir ve bu, özelliklerin genel dengesini iyileştirebilir. Ayrıca yüksek düzeyde yapılandırılmış tanelerin daha kolay dağıldığına inanılmaktadır. Yapı kavramı, Şekil 1'de daha ayrıntılı olarak gösterilmektedir.

Şekil 1. Mineral dolgu malzemesinin yapısının şematik gösterimi (Rothon, 2002)

Bir dolgu maddesinin polimer ile güçlü bağlar oluşturma yeteneği de güçlendirmede önemli bir faktördür. Dolgu partikülü yüksek uzamalarda polimere bağlı kalmalıdır. Mineral dolgu maddeleri, eğer aynı etkiyi elde edeceklerse, genellikle bir tür bağlama maddesine (yüzey modifikasyon ajanına) ihtiyaç duyarlar. Organosilanlar, silikalar ve killer gibi dolgu maddeleri ile kullanıldığında bu amaç için çok etkilidir.

Polimer ile dolgu malzemesi arasında güçlü bir bağın olması gereklidir. Ve özellikle dispersiyon çok önemlidir. Elastomerlerde dolgu maddelerinin kullanımına ilişkin daha fazla ayrıntı, literatürde birçok çalışmada bulunabilir (Skelhorn, 2003; Hepburn, 1997; Payne ve Kraus, 1965; Alemán ve diğ. 2007).

Termoplastikler

Termoplastik, ısıtıldığında homojen bir sıvı haline gelen ve soğutulduğunda sertleşen polimer reçinelerinden üretilen bir plastik türüdür. Kullanımda olan çok sayıda dolgu maddesi/polimer kombinasyonu vardır, ancak dolgu maddelerinin kullanıldığı ana polimerler PVC, PE ve PP'dir (Xanthos ve Todd, 1996). Kullanılan ana dolgu maddeleri şunlardır:

- Doğal kalsiyum karbonatlar
- Çöktürülmüş kalsiyum karbonatlar
- Vollaştonit
- Mika
- Talk

Termoplastiklerde süreç geri dönüşümlüdür. Isıtıldığında yumuşar veya erir ve basınç uygulandığında akar, soğutulduğunda tekrar katılarak eski halini alır.

Polivinil klorür (PVC)

PVC, ağırlıklı olarak doğal ve sentetik kalsiyum karbonatlar olmak üzere büyük bir dolgu maddesi tüketicisidir. Dolgu maddelerinin yaygın kullanımının bir nedeni, bu polimerin işlem yardımcıları ve dengeleyiciler sağlamak için birleştirilmesi gerekmesi ve bu nedenle dolgu maddelerinin çok fazla ekstra maliyet olmadan dâhil edilebilmesidir.

PVC nispeten kararsızdır ve bu nedenle işleme için tamamen eritilemez, bunun yerine bir füzyon işlemi kullanılır. Bu yüzden, dispersiyon diğer bazı polimerlerde olduğu kadar kolay elde edilmez ve dolgu maddesinin ısı transferi ve füzyon işlemi üzerindeki etkisi önemlidir. Yüzey modifikasyon ajanları, PVC'deki dolgu maddeleri için çok az kullanılır, ancak füzyona ve dağılmaya yardımcı olduğundan, yağ asitleri ile yüzey işlemi yaygın olarak uygulanır. Plastikleştirilmiş (esnek) ve plastikleştirilmemiş (sert) PVC'nin iki formu, farklı uygulamalara ve dolgu tepkisine sahiptir (Deshmukh ve diğ. 2011). PVC, endüstriyel anlamda geri dönüşümlü bir plastik olarak kabul edilir ve cam temizleyici, deterjan şişeleri, şampuan şişeleri, açık gıda paketlenme ve film, dış cephe kaplaması, pencere, boru sistemleri vb. alanlarda kullanılır.

Polietilen (PE)

Etilen gazının polimerizasyonu ile sentezlenen polietilen en fazla tüketilen ticari polimerdir. Polietilen paketlenme ve ambalaj filmi, kaplar, kutular, oyuncak, mutfak eşyaları, kaplamalar, boru ve tüp, kablo kılıflaması gibi pek çok alanda kullanılır.

Polipropilen (PP)

PP bileşiklerinde çok sayıda uygulama için büyük miktarlarda dolgu maddesi kullanılır, kullanılan ana dolgu maddeleri doğal kalsiyum karbonat ve talktır. PP'nin yarı kristalli yapısı, kauçuk sertleştirmede kullanımı ve üçüncül karbonun neden olduğu dengesizlik, dolgu maddelerinin dâhil edilmesini gerektirir. PP, kristallik tipinin birçok özelliği üzerinde büyük etkisi olan yarı kristalli bir polimerdir. Kristallik düzeyi, kristal yapı tipi ve kristalitlerin boyutu önemli faktörlerdir ve işleme sırasındaki erime ve soğuma koşullarından etkilenirler.

Dolgu maddeleri ayrıca çeşitli faktörler nedeniyle kristalliğin doğasını önemli ölçüde etkileyebilir ve ince öğütülmüş talk gibi bazıları, daha hızlı döngü sürelerine yol açan çekirdekleştirici maddeler olarak hareket etme yetenekleri nedeniyle kasıtlı olarak kullanılır. Maliyetleri düşürmenin yanı sıra, PP'de dolgu maddelerinin kullanılmasının ana nedenleri, modülü ve ısıl bozulma sıcaklığını arttırmaktır (Wang ve diğ. 2013). Diğer faydalar arasında daha az çekme ve artan termal iletkenlik (böylece döngü sürelerini azaltır) bulunur. Özellikle

düşük sıcaklıklarda darbe dayanımı PP için çok önemli bir husustur ve dolgu maddelerinin bu konuda çok önemli bir etkisi olabilir.

Sertlik, normal aralığın üzerindeki dolgu malzemesi tane boyutundan çok az etkilenir ve büyük ölçüde dolgu yüklemesi ve en-boy oranı tarafından kontrol edilir. Doğal kalsiyum karbonatlar düşük bir en-boy oranına sahiptir ve belirli bir yükleme düzeyine kadar dayanıklılığı artırabilmelerine rağmen, bunlarla elde edilebilecek sertliğin bir sınırı vardır. Toklukta bir miktar kayıp olsa da, talkın yassı yapısı daha yüksek modüllü kompozitlerin yapılmasına olanak sağlar ve bu, PP bileşiklerinde talkın yaygın kullanılma nedenini açıklar. PP'deki dolgu maddeleri için en yaygın kullanılan yüzey modifikasyon türü, bağlayıcı olmayan yağ asidi türüdür. Bu, viskoziteyi önemli ölçüde azaltabilir ve dolayısıyla modifikasyonu da iyileştirebilir.

Poliamidler (Naylonlar)

Naylonlar, mineral dolgu maddelerinin kullanıldığı pahalı polimerlerdir ve genellikle cam elyafı ile birlikte yaygın olarak kullanılmaktadır. Kullanılan ana dolgu maddeleri kalsiyum karbonat, kalsine kil, vollastonit ve talktır (Geyer ve diğ. 2017). Otomotiv sektörü, mutfak eşyaları ve spor giysilerinde dayanıklılıklarından dolayı yaygın olarak kullanılmaktadır.

Termosetler

Termoset plastikler, işlendiğinde üç boyutlu bir ağ oluşturan kimyasal bir değişim geçiren sentetik malzemelerdir. Termoset plastiklere örnek olarak reçineler poliüretan, poliimid, polibütadien ve vulkanize kauçukları örnek verebiliriz. Genellikle gözden kaçmasına rağmen, ısıyla sertleşen polimerlerde, özellikle doymamış polyester reçinesinde (UPR) ve belirli polimetilmetakrilat (PMMA) formlarında büyük miktarlarda dolgu maddesi kullanılır. Isıtılan ve şekil verilen bu moleküller yeniden işlenemez ve şekillendirilemez. Isıtıldığında (katalizörlü ortamda) katılaşırlar ve tekrar ergitilemezler; moleküller kimyasal ve faz değişimine uğrar.

Bu polimerlerde dolgu maddesi kullanılmasının başlıca nedenleri şunlardır (Jackson ve Orton, 1995):

- Tasarruf
- Artırılmış modül
- Azaltılmış genleşme katsayısı
- Sertleşme sırasında ekzoterm indirgeme ve çekme kontrolü
- İyileştirilmiş yüzey sertliği ve aşınma rezistans
- Geliştirilmiş estetik
- Yangın geciktirici.

Termoset plastikler kürlenmiş veya çapraz bağlı bileşikler olduğundan uzun ömürlü ve ısıya dayanıklıdır. UPR'de maliyet tasarrufu, modül, sertlik ve yanmazlık dolgu maddelerinin kullanılmasının ana nedenleri olup, kullanımda ana olanlar öğütülmüş silika, öğütülmüş kalsiyum karbonatlar ve alçı taşı'dır. Dolgu maddeleri genellikle cam elyaf takviyesi ile birlikte kullanılsa da cam elyafı olmadan da önemli ölçüde birçok kullanım alanı vardır. Örneğin; tane boyutu yüksek yükler için optimize edildiği polimer betonlarda öğütülmüş silika ve sentetik mermerde öğütülmüş kalsiyum karbonat vb.

Dolgulu PMMA'nın ana uygulamaları, mutfak ve banyolar için katı yüzeyler ve lavabolardır ve kullanılan ana mineral dolgu maddesi silikadır. Kristalin silika, yüksek aşınma direncinin gerekli olduğu yerlerde (örn. mutfak lavaboları) kullanılır.

Termoset reçinelerin sıvı yapısı, kolay dolgu dağılımına ve doldurulmuş reçinenin reolojisinin iyi bir şekilde kontrol edilmesini sağlar. Yüksek dolgu yüklemeleri, özellikle yüksek düzeyde yangın geciktiriciliğin gerekli olduğu durumlarda sıklıkla kullanılır. Tane boyutu dağılımının kontrolü genellikle düşük viskoziteli ve yüksek yüklü ürünler vermek için kullanılır. Yağ emilimi yine bunun için iyi bir kılavuzdur, düşük bir değer daha yüksek yükleme kabiliyetini gösterir. Dolgu maddeleri genellikle kaplanmamış formda kullanılır, ancak çeşitli dağıtıcılar ve bağlama maddeleri genellikle reçine içinde çözülür.

SONUÇLAR

Mineral dolgu malzemeleri kullanıldığı malzeme içerisinde çözünmeyen, malzemenin bazı fiziksel ve mekanik özelliklerini arttırmak, polimerin maliyetini düşürmek amacıyla kullanılan çok ince öğütülmüş toz halindeki maddeler olarak tanımlanmaktadır.

Polimer matris kompozitler, mekanik, termal ve elektriksel özellikleri ve reolojik davranışları gibi benzersiz özellikleri nedeniyle hem akademi hem de endüstride ilgi görmektedir. Polimerik matrisin hazırlanmasında kullanılan birçok polimer çeşidi vardır. Bu polimerler termoplastikler, termosetler ve elastomerler olabilir. Dolgu maddelerinin bu polimerlerin özelliklerini nasıl etkilediği polimerin doğasına ve dolgu maddesinin oranına bağlıdır. Dolgu maddeleri, polimerlerin birçok özelliğini değiştirmek için kullanılır. Sonuçta, mekanik, elektriksel, manyetik, optik biyoyumluluk, kimyasal kararlılık ve fonksiyonelleştirme gibi spesifik özelliklere sahip malzemeler elde edilir.

ABSTRACT

Gesture recognition has become the focus of research with the development of technology. This situation is inevitable for human-machine interaction today. Thanks to the machines we interact with at every moment, the nature of human movements and especially the recognition of hand movements make life easier in this context. Behaviours required for interaction with the machine that requires contact, such as touching, pushing, and pulling, are transformed into non-contact with hand gesture recognition (HGR). In this regard, radar, which we are accustomed to seeing its applications in every field, encouraged researchers to work to reveal its ingenuity in the context of human-machine interaction. The fact that it is not affected by the conditions of the environment such as light and occlusion and that it does not cause any discomfort to people makes it stand out in HGR studies compared to other devices. In this study, the past, present, and future of the use of radar in HGR are discussed. The radar structures used, signal processing techniques, and scenarios for HGR are presented. The advantages of its use in hand gesture recognition compared to other devices are revealed. It is also shown that it can contribute to fusion studies by working in harmony with more than one device and sensor. The importance of radar in human-machine interaction and its promising potential for future studies are briefly demonstrated.

Keywords: Radar, Hand Gesture Recognition, Human-Computer Interaction, Signal Processing, Machine Learning

INTRODUCTION

Hand gesture recognition has become an important issue for individuals to control devices remotely, depending on the comfort area that has increased with the developing technology. HGR, which has an essential position in terms of human-machine interaction, can overcome the risk of contamination of various viral or microbial health problems that have been popular recently, as well as eliminating physical contact. It is also used in the industrial field, smart home systems, robotic control systems, virtual reality applications, and mobile or wearable device applications. The human hand is a complex structure made up of multiple bones. Hand movement naturally creates kinematic parameters. These are velocity, acceleration, and angle. Therefore, hand gesture recognition depends on the effective detection of these parameters (Chen, 2019).

The basis of successful recognition of the gesture is primarily the correct sensing of the movement. In this regard, more than one device has been used until today. These devices can be divided into contact and non-contact in the most general scope. Contact devices are also called wearable devices and motion detection is provided by devices such as gyroscopes and capacitive sensors, which are most often placed on gloves (Lu et al., 2014), (Pławiak et al., 2016). Depending on the hand movement, these sensors provide the detection of the HGR. The use of these devices is tedious and cumbersome for the user. Other undesirable features include the difficulty and cost of keeping it with you at all times. For this reason, non-contact devices are more preferred for motion sensing (Zou et al., 2016), (Sang et al., 2018). Cameras are widely used in this regard (Choi et al., 2015), (Tran et al., 2020). In the use of the camera for HGR, images are obtained so that the hand wrist is included in the field of view. Then, as a result of processing the images, HGR is revealed. However, the privacy issue and the lighting problem make it disadvantageous. In addition, the need for a direct line of sight and high processing costs are other issues that stand out.

Radar, which can be produced in very small sizes and at affordable costs with the developing circuit production technology, has taken its place in many application areas (Seflek & Yaldiz, 2022), (Ozturk et al., 2021), (Jokanović & Amin, 2017). Researchers have used non-contact, light-sensitive, and non-disturbing radar sensors for motion detection (Kim & Moon, 2015), (Ding et al., 2022), (Yang et al., 2019). In this context, radar has been preferred by many researchers in HGR (Rodrigues & Li, 2021), (Liu et al., 2019), (Hazra & Santra, 2018). Depending on the working principle of the radar, the Doppler frequency shift, which is based on motion, forms the basis for the detection of hand gestures. In addition, they are other

elements used in the correct sensing of motion in qualities such as range and angle. The gesture signals detected by the radar are first pre-processed as required. Then, depending on the experimental environment and setup, it is subjected to one or multi-dimensional signal processing and made suitable for classification. Finally, hand gesture recognition is performed with appropriate methods. This study presents an outline of hand gesture recognition studies conducted with radar. The remainder of the paper is organized as follows. Section II are presented the works fulfilled for radar HGR. The radar structures used and signal processing methods are detailed in Section III. In the last section, the study is summarized.

Related Works

The first study we know of so far with the HGR title is the simulation study performed by Zheng et al. In the study, besides a time effect algorithm for HGR, the differentiate and cross-multiply (DACM) algorithm is presented for the solution of the null point problem, which is a problem for continuous wave (CW) Doppler radar. It has been stated that 2-D or 3-D HGRs can be obtained by using more than one radar. They confirmed their proposed approach with their study (Zheng et al., 2013). In the NVIDIA research lab, Molchanov et al. presented a single input multiple output (SIMO) frequency modulated continuous wave (FMCW) radar system operating at a short-range 24 GHz operating frequency for hand gesture sensing for intelligent driver assistance systems. The radar system reveals the Range-Doppler map of dynamic movements with the 3D position of the detected hand. It also measures range and bidirectional radial velocity. However, it also reveals spatial coordinates with its wide coverage in horizontal and vertical directions. Therefore, dynamic hand gesture detection has been successfully demonstrated (Molchanov et al., 2015). Again, this time the same study group addressed a topic that has become very popular in the last ten years. In their study, they revealed the drivers' HGRs using multiple sensors. It is planned to eliminate the lighting disadvantage created by the cameras with the use of FMCW radar with an operating frequency of 24 GHz. It is also presented in a procedure for calibration of sensors. Convolutional deep neural networks are used to combine and classify multi-sensor data. The algorithm they proposed recognized 10 different movements, including day and night. It has also been shown that the combined use of radar and other sensors improves HGR accuracy and power consumption becomes more efficient (Molchanov et al., 2015).

Kim and Toomajian investigated using radar micro-Doppler signatures for HGR. It was performed by obtaining 10 different hand gestures from a single participant. CW radar is used

at 5.8 GHz operating frequency. Since the CW radar only detects radial velocity, range information is not used. Classification was carried out with Deep convolutional neural network (DCNN) by forming spectrograms of the obtained radar signals. 90% of the data was used for training and the remaining 10% for validation. Their proposed method obtained 85.6% accuracy for 10 hand gestures with 5-fold verification. When the number of gestures was reduced to 7, this value increased to 93.1% (Kim & Toomajian, 2016). In another study, Fan et al. comprised a radar structure operating at 5.8 GHz for the practical application of human-computer interaction and carried out an HGR study. Various architectures and techniques have been proposed to achieve a cost-effective solution. In contrast to the micro-Doppler method, an algorithm based on time-domain linear motion imaging is preferred. As a result of the experiments fulfilled, the validity of the proposed architecture and algorithm has been demonstrated (Fan et al., 2016). In another using an operating frequency of 5.8 GHz HGR study, the researchers used FMCW radar with a bandwidth of 320 MHz. A preliminary study of the recognition of hand gestures of participants who were at different distances from it was carried out. Comparisons of classical time-frequency micro-Doppler analysis from CW radar and Range-Doppler analysis obtained from FMCW radar are presented. It has been shown that FMCW radar can provide HGR by distinguishing movements even in the presence of more than one human (Peng et al., 2017).

A study that set off a different perspective for HGR is utilizing the I-Q plot of a radar signal. The researchers collected data for 6 different hand gestures from 10 subjects using a CW radar with an operating frequency of 2.4 GHz. A Convolutional Neural Network (CNN)-based machine learning algorithm was applied to the time domain I-Q images obtained with the data. Furthermore, the accuracy between the two methods was compared by applying the spectrogram to a similar CNN structure in the study. For HGR using inexpensive time domain signal representation with the proposed technique, the average accuracy rate with gestures obtained from ten users has been declared to be 91.3% (Sakamoto et al., 2018). A continuous hand gesture recognition system that is resistant to environmental conditions has been proposed with called Latern by the researchers. In the study, which was accomplished using FMCW radar with a frequency of 24 GHz and a bandwidth of 4 GHz, data were obtained by asking four participants to make 8 different hand movements. In the study using 3D-CNN and long short-term memory (LSTM), the spatial temporal properties of hand movements were extracted. With the Connectionist Temporal Classification algorithm, hand gesture recognition is provided. As a result of experimental studies, it has been declared that 96% hand gesture recognition rates

have been achieved and the proposed system can be used in real-time (Zhang et al., 2018). Feature-based motion recognition was presented in an HGR study using FMCW radar. A Range-Doppler map (RDM) was obtained from the raw signal data obtained from the SIMO FMCW radar with a center frequency of 25.8 GHz and a bandwidth of 175.6 MHz. In the experiments, measurements were made for 7 movements. Features have been extracted from RDMs. Among the features, those associated with gesture recognition were selected with the proposed feature selection algorithm. A wrapper-based method is used for this, and a quantum-inspired evolutionary algorithm is used for the feature space search algorithm. Moreover, the information factor has been applied to the search algorithm. It is presented that the proposed algorithm improves the motion recognition accuracy in the radar system used (Ryu et al., 2018). A different approach for HGR by researchers has been to classify movements according to envelopes of micro-Doppler (MD) signatures. The study was conducted in the Radar Imaging Laboratory at Villanova University Advanced Communications Center. Data were collected for 15 different hand gestures from 4 participants using CW radar at 25 GHz frequency. Envelopes extracted from radar data were combined. Subsequently, it was applied to the kNN classifier based on L1 distance, providing the highest accuracy and a classification rate of over 96 percent. In addition, the researchers compared the proposed method with several different approaches and it was shown that it outperforms existing techniques based on handcrafted features (Amin et al., 2019). In another study, researchers conducted experiments on 14 different hand gesture recognition by using a SIMO-structured CW radar with 2 receiving antennas at 25 GHz frequency. A DCNN was used to classify movements. It is also stated how the data received from the two receiving antennas will be mapped to the three input arrays of DCNN. The spectrograms and incidence angles of the received signals are used in these sequences. It has been stated that classification accuracy exceeding 95% was acquired with the proposed method, and an improvement of almost 10% was achieved compared to the studies performed with a single receiving antenna (Skaria et al., 2019). In a study using FMCW radar with 60 GHz center frequency and 6 GHz bandwidth, researchers aimed at real-time hand gesture recognition. 10 participants were asked to perform 10 different gestures. Real-time Range-Doppler maps are created using 2D Fast Fourier Transform (FFT). With the Gaussian mixture model (GMM), the clutters are eliminated. The CFAR algorithm is preferred for motion detection. The LSTM encoder is used to extract general temporal features of motion profile sequences. 10 gestures are distinguished with 99.10% classification accuracy. In addition, a high accuracy of 98.48% was obtained in recognizing gestures for a new participant (Choi et al., 2019).

Millimeter wave radars (MMR), which are the favorites of automotive applications, also play an active role in HGR studies. Wang et al. carried out Continuous Hand Gesture Recognition study with MMR with 77 GHz operating frequency and 4 GHz bandwidth. In the study in which 6 hand gestures were examined, the range-time map (RTM) and Doppler-time map were created with a 2-Dimensional Fast Fourier Transform. Moreover, the angle-time map (ATM) was created using the Multi-Signal Classification (MUSIC) algorithm with the radar, which has a multiple input multiple output (MIMO) structure. An amplitude-based decision threshold detection method based on the amplitude of the hand movement spectrogram is presented. In addition, the k-means algorithm was preferred in clustering the central time-frequency trajectories of the maps created. Finally, a fusion-based Dynamic Time Warping algorithm was used for hand gesture recognition. While the hand gesture recognition accuracy of 96.17% was declared by the researchers, the average recognition accuracy is 95.83% (Wang et al. 2020). Another study, in which a 7.29 GHz frequency and 1.5 GHz bandwidth UWB impulse radar are used, aimed at recognizing 14 different gestures is presented. The researchers represented each hand gesture signature in 3D as a tensor from the Range-Doppler framework. With the obtained signatures, features were obtained by means of a CNN, and hand gesture recognition accuracy was demonstrated with four different classifiers. Accuracy rates for 3D CNN - FCNN, 3D CNN k-NN, 3D CNN - SVM, and 2D CNN - LSTM are 93.33%, 92.02%, 94.08%, and 96.15%, respectively (Skaria et al., 2020). Again, in another HGR study with mm-wave FMCW Radar, a method based on multidimensional feature representation and learning is proposed. Measurements were made for 7 hand gestures with 10 participants. A procedure for optimizing radar system parameters is shown. In the study using point cloud representation, the scattering center model is introduced for the Range-Doppler (RD)-angular multidimensional feature space. CNN is preferred for learning and classification of features. It is presented that Doppler-time-image+ horizontal-angle-time-image + vertical-angle-time-image exhibits better classification performance (Xia et al., 2020).

A hand gesture recognition study based on SIMO architecture operating at 60 GHz center frequency and using 5GHz bandwidth made by Arsalan et al. A spiking neural network (SNN) is proposed for based recognition. 2-D FFT range is used to generate a video of Range-Doppler maps. Range, Doppler, and angle spectrogram are extracted from the video of the RDIs. SNN utilized spike sequences to classify movements. The study compared SNN with its deep learning counterparts, showing that SNN can reveal almost the same recognition accuracy with lower memory and computation (Arsalan et al., 2022). In another study that increased accuracy

using CNN for HGR, the researchers conducted experiments to recognize Five American sign languages using Impulse Radio Ultra Wide Band (IR-UWB) radar. Two different CNN models, Double parallel and two-stage series were applied. Classification accuracy is increased by combining 2D-FFT preprocessing with CNN deep learning model. ResNet-50 and GoogLeNet demonstrated high accuracy without using 2D-FFT. The double-parallel CNN model with 2D-FFT used has achieved better results than traditional models. It has also been stated that the Double Parallel CNN Model gives faster results than other models (Park et al., 2023). A study involving radar and image fusion in the context of HGR was presented by the researchers. An mm-wave FMCW radar with an operating frequency of 77 GHz and a bandwidth of 4 GHz is used. Measurements were made with a camera and radar for 10 gestures. In this multimodal study, a deformable mesh-based method with a Gram-matched two-branched fusion is proposed. With LSTM, temporal features of hand movement have been extracted. Gram matching is presented as a loss function. It has been stated that the proposed method can be used successfully for multiple participants that the classifier can be adapted to complex environments (Liu & Liu, 2023).

MATERIALS and METHODS

This section discusses general radar structures and signal processing methods used for HGR.

1. Radar

The radars used for HGR concentrate on three different types. Hand gesture measurements are generally made at a distance of about 0.1-1 m from the radar. The hand and wrist are kept within the radar field of view. Measurements are performed with multiple gestures and single or multiple participants, depending on the application. A general measurement frame for the HGR for all radar types is shown in Figure 1.

Figure 1. General measurement frame for the HGR for all radar types

A. CW Radar

CW radar, which is the most basic radar structure, stands out for HGR in terms of its simple structure, cheap cost, and easy availability. Studies carried out using single receiving and transmitting antennas have evolved to be carried out with multi-receiving antennas. In the most basic sense, the signal sent from the transmitting antenna is as follows.

$$S_{TX}(t) = A_T \cos(2\pi f_c t + \phi(t)) \quad (1)$$

where A_T is the amplitude of the signal and f_c is the frequency of the signal. $\phi(t)$ is phase noise. The signal generated by the radar at a fixed frequency is sent to the hand in the context of the HGR. It is received via the receiving antenna with the phase delay depending on the specific hand gesture. The received signal can be expressed as:

$$S_{RX}(t) = A_R \cos\left(2\pi f_c t - \frac{4\pi d_0}{\lambda} - \frac{4\pi x(t)}{\lambda} - \phi\left(t - \frac{2d(t)}{c}\right)\right) \quad (2)$$

where A_R is the amplitude of the received signal, d_0 is the distance of the target from the radar, and $x(t)$ is the motion of the hand. Depending on the nature of the receiver (homodyne, heterodyne) it is down-converted from high frequency to baseband or intermediate frequency. According to the most basic homodyne architecture, the signal down-converted to the baseband level is stated as follows

$$B(t) = \cos\left(\frac{4\pi d_0}{\lambda} + \frac{4\pi x(t)}{\lambda} + \Delta\phi(t)\right) \quad (3)$$

Hand gesture measurement data for signal processing is acquired at this stage. Depending on the study performed related algorithms are applied to these data.

B. FMCW Radar

FMCW radar, which emerged as a result of the disadvantage of CW radar not being able to reveal range information, is developed and used intensively, especially depending on automotive applications. With the developing circuit manufacturing technology, small-size and high-frequency MIMO structured MMRs are produced. FMCW radar plays an active role in HGR studies thanks to its ability to detect range with variable signal generation and angle

detection with multi-receiver antenna configuration. The signal produced by a linear modulated FMCW radar and sent to the hand is expressed as:

$$S_{TX}(t) = A_T \cos(2\pi f_c t + \pi \frac{B}{T_c} t^2 + \phi(t)) \quad (4)$$

where A_T is the amplitude of the transmitted signal, f_c is the center frequency of the signal, B is the bandwidth of the signal, T_c is the duration of the transmitted signal by linearly increasing frequency, and $\phi(t)$ is the initial phase. The signal reflected as a result of hand movement is received by the receiving antenna(s). The received signal is as follows:

$$S_{RX}(t) = A_R \cos(2\pi f_c (t - t_f) + \pi \frac{B}{T_c} (t - t_f)^2 + \phi(t - t_f)) \quad (5)$$

where A_R is the amplitude of the received signal, t_f shows the round-trip time of the signal to the target hand. Then, as a result of the operations performed on the radar receiver, a signal called beat is obtained. The signal is shown as:

$$S_B(t) = A_B \cos\left(2\pi \left[\frac{B}{T_c} t_f\right] t + 2\pi f_c t_f + \pi \frac{B}{T_c} t_f^2 + \Delta\phi(t)\right) \quad (6)$$

After the necessary adjustments in this signal, it is ready for signal processing for HGR.

C. IR-UWB Radar

With the development of radar production technology, the elimination of high costs has also facilitated access to IR-UWB radar. IR-UWB radar, which has ultra-wide bandwidth by producing short-duration pulses in the order of nanoseconds, is also used in HGR studies. The generated pulse is sent to the hand and received by the radar receiver antenna(s). The received signals are used for signal processing after the necessary steps.

2. Signal Processing

The signals obtained in the first stage of HGR studies by means of radar are preprocessed. At this stage, depending on the radar type, DC removal, DC offset, background subtraction, filtering, etc. are performed. There are studies that use the time-amplitude graph of the signal to represent the data obtained afterward. In addition, depending on the radar type, a spectrogram is usually obtained using a short-time Fourier transform based on time-frequency analysis. With this approach, the representation of data is used extensively. Data representation is also performed with point clouds, trajectory images, and Range-Doppler frames. The basis for presenting the data representation in this way is to benefit from image processing techniques in feature extraction and classification, often by recording the signals as images.

Depending on the representation of the data, feature extraction is extracted either manually or by automated approaches that have been popular recently. Similarly, classification is conducted through traditional algorithms and Deep learning. A general radar signal processing block diagram is presented in Figure 2.

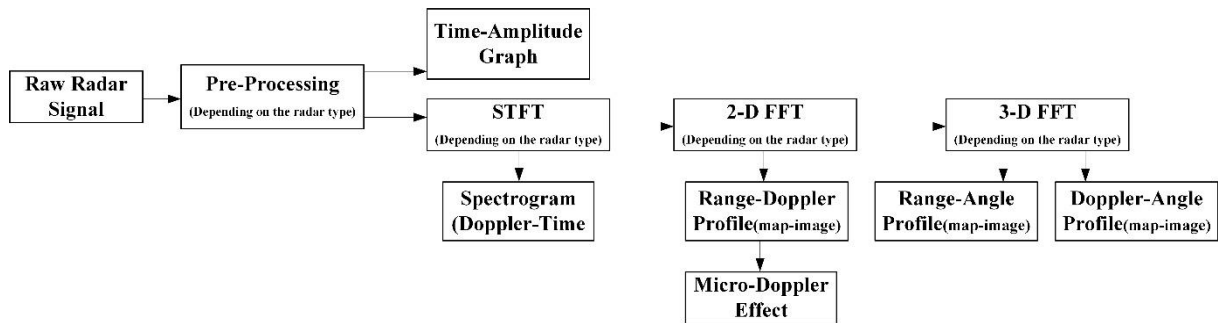

Figure 2. Radar signal processing block diagram

In recent studies, it is shown that the success of the algorithm is also proven with different participants in order to show that the validity of the algorithms put forward is not only on an individual basis and in the environment. The overview of signal processing of an HGR study with radar is presented in Figure 3.

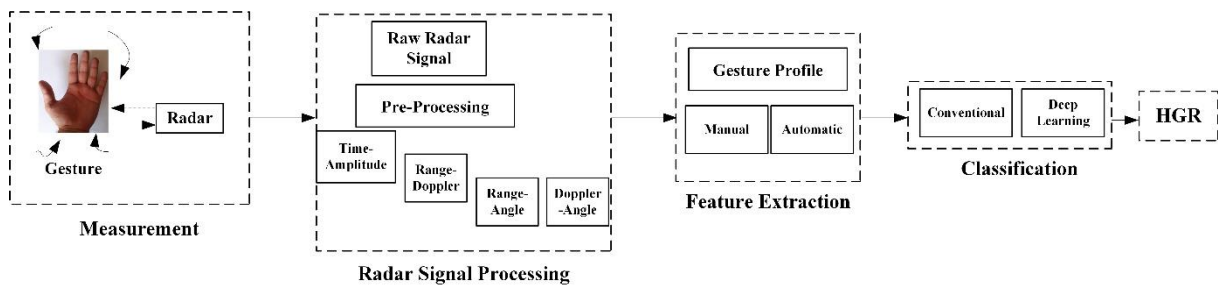

Figure 3. The overview of signal processing of an HGR study with radar

CONCLUSION and RECOMMENDATIONS

In parallel at an unprecedented pace of development of technology, devices accompany us in every moment of our lives. In this period, when the comfort of humans comes to the fore, human-machine interaction has gained importance. In this paper, HGR studies have been presented employing radar in the context of human-machine interaction. In addition, it is aimed to devise a perspective for those who are interested in this subject. The radar architectures and signal processing procedures used in the studies are discussed in general terms. The success

rate in the studies revealed shows that radars will find a place in all areas of our lives and will further strengthen their place in the future.

ABSTRACT

Bovine respiratory disease complex (BRDC) is a multifactorial disease of cattle that presents as bacterial and viral pneumonia. The risk of infection and the severity of the disease are determined by the infectious agents involved, their immunogenicity, the genetics and microflora of the host, and external environmental factors. The infectious agents involved in BRDC are opportunistic and are often amplified by weaning, overcrowding, mycotoxins from food contamination, and stress factors such as fluctuations in temperature, humidity, air, lighting and sound. One of the most common disease-causing pathogens *Histophilus somni* is a component of the bovine respiratory disease (BRD) complex. Most of the bacterial agents associated with BRDC are found in the nasal passages of cattle without disease. It is most commonly diagnosed in subacute to chronic polymicrobial pulmonary infections in combination with *Mannheimia haemolytica*, *Trueperella pyogenes*, *Pasteurella multocida* or *Mycoplasma bovis*. In the case study, sudden deaths occurred especially in pregnant and submerged heifers, hard swellings in all joints and neck regions of the animals, abortions, mastitis cases, difficulties in lying down and getting up, loss of appetite, etc. Complaints of general condition disorders have been reported. Based on these complaints, we helped the treatment of the disease by going to the examinations. Many factors accompany respiratory system complex disease in farm animals. Therefore, it is difficult to control the disease. The important thing is to take preventive measures such as vaccination against the disease rather than treating the disease. It should not be forgotten that diseases and treatment costs will decrease with more specific treatments and protection measures as the opportunities in the field conditions improve, and it is necessary to contribute to the future of the country's livestock by making the correct diagnosis with clinical symptoms and laboratory findings of the diseases.

Keywords: pneumonia, infection, respiratory, *histophilus somni*

INTRODUCTION

The multifactorial disease known as the bovine respiratory disease complex (BRDC) affects cattle and manifests as pneumonia with both viral and bacterial causes (Bell et al., 2021). The associated infectious agents, their immunogenicity, the host's genetics, the presence of microflora, and external environmental factors all affect the likelihood of infection and the severity of the disease. Weaning, overcrowding, mycotoxins from tainted food, and stress factors including changes in temperature, humidity, air, lighting, and sound can all amplify the opportunistic pathogenic organisms that are involved in BRDC (Taylor et al., 2010).

According to Neibergs et al. (2014), 116 genetic loci linked to BRDC susceptibility have been discovered. These areas have been discovered to play a role in the detection of pathogens and the antiviral response (Johnston et al., 2021). These areas might have genetic variants that confer BRDC resistance. A valuable tool for genomic selection and to lower the prevalence of BRDC in herds may be produced by additional characterisation and research (Johnston et al., 2019; Johnston et al., 2021).

One of the most common disease-causing pathogens *Histophilus Somni* It is a component of the bovine respiratory disease (BRD) complex. *Histophilus Somni* is a gram-negative bacterium that causes many diseases such as thrombotic meningoencephalitis, pleurisy, polysynovitis, bronchopneumonia, septicemia, myocarditis, infertility, carpal and tarsal joint arthritis, blood clots in the sternum region, mass formation, high fever and mastitis in animals (Harris and Janzen, 1989). *Histophilus Somni*'s It has also been reported that it causes sudden death in cattle due to the neurological disease thrombotic meningoencephalitis (TME) or suppurative meningitis with ventriculitis (Corbeil, 2007).

Most of the bacterial agents associated with BRDC are found in the nasal passages of cattle without disease (McMullen et al, 2020). most commonly *Mannheimia Haemolytica*, *Trueperella pyogenes*, *Pasteurella multocida* ve *Mycoplasma Bovis* in combination with subacute and chronic polymicrobial pulmonary infections (Guzman and Taylor, 2015).

Mycoplasma infections of cattle are defined as a disease characterized by caseonecrotic pneumonia. in cattle *Mycoplasma Bovis* infections cause chronic pneumonia, lameness and weight loss (Lysnyansky et al, 2015).

Infections with *Mycoplasma bovis* often result in a number of miliary caseous (cheese-like) abscesses with a cranioventral distribution that ranges in size from a few millimeters to several centimeters. Histologically, airways, alveoli, or interlobular spaces exhibit caseous necrotic foci (Maunsell et al., 2011; Fulton and Confer, 2012). Variable surface proteins in *Mycoplasma bovis* provide it an edge in disease production (McAuliffe et al., 2006).

Description of the case

In the family business in Güllü village of Eşme District of Uşak province, there are general condition disorders such as sudden deaths especially in pregnant and submerged heifers, hard swellings in all joints and neck regions of animals, abortions, mastitis cases, difficulty in going to bed and getting up, loss of appetite. complaints have been reported.

In the farm where the animals were examined, in the general examination of the animals, fever of 41-42 °C, heart rate between 80-90 (P) with a frequency of 30-40 (R) and breathing difficulties, decrease in rumen movements, loss of appetite, especially arthritis in the carpal and tarsal joints (Figure 1), a hard swelling in the sternum region (Figure 2) and a feeling of pain when palpated, a hard swelling just below the vena jugularis line, difficulties in lying down, weakness, hardened sounds in the lungs, and some animals with mastitis are among the cases that attract attention. WBC in the hemogram examination. value and high neutrophil ratio showed that the event progressed acutely.

In the case of acute pneumonia, three different pathological changes occur. In its first form, consolidation of pulmonary tissue is noticeable in the cranial lobes of the lung, and these tissues are dark red, with a crunchy consistency, and are manifested by the formation of necrosis. In the second form, intense red/gray hepatization, necrosis and a pus content are formed in the lungs in the form of a clear consolidation. In its third form, congestion characterized by interstitial emphysema, pulmonary edema, alveolar epithelial hyperplasia and hyaline membrane formation is formed (Andrews, 2008).

In the necropsy findings of an animal that died suddenly, the liver appearance was found to be normal. In addition, paraortic fat and lymph nodes parallel to the columna vertebralis, gelatinous edema in the femur and many other articulatio regions, edema in the alveoli of the lung where air must be present, pus and bloody body fluids, lung resembling liver and necrosis, pus content were found (Figure 3-6).

In calves born alive, the first notable symptoms are that the calf does not want to drink colostrum, and that it is weak and unhealthy. Lung infection and breathing difficulties are seen

in calves when they want to forcefully drink colostrum. Swelling is evident in the joints. Buddha prevents the calf from revolting. Calves with weak immune systems get lung infections in a few days, and this picture is accompanied by diarrhea, and deaths occur within 3 days.

When we do necropsy in stillborn or deceased calves, pus is seen in the alveoli in the lungs. In addition, arthritis findings were noted in the joint areas as in the mother.

TREATMENT

Viruses and bacterial agents are usually found in the etiology of cattle pneumonia diseases. In some cases, both of these factors may be present at the same time. In such cases, the desired response may not be obtained with antibiotic treatment alone (Griffin et al., 2010). In the treatment recommended in this study, oxytetracycline L.A was administered as an antibacterial in two doses with an interval of forty-eight hours and tilmicosin in two doses with an interval of forty-eight hours. In addition, three doses of flunixin meglubin were given once a day to prevent fever and toxemia symptoms. Finally, vaccination with viral and bacterial agents in the respiratory system disease complex was recommended and histophilus somni vaccine was requested to be administered in two doses, twenty-one days apart. With the feedback received from the owner, we were informed that the clinical findings in the sick animal decreased and the signs of improvement were visibly noticed.

CONCLUSION

Respiratory system diseases in cattle cause great economic losses. Since many factors are effective in the etiology of BRDC disease, control and treatment of respiratory system disease in cattle becomes difficult. Therefore, in order to minimize stress conditions as well as treatment and vaccination, environmental factors that play a role in the etiology of the disease and especially regulating the shelter and feeding conditions of the calves are of great importance in the prevention of the disease. The importance of early diagnosis and long-term treatment in treatment should be well known. (Hirsh, 2000). Many factors accompany respiratory system complex disease in farm animals. Therefore, it is difficult to control the disease. The important

thing is to take preventive measures such as vaccination against the disease rather than treating the disease. It should not be forgotten that diseases and treatment costs will decrease with more specific treatments and protection measures as the opportunities in field conditions improve.

ÖZET

Marx ve Engels'in tarihin itici gücü olarak gördüğü sınıf çatışmalarına ve toplumsal gelişimin sonuna ithafen, mücadelenin, liberal kanadın nihai zaferiyle neticelendiğini iddia eden kimi liberal teorisyenler bu savlarını; 'tarihin sonu' ve 'ideolojilerin sonu' gibi çeşitli kavramsallaştırmalarla desteklemektedir. Liberal siyasetin önemli araçlarından olan demokrasiyi de benzer bir biçimde konumlandırılan bu yaklaşımın, liberal, muhafazakâr ve aşırı olmayan milliyetçilik dışında kalan 'zararlı' ideolojilere karşı demokrasiyi korumak adına demokratik olmayan yöntemlere başvurulduğu da görülmektedir. Dahası liberal çizgiye temas etmeyen bir siyaset yapılamayacağı düşüncesi nihayetinde 'siyasetin sonu'na gelindiğine işaret etmektedir. Soğuk Savaş'ın sona ermesi aynı zamanda siyasi olarak liberalizmin, iktisadi olarak kapitalizmin, yönetici sınıfın belirlenmesinde yöntem olarak da demokrasinin galip gelmesi ve diğer tüm ideolojilerin/ekonomik modellerin ve yönetim belirleme sistemlerinin artık rafa kaldırılmasını temsil ettiği düşünülmektedir. Çalışmada liberal literatürün ilgili fikriyatının teorik içeriğine dair bir güzergâh sunulmakla birlikte aslen siyasetin doğası gereği sahip olduğu, 'siyasal olan'ın dinamikliği bağlamında toplum ve siyasete ilişkin kavramların sonunun olamayacağı vurgulanacaktır. Liberalizmin temel değerlerinin aşınması, yükselişte olan aşırı milliyetçilik, mülteci krizleri gibi olguların bahsi geçen dinamikliği destekler nitelikte oluşu, liberal öğretinin aldığı tedbirlerin sahip olduğu temel değerlerle çelişmesine dikkat çekilecektir. Bu bağlamda liberalizm son arayışı ve çelişkileri eleştirel bir yaklaşımla ele alınacak olup eleştiriler Mouffe temelinde daha ziyade post modern argümanlarla destelenecektir.

Anahtar Kelimeler: Tarihin Sonu, İdeolojilerin Sonu, Siyasetin Sonu, Siyasal Olan.

**A CRITICAL APPROACH TO THE SEARCH FOR THE 'END' IN LIBERAL
LITERATURE**

ABSTRACT

Some liberal theorists, who claim that the struggle has resulted in the final victory of the liberal wing, in reference to the class conflicts that Marx and Engels saw as the driving force of history and the end of social development, support their arguments with various conceptualisations such as 'the end of history' and 'the end of ideologies'. This approach, which positions democracy, which is one of the important tools of liberal politics, in a similar way, is also seen to resort to non-democratic methods in order to protect democracy against 'harmful' ideologies other than liberal, conservative and non-extreme nationalis. Moreover, the idea that there cannot be a politics that does not touch the liberal line ultimately signalled the 'end of politics'. The end of the Cold War is also considered to represent the triumph of liberalism politically, capitalism economically, democracy as a method of determining the ruling class, and the shelving of all other ideologies/economic models and systems of determining governance. In the study, a route on the theoretical content of the relevant ideas of the liberal literature will be presented, but it will be emphasised that there can be no end to the concepts of society and politics in the context of the dynamism of the 'political', which is inherent to politics. The fact that phenomena such as the erosion of the fundamental values of liberalism, the rise of extreme nationalism, refugee crises support the aforementioned dynamism, and the contradiction of the measures taken by the liberal doctrine with its fundamental values will be pointed out. In this context, the search for the end of liberalism and its contradictions will be handled with a critical approach and the criticisms will be supported by postmodern arguments on the basis of Mouffe.

Keywords: The End of History, The End of Ideologies, The End of Politics, The Political.

GİRİŞ

Liberal yaklaşım sanayileşmiş Batının ideoloji olması ve iddia olunduğu üzere diğer dünya görüşlerini kucaklaması bağlamında bir meta-ideoloji görülmektedir (Heywood, 2007). Teorik çerçevesi İskoç Aydınlanmasıyla başlayan 1800'lü yıllarda ivme kazanan liberal anlatının feodalite, burjuva sınıfı ve kapitalizmle şekillenmiş bir ideolojiye dönüşmesi modern devlet ile karşılıklı etkileşimiyle mümkün olmuştur. Diğer bir ifadeyle düşünsel geçmişi pratik geçmişinden daha erken zamanlara denk düşmektedir. Genel bir perspektiften bakıldığında liberalizm, bireyi sahip olduğu potansiyeli kısıtlayacak tüm dışsal etkilerden kurtarmaktır. Daha özelden ise özgürlük, eşitlik, mülkiyet hakkı, rasyonellik, bireysellik, fırsat eşitliği, ilerleme ve hoşgörü gibi kavramlar liberalizmi tanımlamak için tercih edilmektedir (Berktay, 2010). Bahsi geçen kavramlar aynı zamanda liberalizm ile demokrasi arasındaki rabıtayı da pekiştirmektedir. Zira bu iki fenomen birlikte hareket etmekte kalmayıp iç içe geçmiş bir görünüm sunmaktadır. Bu durumun önemli göstergelerinden biri demokrasinin sahip olduğu geniş havzayı olumlu anlamda daraltmak adına aktüel manada kullanılan biçiminin 'liberal demokrasi' şeklinde adlandırılmasıdır.

Liberal ideolojinin baskın bir dünya görüşü haline gelişi (Dardot ve Laval, 2012) fikri aslen çok da özgün ve yeni bir durum değildir. 1950'li yıllarda benzer bir akım modernleşme kuramı dayatmasıyla vuku bulmuştur. Genel hatlarıyla ifade edildiğinde modernleşme kuramında, Batının geçtiği güzergâhları takip ederek Batı gibi modern olunabileceği düşüncesinin empoze edildiği görülmektedir (Altun, 2005). Yakın bir anlatı liberal dünya görüşünde şu şekilde karşımıza çıkar; modern devletlerin, modern olabilmesi için ön koşullardan biri yönetim anlayışının liberal ideolojiye sahip olması ve yönetim belirleme aracı olarak da demokrasiyi tercih etmeye zorlanmasıdır. Ezcümle bu dayatma nihayetinde liberal düşüncenin zaferi olarak adlandırılmıştır ve artık 'son'a ulaşmıştır.

'Son' Fetişizmi

Fukuyama (1989) yayımladığı 'Tarihin Sonu mu?' isimli makalesiyle liberal demokrasinin zaferine vurgu yapmış, hükümet etme biçiminin son halini ve ideolojik gelişimin nihai noktasını liberal değerlerle ilişkilendirmiştir. Buradaki nihayet, başka bir ifadeyle son, bir yandan Marx ve Engels'in tarihi var eden sınıf çatışmalarının (Marx ve Engels, 2018) bundan böyle kapitalizm zaferiyle neticelenmesine atıfta bulunurken diğer yandan insanlığın gelişim aşamalarından olan kapitalizmin bir basamak olmadığını aksine ulaşılan son nokta olduğu vurgulanmaktadır (Fukuyama, 2016). Bu bağlamda Fukuyama Hegel'in tarihi mutlaklaşma ve

özgürleşme amacıyla ilerlemeci çizgisine de (Hegel, 1995) atıfta bulunmuş olur. Fukuyama ‘Tarihin Sonu ve Son İnsan’ çalışmasının ham hali olan ‘Tarihin Sonu mu?’ makalesinde başlıktan da anlaşılacağı üzere bir takım endişelerini, kullandığı soru işaretiyle göstermiştir (Elliott, 2010). Zira kitabının son kısmında modern toplumların hali hazırda devam eden demokratikleşmesinin modern bir çıkmaza neden olduğunu dile getirmiştir (Fukuyama, 2016). Bu endişelerine rağmen Fukuyama Marx’ta ve Hegel’de karşımıza çıkan belirli bir amaca yönelik ilerlemeci tarih anlayışının, en iyi düzen olan liberal demokrasiyle birlikte sona ulaştığının altını çizmektedir (Bayar-Bravo, 2005).

Liberal yaklaşımın insanlığın ulaştığı son olarak tasviri Fukuyama’ya özgü olmayıp daha öncesinde ‘ideolojilerin sonu’ kavramsallaştırmasıyla Daniel Bell’de karşımıza çıkmaktadır (Bell, 1962). İdeolojilerin sonu tezi öz itibarıyla kavramın ortaya çıktığı Batı toplumlarında sınıflar arasındaki farklılaşmaların giderek eridiği ve dünya görüşünü anlamında ideolojilerin işlevini yitirdiğini savunmaktadır (Sarı, 2010). Diğer bir deyişle, Bell, çalışmasını yayımladığı zamanlara dem vurarak insanların artık ‘ortayolculuk’ fikrinin sıkıcı olduğunu, tutkudan yoksun ve daha az heyecan vaat eden bir siyaset anlayışını dile getirmektedir (Bayar-Bravo, 2005). Diğer yandan, kavram Bell’e ait olsa da E. Shills ve S. M. Lipset’in de katkılarıyla gelişen ideolojilerin sonu fikri, ideolojilerin ortaya çıkışını sadece ekonomik temele indirgeyen yaklaşımı eleştirmekte, Batı toplumlarında kapitalizm ve liberal seyrin refahı artırdığı neticesinde iktisadi temelli sınıfsal farkların azaldığı ve iktisadi eşitsizliklere dayanana ideolojik ayrışmaların ortadan kalktığı savunulmaktadır (Bell, 1962; Shills, 1968; Lipset, 1986). Liberal ve kapitalist anlayışla ilişkili olmakla birlikte karşıt bir yaklaşım olarak post-Marksist bir düşünür olan Rancière tarafından ironik bir vurgu da ‘siyaset sonu’ savıdır. Genel bir ifadeyle ona göre, siyaset sonu siyaset felsefesinin başladığı yerle ilişkilidir. Siyaset felsefesi siyasete dair çelişkilerin nesne haline getirilmesidir. Bu bağlamda felsefe eşit ile eşitsiz olana karar vermedir (Rancière, 2016). O halde eğer liberal değerlere sahip bir sona gelindiye, liberal akım temelinde ulaşılan refah neticesinde insanlar arasındaki eşitlik sağlanmışsa o halde siyaset felsefesine ve siyasete gerek kalmamıştır. Diğer bir ifadeyle *“siyasetin sonu fikri; her seçim öncesinde siyasetçilerin yaptığı vaatler ve tutulmayan sözler yerine, siyaseti dünyanın enerjilerini ilerletme sanatı olarak kabul eden görüşün karşısına, gemisini akılcı bir şekilde kullanarak, siyaseti iç savaşı önleme sanatı olarak gören bir anlayış kazanmıştır”* (Agocuk, 2016). Siyasetin sonu savunusunun merkezinde temsil sorunu yer alır. Liberal öğretinin dayattığı temsil edilenle temsil eden arasındaki ilişki Rancière nezdinde bahsedildiği kadar

zorunlu değildir. Rancière'in bu düşüncesi tersten bir okumayla bir temsil krizi söz konusu ve buna bağlı olarak demokrasi de bir krizin içerisinde. Aslen yeni toplumsal hareketler de bu durumu destekler niteliktedir (Güneş-Esgün, 2012). Siyasetin sonu düşüncesi, ideolojiler sonu ve tarihin sonu gibi liberal akımın zafer olarak addettiği söylemlere karşı duruşun yanı sıra liberal demokrasinin temsil sorununa bir eleştiridir.

'Son' Arayışına Eleştirel Bir Bakış

Rancière'in temsil krizi temelinde eleştirdiği 'tarihin sonu'na ilişkin en hızlı eleştirilerden biri Kimball tarafından gelmiştir. Kimball (1992) liberal ideolojinin zaferinin henüz teorik zeminde gerçekleştiğini dünyanın bir anda kargaşadan ve sosyal problemlerden arındırılmadığını ve hatta politik mücadelenin sonlanmadığını vurgulamıştır. Benzer bir biçimde Huntington 'medeniyetler çatışması' savıyla tarihin liberal akımın zaferiyle sona ermediğini, liberal değerlerin evrenselleşmediğini somut örneklerle çatışmaların devam ettiğini vurgulamıştır (Huntington, 2006). Bunlara ek olarak liberal siyaset ve liberal demokrasiye yönelik eleştirilerden bir diğeri de Mouffe tarafından dile getirilmiştir. Mouffe (2010a), liberal ilkelerin rasyonelliğe ve evrenselliğe yaptığı vurguyu ve siyasal olanın sahip olduğu dinamizmi ve çatışma durumunu görmezden gelişini eleştirilerinin merkezine almıştır.

Mouffe (2010b) liberal demokrasinin içinde bulunduğu krizin neticelerine ilişkin yapmış olduğu bir belirlemede aşırı sağın yükselişine işaret etmiştir. Her ne kadar ideolojilerin sonu savının merkezinde yer alan diğer dünya görüşlerinin işlevini yitirdiği yer olsa da Avusturya'da aşırı sağcı 'Nationaldemokratische Partei' sonrasında yine aşırı sağın temsilcisi 'Freiheitliche Partei Österreichs' yükselişi, Belçika'da benzer bir tavra sahip olan 'Flaman Vlaams Blok' partisinin aşırı sağcı eğilimleri karşımıza çıkmaktadır (Albayrak-Coşkun, 2008). Mouffe bu savını dile getirirken aslen Schmitt'in dost-düşman kavramsallaştırmasına bir göndermede bulunmaktadır. Zira tüm toplumsal örüntülerin en az bir dışlama içerdiğini ve bu dışlamanın doğal olarak dost/düşman ayrımını beraberinde getirdiği vurgulanmaktadır (Mouffe, 2001: Mouffe, 2015). Çalışmanın giriş kısmında vurgulandığı üzere liberal demokrasinin zararlı olan diğer ideolojileri düşman olarak işaretlemesi Mouffe'un vurguladığı 'düşman'dır. İş bu noktada bu mücadele gereği tarihin sonu ve ideolojilerin sonu savı siyasal olanın doğası gereği pek mümkün görünmemektedir.

Mouffe'un üzerinde durduğu konulardan biri de demokrasinin tamamen ortadan kaldırılması değildir. Mouffe'un 'toplumsal nesnelliklerin politik olduğu' söylemi özü itibarıyla toplumsal çelişiklere ve ayrışmalara işaret eder. Bu durum aynı zamanda çatışma bağlamında toplumu

kuran bir antagonizmadır. Siyasal olanın gereği bu antagonizma ortadan kaldırılamaz ancak dönüştürülebilir. İş bu noktada demokratik siyaset ancak toplumsal çatışma olan antagonizmayı barışçıl bir mücadele olana agonizmaya dönüştürebilir (Mouffe, 2001). Bu bağlamda liberal demokrasinin tektipleştirmeye liberal, modern, rasyonel ve evrensel birey modeline karşı çıkan Mouffe, bunun yerine 'özne' olan bir birey tasavvur etmektedir.

SONUÇ

Liberal düşüncenin var etmeye çalıştığı birey aslen modernleşme süreciyle oldukça yakından ilişkilidir. Zira modernleşmenin modern bireyi de tıpkı liberal öğretilerde karşımıza çıktığı üzere rasyonel ve evrensel değerlere bağlı bir bireydi. 'Son insan' olarak tasvir edilen bu bireye yöneltilen temel eleştiri de bu bağlamda ortaya çıkmaktadır; tektipleşme. Siyaset ve demokrasinin işleyişi sağlayan itici güce antagonizmaya ve agonizmaya zıt olan bu durum liberal literatürün son arayışına yönelik eleştirilerin ontolojik kökenlerinden biridir.

Toplumsal olanın siyasal olduğu ve siyasal olanın ancak dinamizmle mümkün olduğu vurgusu, 'son' arayışının anlamsızlığına işaret eder. Eğer ki bir 'son'a ulaşılmışsa, toplumsal mutabakat tamamen sağlanması ve farklı dünya görüşlerine ihtiyaç kalınmaması gerekmektedir. Fakat demokrasinin kendisini korumak için demokratik olmayan yöntemler kullanması (militan demokrasi), mültecilerin toplumsal entegrasyonu ve mülteci krizleri, liberal düşüncenin anavatanında aşırı sağcı eğilimlerin yükselişe geçmesi vb. örneklerde görüldüğü üzere toplumsal antagonizmalar devam etmekte ve bu çatışmaları geçici uzlaşmalara dönüştürme alanı olarak siyasete duyulan ihtiyaç karşımıza çıkmaktadır.

Mouffe eleştirilerinin yanı sıra tüm liberal literatüre toptan bir bakış açısıyla olumsuz bir anlam yüklemek yerine onun tektip bir liberal birey üretimine karşı bir tavra sahiptir. Liberal demokrasinin rasyonalite ve evrenselcilik vurgusunu eleştirir ve liberal demokrasinin krizi kendi vurgusu olan rasyonalitede gizli olduğuna işaret eder. Alternatif bir güzergâh olarak da radikal demokrasiyi önerir.

COHERENT STRUCTURES IN TURBULENT COAXIAL JETS

Dr. Safer Nabil BELKACEM

ABSTRACT

This paper examines the role of coaxial jet vortex structures in the mixing process, using a numerical approach such as Large Scale Simulation, considering the coaxial jet configuration as a hot primary jet and an unheated secondary jet. This study is based on the implementation of a new Riemann solver for convective fluxes resolution. Therefore, the contour of the fraction of the mixture and the temporal power spectral density (PSD) of the velocity fluctuation were plotted and analyzed. Two coherent vortices were observed in a coaxial jet after a molecular diffusion phase. The first vortex was the Kelvin-Helmholtz vortices, which play a very important role in the mixing process. These vortices carry the species and promote the radial transfer of the mixing fraction. The second vortex concerns longitudinal vortices, which allow the passive tracer of the annular jet to be ejected into the central jet and into the surrounding fluid.

Keywords: coherent vortices, mixing process, coaxial jet.

INTRODUCTION

The coaxial jet configuration is widely used in industrial systems, e. g. in combustion chambers and gas turbines. Achieving a better mixture improves combustion efficiency and reduces pollutant emissions to the atmosphere.

Jet flow dynamics are largely defined by the movement of coherent vortices during their first development, it is interesting to understand the dynamics of these vortices and to be able to control them in a second time. Efficient manipulation of the behavior of these coherent vortices to improve industrial processes related to mixing phenomena.

The prediction of coherent vortices in the mixing process involves in-depth information on the spatial and temporal evolution of the scalar field, which is difficult to obtain in experiments requiring a lot of material resources[1-2], therefore, numerical simulation is the most widely used and least expensive process.

The Large Eddy Simulation is a very effective tool for investigating coherent vortices and their role in the mixing process in coaxial jet flow [3-4]; this method provides more accurate information on temporal and spatial evolutions of the mixture fraction.

Therefore, the objective of this work is to study the vortex dynamics of the coaxial jet in order to improve its mixing properties. The coaxial jet configuration adopted in this study is a coaxial jet with a hot primary jet and an unheated secondary jet, where the passive scalar is injected at the secondary jet, or this configuration is widely used in industrial applications.

The turbulence model (LES) is used as the investigation tool in this work. This approach allows to solve the largest scales and to apply the Smagorinsky turbulence model on small scales. The mass, Navier Stokes, energy and species conservation equations are solved through a new solver of the Riemann problem called the linearization solver of the characteristic equations [5-6], which is a simple to build and quick to use solver compared to other Riemann solvers[7-8].

MATERIALS and METHODS

The studied jet corresponds to a heated coaxial jet and the passive tracer is introduced at the level of the external jet. The mixing fraction, modelled by a passive scalar, has an initial profile of $f=1$ in the annular jet and $f=0$ in the inner jet and in the co-current.

The turbulence model (LES) is used as the investigation tool. The research approach of this study was based on the implementation of a new Riemann solver, called the linearization solver of the equations characteristic.

FINDINGS and DISCUSSION

Figure 1 shows the instantaneous contours of the mixture fraction in the central plane of the jet. In the vicinity of the outlet nozzle up to $x/D_p = 7$, the disturbances are low; it is observed that the mixture between species of the annular jet and the central jet, and between the annular jet species and the ambient fluid are mainly due to molecular diffusion.

Above $x/D_p = 7$, the natural development of instabilities occurs in the internal and external shear layers, and the turbulent mixing is initiated by the emergence of the internal and external Kelvin-Helmholtz eddies. Finally, above $x/D_p = 20$, the development of secondary structures initiates turbulence at small scales of turbulence, resulting in a more intense turbulent mixture.

Figure 1. Cross-section view of the instantaneous contours of the mixing fraction in the central plane

Figure 2 shows the instantaneous contours of the mixture fraction in the transverse plane at several downstream locations; it is observed that in the fully developed turbulence zone, the longitudinal vortices lead the tracer to the mushroom shapes in the transverse planes of the mixture fraction

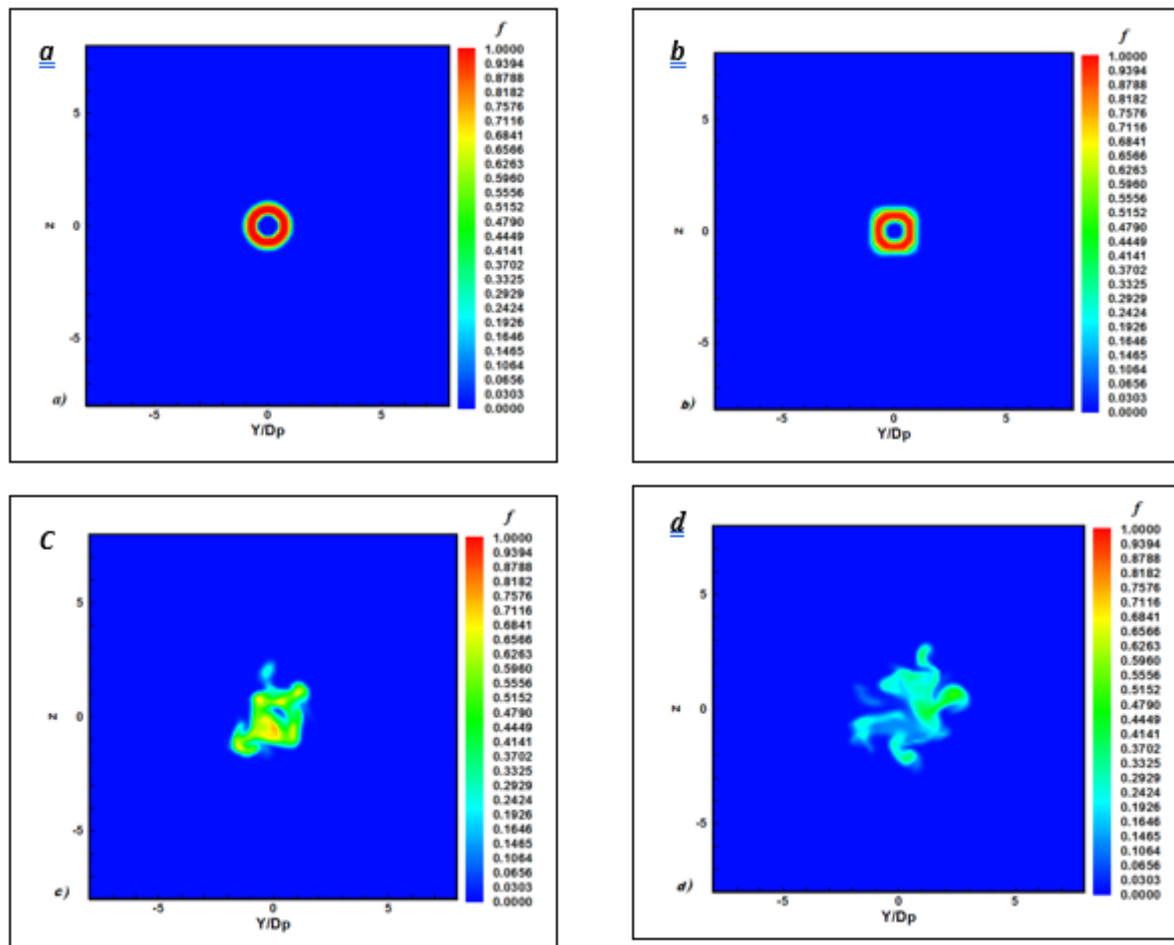

Figure 2. Instantaneous contours of mixing fraction in the transverse plane and at several downstream locations: a) $x/D_p=2$, b) $x/D_p=5$, c) $x/D_p=10$, d) $x/D_p=20$

Geometric characterization of surfaces where species are in equal proportions is important for understanding combustion processes. Figure 3 shows the isosurface of the mixing fraction ($f = 0.5$) with tangential vorticity. The tangential vorticity is cut off in the central plane to observe the mixing layer's (inner and outer). It can be seen that the isosurface of the mixing fraction deforms after the amplification of the jet instabilities. Therefore, this isosurface highlights the presence of the large-scale flow structures (Kelvin-Helmholtz vortices).

The inner and outer Kelvin-Helmholtz vortices increased beyond $x/D_p = 7$, and they transported the mixture fraction, promoting the radial transfer of the mixing fraction on each side of the sheared layers (inner and outer). As a result, the inner and outer isosurfaces were recorded as having two distinct shapes: up to $x/D_p = 15$, the two isosurfaces corresponding to the inner and outer sheared layers are completely dissociated. Then, beyond $x/D_p = 20$, the isosurfaces were fused and only one mixing layer was distinguished. This shows an interpenetration of the

species of each jet that results from the emergence of longitudinal vortices. These vortices, allow the tracer of the annular jet to be ejected into the central jet and into the surrounding fluid.

Figure 3. Cut view of the tangential vorticity with mixing fraction isosurface ($f = 0.5$)

Figure 4 shows the temporal power spectral density (PSD) of the transverse velocity fluctuation at $x/D_p = 5$ and along the internal and external shear layer. Indeed the figure 11 shows the predominance of an axisymmetric mode (Kelvin-Holmheltz vortices) on each of the shear layers. This mode is characterized by peaks with Strouhal number $St = 0.6$ and $St = 0.75$ for the inner and outer layers respectively.

Figure 4. PSD radial velocity profile at $x/D_p=5$

Figure 5 shows the temporal power spectral density (PSD) of the transverse velocity fluctuation at $x/D_p = 15$ and along the internal and external shear layer. Indeed the figure 12 shows the frequency of vortex matching $St = 0.45$ of the external shear layer for $x/D_p = 10$, this frequency corresponds to the frequency of the most amplified mode of the inner layer (longitudinal vortices), that means, the vortex pairing of the outer layer is thus linked to the formation of the structures of the inner layer.

Figure 5. PSD radial velocity profile at $x/D_p=15$

CONCLUSION and RECOMMENDATIONS

This paper studied the role of coherent vortices in the mixing process in a turbulent coaxial jet, using a numerical approach such as Smagorinsky Large Scale Simulation. The research approach of this study was based on the implementation of a new Riemann solver, called the linearization solver of the equations characteristic. As a result, it can be concluded that two coherent vortices were observed in a coaxial jet flow after a molecular diffusion phase; the first vortices are the Kelvin-Helmholtz vortices and their development during the transition phase. These coherent vortices play a very important role in the mixing process. In the fully developed turbulence zone, the longitudinal vortices that appear in pairs allow the passive tracer from the annular jet to be ejected into the central jet and into the surrounding fluid. It is necessary to observe the predominance of an axisymmetric mode (Kelvin-Helmholtz vortices) on each of

the shear layers. This mode is characterized by peaks with the Strouhal number $St = 0.6$ and $St = 0.75$ for the inner and outer layers respectively.

In addition, the vortex adaptation frequency $St = 0.45$ of the external shear layer to $x/D_p = 15$, corresponding to the frequency of the most amplified mode of the internal layer (longitudinal vortices).

ABSTRACT

Weather fluctuation including the amount, duration, frequency and timing of rain in relation to crop growth stages are primary determinants of the levels of terminal or intermittent drought stress under rained conditions. This research was carried out to evaluate 10 chickpea varieties reaction to drought stress and determine the best drought indices for increase and improvement of cultivars yield under different field-growing conditions (rain fed winter sowing, and rain fed-late sowing) in stress and non-stress condition. The experiment was conducted as a randomized block design with 3 replications in in Şırnak, TURKEY in 2020-2021 growing season. According to ANOVA all the indices except SSI, TOL, SDI, RDI, DI, GM, SSPI, SNPI and DTI indices showed significant differences. Yield in stress (Y_{si}) and non-stress (Y_{pi}) conditions were significantly and positively correlated with MP, MRP, GMP, REL, STI, MSTI1, HM and RDY indicating that these are introduced as the superior indices. Considering all indices, Botan, Onur and Sezgin cultivars had the lowest standard deviation and better mean rank so they were identified as the most drought tolerant cultivars.

Keywords: correlation analysis, drought stress, ranking method, selection indices, chickpea

INTRODUCTION

Chickpea is a diploid annual crop that is extremely self-pollinated. After the dry bean, it is the world's second most significant pulses crop. It is a popular cool-season legume crop with nearly 16 million tones production in the World (FAO, 2023). With 630 thousand tons of production per year, Turkey is the third largest producer of chickpea after India and Australia. On the other hand, of 37.7 million hectares of agricultural lands' Turkey, Chickpea took the first place among the pulses with its production of 481 thousand hectares (1.5 %) and cultivation area of approximately 5.1 (% 48.6) million da (TUIK, 2020).

Chickpea is an economically important crop in Turkey and termed as the "poor man's meat" due to supplying protein. Nutritionists have also highlighted its importance due to high nutritional contents in it (Singh et al., 2021). Chickpea is high in lysine and leucine, but low in Methionine+Cysteine and tryptophan (Iqbal et al., 2006). Chickpea seeds comprise 23% protein, 64% total carbohydrates (47% starch, 6% soluble sugar), 5% fat, 6% crude fibre, and 2% ash on average, as well as micronutrients, for example phosphorus, calcium, magnesium, iron, and zinc (Jukanti et al., 2012).

Turkey is situated between the subtropical zone and temperate zone. In its 2021 report, the U.N. Intergovernmental Panel on Climate Change (IPCC) concluded that Turkey will experience three accelerating trends: rising temperatures, dehydration, and rising sea levels. Thus, the country is likely to experience more frequent and more severe weather conditions throughout the year. Total mean rainfall in the country is about 620 mm which this is 15 % less than average rainfall of the World. Turkey's annual precipitation is expected to decrease by about 10% especially in the west and along the Mediterranean coast by 2050. This will result in increased water scarcity and periods of drought, problems that will be exacerbated by glacial retreat and decreased snowfall in the mountains, from which half of the country's water is derived (www.mei.edu).

Turkey has diverse agro ecologies with high potential for chickpea. for this reason, chickpea can be grown in winter and spring seasons in Turkey. Drought, terminal heat, excessive salt, and cold are abiotic variables, whereas Ascochyta blight, Fusarium wilt, and Helicoverpa are biotic factors that have been recognized as key drivers of yield reduction in chickpea (Comas et al., 2013). The lack of genetic divergence and resistance to different stresses has been a major impediment in the development of improved chickpea varieties (Neeraj et al., 2017). After illnesses, drought is the second most significant constraint to the yield of chickpea crop and

affected affect at vegetative as well as reproductive phases (Mohammed et al., 2017). Drought has been reported as a factor of 40–50 percent yield reduction in chickpea (Rani et al., 2020). Besides, of due to drought stress on nutritional parameters of chickpea, significant differences in the nutritional contents is observed (Samineni et al., 2022).

Climatic conditions should be considered in chickpea yield reduction. Weather fluctuation including the amount, duration, frequency and timing of rain in relation to crop growth stages are primary determinants of the levels of terminal or intermittent drought stress under rained conditions. Significant variation for these seasonal factors and their interaction with genotypes complicate the selecting process in field grown nurseries (Sadeghzadeh Ahari et al., 2009). Drought has a substantial influence on crop growth and photosynthesis, both of which are directly related to production (Choudhary et al., 2021).

Thus, drought indices which provide a measure of drought tolerance based on loss of yield under drought conditions in comparison to optimal conditions have been used for drought tolerant genotypes screening (Mitra, 2001). Breeding for drought tolerance has been a difficult task for chickpea breeders due to the happening of strong interactions between genotypes and the environment and restricted knowledge about the function and role of tolerance mechanisms, presence of a limited number of good selection indices, mainly morphological and physiological responses that can be effectively used (Mir et al., 2012; Deshmukh et al., 2014). This research was carried out in order to (a) evaluate chickpea cultivars reaction to drought stress and determine the best measures for increase and improvement of cultivars yield in stress and non-stress condition, (b) to identify key traits and drought indices associated with drought tolerance in chickpea applicable in future field-based screening in Şırnak province of Turkey.

MATERIAL AND METHODS

Growing Conditions of Research Area

The experiment was conducted in Şırnak, TURKEY (37° 17' 42" N, 41° 48' 48" E; 760 m asl) in 2020-2021 growing season. The soil of the experimental area has neutral or slightly acidic reaction (pH 7.35). The physicochemical characteristic of the research area is briefly described in Table 1.

Table 1. Soil physicochemical characteristic of the research area

Deep (cm)	Soil Texture			OM (%)	Lime (%)	E.C. (mmhos cm ⁻¹)	K (mg kg ⁻¹)	P (mg kg ⁻¹)	Cu (mg kg ⁻¹)	Fe (mg kg ⁻¹)	Mn (mg kg ⁻¹)	Zn (mg kg ⁻¹)
	Sandy	Plate	Clay									
0-30	52	41	54	1.51	0.80	1.102	345	4.5	3.62	8.9	13.13	1.51

Important weather parameters of the growing season were recorded from meteorological station located near to the experimental area. The lowest and the highest average temperature in research area were in January with 6.3 °C and in July with 34.3 °C, respectively.

Long term total precipitation during the vegetation period was 622.9 mm, and in the period of November 2020-July 2021, total precipitation was 309.5 mm. During the vegetation period, precipitation was irregular and mostly occurred in the winter months. Considering the long-term average values; the highest precipitation value was determined in January with 109.9 mm and the lowest value in July with 1.7 mm. Considering the precipitation during the research; the lowest value is in June (0.0 mm); the highest value was found in January (109.9 mm).

Plant Material

A total of 10 registered chickpea varieties, namely Botan, Caner, Sezgin, Arslanbey, Onur, Seçkin, Hasanbey, Aksu, Arda and Azkan, were used in the research. Seeds of the cultivars were obtained from the Eastern Mediterranean and GAP International Agricultural Research Institutes. The properties of the materials used in the research are given in Table 2.

Table 2. The properties of the materials used in the research

Name	Days to Flowering (days)	100 Seed Weight (g)	Mean Yield (kg/da)
Botan	86-113	40.3-51.4	277-373
Caner	61-113	35.9-48.0	267.7
Sezgin	63-114	33.9-45.4	276.2
Arslanbey	78	47.0-51.0	240.0-320.0
Onur	61-115	36.0-52.5	214.5
Seçkin	40-76	40.2-45.0	192.4
Hasanbey	30-75	43.7-46.5	199.4
Aksu	83-102	43.0-46.0	230.0-300.0
Arda	90-103	34.1-40.7	250.0
Azkan	88-105	42.0-49.0	262.2

Planting and Experimental Arrangement

The research was arranged in a randomized complete block design with 3 in the 2020-2021 growing season. To evaluate the drought effects, 10 chickpea seeds were sown manually on 30.11.2020 in non-stressed (control) treatment and on 20.02.2021 in stressed treatment. Plots consisted of four rows with a length of 4 m. The sowing was done manually, with 60 seeds per row. Each plot was made up of 0.45 m x 4 rows x 4 m = 7.2 m². Fertilizer was applied at the rate of 3 kg per decare as source of N, 6 kg per decare as source of P, before sowing. After planting, irrigation was not needed as the rainfall was sufficient for the exit. Weed control was carried out by hoe and hand during the seedling period.

Calculation of Indices

The seed yield of each plot was evaluated in 3 m long rows and converted to the standard unit at metric kg per decare. Drought indicators were calculated using the consecrated formulas in Table 3.

17. Stress Susceptibility percentage index	$SSPI = ((Y_{pi} - Y_{si}) / (2 \times \bar{Y}_p)) \times 100$	Moosavi et al. (2008)
18. Stress/non-stress production index	$SNPI = [(Y_{pi} + Y_{si}) / (Y_{pi} - Y_{si}) \times (Y_{pi} \times Y_{si} \times Y_{si})^{1/3}]^{1/3}$	Moosavi et al. (2008)
19. Relative decrease in yield	$RDY = 100 - ((Y_{si} / 100) \times Y_{pi})$	Farshadfar and Elyasi (2012)
20. Drought tolerance efficiency	$DTE = (Y_{si} / Y_{pi}) \times 100$	Fischer and Wood (1981)

In the above formulas, Y_{pi} and Y_{si} are yields of a given genotype under nonstress and stress condition, respectively. \bar{Y}_p and \bar{Y}_s are mean yield of all genotypes under nonstress and stress condition, respectively.

Rank sum (RS) = Rank mean (R) + Standard deviation of rank (SDR) and $SDR = (S^2_i)^{0.5}$

Statistical analysis

The variance analysis and correlation analysis were performed by JMP statistical software.

RESULT AND DISCUSSION

Analysis of Variance

Results of analysis of variation on 10 chickpea cultivars under non stress and stress conditions, showed significant differences for all the indices except SSI, TOL, SDI, RDI, DI, GM, SSPI, SNPI and DTI indices according to ANOVA ($p \leq 0.01$) (Table 4). It indicated that genetic variation exists among genotypes.

Drought tolerance can be defined as an ability of plant to be stable in stressed environment compared to non-stress conditions. Therefore, a genotype with higher yielding capacity can not be always perceived as tolerant. The estimated drought tolerance indicators suggest that identification of drought tolerant cultivars based on a single criterion may be inconsistent. To

determine the most desirable drought-tolerant cultivar according to all indices, the mean rank and standard deviation of the ranks of all drought tolerance criteria were calculated. . Results in the ranking method showed that cultivars with the highest yield in Non-stress conditions (Y_{pi}) are: Arda, Arslanbey, Seçkin, Aksu, Onur, Botan, Hasanbey, Sezgin, Azkan, Caner and in stress condition (Y_{si}): Aksu, Hasanbey, Onur, Seçkin, Botan, Sezgin, Arslanbey, Arda, Azkan, Caner. Both conditions there was significant reduction in seed yield (-30.3%). Various studies confirmed the result (Erdemci, 2018; Yücel, 2018; Shahrokhi et al., 2020; Sachdeva et al., 2022). Considering all indices, Aksu and Seçkin were chickpea cultivars with the best mean rank and almost low standard deviation, as well as Botan, Onur and Sezgin cultivars had the lowest standard deviation and better mean rank so they were identified as the most drought tolerant cultivars. while Arda, Azkan and Caner cultivars with higher mean rank and standard deviation were the most sensitive ones (Table 6). These results for this method can be supported with other Works (Erdemci, 2018; Shahrokhi et al., 2020; Korbu et al., 2021).

Correlation Analysis

To determine the most desirable drought tolerant index, the correlation analysis between yield and drought tolerance indices were determined. The correlation coefficients between Y_p, Y_s, and drought-tolerance indices were presented in Table 7.

Table 7. Correlation coefficients between drought tolerance indices

According to correlation analysis, highly positively significantly correlation under stress as well as non-stress conditions indicated that these indices were more suitable for selection stress tolerant genotype. In this situation, yield in stress (Ysi) and non-stress (Ypi) conditions were significantly and positively correlated with MP, MRP, GMP, REI, STI, MSTI1, HM and RDY indicating that these are introduced as the superior indices. Yield in non-stress condition (Ypi) was significant and positively correlated with TOL, and ATI indicating that these criteria were more effective in identifying high yielding cultivars under different water conditions. Yield in stress condition (Ysi) was significantly and positively corrected with MSTI2, YI, DI, SSPI and SNPI. These results are accordance with those Yücel et al., 2017, Shahrokhi et al., 2020; Korbu et al., 2021.

Conclusion

In conclusion, there were highly significant differences observed among the investigated chickpea genotypes response to drought stress. Our findings indicated that MP, MRP, GMP, REI, STI, HM, YI and RDY can be convenient parameters to select high yielding chickpea genotypes in both stress and non-stress conditions. Aksu and Seçkin were the most drought tolerant genotypes, as well as Botan, Onur and Sezgin were identified as more drought tolerant cultivars. Besides, in both non-stress and stress conditions MP, MRP, GMP, REI, STI, MSTI1, HM and RDY, which highly positively significantly correlated with seed yields, were the best indices. Based on our field studies, it is suggested that the drought tolerance indicators of plants can be used by breeders to select stress-resistant economically productive chickpea genotypes.
