CONGRESS TITLE

Sivas
II. International Conference on Scientific and
Innovation Research

DATE-PLACE

September 15-17, 2023
Sivas, Türkiye

ORGANIZATION

Sivas University of Science and Technology

ORGANIZING COMMITTEE

Prof. Dr. Tolga KARAKÖY - Sivas University of Science and Technology
Prof. Dr. Hüsnü Deniz BAŞDEMİR- Sivas University of Science and Technology
Prof. Dr. Kağan KÖKTEN - Sivas University of Science and Technology
Assoc. Prof. Dr. Emre EVLİCE - Sivas University of Science and Technology
Assoc. Prof. Dr. Şabit HOROZ - Sivas University of Science and Technology
Assist. Prof. Dr. Gökhan BAKTEMUR - Sivas University of Science and Technology
Assist. Prof. Dr. Asuman KAPLAN EVLİCE - Sivas University of Science and Technology
Assist. Prof. Dr. Yeter ÇİLEŞİZ - Sivas University of Science and Technology
Assist. Prof. Dr. Fuat ERDEN - Sivas University of Science and Technology
Assist. Prof. Dr. Fikret SAYGIN - Sivas University of Science and Technology
Research Assist. Meliha Feryal SARIKAYA - Sivas University of Science and Technology
Research Assist. Muhammed TATAR - Sivas University of Science and Technology
Research Assist. Ecem KARA - Sivas University of Science and Technology
Research Assist. İlker YÜCE - Sivas University of Science and Technology
Research Assist. İlhan DANACI - Sivas University of Science and Technology

PARTICIPANTS COUNTRIES

Türkiye, Algeria, Azerbaijan, Bulgaria, Germany, India, Indonesia, Iran (Persia),
Iraq, Kazakhstan, Malaysia, Morocco, Nigeria, Pakistan, Philippines, Romania,
Saudi Arabia, Serbia, Ukraine, Vietnam

TOTAL ACCEPTED ARTICLE

Türkiye: 195
Other Countries: 209

SCIENCE BOARD

Prof. Dr. Tolga KARAKÖY - Sivas University of Science and Technology

Prof. Dr. Hüsnü Deniz BAŞDEMİR - Sivas University of Science and Technology

Prof. Dr. Kağan KÖKTEN - Sivas University of Science and Technology

Prof. Dr. Muhammad AŞİM - Sivas University of Science and Technology

Prof. Dr. Metin ZONTUL - Sivas University of Science and Technology

Prof. Dr. Burhan KARA – Isparta University of Applied Sciences

Prof. Dr. Cengiz TOKER- Akdeniz University

Prof. Dr. Durdane YANAR- Tokat Gaziosmanpaşa University

Prof. Dr. Ercan CEYHAN- Selcuk University

Prof. Dr. Mehmet Ali AVCI- Selcuk University

Prof. Dr. Muhammad AŞİM- Sivas University of Science and Technology

Prof. Dr. Mustafa KIZILŞİMŞEK – Kahramanmaraş Sutcu Imam University

Prof. Dr. Mustafa ŞURMEN-Aydin Adnan Menderes University

Prof. Dr. Osman EREKUL – Aydın Adnan Menderes University

Prof. Dr. Orhan DENGİZ - Ondokuz Mayıs University

Prof. Dr. İlhami BAYRAMİN - Ankara University

Prof. Dr. Oğuz BAŞKAN - Siirt University

Prof. Dr. Şeref KILIÇ - Akdeniz University

Prof. Dr. Yusuf YANAR – Tokat Gaziosmanpaşa University

Assoc. Prof. Dr. Emre EVLİCE - Sivas University of Science and Technology

Assoc. Prof. Dr. Ömer SÖZEN - Sivas University of Science and Technology

Assoc. Prof. Dr. Emre BİÇER - Sivas University of Science and Technology

Assoc. Prof. Dr. Sabit HOROZ - Sivas University of Science and Technology

Assoc. Prof. Dr. Kemal ADEM - Sivas University of Science and Technology

Assoc. Prof. Dr. Pelin ALABOZ - Isparta University of Applied Sciences

**Assoc. Prof. Dr. Tülay TUNÇAY - Ministry of Agriculture and Forestry, Soil Fertilizer
and Water Resources Central Research Institute**

Assoc. Prof. Dr. Ali KAHRAMAN - Selcuk University

Assoc. Prof. Dr. Emine Serap KIZIL AYDEMİR – Bilecik Şeyh Edebali University

Assoc. Prof. Dr. Esra UCAR ŞOZMEN – Sivas Cumhuriyet University

Assoc. Prof. Dr. Hatıra TAŞKIN – Cukurova University

Assoc. Prof. Dr. Ilknur ŞOLMAZ- Cukurova University

Assoc. Prof. Dr. Rahim ADA - Selcuk University

Assoc. Prof. Dr. Ziya DUMLUPINAR- Kahramanmaraş Sutcu Imam University

Assist. Prof. Dr. Gökhan BAKTEMUR - Sivas University of Science and Technology

**Assist. Prof. Dr. Asuman KAPLAN EVLİCE - Sivas University of Science and
Technology**

Assist. Prof. Dr. Yeter ÇİLEŞİZ - Sivas University of Science and Technology

Assist. Prof. Dr. Zemran MUŞTAFİA - Sivas University of Science and Technology

Assist. Prof. Dr. Fikret SAYGIN - Sivas University of Science and Technology

Assist. Prof. Dr. Pervin ERDOĞAN - Sivas University of Science and Technology

Assist. Prof. Dr. Fatih ÖLMEZ - Sivas University of Science and Technology

**Assist. Prof. Dr. Muhammad AZHAR NADEEM - Sivas University of Science and
Technology**

Assist. Prof. Dr. Fuat ERDEN - Sivas University of Science and Technology

Assist. Prof. Dr. Salih ÖZBAY - Sivas University of Science and Technology

Assist. Prof. Dr. Betül KAFKASLIOĞLU YILDIZ - Sivas University of Science and Technology

Assist. Prof. Dr. Ali Suat YILDIZ - Sivas University of Science and Technology

Assist. Prof. Dr. Halit BAKIR - Sivas University of Science and Technology

Prof. Dr. Disna Ratnasekera- University of Ruhuna

Prof. Dr. Hirofumi SANEOKA- Hiroshima University

Prof. Dr. Marian Brestic- Slovak University of Agriculture

Prof. Dr. M. Shohidul ISLAM- Hajee Mohammad Danesh Science and Technology University

Prof. Dr. Oksana SYTAR- Taras Shevchenko National University of Kyiv

Prof. Dr. Disna Ratnasekera- University of Ruhuna

Prof. Dr. Hirofumi SANEOKA- Hiroshima University

Prof. Dr. Marian Brestic- Slovak University of Agriculture

Prof. Dr. M. Shohidul ISLAM- Hajee Mohammad Danesh Science and Technology

Assoc. Prof. Dr. Sina BEŞHARAT- Urmia University

Dr. Adnan Akhter- University of Punjab

Dr. Allah WASAYA- College of Agriculture, BZU, Bahadur Sub-Campus Layyah

Dr. Alfonso CUESTA MARCOS- Bayer Crop Science

Dr. Akbar HOSSAIN- Bangladesh Wheat and Maize Research Institute (BWMRI)

Dr. Ayman ELSABAGH- Kafrelsheikh University

Dr. Adnan Akhter- University of Punjab

Dr. Allah WASAYA- College of Agriculture, BZU, Bahadur Sub-Campus Layyah

Dr. Nihayet KOÇYİĞİT-Batman University

SIVAS

II. International Conference on Scientific and Innovation Research

SEPTEMBER
15-17, 2023
SIVAS

CONFERENCE PROGRAM

ZOOM

Meeting ID: 858 1117 0419

Passcode: 151617

www.iksadkongre.com

IMPORTANT, PLEASE READ CAREFULLY

- ❖ To be able to attend a meeting online, login via <https://zoom.us/join> site, enter ID "Meeting ID or Personal Link Name" and solidify the session.
- ❖ The Zoom application is free and no need to create an account.
- ❖ The Zoom application can be used without registration.
- ❖ The application works on tablets, phones and PCs.
- ❖ The participant must be connected to the session 5 minutes before the presentation time.
- ❖ All congress participants can connect live and listen to all sessions.
- ❖ Moderator is responsible for the presentation and scientific discussion (question-answer) section of the session.

Points to Take into Consideration - TECHNICAL INFORMATION

- ◆ Make sure your computer has a microphone and is working.
- ◆ You should be able to use screen sharing feature in Zoom.
- ◆ Attendance certificates will be sent to you as pdf at the end of the congress.
- ◆ Requests such as change of place and time will not be taken into consideration in the congress program.

ÖNEMLİ, DİKKATLE OKUYUNUZ LÜTFEN

- ❖ Kongremizde Yazım Kurallarına uygun gönderilmiş ve bilim kurulundan geçen bildirimler için online (video konferans sistemi üzerinden) sunum imkanı sağlanmıştır.
- ❖ Online sunum yapabilmek için <https://zoom.us/join> sitesi üzerinden giriş yaparak "Meeting ID or Personal Link Name" yerine ID numarasını girerek oturuma katılabilirsiniz.
- ❖ Zoom uygulaması ücretsizdir ve hesap oluşturmaya gerek yoktur.
- ❖ Zoom uygulaması kaydolmadan kullanılabilir.
- ❖ Uygulama tablet, telefon ve PC'lerde çalışıyor.
- ❖ Her oturumdaki sunucuların, sunum saatinden 5 dk öncesinde oturuma bağlanmış olmaları gerekmektedir.
- ❖ Tüm kongre katılımcıları canlı bağlanarak tüm oturumları dinleyebilir.
- ❖ Moderatör – oturumdaki sunum ve bilimsel tartışma (soru-cevap) kısmından sorumludur.

Dikkat Edilmesi Gerekenler- TEKNİK BİLGİLER

- ◆ Bilgisayarınızda mikrofon olduğuna ve çalıştığına emin olunuz.
- ◆ Zoom'da ekran paylaşma özelliğini kullanabilmelisiniz.
- ◆ Kabul edilen bildiri sahiplerinin mail adreslerine Zoom uygulamasında oluşturduğumuz oturuma ait ID numarası gönderilecektir.
- ◆ Katılım belgeleri kongre sonunda tarafınıza pdf olarak gönderilecektir.
- ◆ Kongre programında yer ve saat değişikliği gibi talepler dikkate alınmayacaktır.

**Before you login to Zoom please indicate your name surname and hall number,
exp. H- 1, Lütfi ARSLAN**

CONGRESS LANGUAGES: English and All Turkish Dialects

-Opening Speech-

Date: 15.09.2023

Ankara Time: 09.00 - 10.00

Sivas Science and Technology University

Prof. Dr. Tolga KARAKÖY

Vice Rector of Sivas University Of Science and Technology
HEAD OF THE CONFERENCE

Prof. Dr. Harpreet KAUR

Principal, Mata Sundri College for Women, University of Delhi

Dr. Mustafa Latif EMEK

President of IKSAD Institute

Prof. Dr. Mehmet KUL

Rector of Sivas University of Science and Technology
HONORARY PRESIDENT OF THE CONFERENCE

PARTICIPATING COUNTRIES:

Türkiye, Algeria, Azerbaijan, India, Iraq, Malaysia, Morocco, Nigeria, Pakistan, Romania, Ukraine, Georgia, Hungary, USA, Bangladesh, Albania, Faridabad, Ibadan, Brazil, South Africa, Korea

15.09.2023 / Session-1 / Hall-1

Ankara Local Time: 10:30-12:30

Sivas University of Science and Technology

HEAD OF SESSION: Prof. Dr. Emre BIÇER

Authors	Affiliation	Presentation title
Betül Kafkaslıođlu Yıldız Ali Suat Yıldız Elif Işık	Sivas University of Science and Technology	Effect of Fracture Type on Strength of 3d Printed Zro2 Rectangular Bars Produced with Sla Technique
Nihayet Koçyiđit	Batman University	Types, Features and Application of Organic Ferroelectric Materials
Ceren Barlas Şefika Arzu Ergen Songül Çavdar Karaçam Sevda Kanat İsmet Şahinler	Istanbul University-Cerrahpaşa	Dosimetric Evaluation of Metal Artifact Reduction Algorithm in Vaginal Cuff Brachytherapy
Fatih Bayrak Alişan Gönül	Siirt University	Bibliometric Analysis of Postgraduate Thesis in The Field of Photovoltaics Between (2020-2023)
Sinem Kulluk Hülya Torun M. Merhad Ay İsmail Akargöl	Erciyes University	Machine Learning in Predictive Maintenance: A Numerical Case Study
Volkan Berk Mehmet Duman	Duzce University	Design and Produce of Chess Pawn Shaped Antenna with 3D Printer
Emre Şahin Furkan Birdal	Kırşehir Ahi Evran University	Investigation of The Laser Scanning and Bim Technology Together Usage in 3d Structural Modeling

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

15.09.2023 / Session-1 / Hall-2

Ankara Local Time: 10:30-12:30

Buruciye Medresesi, Sivas

HEAD OF SESSION: Prof. Dr. Kağan KÖKTEN

Authors	Affiliation	Presentation title
Rahim Ada Ercan Ceyhan Nursel Çöl Keskin Serdar Karadaş Rifat Kepildek Himmet Özcan Feyzullah Kul Ahmet Konuk Tuba Uzun Saliha Mutlu Çoğalan	Selçuk University	Application of Progeny Testing for O-Type Plant Detection in Monogerm Sugar Beet Populations
Serdar Karadaş Ercan Ceyhan	Selcuk University	Determination of Grain Yield and Some Agronomic Characteristics of Newly Developed Cowpea Pure Lines
Ercan Ceyhan Serdar Karadaş	Selcuk University	Green Bean Pure Lines: High Grain Yield and Superior Agricultural Traits
Ercan Ceyhan Serdar Karadaş	Selcuk University	Determination of Biological Yield and Some Agronomic Characteristics of Newly Developed Forage Cowpea Pure Lines
Serdar Karadaş Ercan Ceyhan	Selcuk University	Identification of High Yielding Dry Bean Lines
Meliha Feryal Sarkaya Yeter Çilesiz	Sivas University of Science and Technology	Evaluation of Some Forage Pea Genotypes Grown In Sivas Ecological Conditions In Terms of Some Yield and Yield Components
Yunus Emre Perçin Mehmet Ali Avcı	Selcuk University	Determinatin of Morphological Diversity in Tall Fescue (Festuca Arundinacea Schreb.) Genotypes Collected from The Nature
Musa Tekiner Mehmet Ali Avcı	Selcuk University	Characterization of Orchard Grass Dactylis Spp. Species Collected from Different Regions of Our Country
Müzeyyen Şengün Güleçen Kağan Kökten	Sivas University of Science and Technology	Evaluation of Elaziğ Province in Terms of Crop Production

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

15.09.2023 / Session-1 / Hall-3

Ankara Local Time: 10:30-12:30

Sivas University Of Science and Technology

HEAD OF SESSION: Dr. Öğr. Üyesi Fikret SAYGIN

Authors	Affiliation	Presentation title
Pelin Alaboz Orhan Dengiz	Isparta University of Applied Sciences	Van Genuchten Model Validity Limits for Some Soil Moisture Constants in Semi-arid Ecological Condition
Sena Pacci Orhan Dengiz	Ondokuz Mayıs University	Determination of Carbon Sequestration Potentials of Sunflower Cultivated Areas Under Semi-Arid Climate Conditions and Their Prediction Using Artificial Neural Networks
Ecem Kara Gökhan Baktemur	Sivas University of Science and Technology	Determination of The Tolerance Level of White Cabbage (<i>Brassica oleracea</i> var. <i>capitata</i> f. <i>alba</i>) Plant In Nutritional Media Containing Different Doses of Sodium Chloride In In Vitro Conditions
Ecem Kara Gökhan Baktemur	Sivas University of Science and Technology	Determination of Growth Level of Garden Cress (<i>Lepidium sativum</i> L.) in Nutritional Media Containing Different Concentrations of NaCl In Vitro Conditions
Vildan Akarsu Öztürk Asuman Kaplan Evlice	Sivas University of Science and Technology	Traditional Turkish Wheat-Based Beverage and Foods
Muhammed Tatar İlker Yüce Meliha Feryal Sarıkaya Yeter Çilesiz	Sivas University of Science and Technology	The Evaluation of Some Common Vetch Genotypes Brought in Central Anatolian Conditions with Respect to Some Agromorphological Characteristics
Ramazan Erenler	Iğdır University	Phytochemical Analysis of <i>Thymus leucostomus</i> Var. <i>Leucostomus</i> and Evaluation of Its Antioxidant Effects
Fikret Saygin Pelin Alaboz Orhan Dengiz Murat Birol Serkan İç	Sivas University of Science and Technology	Relationships Between Some Soil Properties and Penetration Resistance

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

15.09.2023 / Session-2 / Hall-1

Ankara Local Time: 14:30-16:30

Sivas University Of Science and Technology

HEAD OF SESSION: Doç. Dr. Ahmet AKSÖZ

Authors	Affiliation	Presentation title
Arif Samed İpek Ahmet Aksöz Büşra Çetinus Emre Biçer	Sivas Cumhuriyet University	State of Health Status of Li-Ion Battery in Unmanned Aerial Vehicles
Ferhat Açar Ahmet Aksöz Mehmet Özel Büşra Çetinus Emre Biçer	Sivas Cumhuriyet University	Optimization of Electronic Speed Control Card and Flight Control Card for A Drone with Increased Flight Time with An Improved Battery Management System
Ayşenur Canan Benli Özçakir Sefa Eldemir Mustafa Oğuz Kethüdaoğlu	Sivas Cumhuriyet University	Investigation of The Relationship Between Foot Protective Sense and Gait Parameters in Individuals with Type II Diabetes
Aslihan Anter Elif Orhan	Gazi University	Characterization of Current / Voltage Feature of Gdnps-Gqds Nanocomposite Diode
Haci Hasan Saf	Sivas Cumhuriyet University	The Usage of Nostalgic Discourses in Populism
Meltem Dağdelen Tuba Kurt Çatal Bülent Arif Aras	Istanbul University-Cerrahpaşa	Evaluation of Fdg Uptake and Treatment Response in Cervical Cancer
Tunay Karan	Yozgat Bozok University	Photochemical Analysis of Consolida Orientalis By Lc- Ms/Ms and Evaluation of Its Cytotoxic Effects
Zeynep Berktaş Elif Orhan	Gazi University	Dielectric Property of a Diode Based on Graphene Quantum Dots
Elanur Dikicioğlu Elif Orhan	Yüksek İhtisas University	Determination of Diode Parameters of Graphene Quantum Dot-Based Semiconductor Structure

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

15.09.2023 / Session-2 / Hall-2

Ankara Local Time: 14:30-16:30

Sivas University Of Science and Technology

HEAD OF SESSION: Doç. Dr. Emre EVLİCE

Authors	Affiliation	Presentation title
Emre Evlice Mustafa Alkan	Sivas University of Science and Technology	Contact Insecticidal Activity of <i>Artemisia vulgaris</i> (Asteraceae) Essential Oil Against Two Important Stored Product Pests
Mehmet Nurullah Önel Barış Kavasogullari Mücahit Emin Karagöz	Sivas University of Science and Technology	The Effect of Fin Usage on Cooling Performance in A Pcm-Based Battery Thermal Management System
Mücahit Emin Karagöz Barış Kavasogullari Mehmet Nurullah Önel Ali Suat Yıldız	Sivas University of Science and Technology	Effects of Different Dynamic Cycles on The Performance of The Pcm-Based Battery Thermal Management System
Aleyna Atılğan Emre Yurtkuran	Sivas University of Science and Technology	Development of Hybrid Gun Design In Tungsten Powder Production By Computational Fluid Dynamics Method
İremnur Duru Nurhan Güneş Timuçin Emre Tabaru	Sivas University of Science and Technology	Design and Simulation of Antenna and Wilkinson Power Divider for Low-Cost Fmcw Radar
Mehmet Özer Serdar Mercan	Sivas Cumhuriyet University	Analysis of Microstructural and Mechanical Properties Depending on Channel Depth In Joining Different Metal Pairs
Asil Alkaya Onur Demirkapi	Aydın Adnan Menderes University	Pm4py for Process Mining
Muhammed Taha Yıldız Nazim Babacan Ramazan Katirci	Sivas University of Science and Technology	Optimization of Dimensional Accuracy in A Co-Cr Alloy Produced by Lpbf Additive Manufacturing
Talha Kiliç Faruk Yeşildal Hüseyin Köksal	Atatürk University	Piezoelectric Fan Cooling Parameters Investigation

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

15.09.2023 / Session-2 / Hall-3

Ankara Local Time: 14:30-16:30

Sivas University Of Science and Technology

HEAD OF SESSION: Prof. Dr. Ramazan KATIRCI

Authors	Affiliation	Presentation title
Harpreet Kaur	University of Delhi	Women's Economic Empowerment in India: A Roadmap
Uzma Nadeem Harpreet Kaur	University of Delhi	Net Zero Emission Target: An Approach to Achieve Sdg-7 in India
Merve Karayılmaz Seyhan Polat Mehmet Gunata Elif Taslıdere Feyzi Dogru Ahmet Acet Alaadin Polat Hakan Parlakpınar	Inonu University	The Protective Effects of Alamandin In A Rat Model of Methotrexate-Induced Hepatotoxicity
Ayşe Betül Tanrıverdi	Sivas Cumhuriyet University	Virtual Reality and Emotions in The Foster Family
Esra Bulut Atalay	Sivas Cumhuriyet University	Metabolite Determination in Cancer Cells
Turhan Turan Hakan İşidan	Sivas Cumhuriyet University	Molecular Detection and Sequence Analysis of Gammalyomavirus Avis (Budgerigar Fledgling Disease Virus) From Budgerigars In Sivas Province
Alev Aktaş	Sivas Cumhuriyet University	The Effect of Autonomous Vehicles on Road Rage Behaviours
Muammer Aktay	Sivas Cumhuriyet University	A Philosophical Investigation on The Relationship of Artificial Intelligence's Imitation Skills with Human Consciousness

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

16.09.2023 | SESSION-1 | HALL-1

Ankara Local Time: 10:00-12:00

Meeting ID: 858 1117 0419 | Passcode: 151617

HEAD OF SESSION: Arş. Gör. Meliha Feryal SARIKAYA

Authors	Affiliation	Presentation title
Neslihan Açıkay Hamdi Karakaş	Sivas Cumhuriyet University	Ecological Footprint Awareness Levels of Primary School Teachers
Safiye Yılmaz Can Hamdi Karakaş	Sivas Cumhuriyet University	Primary School Teachers' Views on Stem Education
Yasin Karakuş	Osmaniye Korkut Ata University	Subhaneke Prayer and Sheikh Musa Emani's Hediyyetu'l-Muhlisin
Halil Çakan Hande Otu Borlu Türkan Keçeli Mutlu	Çukurova University	The Effects of The Cement Factory Dusts on Olive Trees' Some Physiological Parameters
Murat Kalkan	Istanbul University	The Relationship Between Motivation and Productivity
Semra Durak Özge Eşim Canan Hasçıçek	Fırat University	Development and Evaluation of Nanoparticulate Drug Delivery System for The Treatment of Colorectal Cancer
Boughedir Nadia Bailiche Zohra	Université de Tlemcen	Catalytic Esterification of Biodiesel Using Mesoporous Material
Tooba Jabeen Matloob Ahmad Sana Aslam	Government College University	Triazoloquinazolines: Synthesis and Applications
V. Saranya U. Pushpalatha	KCG College of Technology	Utilizing Ai-Driven Tools To Enhance Reading Proficiency In Engineering College Students

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

16.09.2023 | SESSION-1 | HALL-2

Ankara Local Time: 10:00-12:00

Meeting ID: 858 1117 0419 | Passcode: 151617

HEAD OF SESSION: Arş. Gör. Muhammed TATAR

Authors	Affiliation	Presentation title
Ayşe Erol Figen Abatay Sel Mediha Süleymanoğlu Gökhan Demirayak Dürdane Serap Kuruca Fatma Savran Oğuz Ceyhan Şahin	Istanbul University	Evaluation of Optimum Incubation Time of Phytohemagglutinin Stimulation In Intracellular Cytokine Determination: Preliminary Study
Hatice Neval Özbek	Sağlık Bilimleri University	Coexistence of Situs Inversus Totalis and Acute Appendicitis
Emine Dilek Özyılmaz Tansel Çomoğlu	Gaziantep University	Effect Of Packaging In Reduction Of Post-Harvest Losses For Fresh Fruits And Vegetables
Esra Acar Eylem Bektaş Bilgiç	Eastern Mediterranean University	In Vitro Evaluation of Flurbiprofen Oods Prepared With Box-Behnken Experimental Design
Mohammed Abed Abu Jassim Alaa Abdulameer Shaheed Al-Abbooda	Istanbul University-Cerrahpasa	Perioperative Glycemic Management in Cats and Dogs
Fella Chebbah Djouini Amina Smili Chaima Retem Chahira Bairi Abdelmadjid	University of Kufa	Advertising Discourse In Surat Al-Tawheed - A Semiotic Study
Gheorghe Giurgiu Manole Cojocaru Scires I Eusplm	Badji Mokhtar Annaba University	Effect of gallic acid and lavender essential oil taken separately and/or combined on cognitive and behavioural abilities of post-stroke male Wistar rats
	Titu Maiorescu University	The Gut-Brain-Skin Axis in Acne: Impact of Polenoderm

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

16.09.2023 | SESSION-1 | HALL-3

Ankara Local Time: 10:00-12:00

Meeting ID: 858 1117 0419 | Passcode: 151617

HEAD OF SESSION: Arş. Gör. İlker YÜCE

Authors	Affiliation	Presentation title
İlker Yüce Muhammed Tatar	Sivas University of Science and Technology	The Evaluation of Some Feed Oat Genotypes in Terms of Some Yield and Yield Components in Sivas Ecological Conditions
Murat Şentürk	Suleyman Demirel University	Karahalli-Çivril Neogene Basin: Coal Reserves and Geothermal Energy Opportunities
Reyhan Selin Uysal	Istanbul Bilgi University	Analyses of Volatile Compounds from Wine Vinegar
Erkam Köseömr Furkan Birdal Hasan Dilbas	Kırşehir Ahi Evran University	Analytical Investigation of Rc Frames Lateral Load Capacities Made With Sustainable Engineered Cementitious Composite (Ecc)
Aysel Elik Demir	Tarsus University	A Review of Radio-Frequency Applications for Drying Of Foods And Agricultural Products
Abed Hamadouch Khadija Boudour	University of Abd Elhamid Ibn Badis	Investigating EFL Experienced Teachers' Perspective Towards Their Need for an In-service Training
S.K. Kango Pawan Kumar Nirmal Singh	NSCBM Government College Hamirpur	Effect of variable viscosity on thermal convection of nanofluid in porous medium
Ibrahim B. B Usman A	Institute of Applied Sciences, Kwara State Polytechnic	Estimation of Global Solar Radiation Using Five Sunshine Based Models for Ilorin, North-Central Nigeria
Djellouli Amir Berredjem Yamina Hattab Zhou Guesmia Hadjer Yagoub Mohamed Azri Naima	Université mohammed chérif mesaadia de Souk-Ahras	Utilization of Inexpensive Bio-Adsorbents For The Removal of Inorganic Aqueous Effluents
Djellouli Amir Berredjem Yamina Hattab Zhou Guesmia Hadjer Mokhtar Mhenni Azri Naima Yagoub Mohamed	Université mohammed chérif mesaadia de Souk-Ahras	Medecal Phenolic Components and Possible Insecticidal Properties of Two Saharan Plants in BISKRA

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

16.09.2023 | SESSION-1 | HALL-4

Ankara Local Time: 10:00-12:00

Meeting ID: 858 1117 0419 | Passcode: 151617

HEAD OF SESSION: Arş. Gör. Ecem KARA

Authors	Affiliation	Presentation title
Gülşah Bengisu Seyithan Seydoşođlu	Harran University	Microbial Contamination and Mycotoxins in Silages
Teoman Özgür Sökmen Nurgül Şen Özdemir Muharrem Güneş Muammer Kırıcı	Erzincan Binali Yıldırım University	Determination of The Length-Weight Relationship, Condition Factor, And Gonadosomatic Index of Capoeta umbla Caught from Euphrates River (Erzincan, Türkiye)
Ahmet Zeki Hepçimen Necla Çađlarımak	Manisa Celal Bayar University	Trends and Developments in Innovation Processes Of Fruit And Vegetable Engineering
Ruziye Karaman Cengiz Türkay	Isparta University of Applied Sciences	Investigation of Changes in Some Quality Characteristics of Sweet Corn Under Different Packaging and Storage Conditions
Gorgadze Gigi Kuparadze Marina Garuchava Natalia Tamila Silagadze Giorgi Zhorzholiani Mariam Morchiladze	Tbilisi State Medical University	The Neuroticism Rate Among Students Of The International Faculty Of Medicine – A Case Control Study
Arshia Zia	University of Agriculture	Application of Proline As Pre-Sowing Seed Treatment on Okra Under Water Deficit Conditions
M. Lassri M. Sajjeddine	Université Sultan Moulay Slimane	Study Of The Magnetic And Magnetocaloric Properties In The Amorphous Alloy Eu4Au
Ajiboye, A.E. Alabi, O.S. Hammed, B.A.	Kwara State University	Bacterial Assessment of Selected Foods Sold At Some Restaurants At The Federal Polytechnic Offa, Kwara State, Nigeria

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

16.09.2023 | SESSION-1 | HALL-5

Ankara Local Time: 10:00-12:00

Meeting ID: 858 1117 0419 | Passcode: 151617

HEAD OF SESSION: Arş. Gör. İlhan DANACI

Authors	Affiliation	Presentation title
Merve Büşra Ayık Gül Fatma Türker	Süleyman Demirel Univesity	Technological Developments and Artificial Intelligence Used In Fish Farms
Merve Büşra Ayık Gül Fatma Türker	Süleyman Demirel Univesity	Developing Technology in Fish Grading Machines
Sibel Tuna Meral Akkoyun Kurtlu Beril Sungur	Bursa Technical University	On The Use of Magnetite And Silicon Carbide To Improve The Thermal Conductivity Properties of Polypropylene Composites
Kemal Yıldızlı Muharrem Koç	Ondokuz Mayıs University	Conversion of A Vertical Drill to A Robot Feed Honing Machine
Ajiboye, A.E. Yusuf, N.A.	Kwara State University	Isolation, Identification and Screening of Citric Acid Producing Fungi from Fermented Orange, Pawpaw and Banana Peels
Taufyk Azzeddine	Laboratory of Chemistry of Coordination and Analytics	Applications of Cross-Linked and Non-Linked Chitosan For Defluorination Of Water
Ammar Mrabti Nouredine Ouelaa Ramdane Younes Tarek Kebabsa Zakariya Ouelaa	University 8 Mai 1945	Enhancing Rotating Machinery Reliability through Variational Mode Decomposition (VMD) for Fault Detection
Hussein Kh. Rasheed Aseel A. Kareem	University of Baghdad	Enhanced Physical Properties Of Solid Polymer Electrolyte Based On PVAX-y/PMDAy

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

16.09.2023 | SESSION-1 | HALL-6

Ankara Local Time: 10:00-12:00

ABSTRACTS		
Semra Durak Özge Eşim Canan Hasçıçek	Development and Evaluation of Nanoparticulate Drug Delivery System for The Treatment of Colorectal Cancer	1
Boughedir Nadia Bailiche Zohra	Catalytic Esterification of Biodiesel Using Mesoporous Material	3
Tooba Jabeen Matloob Ahmad Sana Aslam	Triazoloquinazolines: Synthesis and Applications	4
Ayşe Erol Figen Abatay Sel Mediha Süleymanoğlu Gökhan Demirayak Dürdane Serap Kuruca Fatma Savran Oğuz	Evaluation of Optimum Incubation Time of Phytohemagglutinin Stimulation İn Intracellular Cytokine Determination: Preliminary Study	5
Ceyhan Şahin	Coexistence of Situs Inversus Totalis and Acute Appendicitis	7
Emine Dilek Özyılmaz Tansel Çomoğlu	In Vitro Evaluation of Flurbiprofen Ods Prepared With Box-Behnken Experimental Design	9
Fella Chebbah Djouini Amina Smili Chaima Retem Chahira Bairi Abdelmadjid	Effect of gallic acid and lavender essential oil taken separately and/or combined on cognitive and behavioural abilities of post-stroke male Wistar rats	11
Gheorghe Giurgiu Manole Cojocaru Scires I Eusplm	The Gut-Brain-Skin Axis in Acne: Impact of Polenoderm	13
Murat Şentürk	Karahalli-Çivril Neogene Basin: Coal Reserves and Geothermal Energy Opportunities	14
Reyhan Selin Uysal	Analyses of Volatile Compounds from Wine Vinegar	16
Aysel Elik Demir	A Review of Radio-Frequency Applications for Drying Of Foods And Agricultural Products	17
Abed Hamadouch Khadija Boudour	Investigating EFL Experienced Teachers' Perspective Towards Their Need for an In-service Training	18
Ibrahim B. B Usman A	Estimation of Global Solar Radiation Using Five Sunshine Based Models for Ilorin, North-Central Nigeria	19
Djellouli Amir Berredjem Yamina Hattab Zhou Guesmia Hadjer Yagoub Mohamed Azri Naima	Utilization of Inexpensive Bio-Adsorbents For The Removal of Inorganic Aqueous Effluents	20

Djellouli Amir Berredjem Yamina Hattab Zhou Guesmia Hadjer Mokhtar Mhenni Azri Naima Yagoub Mohamed	Medecal Phenolic Components and Possible Insecticidal Properties of Two Saharan Plants in BISKRA	22
Teoman Özgür Sökmen Nurgül Şen Özdemir Muharrem Güneş Muammer Kırıcı	Determination of The Length-Weight Relationship, Condition Factor, And Gonadosomatic Index of Capoeta umbla Caught from Euphrates River (Erzincan, Türkiye)	24
Ahmet Zeki Hepçimen Necla Çağlarımak	Trends and Developments in Innovation Processes Of Fruit And Vegetable Engineering	26
Arshia Zia	Application of Proline As Pre-Sowing Seed Treatment on Okra Under Water Deficit Conditions	27
M. Lassri M. Sajieddine	Study Of The Magnetic And Magnetocaloric Properties In The Amorphous Alloy Eu ₄ Au	28
Ajiboye, A.E. Alabi, O.S. Hammed, B.A.	Bacterial Assessment of Selected Foods Sold At Some Restaurants At The Federal Polytechnic Offa, Kwara State, Nigeria	29
Ajiboye, A.E. Yusuf, N.A.	Isolation, Identification and Screening of Citric Acid Producing Fungi from Fermented Orange, Pawpaw and Banana Peels	30
Taufyk Azzeddine	Applications of Cross-Linked and Non-Linked Chitosan For Defluorination Of Water	31
Ammar Mrabti Nouredine Ouelaa Ramdane Younes Tarek Kebabsa Zakariya Ouelaa	Enhancing Rotating Machinery Reliability through Variational Mode Decomposition (VMD) for Fault Detection	32
Hussein Kh. Rasheed Aseel A. Kareem	Enhanced Physical Properties Of Solid Polymer Electrolyte Based On PVAX-y/PMDAy	33
Ceren Kaya İrem Şenyar Yapıcı Rukiye Uzun Arslan	Explatory Data Analysis Based Diabetes Mellitus Disease Prediction Using Machine Learning Techniques and Voting Classifiers	34
Kübra Köşe Kaya Salih Özbay	Effect of Aluminum Addition on The Power of Cl-20, Rdx And Tnt Explosives	36
Mehmet Ali Geniş	Ecosystem-Oriented Transformation of Global Marketing Strategies: A Realistic Analysis	37
Balasubramani G L, Rinky Rajput Manish Gupta Pradeep Dahiya Jitendra K Thakur Rakesh Bhatnagar Abhinav Grover	Structure-based Drug Repurposing To Inhibit the DNA Gyrase Of Mycobacterium Tuberculosis	39
Golda Sahoo	An Annalysis On Balancing The Benefits Of Technology With The Risks Of Increased Human Trafficking	40
Muhammed Sani Babakatun Saidu Abdulrahman Samaila Muhammad Tukur	Niger State Politics: An Overview of March 11, 2023 Zone A Senatorial Election	41
Sümeysra Tüzün	An Overview of Consumption Culture from The Master-Slave Dialectic	42
Hatice Kiliñer	Theological Faculty Students' Responses to Kohlberg's Heinz Dilemma And Their Religious Justifications	43

Polen Bayrak	Reclaiming National Sovereignty in International Investment Law	45
Hasan Ulusoy	Role of Social Constructivist Methodology in Analysis And Strategic Foresights in The Domain of Foreign Policy Formulations And Diplomacy	46
Retem Chahira Chebbah Fella Smili Chaima Djouini Amina Bairi Abdel Madjid	Effect of Pregabalin on Behavior And Cognitive Skills In Patients Referred To The Cisa-Boukhadra-Annaba Intermediate Addictology Care Center	48
Abdul Ghaffar	Structural Transformation Of Ce-Doped Mn-O And Antibacterial Effects	49
Mohammed Alaa Alwafaie Bela Kovacs	Exploring Stress Effects on Piezoelectric Cells for Improved Road-Based Electricity Generation (uniform distributed loading)	50
Bello Hassan Onimisi	Ultraviolet Mediating Cream Against Ageing And Cancer Of The Skin	51
Bello Hassan Onimisi	Increasing The Shelf Life Of Dairy Products For Improved Nutritional Values And Nourishment	52
Osman Karacan	Youth Participation in Urban Management in Türkiye: An Evaluation of The Cities With The Youngest Population	53
Seda Çankaya Kurnaz	Digitalization in Public Administration: Bibliometric Analysis of Published Postgraduate Theses	55
Oktay Atik	Technological Evolution and Youth: Intercultural Interaction With Metaverse	56
Habib Djourdem	Analysis Results for Higher-Order Nonlinear Fractional Differential Inclusions	58
Habib Djourdem Djamel-Eddine Hettadj	A Study of Nonlinear A Caputo Fractional Differential Equations	59
Haruna B. Murtala Rn, Adcon, Pgde Dahiru Abdullahi Rn, Aen	Exploring The Practice of Dental Hygiene: A Study Conducted Among Students Of Integrated Tsangaya Model Schools In Kano State Nigeria	60
Elif Nagihan Türköz	Modernization, Nature, Human, And Disaster	61
Demet Kutgi Bilgin Habibe Yaman	An Overview Of The Performance Of Universities İn Turkey İn Terms Of Green Campus And Environmental Sustainability	62
Hayat Jaadan Mustapha Akodad Mourad Baghour Ali Skalli Said Ezrari	Mineralogical And Chemical Composition Of The Clay Fraction Of The Cap Three Forks (North Of Morocco) Soil	64
Salah Uddin	Examining the Concept of Justice in Greek Philosophy and Islam: A Comparative Analysis	65
Engin Karaman	Analysis Of Industry 4.0 Performance Of Countries With Multidimensional Scaling Method	66
Ömer Genç Mustafa Akgün	Energy Analysis Of Spherical Roller Bearings According To Vibration And Bearing Gap Values In Industrial Fans	67
Yuwvaranni.S Catherin Jeni J Nathiya S Chamundeeswari. M	Synergistic Antioxidant, Antidiabetic, Antihaemolytic, Anti-Microbial And Anticancer Potentials Of Polyherbal-Infused Blue Tea	68

Zohaib Hassan Sain	Students Assessment of Online Education during the Covid-19 Epidemic: An Analysis	70
Zohaib Hassan Sain	Blended Learning Adoption In Pakistani Universities: Challenges And Recommendations	71
Zohaib Hassan Sain	An Examination of Common Challenges Encountered in Institutes of Higher Learning in Pakistan	72
Fatma Altıntaş Meltem Delimanlar Mahmed Sari Njjar Ahmet Koluman Ayhan Korkmaz İrfan Dere Berkay Yılmaz	Use Of Different Electrodes For Electrolysis And Their Effects On Results	73
Özlem Kaplan	Analyzing The Potential of Combined Therapy With Ganetespib And Curcumin in Osteosarcoma	75
Srijani Dasgupta Gaurav Ranjan	Revolutionizing Cancer Diagnosis: Cutting-Edge Nanoplatfrom Imaging Techniques	76
Erfan Suryani Abd Rashid Nurhidayatullaili Muhd Julkapli	Potential Of Nanocellulose-Antioxidant To Increase Nitrile Butadiene Rubber Glove Mechanical Strength, Biodegradability, And Free Radical Stability	77
M. Asif M.Fakhar-E-Alam Muaazam Ali M.Nasir M.Adnan M.Irfan	Green Synthesis Of Magnetic Iron Oxide Nanoparticles (Fe ₃ O ₄ NPs) for Imaging And Brain Cancer Treatment	79
Özden Toprak	Transition From Bentham's Prison Panopticon To The Societal Panopticon: The Society Of Surveillance	80
Gökhan Silahtaroğlu Esra Açıklan Abdurrahman Keskin Nevin Yilmaztürk	Classification Of The Side Effects Of Antidepressant Drugs By Tree Based Algorithms	82
Pooja Rasal Gaurav Kasar	Lycopene: A Potent Natural Antioxidant	83
Gaurav Kasar Pooja Rasal	Overview of Coenzyme Q10	84
Sali Mohammed Bobboi Abatcha Alhaji Kurna Lukman Ibrahim Nura Muhammad Sani	News/Events Automation System	85
Sarwat Sultan Rutaba Salman	Mediating Role of Delegating Leadership Style between Openness Personality Type and Glass Ceiling Effect among Educators	86
Abdulkadir Sağlam	Opinions Of Class Teachers On Summer Learning Losses In Literacy	87
Serkan Cengiz	The Relationship Between General Self-Efficacy and Life Satisfaction of University Students	88
Nazmi Sedefoğlu	Effect Of Two Different Precursors On Photocatalytic Activity Of Zinc Oxide Synthesized By Green Synthesis Method Using Myrtus Communis Extract	89
Madhavan Madheswaran Shobana Babu Pandiaraja Duraisamy Prakash Periakaruppan	Picomolar-range Voltammetric Sensing of an Antipsychotic Drug: Experimentation, Deterministic and Stochastic Simulation Approach	90

Shivani Yadav D.K Chauhan Ruhi Tomar	Ameliorative Role Of Dietary Supplements On Biochemical And Hematological Parameters Of Albino Rats Intoxicated With Cadmium Chloride	91
R. Mary Nancy Flora R. Selvaraj S. Palani M. Ramya M. Chamundeeswari	Toxicity Optimization Of Green Zinc Oxide Quantum Dots In Zebrafish Using Box-Behnken Design: A Novel Approach For Safer Nanoparticle Synthesis	92
Ömer Erbasan	Views of Primary School Teachers on Instruction in Writing Informative Text	93
Ali Güngör	Views of İmam Hatip High School Vocational Course Teachers on Vocational Competitions	94
Sara Lebrazi Mouhcine Fadil Marwa Chraibi Kawtar Fikri Benbrahim	Phenotypic, Molecular, And Symbiotic Characterization of The Rhizobial Symbionts of Acacia Cyanophylla Grown In Different Regions In Morocco: Multivariate Approach	96
Amalia Călinescu	The Concept of Time: An Integrative Overview	97
Syed Misbahul Hasan Shom Prakash Kushwaha Ahsan Ahmed Khan Kuldeep Singh	Ingenious Possessions of Arylidene-2,4-Thiazolidinedione	98
Konul Salmanova	Azərbaycan Və Türk Dilində Birinci Növ Təyini Söz Birləşmələrində Müəyyənlik Və Qeyri-Müəyyənlik Anlayışı	99
Nazan Gökşen Tosun	Exploring Dual Treatment Impact: Curcumin And Sta-9090 in Breast Cancer Cells	100
Rukiye Türk Delibalta Arzu Karabağ Aydın Tuğçe Sönmez Zehra Çoktay	Investigation Of The Effect Of Death Anxiety On The Life Satisfaction Of Individuals Living In The Earthquake Zone In Turkey: The Disaster Of The Century	101
Adedayo, O.A Otaru, M.O. Adekunle T.S. Ugwu, U.C, Muhammed, I., Job. O.S., Musa O.I.	Mathematical Model For Determining The Influence Of Treatment And Vaccination On Measles	102
Taiba Akter Laboni Taslima Khatun Shahinur Khatun Ashekur Rahman Nur-E-Farjana Ilah Obaidur Rahman Amirul Islam Tarek Rahman Likhon Yeamin Hossain	Impact of the COVID-19 Pandemic on the Economic Livelihoods of the Fisheries Community: A Case Study of Saganna Baor Fisheries	104
Salako, Oluwaseun Adewale Bamiro, Tolulope Oluwatosin	E-Governance And Quality Service Delivery In Nigerian Local Governments (A Study Of Yewa South Local Government)	106
El Qadmi, I., Ziri R., Akhrif, F., Abid, N., Brhadda, N.	pH Effect on Enhancing In Vitro Germination, Rooting and Elongation Capacities of Four Argan (Argania spinosa) Genotypes	107

Tülay Tunçay İlhami Bayramın Oğuz Başkan Orhan Dengiz Şeref Kiliç	Bulk Density Estimation Using Random Forest Techniques: A Case Study On Xeric Petrocalcic And Xeric Haplocambid Soils in Semiarid Region	108
Sevim Akçura Ramazan Çakmakçı	Investigation Of The Effects Of Plant Growth-Promoting Bacteria And Hormone Applications On Seed And Oil Yield in Black Cumin	110
Sevim Akçura Ramazan Çakmakçı	Effects Of Plant Growth-Promoting Bacteria And Hormone Applications On Plant Tarits in Black Cumin	112
Ehtisham Umar Ali Haider Iram Shahzadi Muhammad Ikram	In-vitro Synergistic Microbicidal And Catalytic Evaluation Of Polyvinylpyrrolidone/Chitosan Doped Tungsten Trioxide Nanoplates With Evidential In-Silico Analysis	114
Ahmad Fauzi Ita Rodiah	Understanding of Outcome-Based Education Practices in Higher Education	115
James, Tolulope. O Onwuka, G.I. Usman Bello	Risk Factors Associated With Hepatitis B Infection	116
Atanas Boyukliev Emanuela Vasileva Velichka Zlatareva Lyboslav Dimov Stefka Vladeva	Insulin-Induced Lipohypertrophy in A Patient With Diabetes Type 1 Treated With Insulin Analogues: A Case Report. Out Of Date Or Tenacious Complication?	117
Neeraj Kumar Rathore Shubhangi Pande Anuradha Purohit	A Novel Real-Time Multiple Object Tracking Based on Extreme Learning Machine	119
Neeraj Kumar Rathore	Exploring Data Structures and Algorithms: Analysis of Fundamentals and Applications	120
Haktan Dursun	From the Perspective of Newspaper Analysis and After the July 15 Coup Attempt	121
Mevlüt Tatlıyer	What Workers Want And What Actually Happens: Usual And Preferred Working Hours	123
Şule Bakirci Er Güldeniz Zehir Salar Hamdi Özbal	Effects Of Earthquake Motion Levels On Structural Behavior	124
Klodiana Spahiu Gentian Vyshka	Pregnancy and Aortic Pathology, Caveats and Precautions	125
Oualid Rholam	Inequalities For Log-H-Convex Stochastic Process	126
Oya Eralp Inan	Thromboelastographic Evaluation of Coagulation In Farm Animals And Its Clinical Use	127
Seda Arıkan Zehra Korkmaz Fatma Akbay Mustafa Kızıllımsık	Impact on Yield And Quality Of Different Rates Of Cultivation of Certain Wheat Crops With Fodder Pea In Eastern Mediterranean Conditions	128
Hassan Aliyu Abdulrashid Abubakar Garba	Reliability Of Phet Interactive Simulation in Delivering Robust Virtual Instructions To Facilitate Learning Of Abstract Submacroscopic Chemical Processes	130
Rushikesh Rajesh Patil	Life Saving Combined Antibiotics Therapy For Infected Injuries: Case Report	131
Maryam Anwar Safiullah Khan	Design And Evaluation Of Sustained-Release Lipid-PLGA Hybrid Nanoparticles For Enhanced Anticancer Efficacy Of 5-Fluorouracil	132

Namik Kemal Haspolat	Ethical Dilemma, Models, And Solution Process in Psychological Counseling	133

ÖZET

Kolorektal kanser, dünya çapında en yaygın görülen üçüncü kanser türüdür; 2020 yılında yaklaşık 2 milyon vaka teşhis edilmiştir. Kansere bağlı ölümlerin ikinci en yaygın nedenidir ve yılda yaklaşık 1 milyon ölüme yol açmaktadır. Hastalığın lokalizasyonuna ve evrelerine bağlı olarak tedavi protokolünde; cerrahi müdahale, radyoterapi ve kemoterapi gibi uygulamalar bulunmaktadır. Tedavide kemoterapi önemli bir role sahip olmakla birlikte kesin bir tedavi yöntemi henüz geliştirilmemiştir. Nanopartiküler sistemler kontrol edilebilir partikül boyutu, yüzey işlevselliği, yüksek enkapsülasyon etkinliği, çok sayıda terapötik ajanın yüklenebilme özelliği, modifiye edilebilen salım profili ve yüksek stabilitesi gibi çok sayıda avantajları ile kolorektal kanser tedavisinde yeni tedavi yaklaşımlarından biri olarak tanımlanmaktadır. Yeni etkin madde keşfinin zorlukları, farklı kanser türlerini tedavi etmek için yeni ve alternatif stratejilerin keşfetme ihtiyacını ortaya koymaktadır. Mevcut ilaçların endikasyonlarını bir terapötik alandan diğer hastalıkların tedavisini içerecek şekilde başka bir terapötik alana dönüştürme stratejisi, bir diğer tedavi yaklaşımıdır. Son yıllarda yapılan pre-klinik çalışmalar, selektif serotonin geri alım inhibitörleri grubu antidepressan olan paroksetinin kanser hücreleri üzerinde sitotoksik etkilere neden olduğu, kemoterapötik ilaçlarla kombine kullanımlarında sinerjik etki gösterdiği yönündedir. Kemoterapötik ilaçlara direnç geliştirmiş hücrelerde eş zamanlı kullanıldığında ilaç direncini azalttığı ve sitotoksitesiteyi artırdığı bildirilmiştir. Tüm bu bilgilerin ışığında bu çalışmada, kolorektal kanserin ileri evrelerinin tedavisinde kullanılan kemoterapötik ajanların etkinliğini artırmak amacıyla model etkin madde olarak seçilen paroksetin yüklü polimerik nanopartikül formulasyonunun hazırlanması ve hazırlanan formulasyonların in vitro özelliklerin değerlendirilmesi amacıyla nanopartiküllerin partikül büyüklüğü ve dağılımı, yüzey yükü, paroksetinin enkapsülasyon etkinliği ve in vitro etkin madde çıkış tayini ve stabilite çalışmaları gerçekleştirilmiştir.

Anahtar Kelimeler: Kolorektal Kanser, Paroksetin, SSRI, Nanopartikül, İlaç Taşıyıcı Sistem

**DEVELOPMENT AND EVALUATION OF NANOPARTICULATE DRUG
DELIVERY SYSTEM FOR THE TREATMENT OF COLORECTAL CANCER**

ABSTRACT

Colorectal cancer is the third most common cancer worldwide, with nearly 2 million cases diagnosed in 2020. It is the second most common cause of cancer-related deaths, accounting for approximately 1 million deaths annually. Depending on the localization and stages of the disease, the treatment protocol includes surgery, radiotherapy and chemotherapy. Although chemotherapy has an important role in treatment, a definitive treatment method has not yet been developed. Nanoparticulate systems are defined as one of the new therapeutic approaches in the treatment of colorectal cancer with its many advantages such as controllable particle size, surface functionality, high encapsulation efficiency, loading ability of many therapeutic agents, modifiable release profile and high stability. The challenges of new drug discovery reveal the need to explore new and alternative strategies to treat different types of cancer. Another therapeutic approach is the strategy of transforming the indications of existing drugs from one therapeutic area to another to include the treatment of other diseases. Recent pre-clinical studies suggest that paroxetine, an selective serotonin reuptake inhibitor antidepressant, causes cytotoxic effects on cancer cells and shows synergistic effects when used in combination with chemotherapeutic drugs. It has been reported to decrease drug resistance and increase cytotoxicity when used simultaneously in cells that have developed resistance to chemotherapeutic drugs. Based on these informations, in this study, the polymeric nanoparticle formulations loaded with paroxetine, which was selected as a model active substance prepared in order to increase the efficacy of chemotherapeutic agents used in the treatment of advanced stages of colorectal cancer. The in vitro characterization studies were carried out in order to evaluate the physicochemical properties of the prepared nanoparticles such as particle size and distribution, surface charge, encapsulation efficiency of paroxetine, in vitro drug release and stability.

ABSTRACT

The biodiesel or diester sector uses the constituents of fatty substances present in vegetable oils as fuel. Vegetable oils are treated to provide vegetable oil methyl esters (VOME) whose combustion characteristics are close to fuel oil. The vegetable oils mainly used as raw materials are in Europe: sunflower soy rapeseed oil. Biofuels are incorporated from 5% to 30% in fuel oil for use in diesel engines. Esters formed by esterification of fatty acids are used in cosmetics, in pharmaceuticals, in industrial lubricants This type of reaction corresponds to an equilibrium: reaction occurring in both directions and limiting each other. Ag/SBA-15 is a hybrid material composed of silver nanoparticles (Ag) supported on SBA-15, a mesoporous silica with a high surface area and tunable pore size. This catalyst has been widely studied for its potential applications in various fields, including catalysis, sensing, and drug delivery. We synthesized our catalyst by different methods (direct synthesis and post synthesis) we tested our synthesized materials as catalysts in esterification reactions of fatty acids which is a natural molecule and characterize by DRX ; FTIR

Keywords: Ag/SBA15, esterification, fatty acids, biodiesel

ABSTRACT

Triazoloquinazoline is a versatile heterocyclic ring system, known for its several pharmacological applications. Its derivatives have displayed anti-inflammatory, anticancer, antimicrobial, antihypertensive, antiviral, anticonvulsant, antioxidant, and antidiabetic activities. Hence, this privileged scaffold could act as an important candidate in the field of drug development. A range of synthetic routes have been devised and reported by synthetic chemists to efficiently synthesize this impressive heterocycle along with its structural modifications at its various sites. This fused ring system exists in various isomeric forms such as, 1,2,4-triazolo[4,3-*c*]quinazoline, 1,2,4-triazolo[1,5-*c*]quinazoline, 1,2,4-triazolo[4,3-*a*]quinazoline, 1,2,4-triazolo[1,5-*a*]quinazoline etc. This oral presentation will cover various methodologies for triazoloquinazoline as well as their biological activities.

ABSTRACT

Human peripheral blood mononuclear cells (PBMCs) are routinely isolated from whole blood samples and used for several studies of research including autoimmune diseases, immune system disorders, cancers, transplantations. PBMCs include immune systems cells that produce cytokines. PBMCs express significant amount of cytokines particularly after stimulation. The aim of this study is to investigate effect of Phytohemagglutinin (PHA) stimulation in PBMCs. In our project, the PBMC isolated from healthy donors were stimulated by PHA and investigated cytokines levels by flow cytometry. PBMCs from healthy donors were stimulated with PHA for 6, 12, 24, 72 h with different concentrations (5 µg/ml and 10 µg/ml) in vitro. Before and after PHA stimulation, the intracellular cytokines levels of Interleukin-4 (IL-4), Interferon-γ (IFN-γ), and Interleukin-17A (IL-17A) were determined by flow cytometry. We found the similar increase level in IL-4 when the unstimulated and stimulated groups were compared. Each of the concentrations of PHA with 6 and 12 h activation were not significant change for the cytokine levels. However, in 6 h, IL-17 and IFN-γ intracellular cytokine levels were decreased compared to the unstimulated group. We found that IL-4, IFN-γ and IL-17 intracellular cytokine productions were the most significant when stimulated with 10 µg/ml

PHA for 72 hours. We suggest that the stimulation incubation time and dose of cell stimuli should be tested with preliminary studies to determine the optimum values in order to obtain more accurate analyzes for cell activation studies with PHA.

ÖZET

Giriş: Situs inversus totalis (SİT) anomalisi, vücut organlarının normal yerleşim düzeninin ayna görüntüsü şeklinde ters olduğu bir genetik varyasyondur. Akut apandisit ise apendiksin inflamasyonu sonucu ortaya çıkan ve acil tedavi edilmesi gereken bir durumdur. Normalde akut apandisit ağrısı batın sağ alt kadranda lokalize olurken, SİT’de bu ağrı sol alt kadranda olmaktadır. Dolayısı bu anomaliden etkilenen hastalarda, apandisit gibi rahatsızlıkların gelişmesi durumunda tanı ve tedavi süreçlerinde zorluklar yaşanabilir. Özellikle daha önceden SİT tanısı almamış hastalarda bu durum yanlış tanı veya tanı gecikmesine yol açabilmektedir. Bu çalışma, daha önceden SİT tanısı almamış bir hastada gelişen akut apandisit olgusunun tanı ve tedavi süreçlerini literatür eşliğinde tartışmayı amaçladık. **Olgu:** Sol tarafında karın ağrısı nedeniyle acil servise başvuran 13 yaş erkek hastanın yapılan fizik muayenesinde sol alt kadranda hassasiyet, rebound ve defans saptandı. Hikayesinde 2 gün öncede acil servise başvurduğu ancak lavman tedavisi ve önerilerle taburcu edildiği saptandı. Hastanın kusması yok, iştahı yok, bir kaç kez ishal şeklinde hayta çıkışı mevcuttu. Yapılan ultrasonografide sol alt kadranda inflame tübüler yapı saptanması üzerine çekilen akciğer ve batın röntgeninde SİT varlığından şüphelenildi. Hastanın ekokardiografisinde, kardiyak apeksin sağa doğru yerleşimli olduğu saptandı. Hastaya SİT ve akut apandisit teşhisi konularak opere edildi. Sol alt akdrandan yapılan insizyonla opere edildi (Resim). Apendiks patolojisi akut apandisit ile uyumlu olarak raporlandı. **Sonuç:** Sol alt kadranda ağrısı ile başvuran hastalarda fizik muayene bulguları akut apandisiti düşündürüyorsa SİT düşünülmelidir. Ayırıcı tanı açısından röntgen, ultrasonografi ve bilgisayarlı tomografi kullanılabilir. Acil müdahale gerektiren patolojilerin fizik muayene bulguları olması gereken lokalizasyonun dışında ise SİT açısından değerlendirilmelidir.

COEXISTENCE OF SITUS INVERSUS TOTALIS AND ACUTE APPENDICITIS

ABSTRACT

Introduction: Situs inversus totalis (SIT) anomaly is a genetic variation where the normal arrangement of the body organs is reversed, resembling a mirror image. Acute appendicitis, on the other hand, is a condition that arises from the inflammation of the appendix, requiring urgent treatment. While the pain of acute appendicitis is typically localized in the lower right quadrant of the abdomen, in SIT, this pain is situated in the lower left quadrant. Consequently, individuals affected by this anomaly may encounter difficulties in the diagnosis and treatment processes when conditions such as appendicitis develop. Particularly in individuals who have not previously been diagnosed with SIT, this situation can lead to misdiagnosis or delayed diagnosis. This study aims to discuss the diagnosis and treatment processes of a case of acute appendicitis in a patient who had not previously been diagnosed with SIT, in accordance with the existing literature. **Case:** A 13-year-old male patient presented to the emergency department due to left-sided abdominal pain. During the physical examination, tenderness, rebound tenderness, and guarding were observed in the lower left quadrant. His history revealed that he had visited the emergency department two days prior, where he was discharged after receiving enema treatment and recommendations. The patient reported no vomiting, loss of appetite, and had experienced several episodes of diarrhea. An ultrasound examination revealed the presence of inflamed tubular structures in the lower left quadrant, prompting suspicion of Situs Inversus Totalis (SIT). Chest and abdominal X-rays were taken, confirming the presence of SIT. Echocardiography showed that the cardiac apex was positioned to the right. The patient was diagnosed with SIT and acute appendicitis, leading to surgical intervention. The operation was performed through an incision in the lower left quadrant (image). The pathology report indicated findings consistent with acute appendicitis. **Conclusion:** In patients presenting with lower left quadrant pain and physical examination findings suggestive of acute appendicitis, Situs Inversus Totalis (SIT) should be considered. For differential diagnosis, X-rays, ultrasound, and computed tomography can be utilized. If the physical examination findings indicate pathologies requiring emergency intervention that are outside the expected localization, evaluation for SIT should be considered.

ÖZET

Bu çalışmanın amacı, antienflamatuvar ve analjezik etkileri olan flurbiprofenin (FLU) suda çözünürlüğünü arttırmak, deneysel tasarım yaklaşımıyla oral parçalanabilir tablet (ODT) formülasyonları hazırlamaktır. FLU'nun sudaki çözünürlüğünün çok düşük olması nedeniyle, beta-siklodekstrin (β -CD) içeren bir FLU inklüzyon kompleksi hazırlandı. Üç farklı FLU: β -CD oranı (1:1, 1:2 ve 1:3) kullanılarak hazırlanan komplekslerde en yüksek çözünürlük artışı 1:3 FLU: β -CD inklüzyon komplekslerinden elde edildi. Bu nedenle ODT'ler bu oran ile hazırlanan inklüzyon kompleksi kullanılarak doğrudan sıkıştırma yöntemiyle hazırlandı. Hazırlanan ODT'leri optimize etmek için Box-Behnken deney tasarımı kullanıldı. Tasarıma göre, bağımsız değişkenler manitol % (X1), Parteck ODT % (X2) ve magnezyum stearat % (X3) iken dağılım süresi (s) (Y1), sertlik (N) (Y2) ve ufalanabilirlik idi. (%) (Y3) değerleri bağımlı değişken olarak belirlendi. Optimize edilmiş üç ODT formülasyonunun sertlik ve ufalanabilirlik değerleri sırasıyla %35.7 N/0.28, %32.5 N/0.25 ve %36.8 N/0.32 olarak belirlendi. Tüm optimize edilmiş formülasyonlar, bir dakikadan daha kısa bir parçalanma süresine sahipti. Optimize edilmiş ODT'lerin çözünme profilleri pH 6.8'de belirlendi ve 15 dakika sonra maksimum çözülmüş FLU miktarına ulaştığı bulundu. Sonuç olarak, FLU- β -CD içerme kompleksi ile ODT'lerin yeni formülasyonu, Box-Behnken deneysel tasarımı kullanılarak başarıyla geliştirilmiştir.

Anahtar Kelimeler: Flurbiprofen, β -CD, Box-Behnken deney tasarımı, ODT

IN VITRO EVALUATION OF FLURBIPROFEN ODTs PREPARED WITH BOX-BEHNKEN EXPERIMENTAL DESIGN

ABSTRACT

The aim of this study is to increase the water solubility of flurbiprofen (FLU), which has anti-inflammatory and analgesic effects, to prepare orally disintegrating tablet (ODT) formulations with an experimental design approach. Due to the very low solubility of FLU in water, an inclusion complex of FLU with beta-cyclodextrin (β -CD) was prepared. In complexes prepared using three different FLU: β -CD ratios (1:1, 1:2, and 1:3), the highest solubility increase was obtained from the 1:3 FLU: β -CD inclusion complexes. Therefore, ODTs were prepared by the direct compression method using the inclusion complex prepared with this ratio. Box-Behnken experimental design was used to optimize the prepared ODTs. According to design, the independent variables were mannitol % (X1), Parteck ODT % (X2), and magnesium stearate % (X3), while the disintegration time (s) (Y1), hardness (N) (Y2), and friability (%) (Y3) values of ODTs were determined as dependent variables. The hardness and friability values of the three optimized ODT formulations were determined as 35.7 N/0.28%, 32.5 N/0.25%, and 36.8 N/0.32%, respectively. All optimized formulations had a disintegration time of less than one minute. Dissolution profiles of optimized ODTs were determined at pH 6.8 and found to reach the maximum amount of dissolved FLU after 15 minutes. As a conclusion, the novel formulation of ODTs with FLU- β -CD inclusion complex was successfully developed using Box-Behnken experimental design.

ÖZET

İnme ölümcül olmaktan çok sakat bırakıcıdır ve inmeden kurtulanların tekrarlama riski yüksektir; bu nedenle, esasen motor ve bilişsel rehabilitasyon sağlayan multidisipliner yönetime dayanan terapötik yönlere bakmaya olan ilgi artmaktadır. Günümüzde, doğal ürünlerin geliştirilmesi ve serebral iskeminin nüksetmesini önlemeye gösterilen ilgi, düşük riskli, maliyet etkin ve kolay bir tedavi yöntemi olan tamamlayıcı tıbbi yeni bir soluk getirmektedir; aromaterapi, demansın davranışsal ve psikolojik semptomlarını yönetmek, bilişsel işlevi iyileştirmek, yaşam kalitesini artırmak ve günlük yaşam aktivitelerinde bağımsızlığı geliştirmek için etkili bir tedaviyi temsil eden dallarından biridir. Bitkisel ilaçlar inme öncesi ve sonrası önlemede rol oynar. Geleneksel tedaviye yardımcı olabilir, ancak bitkilerin ve özlerinin bu katkısı serebral sistemin kendisi üzerinde etkili olabilir. Bu nedenle, çalışmamızın amacı, Wistar sıçanlarında orta serebral arterin tıkanmasıyla cerrahi olarak oluşturulan iskemik inme indüksiyonunda, gallik asit ve lavanta esansiyel yağının ayrı ayrı etkilerini ve ardından profilaktik tedavi olarak (gastrik gavaj yoluyla) sırasıyla 100 mg/kg ve 200 mg/kg dozlarında alınan ikisinin kombinasyonunu değerlendirmektir. Bu erdemler, anksiyete, keşif ve yaralı hastaların motor becerileri ölçülerek davranışsal düzeyde ve inme sonrası sıçanlarda hafıza ve keşif becerileri değerlendirilerek bilişsel düzeyde ölçülmüştür. Bu çalışmanın amacı hem inme sonrası görünmez engelliliği tanımlamak hem de gallik asit ve HEL ile ön tedavinin bilişsel rehabilitasyon üzerindeki etkisini değerlendirmektir.

Anahtar Kelimeler: İnme, Gallik asit, Gerçek lavanta esansiyel yağı, Wistar sıçan, bilişsel rehabilitasyon

**EFFECT OF GALLIC ACID AND LAVENDER ESSENTIAL OIL TAKEN
SEPARATELY AND/OR COMBINED ON COGNITIVE AND BEHAVIOURAL
ABILITIES OF POST-STROKE MALE WISTAR RATS**

ABSTRACT

Stroke is more often incapacitating than fatal, and stroke survivors have a high risk of recurrence; hence the interest in looking at the therapeutic aspects, which are essentially based on multidisciplinary management enabling motor and cognitive rehabilitation. At present, the development of natural products and the interest shown in preventing recurrences of cerebral ischaemia are giving a new lease of life to complementary medicine, which is a low-risk, cost-effective and easy therapeutic method with trivial side-effects, aromatherapy being one of its branches, representing an effective treatment for managing the behavioural and psychological symptoms of dementia, improving cognitive function, enhancing quality of life and improving independence in the activities of daily living. Herbal medicine plays a role in pre-stroke and post-stroke prevention. It can be an adjunct to conventional treatment, but this contribution of plants and their extracts can act on the cerebral system itself. For this reason, the aim of our study is to evaluate the separate effects of gallic acid and lavender essential oil, and then the combination of the two taken as prophylactic treatment (by gastric gavage) at doses of 100 mg/kg and 200 mg/kg respectively, in the induction of ischaemic stroke, surgically produced by occlusion of the middle cerebral artery in Wistar rats. These virtues were quantified at the behavioural level by measuring anxiety, exploration and the motor skills of injured patients, and at the cognitive level by assessing memory and exploration skills in post-stroke rats. The aim of this study was both to identify the invisible disability after stroke and to assess the impact of pretreatment with gallic acid and HEL on cognitive rehabilitation.

ABSTRACT

Background It is increasingly believed that the interaction between skin microbes and host immunity plays an important role in acne. Acne also has close connections with the gastrointestinal tract, and many argue that the gut microbiota could be involved in the pathogenic process of acne. The emotions of stress, have been hypothesized to aggravate acne by altering the gut microbiota. The presence of a gut-brain-skin axis that connects gut microbes, oral probiotics, and diet, currently an area of intense scrutiny, to acne severity. This study concentrates on the skin and gut microbes in acne, the role that the gut-brain-skin axis plays in the immunobiology of acne, and newly emerging microbiome-based therapies that can be applied to treat acne. **Objective** The purpose of this study was to compare the diversity of the skin microbiota in acne patients before and after taking Polenoderm. **Materials and methods** A longitudinal cohort study was performed on 20 participants with moderate to severe facial acne with no recent use of oral and topical antibiotics/retinoids. **Results** Hence, it is crucial to understand Polenoderm impact on the acne skin microbiota which is thought to be perturbed, our study provides insight into the skin microbiota in acne and how it is modulated by Polenoderm and diet. **Conclusion** Acne also has close connections with the gastrointestinal tract, and many argue that the gut microbiota could be involved in the pathogenic process of acne. As understanding of the microbiome in healthy skin and the pathophysiology of acne continues to develop, new therapeutic targets are arising.

ÖZET

Batı Anadolu’da yer alan Uşak Neojen havzalarının doğu bölümünde bulunan Karahallı-Çivril Neojen havzası, jeolojik özellikleri ve kömür ile jeotermal enerji potansiyeli açısından büyük öneme sahiptir. Havza, Menderes Masifinin metamorfik kayaları üzerinde gelişmiş ve akarsu ile göl ortamlarında çökelmiş sedimanlardan oluşmaktadır. Bu çalışmada, havzanın litolojisi, stratigrafisi ve mineralojisi belirlemek amacıyla sondaj verileri, X-ışını floresans (XRF) analizi, X-ışını difraksiyonu (XRD) analizi ve termal analiz yöntemleri kullanılmıştır. Yapılan çalışmalar sonucunda havzada 0.5-1 m kalınlığında, 10-15 km uzunluğunda ve 4500-7500 kcal/kg kalorifik değerinde ince kömür damarları tespit edilmiştir; ancak ekonomik değerde kömür rezervleri bulunmamaktadır. Havzanın sedimanlardan oluşan kayalarının mineralojisinde dolomit, kalsit, anhidrit ve alçı baskın mineraller olarak gözlemlenmiştir. Bu mineralojik bileşim, havzanın kurak ve yarı kurak iklim koşullarında geliştiğine işaret etmektedir. Ayrıca, havzanın jeotermal enerji potansiyeli, yeraltı suyu kaynakları ve doğal afet riskleri gibi konularda da jeotermal sıcaklık dağılımı, hidrojeolojik özellikler ve tektonik aktivite gibi önemli veriler sunulmuştur. Bu araştırma, bölgenin jeolojik yapısı ve ekonomik potansiyeli üzerinde önemli bir temel oluştururken aynı zamanda diğer Batı Anadolu Neojen havzalarının benzer şekilde değerlendirilmesi için bir örnek teşkil etmektedir. Karahallı-Çivril Neojen havzası, Türkiye’nin enerji ve madencilik sektörleri için gelecekteki planlamalarda ve jeolojik araştırmalarda dikkate alınması gereken önemli bir potansiyele sahiptir.

**KARAHALLI-ÇIVRIL NEOGENE BASIN:
COAL RESERVES AND GEOTHERMAL ENERGY OPPORTUNITIES**

ABSTRACT

The Karahallı-Çivril Neogene Basin, located in the eastern part of the Uşak Neogene basins in Western Anatolia, holds significant geological characteristics and potential for coal and geothermal energy. The basin is formed by sedimentary rocks that developed on the metamorphic rocks of the Menderes Massif and accumulated in fluvial and lacustrine environments. In this study, drilling data, X-ray fluorescence (XRF) analysis, X-ray diffraction (XRD) analysis, and thermal analysis methods were employed to determine the lithology, stratigraphy, and mineralogy of the basin. The investigations revealed the presence of thin coal seams with a thickness of 0.5-1 m, a length of 10-15 km, and a calorific value of 4500-7500 kcal/kg; however, no economically viable coal reserves were identified. The dominant minerals in the sedimentary rocks of the basin were dolomite, calcite, anhydrite, and gypsum. This mineralogical composition indicates the development of the basin under arid and semi-arid climatic conditions. Furthermore, important data on geothermal energy potential, groundwater resources, and natural hazard risks, including geothermal temperature distribution, hydrogeological characteristics, and tectonic activity, were provided. This research establishes a solid foundation for understanding the geological structure and economic potential of the region and serves as a valuable example for the assessment of other Neogene basins in Western Anatolia. The Karahallı-Çivril Neogene Basin holds significant potential for Turkey's energy and mining sectors and should be considered in future planning and geological research endeavors.

Keywords: Karahallı-Çivril Neogene Basin, coal potential, geothermal energy potential, mineralogy, Western Anatolia

ANALYSES OF VOLATILE COMPOUNDS FROM WINE VINEGAR

ABSTRACT

Jerez vinegar, a wine-vinegar, is one of the most famous oenological products of this type in Central European and Mediterranean countries. “Vinagre of Jerez” is produced under the umbrella of the European Union with a legislative system called Protected Designation of Origin (PDO). The objective of the present study was to analyse and evaluate the volatile compound diversity of four Vinegar of Jerez samples aged in oak barrels in different periods. The samples analysed in the present study are as follows: (i) non-aged, (ii) *crianza* (aged at least six months), (iii) *reserva* (aged minimum two years), and (iv) *gran reserva* (aged more than 10 years). In this context, volatile compounds of the samples were analysed by using Gas Chromatography (GC-2030)-Mass Spectrometer (GCMS-TQ8040 NX, Shimadzu) coupled with Head space solid-phase microextraction (HS-SPME) technique. Separation and identification of the analytes was performed by InertCap Pure-WAX (30 m × 0.25 mm × 0.25 µm) capillary columns. With these analyses, seven major chemical families of volatile compounds were identified for the Jerez vinegar samples, which are esters, alcohols, acids, aldehydes, ketones, lactones, and phenolic compounds. Esters were found the main chemical family among these groups for all samples, with contents being 214.1, 115.1, 117.2, and 170.4 mg L⁻¹ for non-aged, *crianza*, *reserva*, and *gran reserva* “Jerez” vinegars, respectively. Depending on the aging time, a decrease in the amount of aldehydes (from 3.56 to 1.42 mg L⁻¹ and acids (from 661 to 364.2 mg L⁻¹) was detected. On the other hand, a remarkable decrease was observed in total volatile compounds contents of the samples with the prolongation of the aging period. As a conclusion, it was revealed that there was a significant change in volatile compounds depending on the different aging times of the samples.

ABSTRACT

Drying is one of the oldest food preservation methods. Conventional drying methods (e.g. conventional hot air drying) are the most used drying methods for the drying of many foods and agricultural products. However, these methods possess several drawbacks such as longer drying time and lower product quality. Radio frequency heating, also known as dielectric-heating, is an innovative and fast heating method due to volumetric heating. Because, in radio frequency drying, heat is generated within the products it is highly unique and rapid technique compared to conventional drying methods. Recently, a lot of work has been carried out on radio frequency drying. In most of these studies, radio frequency heating is not used alone, but combined with forced hot air or vacuum system. This is due to radio frequency heating alone causing to non-uniform heating and, in some cases, thermal runaway heating. The studies in the literature have been presented that the combination of radio frequency drying with conventional drying methods such as hot air or vacuum drying enhanced drying uniformity and provided better product quality. Radio frequency drying conditions (e.g. electrode gap, sample thickness, sample weight) highly affect the drying characteristics of the sample. The main aim of this review is to evaluate radio frequency drying systems in terms of drying characteristics of foods and agricultural products.

ABSTRACT

The current study deals with the in-service teacher training from the perspective of experienced teachers of English. To this end, it is concerned with studying Algerian middle school EFL teachers' perspectives towards their needs in terms of training; especially after integrating English as a foreign language at the level of primary school since September 2022. In order to get clearer insight about the phenomenon, the researchers have adopted a qualitative research whereby a semi-structured interview was administered to 15 EFL teachers from different middle schools in Algeria. The collected data was analysed through a descriptive analysis, which involved MAXQDA software based on thematic approach. After the analysis, the findings show that teachers are perplexed with the ongoing changes in the English syllabus where continuous development is called for. The study provided a clear understanding of the teachers' standpoint vis-à-vis in-service training and the aspects that require more improvement such as classroom management, integrating ICTs, and lesson design.

ABSTRACT

Estimation of global solar radiation using five sunshine hour models in Ilorin, north-central, Nigeria (8.54°N, 4.54°E) was developed using the Angstrom type regression equation. The solar radiation (W/m^2), hours of bright sunshine were collected from achieve of Nigeria Metrological Centre, Oshodi, Lagos, for a period from (1992-2022). The constants of the Angstrom-type regression equation (Models) were determined by plotting the clearness index (H/H_0) against the fraction of sunshine hours (n/N) to obtain the line of best fit. The result of the correlation were also tested for error using statistic test methods of the mean biased error, MBE, root mean square error, RMSE, and mean percentage error, MPE to assess the performance of the models. It was observed that out of all models used, modes III and IV gave the best prediction for global solar radiation using sunshine.

ABSTRACT

Protecting the environment, including surface waterways, is one of the pillars of sustainable development, which represents a major challenge for the future of mankind and our planet. It is important to point out that Algeria is making great efforts to protect the environment and reduce chemical and biological pollution, well aware of the environmental and economic stakes involved in the problem of liquid waste. In fact, chemical substances are constantly being released into the environment, and can threaten the balance of aquatic ecosystems and human health. Consequently, to limit pollution, laws must be respected by setting standards for harmful substances discharged into water. This study's goal was to synthesize and construct biomaterials of the cationic and anionic types. These substances were utilized as adsorbents in waters that had been contaminated by various adsorbates that were probably prevalent in the environment. In order to describe the various materials, various approaches (IRTF, DRX, MEB, BET, and ATG/DTA) will be used. Studies on the adsorption by these substances will be conducted while

changing a number of variables, including pH, mass, concentration, and temperature. Removal of effluents in aqueous media, particularly the adsorption technique, which appears to be well suited to remove pollutants due to its shown efficacy as well as for financial reasons, using inexpensive adsorbents such agricultural and industrial wastes.

ABSTRACT

The present work, is about the dosage of the phenolic compounds of two Saharan plants, *Anvillea radiata* and *Astragalus armatus* and their insecticidal (*Aphis gossypii*) and microbial (*Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*., *Candida albicans*) effectiveness. The dosage of the total polyphenols and flavonoids is carried out by the method of Folin-Ciocalteu and $AlCl_3$ respectively, the phenol contents of *Anvillea radiata* ethanol = 91.06 ± 13.8 ., *Astragalus armatus* ethanol = 82.17 ± 10.8 , *Anvillea radiata* chloroforme = 24.17 ± 4.12 and *Astragalus armatus* chloroforme = $35.28 \pm 13.3 \mu\text{gEGA} / \text{mg DM}$. While the flavonoid contents remain low for all extracts (*Anvillea radiata* ethanol = 5.40 ± 2.8 , *Astragalus armatus* ethanol = 0.3125 ± 0.2 , *Anvillea radiata* chloroforme = 1.6 ± 0.6 and *Astragalus armatus*

chloroform = 0.312 ± 25.7 $\mu\text{g EGA} / \text{mg DM}$). Both chloroform and ethanolic extracts from *A. radiata* revealed antibacterial activity against *staphylococcus aureus* bacilli, with zones of inhibition of 10 ± 2.6 mm and 16.5 ± 2.1 mm respectively, on the other hand the four extracts of the two plants showed an insecticidal effect for the three doses.

ÖZET

Bu çalışmada, 2023 İlkbaharında Erzincan ili, Fırat Nehri'nden yakalanan *Capoeta umbla*'nın boy-ağırlık ilişkileri (LWRs), kondisyon faktörü (*K*) ve gonadosomatik indeks (GSI) değerleri incelenmiştir. Çalışmada toplam 30 (7 erkek, 23 dişi) *C. umbla* (Heckel, 1843) örneği incelenmiştir. Dişi/erkek oranı (D/E) 1/3.28 olarak belirlenmiştir. Ortalama toplam uzunluk (TL) erkeklerde 31.14 cm, dişilerde 35.04 cm'dir; toplam ağırlık (TW) erkeklerde 447.14 g ve dişilerde 533.48 g; *K* değeri erkeklerde 1.48 ve dişilerde 1.24 olarak belirlendi. *C. umbla*'nın tüm bireylerinde negatif allometrik büyüme saptanmıştır ($b < 3$). Cinsiyetler arasında *K* ($p = 0.015$) ve GSI ($p = 0.001$) değerleri ($p < 0.005$) açısından istatistiksel olarak anlamlı fark vardı. GSI, *C. umbla*'nın yumurtalıklarında Mayıs (17.48 g) ve testislerinde en yüksek değere Nisan (1.32 g) aylarında ulaşmıştır. *C. umbla*'nın gonadosomatik indeksi, ilkbahar mevsiminde yumurtlama için en önemli dönemin Mayıs ayı olduğunu göstermiştir.

Anahtar Kelimeler: *Capoeta umbla*, Negatif allometrik, D/E oranı, LWR, GSI

DETERMINATION OF THE LENGTH-WEIGHT RELATIONSHIP, CONDITION FACTOR, AND GONADOSOMATIC INDEX OF *CAPOETA UMBLA* (HECKEL, 1843) CAUGHT FROM EUPHRATES RIVER (ERZİNCAN, TÜRKİYE)

ABSTRACT

In this study, length-weight relationships (LWRs), condition factor (K) and gonadosomatic index (GSI) values of *Capoeta umbla* taken from Euphrates River in Erzincan province in Spring 2023 were investigated. A total of 30 (7 males, 23 females) *C. umbla* (Heckel, 1843) specimens were examined in the study. The female/male ratio (F/M) was determined to be 1/3.28. Average total length (TL) was 31.14 cm in males and 35.04 cm in females; total weights (TW) 447.14 g in males and 533.48 g in females; K was 1.48 in males and 1.24 in females. Growth was detected as negative allometric growth in all individuals of *C. umbla* ($b < 3$). There was statistically a significant difference between the genders in terms of K ($p = 0.015$) and GSI ($p = 0.001$) values ($p < 0.005$). GSI reached the highest value in May (17.48 g) for ovary and March (1.32 g) for testis *C. umbla* during the spring. Gonadosomatic indices of *C. umbla* showed that May was the most important for the spawning.

Keywords: *Capoeta umbla*, Negative allometric, F/M ratio, LWR, GSI

ABSTRACT

Food industry developing day by day like the other industry fields. New processes and food treatment were created to be able get better and productive and providing well food safety conditions for consumers. The basic condition should be preserve and save nature of food items and be able to make faster and safer productions with reducing costs including energy and less time during the production steps. Food industry includes kinds of scientific fields such as mechanic, computer, electronics, process and treatments with microbiology and food chemistry because of nutrition and health. Fruit and vegetable processing technology has witnessed significant developments in recent years due to the increasing demand for processed products, advances in preservation techniques, and the need to ensure quality and safety throughout the production process. The field of fruit and vegetable processing is dynamic and continually seeks innovative techniques to increase efficiency, product quality, and sustainability. This article provides an overview of some of the latest developments in fruit and vegetable processing, focusing on techniques that have emerged in recent years. It discusses various areas of innovation, including:- Preservation methods: high-pressure processing (HPP), pulsed electric field (PEF), active/smart packaging, high-intensity pulsed light (HIPL), bio-preservation techniques, etc. : freeze-drying, vacuum drying, infrared drying, vacuum impregnation, minimal processing, plant-based coatings, nanotechnology applications, electrostatic field-assisted separation, enzyme-assisted extraction, etc.- Automation and industry 4.0: robotics, artificial intelligence, and the Internet of Things (IoT), intelligent sorting and grading, precision agriculture and harvesting.- Quality control and traceability.- Waste valorization. In conclusion, the field of fruit and vegetable processing continues to witness advancements in innovative techniques aimed at improving efficiency, product quality, and sustainability.

**APPLICATION OF PROLINE AS PRE-SOWING SEED TREATMENT ON OKRA
UNDER WATER DEFICIT CONDITIONS**

Arshia ZIA

Department of Botany, University of Agriculture, Faisalabad

ABSTRACT

Okra (*Abelmoschus esculentus* L.) is a flowering plant belongs to Malvaceae family and it is one of the most well-known and frequently used species. A pot experiment was carried out at Old Botanical Garden, University of Agriculture, Faisalabad, to examine the effect of proline as pre-sowing seed treatment on okra. In the Pots, two okra (*Abelmoschus esculentus* L.) varieties i.e. Sabzpari and Roshni were used for sowing. There were 3 replicates of each treatment. Five kg soil was used in each pot. Okra seeds were pre-soaked in three levels of proline i.e. H₂O, 10 and 20 mM for 12 h to investigate the effect of proline. Two levels of drought (normal watering as control and 60% Field Capacity) were maintained. Experimental layout was completely randomized design (CRD). After 15 days maintaining of drought growth and biochemical related attributes were studied. Results indicated that morphological parameters (shoot length, plant length, shoot fresh and dry weight, root fresh and dry weight, plant fresh and dry weight) were decreased under drought stress. Proline implementation overcame drought effects by increasing these morphological parameters. Antioxidant activities i.e. catalase (CAT), superoxide dismutase (SOD) and peroxidase (POD) also enhanced under drought by the implementation of proline. While reactive oxygen species malondialdehyde (MDA) and hydrogen peroxide (H₂O₂) contents decreased by the application of proline. Mineral shoot ions (Na⁺, K⁺, Ca²⁺) showed positive role in okra plant by the application of proline. Roshni showed better performance than Sabzpari. Best response was recorded at 20 mM proline level.

ABSTRACT

Amorphous Eu_{0.8}Au_{0.2} alloy was prepared by liquid quenching with the piston-and-anvil technique. The magnetic properties were identified by exploiting the magnetization data. The magnetocaloric effect was evaluated by calculating the magnetic entropy changes ($-\Delta S_M$) from the magnetization data sets measured at various temperatures and applied magnetic fields. From the Arrott plots, it is found that the amorphous alloy exhibits a second-order magnetic transition from ferromagnetic to paramagnetic state at the Curie temperature $T_C=80$ K. The magnetic entropy change ΔS_M in the amorphous Eu_{0.8}Au_{0.2} alloy is found to be 4.6 J/K.kg under a magnetic field of 0–4 T with a large relative cooling power of 663.7 J/kg.

ABSTRACT

Foodborne illness occurs after consuming food contaminated by sufficient numbers of viable pathogens. It is a common and preventable occurrence that is of public health concern. The research aimed at isolating, identifying and studying the antibiotics sensitivity patterns of bacteria present in some foods sold at the Federal Polytechnic, Offa, Kwara State. Three (3) food samples namely (rice, beans and moi moi) were collected from three different canteens within the school premises. Isolation and identification of isolates were done by standard procedures. The antibiotic sensitivity of the isolates obtained from the food samples were also performed using standard microbiological procedures. Beans sample had the highest total heterotrophic, *Staphylococcus*, *Salmonella* and *Shigella* and coliform counts of $26.67 \pm 8.32 \times 10^5$ cfu/ml, $3.00 \pm 1.00 \times 10^5$ cfu/ml, $4.67 \pm 3.06 \times 10^5$ cfu/ml and $6.67 \pm 4.93 \times 10^5$ cfu/ml respectively. Moi moi sample had total heterotrophic count of $13.67 \pm 3.27 \times 10^5$ cfu/ml and rice sample had total heterotrophic count of $9.00 \pm 3.00 \times 10^5$ cfu/ml. The isolates were identified as *Enterococcus aerogenes*, *Proteus vulgaris*, *Citrobacter freundii*, *Escherichia coli*, *Bacillus* sp, *Staphylococcus aureus*, *Micrococcus luteus* and *Salmonella enterica*. *Proteus vulgaris* had the highest zone of inhibition of 15.00 mm with ciprofloxacin while all the isolates were resistant to rifampicin, zinnacef and streptomycin except *Bacillus* sp. It can be concluded that all food samples had considerable number of pathogenic bacteria and some were resistant to the antibiotics which can cause public health hazard.

Keywords: foodborne illness, pathogenic bacteria, food samples, antibiotics, antibiotics sensitivity.

ABSTRACT

The high demand for citric acid in diverse industries is increasing annually. Fruit peels which serve as wastes can be utilized as valuable substrates for cultivating fungi that can be used to produce citric acid through fermentation. The present study was conducted to isolate, identify and screen citric acid producing fungi from selected fruit peels. Orange, pawpaw and banana peels were obtained from Ipata market, Ilorin, Kwara State, Nigeria. They were rinsed, dried and pulverized. Submerged fermentation of the peels was carried out for 14 days to isolate naturally occurring fungi. The peels were fermented singly and combined as pawpaw and orange, pawpaw and banana and banana and orange. Isolation was done using pour plate method, identification was done using standard methods while screening for citric acid was done using Czapek-dox agar and bromocresol green as indicator. Highest fungal count was obtained from fermented pawpaw peels ($49.0 \pm 2.83 \times 10^3$ cfu/ml), while banana peels had ($43.00 \pm 0.71 \times 10^3$ cfu/ml) and orange peels ($40.50 \pm 0.71 \times 10^3$ cfu/ml). Fermented banana and orange peels had the highest fungal count of $60.50 \pm 1.41 \times 10^3$ cfu/ml, while fermented pawpaw and orange peels had a fungal count of $28.00 \pm 1.41 \times 10^3$. A total of five fungi were isolated and identified as *Aspergillus niger*, *Fusarium* sp, *Aspergillus flavus*, *Mucor* sp and *Penicillium* sp. Four of the fungal isolates screened positively with yellow halos surrounding the colonies except *Fusarium* sp. that screened negatively. *A. niger* had the highest zone of yellow coloration with a diameter of 41.00 mm, *Penicillium* sp. (33.00 mm), *Mucor* sp (29.00 mm) and *A. flavus* (18.00 mm). It can be concluded that orange, pawpaw and banana peels are potential substrates for cultivating citric acid producing fungi and *A. niger* screened best for citric acid production.

ABSTRACT

The conservation and protection of water and its resources has become an absolute necessity, due to the release of various toxic chemical compounds into nature by different industrial activities. Among these chemical compounds are fluorides, which are released into the environment through the weathering of fluorine-rich mineral rocks such as fluoroapatite. To remove fluoride from aqueous solution. In this work, chitosan in its non-crosslinked and epichlorohydrin-crosslinked form was synthesized. In order to obtain better adsorbents of natural origin for the removal of fluoride ions from a synthetic aqueous solution. Experiments were carried out in a batch reactor for both kinetics and adsorption isotherms. Several experimental parameters were taken into account, such as the effect of pH, adsorbent mass, initial fluoride ion concentration and contact time. The percentage removal of fluoride ions on chitosan cross-linked with epichlorohydrin was found to be higher than that obtained on non-cross-linked chitosan. Fluoride ion adsorption isotherms were studied. Test results show that adsorption occurs according to the Langmuir model and that adsorption kinetics follow the pseudo-first-order model.

Keywords: absorption; defluorination; chitosan; cross-linking; epichlorohydrin

ABSTRACT

Ensuring the reliability and safety of industrial machinery relies heavily on the detection of faults in gears and bearings. The vibratory signals generated by these components contain valuable information about their health condition, making them an indispensable resource for fault monitoring and diagnosis. In this research, we introduce an innovative approach employing Variational Mode Decomposition (VMD) for the detection and diagnosis of defects in gears and bearings. The efficacy of our approach is rigorously evaluated using real-world data acquired from two distinct sources. Gear defect measurements provided by the Technical Centre for Mechanical Industries (CETIM) in France and high-speed bearing defect measurements from Green Power Monitoring Systems in the USA form the basis of our evaluation. The experimental results demonstrate the high effectiveness and accuracy of the VMD-based fault detection method in successfully identifying faults. This research contributes to the advancement of fault detection in gears and bearings, as it demonstrates the applicability and robustness of the VMD approach in real-world scenarios. Leveraging this innovative technique holds significant potential for enhancing the reliability, productivity, and safety of industrial machinery systems by facilitating timely maintenance and fault mitigation strategies.

**ENHANCED PHYSICAL PROPERTIES OF SOLID POLYMER ELECTROLYTE
BASED ON PVA_X-Y/PMDA_Y**

Hussein Kh. RASHEED

Department of Physics, College of Science, University of Baghdad, Baghdad, Iraq

Aseel A. KAREEM

Department of Physics, College of Science, University of Baghdad, Baghdad, Iraq

ABSTRACT

In this work we study the effect of concentration of pyromellitic dianhydride (PMDA) (0,5,10,15 and 20) and the effect of acid molarity (sulfuric acid) (0, 5 and 9) on the thermal and wettability properties of the pure Poly (vinyl alcohol) (PVA) and its cross-linked. The XRD patterns for the pure PVA and crosslinked PVA films showed all polymers have one diffraction peak with a 2θ value of 19.5° . For pure PVA, the peak is very sharp and strong indicating its high crystallinity, the peak becomes weaker and broader as the crosslinking degree increases. The thermal behavior of the crosslinked PVA is investigated by DSC characterizations. the T_g values of all crosslinked PVA membranes are lower than that of pure PVA film ($T_g = 60.62^\circ\text{C}$). It has been reported that the addition of PMDA as crosslinking into the PVA matrix produces a shift in the melting point, attributed to the increase in crystallization. The pure PVA has a T_m of 247.4°C , but the T_m of the PVA doped by 5M and 9M H_2SO_4 is close to (246.8 and 246.88) $^\circ\text{C}$, The increase of T_m at 20 wt.% PMDA concentration is attributed to a high content of a uniformly distributed crosslinking phase. The contact angle slightly decreased from 90.19 for pure PVA to 86.96 for PVA doped by 9M H_2SO_4 . PMDA as crosslinker significantly improved the wettability to a strong hydrophobic surface showing 54.54° of contact angle at 20 wt.% PMDA. SEM image showed that PMDA were approximately implanted uniformly within the PVA matrices and have intimate contact with these polymeric matrices which suggests the existence of strong interfacial bonding among PMDA and PVA.

ÖZET

Çok sayıda insan, vücudun yeterli insülin üretilmediği veya insüline normal şekilde yanıt vermediği ve bunun sonucunda anormal derecede yüksek kan şekeri (glikoz) seviyelerine neden olan ve dünyanın en ciddi hastalıklarından biri olan diyabete (şeker hastalığı) sahiptir. Yaş, obezite, fiziksel hareketsizlik, genetik diyabet, kötü beslenme, sigara, yüksek tansiyon ve diğer faktörlerin tümü bu hastalığa katkıda bulunabilmektedir. Diyabet, kişinin kalp hastalığı, böbrek hastalığı, inme, görme sorunları, sinir hasarı vb. uygun tedavi verilir. Yapay zekanın sağlık sistemlerine uygulanması son yıllarda önemli ölçüde ilerlemiştir. Makine öğrenmesi (MÖ), çok çeşitli tıbbi teşhislerde kullanılmaktadır. Kanseri, diyabet, kalp hastalığı, tiroid hastalığı vb. hayatı tehdit eden birçok durum MÖ teknikleri kullanılarak tahmin edilebilmekte veya tespit edilebilmektedir. Teşhis prosedürünün daha kolay ve hızlı hale getirilmesi, kronik diyabetin tedavi sürecinde önemli bir etkiye sahip olacaktır. Bu çalışmada, diyabet öngörüsünü değerlendirmek için diyabetle ilgili birçok özellik kullanılmaktadır. Pima Hint Diyabet Veri seti kullanılarak diyabet tahmini için beş MÖ sınıflandırma tekniği (K-En Yakın Komşu (K-EYK), Rastgele Orman (RO), Aşırı Gradyan Artırma (XGBoost), Hafif Gradyan Artırma Makinesi (LightGBM), Sınıflandırma ve Regresyon Ağaçları (CART)) uygulanmıştır. Keşifsel veri analizi, veri ön işleme ve özellik mühendisliği teknikleri kullanılarak ilgili veri setinden yeni özellikler elde edilerek yeni bir veri seti oluşturulmuştur. Eski veri seti ile karşılaştırıldığında, yeni veri setinin sınıflandırma doğruluğunu geliştirdiği görülmüştür. Ek olarak, son veri setinde sınıflandırma doğruluğunu arttırmak amacıyla diyabet tahmini için oylama sınıflandırıcısı modeli uygulanmıştır. Elde edilen sonuçlara göre, LightGBM modeli (%89,98), diğer makine öğrenmesi tekniklerine (CART (%87,50), K-EYK (%78,78), RO (%88,29) ve XGBoost (%89,07) göre diyabeti tahmin etmede daha yüksek doğruluğa sahiptir.

**EXPLORATORY DATA ANALYSIS BASED DIABETES MELLITUS DISEASE
PREDICTION USING MACHINE LEARNING TECHNIQUES AND VOTING
CLASSIFIERS**

ABSTRACT

Numerous people have diabetes mellitus (diabetes), in which the body does not produce enough insulin or respond normally to insulin, resulting in abnormally high blood sugar (glucose) levels, one of the most serious diseases in the world. Age, obesity, physical inactivity, genetic diabetes, a poor diet, smoking, high blood pressure, and other factors can all contribute to this disease. Diabetes increases a person's risk of developing various illnesses, including heart disease, renal disease, stroke, vision problems, nerve damage etc. A variety of tests are currently used in hospitals to get the data needed to diagnose diabetes, and depending on that diagnosis, the proper treatment is given. The application of artificial intelligence in healthcare systems has advanced significantly in recent years. Machine learning (ML) is used in a wide range of medical diagnoses. Many life-threatening conditions such as cancer, diabetes, heart disease, thyroid disease etc., can be predicted or detected using ML techniques. Making the diagnosis procedure easier and faster would have a significant impact on the treatment process for chronic diabetes. In this study, many diabetes-related features are used to assess diabetes prediction. Five ML classification techniques (K-Nearest Neighbors (K-NN), Random Forest (RF), Extreme Gradient Boosting (XGBoost), Light Gradient Boosting Machine (LightGBM), Classification and Regression Trees (CART)) have been applied for diabetes prediction using Pima Indian Diabetes Dataset. A new dataset was created by obtaining new features from the relevant dataset by using exploratory data analysis, data preprocessing and feature engineering techniques. Compared with the old dataset, it was seen that the new dataset improved the classification accuracy. Additionally, voting classifier model for diabetes prediction was imposed with the goal of enhancing classification accuracy in last dataset. LightGBM model (89.98%) has higher accuracy in predicting diabetes compared to other machine learning techniques (CART (87.50%), K-NN (78.78%), RF (88.29%) and XGBoost (89.07%)) according to the results obtained.

ABSTRACT

CL-20, RDX and TNT are often used in military and industrial areas among the explosives having high-energy. However, further improvement of the performance of these explosives are critical in the field. In this context, the use of aluminum (Al) as an additive in an explosive is a good option due to its high combustion enthalpy and cost-advantageous. Therefore, mixing of Al with secondary explosives can give promising performance properties. To evaluate this, we decided to investigate the power values of CL-20, RDX, and TNT, which containing various amounts of Al. For this purpose, the explosion products of the explosive/Al mixtures were estimated by applying Kamlet-Jacobs principles to propose final explosion reactions. Then, detonation heat values of the proposed reactions were calculated by using standard formation enthalpies of the reaction components. Simultaneously, the volume of the gaseous formed at the end of the explosions was calculated from the number of moles of gaseous products of the reactions. Accordingly, power of CL-20/Al mixture that contains 10 wt.% Al was calculated as 458.3×10^{-4} kJ.L/kg² which was approximately 1.5% higher than that of pure CL-20. Similarly, power of RDX/Al mixture that contains 15 wt.% Al was calculated as 484.5×10^{-4} kJ.L/kg² which was approximately 2.7% higher than that of pure RDX. As for TNT, power of TNT/Al mixture that contains 20 wt.% Al was calculated as 331.7×10^{-4} kJ.L/kg² which was approximately 7.9% higher than that of pure TNT. These results indicate that power values of CL-20, RDX, and TNT can be improved by addition of appropriate amount of Al to the mentioned explosives. Our studies are progressing on the evaluation of alternative explosive/metal mixtures to improve the power of secondary explosives.

Keywords: Explosive/Aluminum mixtures, power of explosives, CL-20, RDX, TNT

**KÜRESEL PAZARLAMA STRATEJİLERİNİN EKOSİSTEM ODAKLI
DÖNÜŞÜMÜ: BİR GERÇEKÇİ ÇÖZÜMLEME**

ÖZET

İş ekosistemleri, çağdaş/küresel rekabet koşullarında şirketlerin, teknokratik ağ kurma yetenekleri ile çevreci (yeşil) yenilik/süreç geliştirme yeteneklerine bağlı rekabetçi üstünlük elde etmelerini sağlayan bir yaklaşımdır ve bu yaklaşımın yaslandığı rekabetçi üstünlük modellerinin soykütüğü, 1970’li yıllara (egemen ekonomi-politik birikim rejimindeki değişim dönemine) kadar takip edilebilir. Bu açıdan çalışma, küresel pazarlama stratejilerinin (KPS) ekosistem odaklı dönüşümünü özellikle 1970’li yıllar sonrası şekillenen uluslararası ekonomi-politik birikim rejiminin yeniden üretimi/evrimi bağlamında açıklamayı amaçlamaktadır. Çünkü 1970’li yıllardaki ekolojik sorunlara yönelik “yeşil” çözümler ile bilgi teknolojilerindeki gelişim bağlamında iş ekosistem stratejilerinin (yeşil/eko-yenilik ve ağ yetenekleri/ortaklıkları üzerinden rekabetçi üstünlüğü kazanma) KPS’ine eklenmeye başladığı görülür ve bu bağlam aynı zamanda egemen endüstriyel birikim rejimindeki bir değişim anını da (Refah Devleti/Atlantik Fordizmi-Küresel Neoliberalizm) içerir. Bu çerçevede çalışmada öncelikle iş ekosistem yaklaşımını yazında ilk kez kullanan James F. Moore’un (1993) görüşlerine ve bu görüşlerin modern endüstriyel gelişim tarihindeki uzantılarına değinilir. Böylece iş ekosistemlerinin modern rekabetçi üstünlük teorilerinin bir uzantısı olduğu ve fakat bu uzantının, çağdaş teknolojik ve ekonomi-politik (yeşil ekonomi) bağlam çerçevesinde yeniden tasarılan bir yaklaşım olduğu açıklanır. Daha sonra çalışmada, KPS’in 1960’lı yıllardan itibaren gelişimi üç ana akım yaklaşım/strateji (standardizasyon, koordinasyon/konfırgasyon ve entergrasyon) çerçevesinde açıklanır ve bu stratejilerin gerektirdiği rekabetçi üstünlük modellerinin (küresel ağ ortaklıkları, ölçek ekonomisi, kaynakların etkin kullanımı/korunması, eko-yenilik, vs.), ekosistem pazarlama yeteneklerini (çevre duyarlı, bilgi iletişim teknolojilerine bağlı sürdürülebilir ekosistem) özellikle 1980’li yıllardan itibaren ağırlıklı olarak içermeye başladığı vurgulanır. Bu açıdan çalışmada uygulanan bağlamsal/ekonomi-politik çözümler aracılığıyla, ekosistem pazarlama stratejilerinin KPS’i yazınında gömülü şekilde yer aldığı fakat özellikle 2000’li yıllardaki değişimler (bilgi teknolojilerinin hâkimiyeti, 2008 krizi, yeşil ekonomi, vs.) bağlamında ana akım bir yaklaşım haline geldiği sonucuna ulaşılır. Çalışmanın temel katkısının, küresel pazarlama stratejilerinin ekosistem odaklı dönüşümü üzerinden, çağdaş/küresel rekabet koşullarında şirketlerin ekosistem yeteneklerine bağlı üstünlükleri nasıl elde edebileceklerini gerçekçi/ekonomi-politik bağlamda açıklama çabası olduğu söylenebilir.

**ECOSYSTEM-ORIENTED TRANSFORMATION OF GLOBAL MARKETING
STRATEGIES: A REALISTIC ANALYSIS**

ABSTRACT

Business ecosystems is an approach that enables companies to gain competitive advantage based on their technocratic networking capabilities and environmental (green) innovation/process development capabilities in contemporary/global competitive conditions, and the genealogy of competitive advantage models on which this approach is based can be traced back to the 1970s (to the period of change in the dominant economic-political accumulation regime). In this respect, the study aims to explain the ecosystem-oriented transformation of global marketing strategies (GMS) especially in the context of the reproduction/evolution of the international economic-political accumulation regime that took shape after the 1970s. Because it is seen that business ecosystem strategies (gaining competitive advantage through green/eco-innovation and network capabilities/partnerships) began to be articulated with GMS in the context of development in information technologies and “green” solutions to ecological problems in the 1970s, and this context also includes a moment of change in the dominant regime of industrial accumulation (Welfare State/Atlantic Fordism-Global Neoliberalism). In this context, firstly, the views of James F. Moore (1993), who used the business ecosystem approach for the first time in the literature, and the extensions of these views in the history of modern industrial development are mentioned. Thus, it is explained that business ecosystems are an extension of modern competitive advantage theories, but that this extension is an approach redesigned within the context of contemporary technological and political economy (green economy). Later in the study, the development of GMS since the 1960s is explained within the framework of three mainstream approaches/strategies (standardization, coordination/confirmation and integration), and it is emphasized that the competitive advantage models (global network partnerships, economies of scale, efficient use/conservation of resources, eco-innovation, etc.) required by these strategies have started to include ecosystem marketing capabilities (environmentally sensitive, sustainable ecosystem dependent on information and communication technologies), especially since the 1980s. In this respect, through the contextual/economic-political analyzes applied in the study, it is concluded that ecosystem marketing strategies are embedded in the GMS literature, but have become a mainstream approach, especially in the context of changes in the 2000s (domination of information technologies, 2008 crisis, green economy, etc.). It can be said that the main contribution of the study is the effort to explain in a realistic/economic-political context how companies can achieve advantages based on their ecosystem capabilities in contemporary/global competitive conditions through the ecosystem-oriented transformation of global marketing strategies.

ABSTRACT

Drug repurposing is an alternative avenue for identifying new drugs to treat tuberculosis (TB). Although TB can be cured with anti-tubercular drugs, the emergence of multidrug-resistant and extensively drug-resistant strains of *Mycobacterium tuberculosis* H37Rv (Mtb), as well as the significant death toll globally, necessitate the development of effective drugs to treat TB. In this study, drug repurposing approach was employed to address this drug resistance problem by screening drugbank database to identify novel inhibitors of the Mtb target enzyme, DNA gyrase. The compounds were screened against the ATPase domain of gyrase B subunit (MtbGyrB47), and the docking results showed Echinacoside, Doxorubicin, Epirubicin, and Idarubicin possess high binding affinities against MtbGyrB47. Comprehensive assessment using fluorescence spectroscopy, SPR, and CD titration studies revealed that Echinacoside as a potent binder against MtbGyrB47. Further, ATPase, and DNA supercoiling assays exhibited IC₅₀ values of 2.1-4.7 μM for Echinacoside, Doxorubicin, Epirubicin, and Idarubicin. Among these compounds, the least MIC₉₀ of 6.3 μM and 12 μM were observed for Epirubicin and Echinacoside, respectively. Hence, our findings indicate that Echinacoside and Epirubicin target mycobacterial DNA gyrase, inhibit its catalytic cycle, and retard mycobacterium growth. Further these compounds exhibits potential scaffolds for optimizing novel anti-mycobacterial agents that can act on drug-resistant strains.

**AN ANNALYSIS ON BALANCING THE BENEFITS OF TECHNOLOGY WITH THE
RISKS OF INCREASED HUMAN TRAFFICKING**

Assist. Prof. Golda SAHOO

FIC Centre for Studies in Victimology, Tamil Nadu National Law University, Trichy, Tamil Nadu, India

ABSTRACT

The way people connect has changed as a result of technology, and this is mirrored in crime, especially human trafficking which is one of the most horrific crimes in the world is human trafficking. Victims are deprived of their essential human rights, freedom, and dignity. Human trafficking is a felony that involves using another person for labour, services, or prostitution. This is sometimes accomplished by requesting images or films from the victims in order to gather "compromising" information about them, which is then used to force them into prostitution. Technology can make the sale of sexual services rendered by victims of human trafficking easier during the exploitation stage. Furthermore, while though live streaming is frequently Assoc.d with child sexual exploitation, it may also involve adult victims of trafficking. Technology is crucial in that it makes it possible to separate the location of sexual action from the location of coordination, which has significant legal ramifications. New developments in the field of sexual exploitation that have been recognised by different nations include the growth of "live web cams" and "pay-as-you-go" video chat services as well as an increase in the usage of victim-controlling apps. According to a study, in 2020, online advertising was a factor in more than eighty percent of the U.S. Department of Justice's sex trafficking indictments. Virtually, sexual abuse and other sorts of exploitation are occurring, and images and videos are being sold to consumers all around the world on various platforms, making even more money for the traffickers at no further effort. Numerous examples of partnerships and instruments that nations are utilising or developing are shared in the UNODC background study as either existing or prospective. Digital forensics, data scanning tools, smartphone apps, and fruitful partnerships with IT, social media, and Internet corporations are a few of them. Along with IBM and the Colombian non-governmental organisation Pasos Libres, UNODC has also co-organized "DataJams," an online competition where students compete to create tech-based solutions to locate and safeguard victims of trafficking and aid investigations. As the theme of this 2023 year's World Day against Trafficking in Persons is "use and abuse of technology", the paper provides an evaluation of the degree of which technology facilitates human trafficking as well as an investigation of the traffickers' methods in the context of online and technologically enabled human trafficking. The paper explores the practical and legal difficulties faced by State Parties and offers solutions to the problem.

ABSTRACT

The 2023 Nigeria general elections held on 25th February 2023 and 11th March 2023 for both Presidential, National Assembly (Senate and House of Representatives) and governorship as well as state house of assembly respectively. Niger State is a state in the North central region of Nigeria and the largest state in the country with a vast land mass of 86,000km²; approximately 8.6 million hectares constituting about 9.3% of the total land area of the country. It was formed in 1976 and has 25 local government areas, the state was created out of the defunct North-Western State. The State has three (3) geopolitical Zones (A, B and C) with state capital at Minna. The Niger South “Zone A” covers the local government areas of Agaie, Bida, Edati, Gbako, Katcha, Lapai, Lavun and Mokwa. Muhammad Bima Enagi was the senatorial flag bearer of All Progressive Congress (APC) and also the incumbent senator representing Zone A, while Peter Ndalikali Jiya for People’s Democratic Party (PDP), Muhammadu Bala Faruk for People’s Redemption Party (PRP), Adamu Alfa Ab for New Nigeria People’s Party (NNPP), and others representing different political parties. Widespread violence marred the elections following a wide range of habitual and causalities causes to lose properties and economic down fall in the zone. The study adopts analytical and historical research using secondary data to arrive at the conclusion. The independent Electoral Commission (INEC) declared Peter Ndaliki of People’s Democratic Party (PDP) as winner of Zone A senatorial election with 100,498 votes. Ndaliki defeated his close rival and the serving senator who scored 97,453 votes. However, the study reveal that senator Muhammad Bima Enagi is requesting for a supplementary election to be conducted because according to his claims before the tribunal, there were several polling units where the BVAS were not used while in other polling units, there were disruptions to the elections due to violence and others declaring Niger South senatorial election inconclusive. In recommendations, Prof. Abubakar Muhammad Bitagi, Niger South Senatorial District returning officer, said the PDP candidate won the March 11th 2023 senatorial election and therein no outstanding.

ABSTRACT

The understanding that causes cultural codes to be replaced by universal capitalist consumption codes permeates our lives through advertisements. While consumption is the purchase of a material commodity, it has now evolved into a direction loaded with spiritual feelings and values. Today, it is seen that consumption has shifted from the consumption of essential needs to luxury consumption. The master-slave dialectic that emerged as a result of the demands for mutual acceptance in Hegel similarly shows the efforts of institutions to seek suitors for their product advertisements to increase their profits. At the individual level, people can make themselves visible through the products they use. This study aims to explain how the ideals of increasing consumption are realized through communication, basing the epistemological roots of the increase in luxury consumption on Hegel. Within the scope of the study, personal care and accessory advertisements on national television channels will be shown. The study will be examined using the semiotic analysis method. In the study, only advertisements broadcast on national general channels will be included, internet advertisements, viral advertisements and outdoor advertisements will not be included. In the products shown in the sample advertisements, emotional manipulation is carried out with themes such as being admired, coming to the fore, freedom, being envied, and being special. They are the products offered in advertisements, but with those products, what is desired is peace, love, prestige, a challenge, being admired and at the forefront. As a result, when we adapt Hegel's master-slave dialectic to consumption culture, we encounter an image where institutions become masters and consumers become slaves.

ÖZET

Bireyin iyi-kötü, doğru-yanlış ayırt edebilmesi, kendi değer yargıları ve ilkelerini geliştirerek bulunduğu çevreye uyum sağlaması olarak tanımlanabilen ahlak gelişimi başta psikoloji, sosyoloji, teoloji olmak farklı disiplinler tarafından farklı boyutlarıyla ele alınmaktadır. Ahlakın önemini vurgulayan dinler, öğretiler, ibadetler, kutsal metinler aracılığıyla ahlaki gelişimi sağlamaya çalışmaktadır. Kohlberg'in ahlaki gelişim kuramı bireylerin ahlaki karar ve değerlerinin nasıl geliştiğini ortaya koyan önemli kuramlardandır. Kohlberg ahlaki gelişimi gelenek öncesi düzey, geleneksel düzey, gelenek sonrası düzey olmak üzere üç aşamada ele almıştır. Çalışma, ilahiyat fakültesinde dini eğitim alan öğrencilerin Heinz ikilemine hangi ahlaki gelişim düzeyine göre cevap verdikleri ve cevaplarını dayandırdıkları dini gerekçeleri belirlemeyi amaçlamaktadır. Başka bir ifadeyle, ilahiyat fakültesi öğrencilerinin Kohlberg'in Heinz ikilemine verdiği cevaplar ve cevapları dayandırdıkları dini gerekçelerin belirlenmesi hedeflenmiştir. Çalışmanın amacına uygun olarak nitel araştırma yöntemlerinden olan durum çalışması yapılmıştır. Bu bağlamda N:90 ilahiyat fakültesi öğrencisine Kohlberg'in Heinz ikilemi anlatılmış ve kararlarını gerekçeleriyle birlikte yazmaları istenmiştir. Elde edilen veriler içerik analiziyle analiz edilmiş ve ilahiyat fakültesi öğrencilerinin Kohlberg'in ahlaki ikilemine verdikleri cevaplar ve cevapları dayandırdıkları dini gerekçeler analiz edilmiştir. Elde edilen bulgular "*İlahiyat Fakültesi Öğrencilerinin Cevaplarının Ahlaki Gelişim Düzeylerine Göre Değerlendirilmesi*", "*Dini Kaynaklara Dayandırılan Gerekçeler (Günah, Kader, Haram)*" ve "*Dini Kaynaklara Dayandırılmayan Gerekçeler*" olmak üzere 3 başlık halinde sunulmuştur. Elde edilen bulgulara göre ilahiyat fakültesi öğrencilerinin cevaplarının büyük oranda Kohlberg'in ahlaki gelişim aşamalarından gelenek sonrası düzeye denk geldiği ve cevapların çoğunlukla canın kutsallığı, günah, kader gibi dini gerekçelere dayandırdıkları belirlenmiştir.

**THEOLOGICAL FACULTY STUDENTS' RESPONSES TO KOHLBERG'S HENZ
DILEMMA AND THEIR RELIGIOUS JUSTIFICATIONS**

ABSTRACT

Moral development, which can be defined as an individual's ability to distinguish between good and bad, right and wrong, and to adapt to the environment by developing their own value judgments and principles, is handled by different disciplines, especially psychology, sociology and theology, with different dimensions. Religions that emphasize the importance of morality try to ensure moral development through teachings, worship and sacred texts. Kohlberg's moral development theory is one of the important theories that reveal how individuals' moral decisions and values develop. Kohlberg handled moral development in three stages: pre-conventional level, conventional level and post-conventional level. The study aims to determine at which moral development level students studying religious education at the theology faculty respond to the Heinz dilemma and the religious justifications they base their answers on. In other words, it is aimed to determine the answers of the seminary students to Kohlberg's Heinz dilemma and the religious justifications on which they base their answers. In accordance with the purpose of the study, a case study, which is one of the qualitative research methods, was conducted. In this context, N: 90 seminary students were told about Kohlberg's Heinz dilemma and asked to write their decisions with their justifications. The data obtained were analyzed by content analysis and the answers given by the seminary students to Kohlberg's moral dilemma and the religious justifications on which they based their answers were analyzed. The findings are presented under three headings: " Evaluation of the Answers of Theology Faculty Students According to Their Moral Development Levels", "Justifications Based on Religious Sources (Sin, Destiny, Haram)" and "Justifications Not Based on Religious Sources". Based on the obtained findings, it has been determined that the responses of theology faculty students largely correspond to Kohlberg's post-conventional level of moral development, and the answers are mostly based on religious justifications such as the sanctity of life, sin, and destiny

ABSTRACT

The globalization that surged in the last quarter of the twentieth century had caused the delegation of states' national sovereignty to international institutions. However, this practice has faced a backlash from countries in all parts of the world, and they have begun reclaiming their national sovereignty back. There is a growing tendency among States to repeal their international investment agreements or replace them with their national rules giving more restricted rights to non-nationals. In the globalization era, some countries were even more cautious to introduce vast amounts of rights to foreign investors in the first place. For example, the United Arab Emirates (UAE) limits foreign access to domestic markets by introducing a minimum threshold of %51 ownership of UAE nationals that must be contributed to the capital of the company. There are also domestic laws restricting foreigners' accession to certain sectors, such as traditionally land ownership. Türkiye is one example where foreigners are subject to certain restrictions by law when acquiring land or immovable property. One of the most challenging standard terms is the guarantee against expropriation as it covers any interference whether direct or indirect with the property rights of the foreign investor. In order to regain their right to regulate, some states including the Republic of Türkiye has started to include clauses to their investment agreements. It shall be noted that up till now, the arbitral tribunals' interpretation of these "new model BITs" are far from being clear. This memorandum will analyze firstly the approach of some states that have preserved their sovereignty, and secondly the different methods the states adopted to reassert national sovereignty.

DIŞ POLİTİKA ÜRETİMİ VE DİPLOMASİ ALANINDA ANALİZ VE STRATEJİK ÖNGÖRÜLEMEDE SOSYAL İNŞAACI YÖNTEMLERİN KATKISI

Dr. Hasan ULUSOY (ORCID: 0009-0007-9341-7858)

Diplomat, Büyükelçi, T.C. Dışişleri Bakanlığı, Ankara,

Email: hasan.ulusoy@mfa.gov.tr

ÖZET

Dış politika üretimi ve diplomasi alanında yerleşik klasik irdeleme ve analiz, sahada olana bakarak yapılmaktadır. Bir başka deyişle analizler olgu odaklıdır. Uluslararası ilişkiler teorilerinde anaakım yaklaşımlar bu kapsamda analizlerinde ağırlıklı olarak “ne” sorusuna odaklanır. Bu yaklaşımın yeterli olmaması esasen uluslararası ilişkiler teorilerinde pozitivist odaklı ana akım yaklaşımlara ilave destek veren post-positivist yaklaşımların ortaya çıkmasında etkili olmuştur. Bunlar arasında sosyal inşaacı yaklaşım, konvansiyonel formuyla, politik realist paradigmaları reddetmeden, uluslararası ilişkiler analizlerine tamamlayıcı açıklamalar getirmiştir. Bu yaklaşımın dış politika analizlerinde de günümüzde kullanılması, ülkelerin dış politikalarını anlama ve buna göre politika belirlemede fayda sağlamaktadır. Buna rağmen, ülkelerin dışişleri bakanlıkları, ağırlıklı olarak klasik yöntemle bağlı kalmakta ve sadece “ne” sorusu üzerinden olgulara bakarak çözümler ve ileriye dönük stratejiler belirlemektedir. Bunun yetersiz olduğu esasen Rusya Federasyonu’nun Ukrayna’yı işgaline giden RF-Ukrayna savaşıyla ilgili süreçteki analizlerin sınırlı olmasında da gözlemlenmiştir. Bu bağlamda, kapsayıcı olmak için, savaş gibi olgulara yol açan arka planların analizinin de yapılması önem taşımaktadır. Arka plan analizi, söz konusu olguya (savaş) giden süreçte tarihten kültüre her türlü alanın karar alıcılara yönelik etkileşim süreçlerinin irdelenmesine, bir başka deyişle kimlik analizlerinin yapılmasına imkan vermektedir. Olguların yanında algıları da irdelemeye imkan veren bu yaklaşımla, klasik “ne” sorusuna tamamlayıcı olarak “neden ve “nasıl” sorularına da odaklanılması ve böylece daha bütüncül analizler yapılması mümkün olabilecektir. Bu yöntem, gelecek okuryazarlığına da katkı sağlayarak, bu analizler yoluyla stratejik öngörüleme ve buna dayalı senaryoların daha kapsayıcı olması mümkün hale gelebilecektir. Tabiatıyla, artık yapay zekanın sosyal bilimlerde de kullanılmaya başladığı dikkate alındığında, “ne” sorusuna ilave olarak “neden” ve “nasıl” sorularına da odaklı veri bilgi girişleriyle, yapay zeka programlarının bir yandan “tailor made” analiz yapılmasını, diğer yandan da bunların üzerinden stratejik öngörülere gidilmesini kolaylaştırması da daha kolay olabilecektir.

Anahtar kelimeler: Sosyal İnşacılık, Bütüncül Dış Politika Analizi, Olgu Odaklı Analizlere Karşı Arka Plan Analizleri, Stratejik Öngörüleme, Diplomaside Yapay Zeka Kullanımı

**ROLE OF SOCIAL CONSTRUCTIVIST METHODOLOGY IN ANALYSIS AND
STRATEGIC FORESIGHTS IN THE DOMAIN OF FOREIGN POLICY
FORMULATIONS AND DIPLOMACY**

ABSTRACT

In foreign policy formulation and diplomacy, prevailing classical examination and analysis is conducted via focusing on what is present on the ground. In other words, such analyses are facts-based. In this context, in the theories of international relations, mainstream approaches focus primarily on “what” questions in an analysis. Over the years the lack of sufficiency prevalent in this analytical methodology has in fact led to the emergence of post-positivist approaches providing additional contributions to the mainstream approaches of positivist nature in the theories of international relations. Among them has the social constructivism in its conventional form brought complementary explanations to the analysis of international relations, without rejecting the paradigms of political realism. Adapting this approach into foreign policy analyses at present helps for understanding states’ foreign policies and for formulating tailor-made policies in diplomacy. Despite this, generally speaking, MFAs of states remain still attached to the classical methodology extensively and carry out analyses and strategies for future, by focusing only on facts through “what” questions. Yet, this insufficiency of this methodology has caused limited analyses of processes unfolding in world affairs, as observed, in the Russian-Ukrainian war and the occupation of Ukraine by the Russian Federation. In this context, for comprehensive studies it is of importance to conduct analyses of backgrounds leading to such factual developments as wars. Background’s analyses facilitate the evaluation of related processes in which all sorts of factors varying from history to culture happen to influence decision makers, i.e. the identity analysis as well. This approach, which makes it possible to analyse not only facts on the grounds but also constructed perceptions, helps to focus on “why” and “how” questions, in a complementary way to “what” questions and thus facilitates for more holistic analyses. This methodology is capable of allowing for more comprehensive strategic foresights and scenarios, by contributing to future literacy as well. Naturally, considering the fact that AI is also being made use of in social sciences too, via data processing, in focusing not only on “what but also “why” and “how” questions, AI programs would likely facilitate both for the conduct of tailor-made analyses, and for making strategic foresights based on such analyses.

SUMMARY

As Paracelsus said so well, "Everything is poison, nothing is poison, it is the dose that makes the poison". This quote underlines a fundamental principle of medicine and of the healthcare system in general: there is no clear distinction between a beneficial drug and a deadly poison. In reality, any drug, whether used in doses higher than the recommended dosages or in unjustified indications, carries risks. Even when its use is justified and all recommendations are followed, it is never completely free from danger for the patient. This reality also applies to pregabalin. Pregabalin, originally used to treat specific medical conditions, is now being diverted as a recreational drug in Algeria. This misuse of pregabalin can have harmful consequences on the behavior and cognitive abilities of individuals. The epidemiological study that we conducted at the CISA Intermediate Addictology Care Center on 30 patients highlights the adverse effects of pregabalin. The target population includes 30 people who consume pregabalin aged 16 to 47. A questionnaire was developed to collect information on pregabalin consumption habits and the general state of health of patients. The MoCA test (Montreal Cognitive Assessment) was used to assess the cognitive functions of patients. The investigation lasted two and a half months from February 16 to May 2, 2023 in the CISA center. Pregabalin use can cause problems with memory, concentration, danger perception, and even spatial orientation. These side effects may negatively impact long-term cognitive abilities and decision-making, raising concerns about prolonged use of this drug. Our results highlight the importance of a thorough evaluation of drugs, and their potential adverse effects on behavioral and cognitive aspects. Educating healthcare professionals and patients about these risks is essential to support informed treatment decisions.

**STRUCTURAL TRANSFORMATION OF CE-DOPED MN-O AND
ANTIBACTERIAL EFFECTS**

Dr. Abdul GHAFFAR

Department of Physics Government College University, Lahore 54000, Pakistan

Email: abdulghaffar@gcu.edu.pk

ABSTRACT

Pressure and temperature are the natural and atmospheric parameters that can change the properties of a system. In the nanoparticle synthesis temperature is necessary for chemical reaction and for achieving certain crystalline phase of a material. In a Ce-doped Mn-O system (Ce as 0.0, 2.0, 4.0, 6.0 and 8.0 wt%), after first heating at 700 °C, mixed MnO₂ and Mn₅O₈ phases were achieved. Later, on second heating at 900 °C the mixture of phases was transformed to Mn₂O₃ along with the development of CeO₂ phase additionally. Multiphase metal oxides as a mixture of Mn₂O₃ and CeO₂ both then reveals excellent synergistic antibacterial response against the selected pathogens.

Keywords: Ce as dopant, Mn-O multiphase, Structural transformation. Synergistic antibacterial activity

**EXPLORING STRESS EFFECTS ON PIEZOELECTRIC CELLS FOR IMPROVED
ROAD-BASED ELECTRICITY GENERATION (UNIFORM DISTRIBUTED
LOADING)**

ABSTRACT

The findings of this research provide valuable insights into the impact of stress on piezoelectric cells. Moreover, the research outcomes have the potential to contribute to the development of advanced materials and technologies for road surfaces. These advancements can improve the resilience of road infrastructure, enabling it to better withstand the stress and shear forces exerted by heavy vehicles. In summary, this research has the potential to make significant contributions to the fields of transportation, energy, and materials science. By optimizing the design and placement of piezoelectric cells on roads, it can lead to more efficient and sustainable electricity generation from passing vehicles, while also contributing to the development of robust road surfaces capable of withstanding heavy vehicle loads. The primary objective of this research is to investigate the influence of stress on piezoelectric cells installed on roads with an electric voltage. The main goal is to optimize the design and placement of these cells in order to maximize their accuracy and efficiency in generating electricity from vehicles passing over them. Specifically, the study focuses on analyzing the effects of uniform distributed loading, which is crucial for understanding the behavior of the cells under different loading scenarios. To carry out this research, finite element analysis (FEA) simulations are employed to create detailed models of the compression cells and accurately replicate the loading conditions caused by passing trucks.

Sustainable transportation

ULTRAVIOLET MEDIATING CREAM AGAINST AGEING AND CANCER OF THE SKIN

Bello Hassan ONIMISI

Mountain Top University, Lagos Nigeria

Email: belloonimisi5@gmail.com

ABSTRACT

The effect of ultraviolet and cosmic rays from the sun on the earth and its inhabitant is no longer a news for the conscious scientist in the world. The ozone layer depletion this ozone layer normally prevents these rays from touching directing on man. The activity of man over time has increase the production of carbon dioxide that depletes this layer and exposes man to the danger of these rays. These rays have much adverse effect on man and the society. It causes ageing in man and also causes oceanic turbulent resulting in different calamities in the world. The cream is made from liquid oil from fish (containing vegetable oils and manuka oils), moisturizer (lipid liquid), perfume and “wonderful kola”. The whole ingredient is mixed together and filled in 50ml containers for trials. The cream when used helps to reflect back these rays and reduce the amount of its rays that enters the skin. This helps to slow down ageing and other allied diseases. Cancer of the sin has and other related cancers have been traced to the effect of this rays. This solution would slow down this process and prolong our life on the planet earth.

**INCREASING THE SHELL LIFE OF DAIRY PRODUCTS FOR IMPROVED
NUTRITIONAL VALUES AND NOURISHMENT**

Bello Hassan ONIMISI

Mountain Top University Lagos, Nigeria

Email: belloonimisi5@gmail.com

ABSTRACT

Yoghurt is produced from partly skimmed pasteurized milk (cow). basically, cow milk contains lactose, fat, solid-not-fat, minerals, vitamins etc. This research is carried out to find out if dairy products can be stored for four weeks and still maintain its organoleptic qualities. In carrying out this work, milk samples divided into three different categories of varying fat content (because it is the only parameter that can easily be regulated) were taken that covers four weeks. Twelve samples were taken inside a plastic bottle with cover. They were stored in a fridge and maintained at 4°C. In the first week, one sample is analysed for fat content, lactose, solid-not fat, moisture content (M.C) every day. In the second week, one sample for every two days was picked and analysed. In the last two weeks one sample each were analysed. The results were analysed using mean and standard deviations. The result shows that milk with high fat contents is normally prone to spoilage than the ones with low fat contents. This is the major factor that affects their shelf life. Moreover, the milks at the fourth week with the lowest fat content maintains its organoleptic quality.

Keywords: solid-not-fat, minerals, yoghurt

**TÜRKİYE’DE GENÇLERİN KENTSEL YÖNETSEL SÜREÇLERE KATILIMI:
NÜFUSU EN GENÇ KENTLER ÜZERİNDEN BİR DEĞERLENDİRME**

Dr. Öğr. Üyesi Osman KARACAN (ORCID: 0000-0001-8250-1981)

Siyaset Bilimi ve Kamu Yönetimi Bölümü, Kastamonu-Türkiye,

Email: osmankaracan@kastamonu.edu.tr

ÖZET

Gençliği belirleyen yaş grubunun evrensel bir tanımı olmamakla birlikte Birleşmiş Milletlerin (BM) istatistikler saptamalarda bulunmak için 15–24 yaşları arasındaki bireyleri genç olarak kabul etmekte, Türkiye İstatistik Kurumu (TÜİK) da genç nüfusu bu yaş grubu üzerinden belirlemektedir. TÜİK verilerine göre 2022 yılı sonu itibarıyla Türkiye 85 milyonu aşkın nüfusa sahip olup nüfusun %15.2’sinin 15–24 yaş aralığındaki bireylerden oluşmaktadır. Türkiye’nin genç nüfus oranı Avrupa Birliği üyesi 27 ülkenin her birinin genç nüfus oranından daha yüksektir. Bu durum pek çok bakımdan önemli olsa da onların düşüncelerine ne derece değer verildiği de büyük önem arz etmektedir. Gençleri yönetime dâhil etme noktasında halka en yakın yönetim birimleri olan belediyelere önemli sorumluluklar düşmektedir. Bu çalışmanın amacı, Türkiye’de belediyelerin gençlere kent yönetimine katılmalarına ne derece izin verdiğini ortaya koymaktır. Bu doğrultuda bu çalışmada, TÜİK 2022 verilerine göre genç nüfusun %20’den fazla olduğu altı il olan Hakkâri, Şırnak, Siirt, Bayburt, Ağrı ve Muş illerinin merkez ilçe belediyelerinin gençlerin yönetime katılım hususundaki tutumları incelenmiştir. Bu bağlamda, bu belediyelerin 2019 yerel seçimlerinden sonra hazırladıkları stratejik planlar ve yıllık faaliyet raporları, gençlik meclisi faaliyetleri ve basında ve resmi web sitelerindeki belediye faaliyetlerine ilişkin haberler analiz edilmiştir. Bu analiz sürecinde karşılaşılan en büyük zorluk mevzuat gereği katılımcı bir anlayışla hazırlanması gereken stratejik planların Muş Belediyesi hariç kamuoyu ile paylaşılmamasının yanı sıra kamuoyu ile paylaşılması gereken yıllık faaliyet raporlarının Ağrı ve Siirt Belediyelerinin resmi web sitelerinde mevcut olmamasıdır. Araştırma bulguları ortaya koymaktadır ki ilgili belediyeler tarafından gençlere kent yönetiminde neredeyse hiç söz hakkı tanınmamaktadır. İlgili belediyeler gençlerin yönetime katılımı noktasında önemli birimler olan ve bünyelerinde gençlik meclislerini de barındıran ve kanunen kurmaları gereken kent konseylerini ya kurmamış ya da bu konseyler uzun zamandır faaliyet göstermemektedir. Öte yandan bu belediyeler iddia ettiklerinin aksine stratejik planları katılımcı bir anlayışla hazırlanmamışlardır. Ayrıca gerek faaliyet raporlarında gerekse ilgili belediyelerin faaliyetlerine ilişkin haberlerde gençlere yönetimde söz hakkı tanımaya yönelik pek bir faaliyet tespit edilememiştir.

Anahtar Kelimeler: Katılım, Gençlik, Genç Katılımı, Yerel Katılım, Yerel Demokrasi

**YOUTH PARTICIPATION IN URBAN MANAGEMENT IN TÜRKİYE: AN
EVALUATION OF THE CITIES WITH THE YOUNGEST POPULATION**

ABSTRACT

There is no universally agreed definition of the youth age group. However, for statistical purposes, the United Nations (UN) defines “youth” as individuals between the ages of 15 and 24 years, and the Turkish Statistical Institute (TUIK) accepts the UN’s definition. According to the data of TUIK, as of the end of 2022, Türkiye has a population of more than 85 million, and 15.2% of the population consists of individuals aged 15–24. Türkiye’s youth rate is higher than that of each of the 27 European Union member countries. Although this situation is important in many respects, how much their opinions are valued is also of great importance. Municipalities, the closest administrative units to the public, have important responsibilities involving youth in management. This study aims to reveal the extent to which municipalities in Türkiye allow youth to participate in urban management. Accordingly, in this study, the attitudes of the central district municipalities of Hakkari, Şırnak, Siirt, Bayburt, Ağrı and Muş, which are six provinces with a young population of more than 20% according to TUIK 2022 data, towards youth participation in management were examined. In this context, the strategic plans and annual activity reports prepared by these municipalities after the 2019 local elections, the activities of the youth councils and the news about the municipality activities in the press and official websites were analyzed. The most significant difficulty encountered in this analysis process is that the strategic plans, which should be prepared with a participatory approach as per the legislation, are not shared with the public except Muş Municipality, and the annual activity reports that should be shared with the public are not available on the official websites of Ağrı and Siirt Municipalities. The research findings demonstrate that the municipalities do not offer opportunities for youth to have a say in the future of their cities. Citizens’ assemblies are important units in youth participation in urban management and they include youth assemblies, but these municipalities have either not established citizens’ assemblies or operated for a long time. In addition, contrary to what these municipalities claim, their strategic plans were not prepared with a participatory approach. Moreover, there is no information in the activity reports and the press that youth have a say in shaping the future of their cities.

ABSTRACT

Digital technologies are bringing unprecedented transformation in almost all sectors, changing business management processes and our lives in ways we never imagined. Digitalization, which is seen as the most important representative of change and transformation in the last thirty years, has been attracting increasing interest in literature. The aim of this study is to examine the impact of the digital age, which has brought a serious transformation in many fields, on public administration literature by bibliometric analysis method, one of the quantitative research methods. Within the scope of the study, postgraduate theses on digitalization in the public administration literature between 2003-2023 in the National Thesis Center database of the Council of Higher Education (YÖK) were examined. The concepts of "e-government", "digital transformation", "digitalization", "artificial intelligence" and "digitalization of public administration" were scanned in the national database of YÖK in order to examine the impact of digitalization on public administration studies. According to the concepts determined, it was specified that 129 of the 151 graduate theses in the national database of YÖK were undergraduate theses and 22 of them were doctoral theses. In the analysis, it was also seen that the studies conducted until 2019 varied between 1-8; it increased to 13 in 2019 and continued in the same way in the following years. It can be said that the intensification of studies on digitalization in the field of public administration since this date is directly related to the increase in the variety of services carried out through the e-government portal, which was opened in 2008, and the establishment of the Presidential Digital Transformation Office in 2018. The increasing use of digital technologies in the public sector, especially in service delivery, has attracted the attention of researchers and has been effective in increasing studies in this field.

ÖZET

Gençlik, teknolojik gelişmelerin izinde ilerlerken, Covid-19'un etkisiyle gençlerin yaşam alanlarında ve davranışlarında da dijital dönüşüm hız kazanmıştır. “Evren ötesi” ya da “öte evren” anlamlarına gelen Metaverse, sanal gerçeklik ve artırılmış gerçeklik teknolojilerini kullanarak kullanıcıların gerçek dünyadan ayırt edilemeyen bir sanal ortamda etkileşime girmesini sağlayan bir teknolojidir. Bu siber dünya oyun oynamak, alışveriş yapmak, konsere gitmek, konferanslara katılmak ve yeni bir dil öğrenebilmek gibi birbirinden farklı olanakları bir arada sunmaktadır. Böylelikle bu yeni teknoloji genç kullanıcıların farklı kültürlere daha fazla ilgi duymasına ve onları daha iyi anlamalarına yardımcı olmaktadır. Metaverse, teknolojinin hızlı ilerleyişi ile birlikte kültürlerarası etkileşimi yeni bir paradigma ile yeniden tanımlama çabası içindedir. Sanal gerçeklik ve iletişimi bir araya getirerek farklı kültürlere ait özellikle genç bireyleri sanal bir platformda buluşturmakta ve kültürel etkileşimi mümkün kılmaktadır. Bu bağlamda, kültürlerarası etkileşim, farklı kültürel bağlamlardan gelen gençler arasındaki karşılaşma ve anlama yeteneğini içerirken, Metaverse bu yeteneği daha zengin ve etkili bir deneyime dönüştürmektedir. Ancak, bu aşamada dikkate değer husus, bu yeni teknolojinin genç kullanıcılar arasındaki kültürel etkileşimi ne ölçüde etkileyebileceği ve gelecekte gençler arasında yeni bir dijital kültürün meydana gelmesine katkı sağlayıp sağlayamayacağı, bununla birlikte kültürlerarası sınırları ortadan kaldırarak tek bir evrensel gençlik kültürünün oluşumuna potansiyel olarak hizmet edip edemeyeceği konularıdır. Çalışma Metaverse teknolojisinin gençler arasındaki kültürel etkileşim olanaklarına örnekler vererek adı geçen durumlara yönelik tartışmalı öngörüler sunmayı amaçlamaktadır.

Anahtar Kelimeler: Metaverse, sanal gerçeklik, kültürlerarasılık, gençlik, dijital gençlik kültürleri

**TECHNOLOGICAL EVOLUTION AND YOUTH: INTERCULTURAL INTERACTION
WITH METAVERSE**

ABSTRACT

As youth progresses in the direction of technological developments, digital transformation has accelerated in social living spaces and behaviours of young people with the impact of Covid-19. Metaverse, which means "beyond the universe" or "the other universe", is a technology that enables users to interact in a virtual environment indistinguishable from the real world by using virtual reality and augmented reality technologies. This cyber world offers many different opportunities such as playing games, shopping, going to concerts, attending conferences and learning a new language. Thus, this new technology helps young users to become more interested in and better understand different cultures. Metaverse is in an endeavour to redefine intercultural interaction with a new paradigm with the rapid advancement of technology. By combining virtual reality and communication, it brings young individuals from different cultures together on a virtual platform and enables cultural interaction. In this context, intercultural interaction encompasses the encounter and understanding ability among young individuals from different cultural contexts, while the Metaverse transforms this capability into a richer and more impactful experience. However, it is worth considering at this stage to what extent this new technology can influence the cultural interaction among young users and whether it can contribute to the emergence of a new digital culture among young people in the future, as well as whether it can potentially serve the formation of a single universal youth culture by eliminating intercultural boundaries. The study aims to provide examples of the possibilities of metaverse technology within the scope of interculturality and to offer controversial insights into the aforementioned situations.

ABSTRACT

The mathematical modelings of some physical phenomenon which appears in some technological fields was a research area of many authors, for example physics, mechanics and chemistry based on fractional integro-differential operators. Some examples of these applications that have appeared in many applied aspects of the basic sciences and advanced engineering are chemistry, fractal theory, optics, control theory, biology, biophysics, economics, etc. For this importance, one can find many papers published in this field. The Riemann-Liouville (R-L) and Caputo integro-differential operators are the most famous fractional operators which have been used. The Caputo derivative is of use to modeling phenomena which takes account of interactions within the past and also problems with nonlocal properties. Differential inclusions appear in the mathematical modeling of certain problems in stochastic calculus and optimal controls. They include two, three, and multi-point and multi-strip boundary value problems. The existence and multiplicity of positive solutions for such problems have received a lot of attention. In this work, we investigate the existence results for higher-order nonlinear fractional differential inclusions involving Caputo-type derivative supplemented multi-strip conditions, when the right-hand side is convex-compact as well as nonconvex-compact values. In First part, we apply the nonlinear alternative of Leray-Schauder type for multivalued maps. In the second part, we use the Covitz and Nadler's fixed point theorem for multivalued contractions. To show the applicability of our obtained results we give two examples.

Keywords: nonconvex-compact values, integral boundary conditions, Covitz and Nadler's fixed point theorem.

ABSTRACT

The mathematical modelings of some physical phenomenon which appears in some technological fields was a research area of many authors, for example physics, mechanics and chemistry based on fractional integro-differential operators. The Riemann-Liouville (R-L) and Caputo integro-differential operators are the most famous fractional operators which have been used. The Caputo derivative is of use to modeling phenomena which takes account of interactions within the past and also problems with nonlocal properties. Differential equations of fractional order are one of the fast growing area of research in the field of mathematics and have recently been proved to be valuable tools in the modeling of many phenomena in various fields of science and engineering. Indeed, one can find numerous applications of fractional order differential equations. in viscoelasticity, electro-chemistry, control theory, movement through porous media, electromagnetics, and signal processing of wireless communication system, etc. We investigated existence and uniqueness conditions of solutions of a nonlinear differential equation containing the Caputo operator supplemented with multipoint and multi-term integral boundary conditions. The existence results are obtained by using fixed point theory. Our results are illustrate by some examples.

ABSTRACT

The purpose of this study is to explore the practice of dental hygiene among students of integrated Tsangaya model schools in Kano state, Nigeria. A cross-sectional survey was conducted from 22nd March to 3rd April, 2023 among the study participants. A well structured questionnaire was administered through interview method, to the research participants. Simple random sampling technique was employed to select the sample of 273 participants for the study, comprising of 234(99.7%) males and 39(14.3%) females. The questionnaire comprises of two parts; part 1 consists of the demographic information of the participants and part 2 consists of the information about the dental hygiene of the participants. The results shows that 41% (n=111) clean their teeth once daily, 46% (n=126) clean their teeth twice daily, while 13% (n=36) clean their teeth more than twice daily. The result shows that there is significant level of dental hygiene practice among students of integrated Tsangaya model schools in Kano state. It is recommended that dental health should be incorporated into school health programs, in order to sustain and maintain the level of dental hygiene among students of integrated Tsangaya model schools and other similar institutions in Kano state and the nation in general.

ABSTRACT

The Enlightenment is a philosophy that predicts that human beings will be able to understand and explain the world with their intellect alone, and in this respect, it gives them the ability to make predictions about the future. Being able to make predictions about the future also means discovering the formulas for dominating nature. In this period, scientific advances and attempts to explain the universe based on experimentation and observation were the most fundamental practices of knowing the unknowns of the world. Thanks to these practices, the proportion of what was known about nature and society would increase and predictions about the future would be made. The increase in the proportion of what is known in the world also formed the basis for dominating it. The idea of dominating nature corresponds to a paradigmatic transformation. However, the tendency to dominate also means alienation from the essence of what is to be dominated and alienation from its own dynamics. In this respect, moving away from its own nature also means the emergence of incompatibilities. These incompatibilities bring up some problems called ecological problems. At this point, a transition from the human paradigm that dominates nature to the human paradigm that is in harmony with nature seems essential. This transition should be effective in a wide range of areas such as economy, health and urbanization. The study focuses on the urbanization practice based on the paradigm of human being in harmony with nature and as a result, the destructive impact of possible disasters on cities can be reduced. In order to reduce the destructive effects of disasters, especially faulty urbanization should be eliminated. While doing this, it is suggested that engineering, architecture and social sciences should be transferred to urbanization practice by acting jointly with a multi-disciplinary approach, dominating the details of the ecosystem.

ÖZET

Küresel ekonominin işleyiş sürecinde döngüsel ekonomi konseptine olan ilgi her geçen gün artmaktadır. Doğal kaynaklarının sınırlı olması ve sürdürülebilirliğin sağlanması açısından döngüsel ekonomi önem arz etmektedir. Bu süreçte üniversiteler de gerek ekonomik gerekse sosyal ve çevresel sürdürülebilirlik noktasında önemli çalışmalar yapan, sosyal ve kültürel alanlarda değişimi tetikleyen, toplumun refahı açısından önem arz eden kurumlar olarak karşımıza çıkmaktadır. Bilinçli gençlerin yetiştirilmesi, yeni fikirlerin ve yeniliklerin geliştirilmesi, çevresel sürdürülebilirliğin sağlanması, iklim değişikliği ile etkin şekilde mücadele edilmesi gibi pek çok açıdan kritik bir rol üstlenen bu kurumlar, yeşil kampüs alanları ve buna yönelik uygulamaları ile farklı alanlardaki sürdürülebilirlik çalışmalarına örnek/model olabilme potansiyeli taşımaktadır. Bu araştırmanın temel amacı, yeşil kampüs ve çevresel sürdürülebilirlik açısından üniversitelerin yıllar içindeki performans değişimini analiz etmek ve bu değişimin arka planındaki etkenleri saptamaktır. Çalışmanın veri seti Türkiye'de yer alan kamu ve vakıf üniversiteleri için UI GreenMetric Dünya Üniversite Sıralamasını oluşturan değişkenlere dayanmaktadır. Söz konusu değişim ise 2018-2022 dönemi için karşılaştırmalı metot ile ortaya koyulmaktadır. Çalışma kapsamında ilk ve son beşte yer alan üniversitelerin güçlü ve zayıf yönleri ayrıca doküman analizi yapılarak detaylı şekilde incelenmektedir. Çalışma sonucunda; üniversitelerin yıllar itibarıyla toplam skorlarında kayda değer artışlar olduğu ve Türkiye sıralamasında ilk beşe giren üniversitelerin sıralamalarının sabit olmayıp öne çıkan üniversitelerin yıllara göre farklılık gösterdiği saptanmıştır. Fakat İstanbul Teknik Üniversitesi'nin ilk sıradaki yerini koruduğu gözlemlenmiştir. Son olarak çalışma bulgularına dayanarak ilk sıralardaki üniversitelerin yeşil kampüs ve sürdürülebilirlik çalışmalarının ve bu alanda farkındalığın arttırılmasına yönelik faaliyetlerinin dikkat çektiği söylenebilir.

**AN OVERVIEW OF THE PERFORMANCE OF UNIVERSITIES IN TURKEY IN
TERMS OF GREEN CAMPUS AND ENVIRONMENTAL SUSTAINABILITY**

ABSTRACT

In the process of functioning of the global economy, interest in the concept of circular economy is increasing day by day. Circular economy is important in terms of limited natural resources and ensuring sustainability. In this process, universities appear as institutions that perform important studies on both economic, social and environmental sustainability, trigger change in social and cultural areas, and are important for the welfare of society. These institutions, which assume a critical role in various aspects such as raising conscious young people, developing new ideas and innovations, ensuring environmental sustainability, effectively combating climate change, have the potential to be an example/model for sustainability studies in different fields with their green campus areas and related practices. The main purpose of this study is to analyse the change in the performance of universities in terms of green campus and environmental sustainability over the years and to determine the factors behind this change. The data set of the study is based on the variables that make up the UI GreenMetric World University Rankings for public and foundation universities in Turkey. The change in question is revealed with a comparative method for the period 2018-2022. Within the scope of the study, the strengths and weaknesses of the universities in the first and last five are also examined in detail through document analysis. Because of the study, it has been determined that there are significant increases in the total scores of the universities over the years and that the rankings of the universities in the top five in the Turkey ranking are not constant and the prominent universities varied over the years. However, it has been observed that Istanbul Technical University has maintained its first place. Finally, based on the findings of the study, it can be said that the green campus and sustainability studies of the universities in the top ranks and their activities to raise awareness in this field attract attention.

ABSTRACT

Parallel to the plant analysis, soil samples were collected from the Cap Three Forks (CTF) area and subjected to extensive testing. The soil study aimed to assess mineral composition by X-ray diffraction (XRD) method, structure, and other important parameters. It encompassed certain physicochemical characteristics such as particle size distribution (texture) determined by the Robinson pipette method, pH, and organic matter by the Walkley-Black method, as well as calcium carbonate by the Bernard Calcimeter method. Our results showed that the CTF soil is characterized by a sandy to sandy-loamy texture with a high percentage of sandy fraction reaching 80.5% and a portion of loamy fraction ranging between 10.3% and 45%. An alkaline pH varies between 7.85 and 8.61, with total limestone levels for both 0-30 cm and 30-60 cm deposits. Organic matter levels are high, ranging from 0.28 to 3.6%. The available phosphorus content is significant (5-183.88 mg/kg) and varies from the 0-30 cm depth to the 30-60 cm depth. The diffractograms of the natural, glycolated, and calcined treatments corresponding to different clay fractions of Cap des Trois Fourches have shown a distinct composition, with the presence of irregularly interstratified illite-smectite, smectite, illite, and kaolinite, as well as quartz and feldspar as accessory minerals.

Istanbul-Türkiye

Email: suddinmu@gmail.com

ABSTRACT

This study delves into the concept of justice within the framework of Greek philosophy, with a particular focus on the perspectives of Plato and Aristotle, as well as Islam. The study highlights the absence of justice as the primary cause for various societal issues, including corruption, theft, unequal distribution, and oppression, which continue to prevail globally. Throughout history, influential socio-political and economic groups have consistently obstructed the establishment of justice, often perceiving laws as applicable to others but not themselves. As a result, justice has remained largely theoretical rather than practical. In exploring the notion of justice within both the state and society, individuals lean towards either Plato and Aristotle or emphasize the significance of Islam. This study aims to critically evaluate both forms of justice by first elucidating the concept of justice as perceived by Greek philosophy, particularly Plato and Aristotle. Subsequently, it sheds light on the understanding of justice conveyed by Quranic verses and Hadith, or sayings of Prophet Muhammad (upon whom be peace). Finally, the study establishes a clear distinction between the two concepts of justice.

ABSTRACT

The emergence of the Industry 4.0 concept has garnered the attention of both institutions and nations. While businesses have been implementing changes in alignment with Industry 4.0 principles, governments have also been actively investing to secure a competitive position. This study seeks to identify countries with similar Industry 4.0 performances by analyzing internationally recognized indices (Digital readiness score, Basic needs, Business & government investment, Ease of doing business, Human capital, Start-up environment, Technology adoption, Technology infrastructure). To achieve this, the multidimensional scaling method, a widely employed technique for dimension reduction, was employed. Index scores determined from many international sources were collected for 207 countries. Since the scores of some countries are not included in the indexes, 146 countries were made ready for analysis after countries with missing or invalid data were eliminated. Based on the scores derived from data transformation, 146 countries are positioned within a two-dimensional plane. As a result, the countries with the highest scores were identified as Singapore, Luxembourg, and Iceland. Conversely, the least successful countries were found to be Liberia, Afghanistan, and Eritrea. The countries closest to Turkey in terms of Industry 4.0 performance were determined to be Azerbaijan, Macedonia, Armenia, and Panama, in respective order.

Keywords: Industry 4.0, Digital readiness score, Multidimensional scaling method.

**ENERGY ANALYSIS OF SPHERICAL ROLLER BEARINGS ACCORDING TO
VIBRATION AND BEARING GAP VALUES IN INDUSTRIAL FANS**

ABSTRACT

The ever-increasing trend of energy costs has led to an increase in studies on energy efficiency, especially in industrial enterprises. Fans constitute an important item in terms of energy consumption in industrial enterprises, and a certain amount of energy efficiency has been achieved in past research, such as improvements in the fan blade structure and the use of drivers in the systems. However, no study was found on the effect of bearing clearance and vibration in industrial fans on energy efficiency. In this study, vibration and bearing clearance values of 6 different industrial fans (160-315 kW) in an operating calcite factory were recorded for 6 months, and the data obtained were analyzed in terms of energy cost. First of all, coupling adjustment (easy laser) was made in order to ensure that six fans could operate under the same conditions. Later, a Lincoln automatic lubrication system was installed in order to lubricate all fans equally and in the same amount. Finally, a 6-month data recording system was created with the help of a program called Smatic Manager, which records the current values and fan revolutions from the fan drives. While the installed system was in continuous recording, the vibration and gE values of the fan bearings were recorded once every 15 days by measuring with a vibration pen called the SKF CMDT 391. When the results are analyzed, it has been determined that the fans draw between 1% and 10% extra current in cases where either or both of the vibration and gE values increase, and therefore they consume extra energy at these rates. Considering the vibration and gE values measured from all fans, it has been determined that a fan that is not regularly maintained and monitored causes an extra energy consumption of 8.8 kWh on average.

ABSTRACT

Numerous phytochemicals are found in plant parts such as leaves, flowers, stems, roots, etc. that may have health advantages. In the modern world, people's lifestyles and certain environmental variables like radiation, pollution, etc. cause the body to produce free radicals, which in turn cause a variety of human ailments like diabetes, heart disease, cancer, etc. Despite the advancements in medicine, people still have a variety of health problems. Particularly many people suffer from cancer and diabetes. Medicinal value-bearing plants were tried in a polyherbal mixture to alleviate these health difficulties that individuals in the fast-paced modern world experience. The main objective of this study is to develop a herbal beverage by infusing a combination of herbs like *Clitoria ternatea* (flower), *Cassia auriculata* (flowers), *Hibiscus rosa-Sinensis* (flowers), and *piper betel* (leaves). The herbal extracts were studied for their phytochemical compounds, anti-oxidant (DPPH), anti-diabetic, Anti haemolytic, anti-microbial and Anti cancerous activities. The cytotoxicity assay was carried out in a human triple-negative breast cancer cell line (MDAM231), and it was found that at a concentration of 500 µg/ml, the formulation had a best control over the development of cancerous cells. The anti-diabetic activity of the herbal combination was determined by alpha-amylase inhibitory assay. Phytochemical analysis indicates that all four herbs have phenolic and tannin compounds that have redox properties. The total antioxidant activity was determined by DPPH (1,1-diphenyl-2-picryl-hydroxyl) assay. The antimicrobial activity was tested against *E.Coli* and *Bacillus sp.* The tea has a slightly earthy flavor smell with dark bluish color proving its antimicrobial and antioxidant nature. Thus the formulated polyherbal drink shown

positive control over diabetes and cancer cells could be considered as a healthy alternative to sugary beverages.

**STUDENTS ASSESSMENT OF ONLINE EDUCATION DURING THE COVID-19
EPIDEMIC: AN ANALYSIS**

Zohaib Hassan SAİN*

Faculty of Business & Management Sciences, Superior University, Pakistan

Email: zohaib3746@gmail.com

ABSTRACT

The purpose of this study was to assess the online instruction given to students during the COVID-19 epidemic. At the four universities of Lahore city that were the center of the study, 600 students pursuing undergraduate, graduate, and doctoral degrees participated. A mixed method was used to design the research using both qualitative and quantitative components. An online survey was employed during the quantitative phase. Online in-depth interviews using a semi-structured interview form were carried out during the qualitative phase. Local Lahore, Pakistan, inhabitants were among the responses. The content analysis led to the identification of 21 categories and three major themes. The following themes were accomplished: "It could have been better!" for their suggestions, "Face-to-face education is better!" for the bad parts of the student's experiences, and "Better than nothing!" for the positive aspects of their experiences. It has been decided that a technology approach should be employed to further expand the distance education curriculum in the four universities that have been selected.

**BLENDED LEARNING ADOPTION IN PAKISTANI UNIVERSITIES: CHALLENGES
AND RECOMMENDATIONS**

Zohaib Hassan SAIN (ORCID: 0000-0001-6567-5963)

Superior University, Faculty of Business & Management Sciences, Pakistan

Email: zohaib3746@gmail.com

ABSTRACT

The aim of this study was to examine the standpoints of BS 4 years program (BSCS) students in Pakistani universities regarding the issues and challenges they face. The study utilized a descriptive survey method with a quantitative approach to quantify and measure students' perceptions and issues related to blended learning in education. The study collected data from 219 students out of 482 enrolled in the BS 4 years program (BSCS) at three public universities in Pakistan in the 2022 academic year. A questionnaire with a three-point Likert scale was used to gather data, which was then analyzed using frequencies, percentages, and diagrams. The findings showed that most students had a positive view of blended learning, but they also encountered various issues, such as lack of time, insufficient skills and support for proper use, lack of training, and unavailability of Learning Management Software (LMS) for technological learning tools. The study suggests the need for the development of institutional policies for the effective use of blended learning in universities and the implementation of training and skill development programs for teachers to integrate technology in their teaching.

ABSTRACT

The purpose of this study is based on exploratory research to identify Common Challenges Encountered in Institutes of Higher Learning. The exploratory research approach is used to achieve the objectives of the study in less time and with inexpensive means. For the last few years, Pakistan is facing a lot of emerging challenges in the education sector such as curriculum, few training institutions, corruption in education, teachers' behavior, and less research work. Emerging challenges in the education sector are fewer training institutions and the trend toward research work which is essential to follow for the growth and strength of any economy. The purpose of our research is to identify the emerging challenges in the educational sector in Pakistan which the educational sector is suffering for the last few years. The researcher used triangulation to carry out the reliability and validity of the data for results. So, to conduct this triangulation the researcher used questionnaires for the students, questionnaires for the teachers, and interviews with the management. In this regard primary data was collected from the focused group of students using a sample of 100 questionnaires for each university filled by the students of the selected five universities. The findings highlight the positive relationship of quality education with curriculum, few training institutions, corruption in education, teachers' behavior, and less research work. These challenges caused restrictions in accomplishing competent teaching and learning with respect to quality education. According to the current situation in Pakistan, the same challenges are being faced.

ABSTRACT

Electrolysis is a process used to carry out a non-spontaneous chemical reaction using direct electric current. It is used to separate elements from their ores or compounds, using an electrolytic cell. The electrolytic cell contains the electrolyte, the substance undergoing breakdown, and two conductive electrodes that contact the electrolyte. There are two types of electrodes: reactive and inert. Reactive electrodes are electrodes that actively participate in the reaction and are soluble in the electrolyte. Some examples of reactive electrodes are zinc, copper, lead and silver. Inert electrodes do not participate in the reaction and do not change. Some examples of inert electrodes are platinum, gold, graphite and rhodium. The choice of electrode depends on the type of electrolysis and the desired products. For example, to separate a metal from its ore, a reactive electrode is used as the anode (the positive electrode where oxidation takes place), while an inert electrode is used as the cathode (the negative electrode where reduction takes place). In this way, metal ions in the

ore will be reduced to metal atoms at the cathode and the anode will be consumed by oxidation. The change of electrodes can have an impact on the pH, concentration and behavior of hypochlorous acid in the electrolysis system. The choice of electrode material can influence the redox reactions that occur at the electrodes and thus affect the production and concentration of different chemical compounds. The aim of this study is to describe the advantages and disadvantages of using different electrodes in the electrolysis process for various applications and industries, methods of use and results.

ABSTRACT

Osteosarcoma is the most common bone cancer among children and young adults. Despite advances in diagnostic techniques and targeted cancer therapies, osteosarcoma continues to exhibit high mortality rates and a tendency to metastasize. An innovative alternative to conventional chemotherapy is required due to poor response rates, challenging dosages, and side effects. The concept of combined therapy, in which more than one agent is administered simultaneously, is emerging as an effective strategy in osteosarcoma treatment. Curcumin stands out with its multifaceted mechanisms preventing tumor progression and exhibits significant anti-cancer activity in both *in vivo* and *in vitro* studies. However, the clinical use of curcumin is inadequate due to its limited water solubility, rapid metabolism, and rapid elimination from the system. On the other hand, ganetespib, an Hsp90 inhibitor, acts by disrupting protein folding, resulting in the degradation of essential oncoproteins necessary for cancer cell survival. This study investigated the effect of the combined use of curcumin and ganetespib on Saos-2 osteosarcoma cells. Evaluation of the effect of ganetespib and curcumin on Saos-2 cell viability was done by the MTT assay. In addition, the Chou-Talalay test was applied to determine the potential interaction between these two agents. When administered individually, both ganetespib and curcumin significantly and progressively inhibited the growth of Saos-2 osteosarcoma cells in a dose- and time-dependent manner. IC₅₀ values were $14.02 \pm 0.003 \mu\text{M}$ and $7.30 \pm 0.004 \mu\text{M}$ at 24h and $17.20 \pm 0.005 \mu\text{M}$ and $16.02 \pm 0.005 \mu\text{M}$ at 48h for ganetespib and curcumin, respectively. Curcumin and Ganetespib combined induced an antagonistic response in Saos-2 osteosarcoma cell lines. The findings provided important insights into unravelling the mechanisms underlying the combined antagonist effect of the two agents and formulating improved strategies.

ABSTRACT

This paper explores the cutting-edge of cancer diagnosis by introducing innovative imaging techniques based on nanoplatforms. The ever-progressing field of oncology requires more precise and effective diagnostic tools, and nanotechnology has emerged as a transformative solution. By utilizing the distinctive properties of nanoparticles, researchers have devised new imaging platforms that enable early and precise detection of cancer. Nanoplatforms offer clear advantages over conventional imaging methods. Their customizable characteristics allow for precise targeting and improved contrast, resulting in better visualization of cancerous tissues. This paper examines recent strides in nanoparticle creation and modification, showcasing their role in producing tailored imaging agents for specific cancer types. Furthermore, by integrating multifunctional components within these nanoplatforms, a comprehensive diagnostic approach is achievable, encompassing both imaging and therapeutic applications simultaneously. Key focal points encompass the creation of high-specificity contrast agents, the utilization of advanced imaging techniques like photoacoustic and multimodal imaging, and the integration of strategies for molecular targeting. The paper also delves into the challenges linked with transitioning these innovations into clinical practice, addressing concerns regarding biocompatibility, toxicity, and regulatory clearance. The significance of this research lies in its potential to transform cancer diagnosis fundamentally. The capability to detect malignancies in their early stages is pivotal for enhancing patient outcomes. Nanoplatform-based imaging techniques hold the potential to enable non-invasive, accurate, and individualized diagnostics. With their exceptional sensitivity, these techniques have the capacity to identify cancer at its inception, facilitating timely interventions and customized treatment strategies.

Keywords: nanoplatforms, cancer diagnosis, imaging techniques, molecular targeting, contrast agents, multimodal imaging, therapeutic applications.

ABSTRACT

The limitations of nitrile butadiene (NBR) gloves in terms of mechanical strength, biodegradability, and free radical stability have restricted their use in commercial and industrial application. NBR gloves are insufficient in flexibility, strength, and puncture-resistance compared to natural rubber and instable to chemical agents. In addition, their nonbiodegradability creates disposal difficulties. To address stated problems, a multifunctional nanomaterial containing sulfonated-nanocrystalline cellulose-antioxidant (ANCC) was developed and applied to improve the mechanical, stability and biodegradability properties of NBR gloves. The carbon content and natural derivatives of nanocrystalline cellulose (NCC) confer biodegradability on NBR gloves. The attachment of gallic acid (GA) antioxidant is not causing any changes in morphology of NCC, while only the crystallinity has been reduced significantly. The chemical bonds have been confirmed using Fourier Transmission Infra-Red (FTIR) at 1645cm⁻¹. DPPH test was performed to study the effectiveness of GA in non-modified nanocellulose and sulfonated-nanocrystal cellulose-antioxidant with ratio 1:4 gives the lowest IC₅₀ value which is less than 3mg. Both NCC and ANCC have been synthesized with different aspect ratio to investigate the mechanical and thermal properties of the NBR/NCC and NBR/ANCC composites with defined optimal loading. The production of NCC using hydrolysis acid method and NBR composites has been prepared using dipping method to simulate the real condition of glove production. NBR/NCC5 showed the highest value of 500% MOE (8.6MPa) with the highest elongation at break at 770% and highest tensile strength (27MPa). NBR/ANCC5 observed highest elongation at break at 1200% compared to pure NBR. With increased of carbonyl content increased the surface activity of ANCC that contributed to increment in elongation at break. Biodegradability properties of NBR/ANCC5 composites more promising as compared to NBR/NCC5 with 8% of weight loss differences in 6 months. Thermal stability for both NBR/NCC and NBR/ANCC increased with the additional of filler loading. It is believed that at lower concentrations of NCC, the Zn/NCC complex and percolation network are crucial towards increasing the thermal stability of the nanocomposite. From this analysis, it has been revealed that NCC and ANCC obtained a good interfacial bond of electrostatic interactions and hydrogen bonds with NBR polymeric chains which contribute to the above-mentioned results. Furthermore, the highly crystalline and nanosized of ANCC played important role to improve the flexibility and strength of NBR composites. This study brought a new alternative on green and high

performance of additive in NBR compounding formula that impact on environmentally friendly, low cost and sustainable glove industries.

ABSTRACT

Brain cancer disrupt specific properties of the vascular endothelia, even affecting the special blood-brain barrier, collectively known as the blood-brain tumor barrier. Green synthesis of magnetic Fe₃O₄ NPs using grape extract has become a promising nanomaterial as their magnetic properties have excellent potential against brain cancer treatment. The magnetic nanoparticles (Fe₃O₄ NPs) were synthesized by a Sol-gel method. The manifold characterization i.e., XRD, SEM, FTIR, UV-Visible and EDX were performed to confirm the crystalline structure, morphological analysis, functional group analysis, energy band gap and elementary composition to demonstrate the synthesis of green magnetic nanoparticles (Fe₃O₄ NPs). Several nanoparticles (such as NiO NPs, Gd NPs, and Au NPs etc.) have been used for biomedical application as well as for brain cancer treatment. The potent antibacterial inhibitory activities of Fe₃O₄ NPs have been examined by pathogenic bacterial strains studied against Gram-negative bacterial strain *Klebsiella pneumoniae* and Gram-positive bacterial strain *Staphylococcus aureus*. Finally, synthesized Fe₃O₄ NPs were tested for potential cytotoxicity against AMGM5 (human brain cancer) cell line. The Current development of therapeutic analysis like radiotherapy was led to comprehensive treatment of various malignant tumors. Future studies are underway to understand the excellent effects of Fe₃O₄ NPs in the treatment of brain cancer.

ÖZET

Gelişen teknolojik cihazlar insanları ve toplumu daha kolay izlenir ve gözetlenir hale getirmiştir. Bireyler sosyal hayatlarını, yaşadıkları konutları, ortamları, ailelerini, arkadaşlık ilişkilerini, ilişki durumlarını yaşamlarını ve kimliklerini oluşturan bütün bilgileri açık bir platformda gönüllü bir şekilde umuma sunmaya başlamışlardır. Yaşadıkları hayatı fotoğraflar, videolar ve etkileşimli görsel aktivitelerle tüm internet kullanıcılarının erişimine açmışlardır. Sosyal medya platformlarının sunduğu gizlilik seçenekleri dahi artık bu durumu engelleyebilecek güçte değildir. Bireylerin gönüllü paylaşımları ile özel yaşam alanları kamu malı haline gelmiştir. Bentham'ın hapisane panoptikonu artık bu özel mekanı aşmış ve bir dünya panoptikonu haline dönüşmüştür. Sadece azınlığın çoğunluğu gözetlediği bir toplumdan çıkılmış herkesin herkesi gözetlediği bir toplum oluşturulmuştur. Bireyler, gözetlenmek fark edilmek, takipçi kazanmak, beğenilmek istemektedir. Kusursuz olmak, gerçek dünyanın sıradanlığı ve sadeliği dışında bir sanal mükemmel yaşam yaratma arzusu ile yapılan paylaşımlar daha çok etkileşim almakta, bireyler kurulan bu sahte yaşamların gönüllü piyonları haline gelmektedir. Günümüzde, teknolojik imkanlarla birçok veri toplanmakta, bu veriler ile büyük arşivler oluşturulmaktadır. Gözetim günlük yaşamın rutinlerine daha fazla nüfuz etmektedir. Eylemlerimiz sandığımız gibi özgür irademizle gerçekleşmemektedir. Elektronik panoptikon egemenin kendi iktidarını sağlama alma çabasıdır. Dijital gözetimin bir türü, katı bir devlet gözetimi iken, diğeri gözetimi gönüllü kabul ettiren, gözetime özendiren, onu geliştiren ve mükemmelleştiren ideolojileri içinde barındıran tüketim alanının akışkan şekildeki gözetimidir. Zaman içerisinde iktidarlar, gözetledikleri kitleleri, kendilerini onlara göstermeden gözetlemenin yollarını aramışlardır. Burada panoptikon artık hapisane sistemi olmaktan çıkmakta; veri tabanları ile gerçekleştirilen bir iletişim sistemi haline gelmektedir. Yollarda kullanılan mobese kameraları, güvenlik kameraları, akıllı cihazlar üzerindeki kameralar, GPS takip sistemleri, sosyal medya paylaşım siteleri, internet üzerinden yapılan alışverişler vb. etkinlikler süperpanoptikon modelinin bireyleri takip vasıtası haline gelmiştir. Kurum ve şirketler bireylerin parmak izlerine kadar alabilmekte; elektronik verileri ve profilleri sınıflandırarak insanların genel eğilimlerini arşivlemektedir.

Anahtar Kelimeler: Panoptikon, Gözetim, Gözetim Toplumu

**TRANSITION FROM BENTHAM'S PRISON PANOPTICON TO THE SOCIETAL
PANOPTICON: THE SOCIETY OF SURVEILLANCE**

ABSTRACT

Developing technological devices have made people and society more easily monitored and surveilled. Individuals have begun to voluntarily make public on an open platform all the information that constitutes their social lives, residences, environments, families, friendships, relationship status, lives, and identities. They have made their lives accessible to all internet users through photographs, videos, and interactive visual activities. Even the privacy options social media platforms offer aren't preventing this situation. Voluntary sharing of individuals, private living spaces have become public property. Bentham's prison panopticon has transcended this private space and becomes world panopticon. Society where only the minority spies on the majority, society where everyone spies on everyone has been created. Individuals want to be observed, to be noticed, to gain followers, to be liked. The posts made with the desire to be perfect, to create virtually perfect life outside the mediocrity and simplicity of the real world, receive more interaction, and individuals become voluntary pawns of these fake lives. Today, much data is collected with technological means, and large archives are created. Surveillance is penetrating further into the routines of daily life. Our actions do not take place with our free will as we think. The electronic panopticon is the sovereign's attempt to secure its power. While one type of digital surveillance is strict state surveillance, the other is the fluid surveillance of the consumption sphere, which includes ideologies that make surveillance voluntary, encourage it, develop, and perfect it. Here the panopticon is no longer a prison system; it becomes communication system realized through databases. Activities such as CCTV cameras on roads, security cameras, cameras on smart devices, GPS tracking systems, social media sharing sites, online shopping, etc., have become the means of tracking individuals by the superpanopticon model. Institutions and companies can take individuals' fingerprints, classify electronic data and profiles and archive people's general tendencies.

Keywords: Panopticon, Surveillance, Surveillance Society

ABSTRACT

Antidepressants are seen as a great achievement in the field of psychopharmacology. It is known that there are numerous clinical studies and professional observations on the effective regression of symptoms caused by the disease when used under the supervision of a psychiatrist in psychiatric conditions and diseases. As stated in academic publications, there is an intense use of antidepressive drugs in the world and in Turkey. Detection and management of the side effects of the antidepressant drugs used are of great importance for the success of the treatment process. Antidepressants have side effects that differ from person to person. Accurate detection of these side effects is critical for patients to continue treatment and to select the appropriate drug. In studies, it is known that 1/3 of patients discontinued treatment due to drug side effects. The aim of this study is to estimate side effects in antidepressant drugs using data mining techniques. The data set used for antidepressant side effects was obtained from the “Kendine İyi Bak” mobile application of Pusula HBYS Company. In the study, side effects were estimated by using data from 202 patients using antidepressant medication at different times. For the antidepressant side effect study, in the first stage, the "Decision tree" accuracy 0.85 accuracy, "Random forest" accuracy 0.85 accuracy was obtained in the predictions made with the 5-fold cross validation method of the "Decision tree" and "Random forest" models. After feature extraction and hyperparameter optimizations, the highest success metrics in tree-based algorithms are recommended with “Decision tree” accuracy 0.85, F1-Score 0.82, recall 0.82, precision 0.87, “Gradient Boosting Learning” accuracy 0.84 and “XGBoost” accuracy 0.85. It can be said that the approach is quite promising.

ABSTRACT

Among other carotenoids, lycopene is a potent antioxidant with the capacity to trap Peroxyl radical and quench singlet oxygen. Lycopene commonly found in tomatoes, pink grape fruits and watermelon. Lycopene cyclase generally found in tomatoes, convert lycopene into beta-carotene by catalyzing the formation of two β -rings. Lycopene is the most powerful antioxidant, followed by α -tocopherol, α -carotene, β -crypto-xanthin, zeaxanthin- β -carotene, and lutein. Lycopene is poorly absorbed. It is mainly distributed to fatty tissue such as adrenal gland, liver and testes. It is absorbed across gastro intestinal tract via a chylomicron mediated mechanism and released to lymphatic system for transport to the liver. Lycopene trap free radical by adduct formation, electron transfer to radical and allylic hydrogen abstraction. Lycopene shows variety of pharmacological properties such as anti-inflammatory, anticancer, photo-protective, anti-obesity, anti-asthmatic, immune system, apoptosis and useful in cataract. In nature, antioxidants exist in combination, and the combination of different antioxidants may act additively or even synergistically. Carotenoids mixtures were more efficient than individual substances. Lycopene showed synergistic activity with other antioxidant like Coenzyme Q10, vitamin E, olive oil, N-acetylcysteine etc. They interact with vitamin C, E, β -carotene and lutein, thereby increases its free radicals scavenging activity in the lipoprotein particle. It was revealed that the coefficient effect of lycopene and Vitamin E is Assoc.d with vitamin E regeneration from α - tocopheroxyl radical by lycopene. It has been suggested that the synergistic effects may be related to their physicochemical properties and or their location within the biomembrane or low density lipoprotein particle; that one antioxidant is able to regenerate the second antioxidant.

ABSTRACT

Coenzyme Q10 (CoQ10), a fat-soluble lipophilic molecule ubiquitously located at the hydrophobic domain of cell membranes, is an endogenous antioxidant that is partially involved in the process of energy metabolism and antioxidant protection. It is composed of a benzoquinone ring and a polyisoprenoid tail containing between 6 and 10 subunits. It is the only naturally occurring antioxidant that the body may recycle into its active state. CoQ10 is a potent antioxidant with the capacity to scavenge free radicals and shield cells from oxidative stress. CoQ10 is absorbed slowly. Peak plasma levels are attained within 5 to 10 hr. following oral administration. It is distributed in liver & incorporated into very low density lipoproteins (VLDL). The elimination half-life is approx 34 hr. excretion is primarily through the biliary tract. CoQ10 serves as an electron and proton carrier of the mitochondrial respiratory chain, playing an essential role in ATP synthesis by enabling the process of oxidative phosphorylation. CoQ10 controls cell redox status and regulates reactive oxygen species (ROS) generation, exhibiting its effects on protecting the cell against free-radical-induced oxidation. CoQ10 is a central component in the mitochondrial electron transport chain (ETC) located in the inner mitochondrial membrane where it transports electrons from complexes I and II to complex III to provide energy for proton translocation to the inter membrane space. CoQ10 shows variety of pharmacological actions such as inhibition of lipid and protein peroxidation, protection against apoptosis and autophagy, scavenges free radical along with membrane stabilizing property.

ABSTRACT

News and event system is a platform developed in order to alleviate the problems faced by numerous organizations that use the notice boards method to pass information. The software tackle problems Assoc.d with the use of notice boards which include; information not reaching the target audience in real time, loss of important files, and news or information been tempered with during the process of transmission. The project was conduct so as to develop a software that will be able to take care of all the processes that are involved in automating the notice board method of conveying news and events, this includes; to effectively and efficiently disseminate information about real time news and upcoming events, to provide a reliable source of information, and to bridge the gap between heads of organizations and their staff. The software is designed to carter for the needs of activities document news and events system through the automation of the existing manual system. HTML and XPSS as used to design the GUI, PHP my admin was used to design the database and XAMP server was used to preview the work on browser.

**MEDIATING ROLE OF DELEGATING LEADERSHIP STYLE BETWEEN OPENNESS
PERSONALITY TYPE AND GLASS CEILING EFFECT AMONG EDUCATORS**

Dr. Sarwat SULTAN

Department of Applied Psychology
Bahauddin Zakariya University, Multan

Rutaba SALMAN

Department of Applied Psychology
Bahauddin Zakariya University, Multan

ABSTRACT

The study investigated the mediating role of delegating leadership style between the relationship of openness personality trait with glass ceiling effect among educators of public and private sectors. Using the survey research design data were collected from 250 female educators through Big five Personality inventory (BFI), Leadership Style Questionnaire and Glass Ceiling Questionnaire. Regression analysis exhibited 12% effect of openness personality trait on glass ceiling effect. Mediation analysis showed the significant indirect effect ($p < 0.1$) in the relationship between openness personality trait and glass ceiling effect. Hence the results showed that the direct impact of openness trait on glass ceiling was not significant, findings indicated the complete mediation through delegating leadership style. The results of the study can be generalized on working young women in different organizations, as well as for those who are going to develop their career. Findings can be helpful to know the unseen barriers that affect the employees' progress, and therefore can provide help to overcome the barriers.

OPINIONS OF CLASS TEACHERS ON SUMMER LEARNING LOSSES IN LITERACY

Dr. Abdulkadir SAĞLAM (ORCID: 0000-0003-3023-5751)

Ministry of Education, Van Edremit Science and Art Center, Van-Türkiye

Email: saglam6888@gmail.com.tr

ABSTRACT

Considering the intervals of summer breaks during the educational process, educators must pay careful attention to learning losses. Particularly, the learning gaps experienced during the initial stages of reading and writing can lead to the failure in achieving targeted outcomes for second-grade students within the stipulated timeframe. Given the critical developmental phases, the identification and rectification of these learning losses in the processes of reading and writing hold significant importance. It is imperative that classroom teachers possess adequate knowledge and engage in pertinent interventions. The objective of this study is to ascertain the perceptions of second-grade classroom teachers, who conducted educational activities during the 2022-2023 academic year, regarding the learning losses in reading and writing skills observed among their students over the summer vacation period. The research was conducted utilizing the qualitative research method known as case study. The participants consisted of 17 experienced classroom teachers working in the province of Van. The data collection instrument was designed in accordance with expert opinions and took the form of a semi-structured interview questionnaire. The data acquired was analyzed using the content analysis method. The findings of the research illustrate that classroom teachers frequently encounter learning losses in the initial stages of their students' reading and writing processes. Students' reading abilities, specifically, are marked by challenges such as forgetting phonetic sounds, confusing phonetic sounds, and slowing down in reading speed. With regard to writing, students exhibit difficulties in recalling the correct spellings of phonetic sounds and struggle with activities like dictation exercises.

Keywords: Summer reading loss, reading, writing, teacher's view.

**THE RELATIONSHIP BETWEEN GENERAL SELF-EFFICACY AND LIFE
SATISFACTION OF UNIVERSITY STUDENTS**

Dr. Öğr. Üyesi Serkan CENGİZ (ORCID: 0000-0001-9070-6338)

Ağrı İbrahim Çeçen University, Faculty of Science and Literature, Department of Psychology,
Ağrı-Türkiye

Email: scengiz@agri.edu.tr

ABSTRACT

The aim of this research is to examine the relationship between the general self-efficacy levels of university students and their life satisfaction. The researcher used a snowball method to distribute the online questionnaires prepared through the Google forms platform via the student information system and e-mail. Then, the participants were asked to copy the link of the survey's web page and share it among their acquaintances. The study group of the research consists of 210 university students. 52.9% (n = 111) of the students who voluntarily participated in the current research were female and 47.1% (n = 99) were male students. In addition, the average age of the students was calculated as 19.38 ($SD = .74$). Research data were obtained by using the General Self-Efficacy and Life Satisfaction Scale. The relationship between students' self-efficacy levels and their life satisfaction was determined by Pearson correlation analysis. Afterwards, the predictive effect of students' proficiency levels on their life satisfaction was examined by simple regression analysis. As a result of the correlation analysis, it was revealed that there was a low-level positive and significant relationship between general self-efficacy and life satisfaction ($r = .24, p < .05$). As a result of simple regression analysis, it was determined that self-efficacy significantly predicted life satisfaction and explained 6% of the variance of life satisfaction. The results show that self-efficacy is a significant predictor of life satisfaction.

ABSTRACT

In this study, ZnO nanoparticles were synthesized using plant extract by the green synthesis method with two different precursors. Zinc acetate dihydrate ($Zn(CH_3CO_2)_2 \cdot 2H_2O$) and zinc nitrate hexahydrate ($Zn(NO_3)_2 \cdot 6H_2O$) were used in a straightforward green synthesis technique to produce zinc oxide NPs. Heterogeneous photocatalysis was used to assess ZnO nanoparticles' potential use for dye removal from wastewater. The ZnO nanoparticles' photocatalytic performance has been assessed using methylene blue (MB). The structural properties of the nanopowder were investigated using PXRD (Powder X-ray Diffractometer). PXRD results show typical PXRD patterns of ZnO NPs prepared with Zinc acetate and Zinc nitrate. All of the detected peaks were indexed to hexagonal wurtzite ZnO with space group P63mc based on XRD data. Furthermore, XRD patterns revealed polycrystalline ZnO NPs with no secondary phase. The presence of diffraction peaks (100), (002), (101), (102), (110), (103), (200), (112), and (201) in PXRD results indicate that ZnO nanoparticles were synthesized with high purity and polycrystalline form. The synthesized ZnO-NPs' photocatalytic activity was evaluated using MB (C₁₆H₁₈ClN₃S) under UV light. A Pyrex discontinuous batch reactor was filled with 0.1 g of ZnO NPs and 100 milliliter of MB solution (10 ppm). Under UV light alone or photocatalysis in the absence of UV light, the test resulted in a quite small degradation in MB. This outcome demonstrated that very slowly phenol desegregate in the absence of a photocatalyst or under UV light without photocatalysis. In this work, ZnO NPs with zinc nitrate photocatalysts took 30 minutes to degrade about 96% of the MB, and ZnO NPs with zinc acetate photocatalysts took 90 minutes to degrade about 96% of the MB.

ABSTRACT

In the present work, we propose an electrochemical sensor that can recognize an antipsychotic drug, chlorpromazine hydrochloride (CPH) in pico molar level using glassy carbon electrode (GCE) modified with ceria doped zirconia ($\text{CeO}_2/\text{ZrO}_2$) nanocomposite. The detection of CPH is very much required because overdosing of it leads to hyper activity and lethal bipolar illness amongst children and adults. To predict the experimental conclusions, identify the influencing parameters and demonstrate the efficacy of proposed sensor, the mathematical modelling of voltammetry experiments was carried out using deterministic and stochastic approach. This approach of investigating the experimental results along with mathematical model's analytical and numerical solutions allows for the effective qualitative and quantitative study of parameters that characterize the output of electrochemical measurements, which will be of immense use to construct sensing devices for medical diagnostics and environmental monitoring extremely effectively.

ABSTRACT

The present study highlights the ameliorative role of zinc (essential metal), vitamin B₁ (vitamin), Methionine (amino acid) and NAC, (N-acetyl cysteine) (antioxidant) on cadmium induced oxidative stress in albino rats. The study was divided in the eleven groups and the animals were given CdCl₂ along with different nutrients. First group having Negative Control animals were given normal saline water for forty days, while the second group having positive control animals were treated with cadmium chloride (2mg/kg) orally, third group were administered with cadmium chloride and zinc (CdCl₂+Zn), fourth group of animals were given cadmium chloride along with dietary nutrients that is zinc, vitamin B₁ and NAC in combination (CdCl₂+Combination (Methionine+Zn+Vit B₁+NAC)). The physiological response of Cd intoxication on the albino rats was evaluated towards haematotoxicity and hepatotoxicity based on various biochemical variables. The protective effects of dietary nutrients were analyzed separately as acute and sub chronic studies for five and forty days respectively. The overall toxic effects of continuous exposure to cadmium were assessed by monitoring body weight and organ-body weight ratio in rats. A significant decrease was observed in body weight, while significant increase in organ-body weight was observed after the Cd exposure as compare to control rats. The results evinced that combined treatment of zinc (essential metal), methionine (amino acid), Vit-B₁ (vitamin) and NAC (antioxidant) was most effective than either of them alone in reversing Cd induced changes in the selected vital organs of albino rats.

Key words: Cadmium, Essential metal, Antioxidant, Methionine, Necrosis.

ABSTRACT

Zinc oxide quantum dots (ZnO QDs) possess a versatile range of beneficial characteristics, including impressive photoluminescence, water solubility, and robust photostability. These attributes position them as promising candidates for applications in drug delivery, bioimaging, and other biomedical fields. Nonetheless, prior to their potential human use, a comprehensive exploration of their in-vivo toxicity is imperative. Zebrafish (*Danio rerio*), due to their cost-effectiveness, rapid development, and genetic similarity to humans, serve as a prevalent in-vivo model for assessing nanomaterial toxicity. This study delves into the assessment of concentration-dependent toxicity of ZnO QDs and Zinc oxide bionanocomposite (ZnO BC) in zebrafish, with a concurrent optimization of methodologies using Box-Behnken design. To ensure judicious toxicity assessment in zebrafish, preliminary investigations encompassed cell line and hemocompatibility analyses, establishing appropriate dosages. Intriguingly, neither ZnO QDs nor ZnO BC exhibited discernible embryonic toxicity or adverse effects during hatching or developmental stages at a dosage of 2.5 μl for ZnO BC and 2 μl for ZnO QDs. Meanwhile, behavioral assays on larval zebrafish under visible light unveiled a dose-dependent decrease in total swimming distance and speed. However, noticeable effects materialized only at elevated concentrations (>250 μl for ZnO BC and >200 μl for ZnO QDs) in zebrafish embryos. Consequently, it is apparent that lower concentrations of ZnO BC and ZnO QDs remain substantially non-toxic. This pioneering research significantly contributes to the arsenal of future investigators in the realm of in-vivo imaging studies, offering valuable insights into the potential toxic ramifications of nanomaterials. These insights are pivotal in guaranteeing the safety of nanomaterials in various bio-applications, thereby facilitating the responsible advancement of cutting-edge biomedical technologies.

ABSTRACT

Writing skill is one of the most important skills acquired in primary school period. Informative text writing is a type of writing that is often neglected. With this research, it was tried to determine the place of writing informative texts in the studies of primary school teachers about teaching writing. The research was designed with a case study, one of the qualitative research types. The participants of the research are 14 primary school teachers. Data were collected through face-to-face interviews with volunteer teachers using a semi-structured interview form prepared by the researcher. Descriptive analysis technique was used in the analysis of the data. Descriptive analysis technique was used in the analysis of the data and the opinions of the teachers were presented with direct quotations. As a result of the research, it has been determined that the interviewed teachers are unable to allocate an adequate amount of time for writing activities. The time designated for composing informative texts is notably limited, and there exists an insufficient implementation of strategies and techniques concerning the composition of informative texts. Moreover, there is a notable dearth of attention given to various text genres in writing exercises. Based on the research findings, suggestions were made to give more importance to the studies of writing informative texts.

ÖZET

Türk eğitim sistemi içinde ortaöğretim kurumları akademik ve mesleki eğitim veren kurumlar olmak üzere iki gruba ayrılmaktadır. İmam hatip Liseleri uygulamada bazı yönlerden meslek liselerinden ayrılrsa da bu sınıfta yer almaktadır. İmam Hatip Liselerinin hukuki dayanağı Tevhidi Tedrisat Kanunudur. Tevhidi Tedrisat Kanununda da belirtildiği üzere İmam Hatip Liselerinin temel amacı din hizmetlerinin yerine getirilmesidir. Bu okullardaki öğrencilerin hedeflenen mesleki kazanımları elde edebilmesi meslek dersleri öğretmenlerinin öğretim yeterliklerine bağlıdır. Öğretmenlerin okullarda düzenledikleri öğretim süreçleriyle birlikte, millî eğitimin genel amaçları doğrultusunda, öğrencilerin meslek dersleri kazanımlarını desteklemek, mesleki bilgi, beceri ve yetkinliklerini geliştirmek, sosyal ve kültürel gelişimlerine katkıda bulunmak amacıyla öğrenciler arası Kuran'ı Kerimi güzel okuma ve Arapça gibi konularda mesleki yarışmalar düzenlenmektedir. Bu çalışmada meslek derslerinin öğretiminde okul dışı bir öğretim faaliyeti olan ve Din Eğitimi Genel Müdürlüğü tarafından organize edilen mesleki yarışmalar konusu ele alınacaktır. Öğretmen görüşlerine dayalı olarak bu yarışmaların meslek derslerinin öğretimine katkısının belirlenmesi araştırmanın temel amacını oluşturmaktadır. Bu araştırma, mesleki yarışmaların işleyişi ve kazanımları hakkında yarışmaları uygulayanlara ve yarışmaları düzenleyen kurumlara dönüt oluşturup eğitimi literatürüne katkı sunmayı amaçlamaktadır. Araştırmada, nitel araştırma desenlerinden biri olan “olgu bilim” deseni kullanılmıştır. Katılımcı seçiminde “Amaçlı örnekleme” yöntemlerinden “Ölçüt örnekleme” kullanılmıştır. Araştırma katılımcılarını, örneklem yöntemine uygun olarak İmam Hatip Liselerinde görev yapan ve mesleki yarışmalarda öğrencilere danışmanlık yapan 21 meslek dersleri öğretmeni oluşturmaktadır. Veriler, yapılandırılmış mülakat formları kullanılarak elektronik ortamda toplanmış ve içerik analizi yapılarak tema ve kategoriler oluşturulmuştur. Yapılan analizler sonunda mesleki yarışmaların; öğrencilerin özgüveninin artmasına, sosyalleşmelerine ve okul derslerinde motivasyonlarına katkı sağladığı sonucuna ulaşılmıştır. Mesleki yarışmalardan beklenen amacın gerçekleşmesi için, öğrencilerin yarışmalara hazırlanma esnasında kaçırdıkları derslerin telafisi yapılabilir ve dereceye giren öğrencilere daha fazla motive edici ödüller verilebilir.

Anahtar Kelimeler: Din Eğitimi, Mesleki Yarışmalar, İmam Hatip Lisesi

**VIEWS OF IMAM HATIP HIGH SCHOOL VOCATIONAL COURSE TEACHERS ON
VOCATIONAL COMPETITIONS**

ABSTRACT

In the Turkish education system, secondary education institutions are divided into two groups: academic and vocational institutions. Although Imam Hatip High Schools differ from vocational high schools in some aspects in practice, they are included in this class. The legal basis of Imam Hatip High Schools is the law of Tevhidi Tedrisat. As stated in the Tawhidi Tedrisat Law, the main purpose of Imam Hatip High Schools is to fulfil religious services. The ability of students in these schools to achieve the targeted professional gains depends on the teaching competences of vocational courses teachers. Along with the teaching processes organised by teachers in schools, in line with the general aims of national education, vocational competitions are organised among students in subjects such as reading the Qur'an beautifully and Arabic in order to support students' vocational course achievements, to improve their professional knowledge, skills and competencies, and to contribute to their social and cultural development. In this study, vocational competitions organised by the General Directorate of Religious Education as an out-of-school teaching activity in the teaching of vocational courses will be discussed. The main purpose of the research is to determine the contribution of these competitions to the teaching of vocational courses based on teachers' opinions. This research aims to contribute to the educational literature by providing feedback to those who implement and organise competitions about the functioning and achievements of vocational competitions. In the study, "phenomenology" design, which is one of the qualitative research designs, was used. "Criterion sampling", one of the "purposive sampling" methods, was used in participant selection. The participants of the study consisted of 21 vocational courses teachers working in Imam Hatip High Schools and counselling students in vocational competitions in accordance with the sampling method. The data were collected electronically using structured interview forms and themes and categories were formed by content analysis. At the end of the analyses, it was concluded that vocational competitions contribute to increasing students' self-confidence, socialising and motivation in school lessons. In order to realise the expected purpose of vocational competitions, the lessons missed by the students during the preparation for the competitions can be compensated and more motivating awards can be given to the ranking students.

ABSTRACT

Acacia is a leguminous tree widely spread in the arid and semi-arid regions of Morocco. The tree's key role in soil protection, litter production and, more generally, in improving edapho-climatic conditions has been demonstrated by its ability to adapt to various environmental stress factors. Fourteen nitrogen-fixing bacteria were isolated from root nodules of wild *Acacia cyanophylla* growing in distinct geographic locations in Morocco and were examined for their symbiotic efficiency and phenotypic properties. Multivariate tools such as Principal Component Analysis (PCA) and hierarchical clustering analysis (HCA) were used to study the correlation between phenotypic and symbiotic variables, then discriminate and describe the similarities between different isolated bacteria with respect to all the phenotypic and symbiotic variables. Phenotypic characterization showed a variable response to extreme temperature, NaCl and pH. At the plant level, the nodulation, nitrogen fixation, and the shoot and root dry weights (g.plant⁻¹) were considered. Results revealed that some of these isolates were notably tolerant to the tested abiotic stresses, while exhibiting significant N₂ fixation, thereby indicating their potential as effective candidates for acacia inoculation. PCA was also used to highlight groups of isolates that show similarity with regard to the studied phenotypic and symbiotic parameters. Genotypic identification of nitrogen-fixing bacteria, using the 16S rDNA approach, revealed variable genetic diversity among a total of isolates, and their belonging to three different genera: *Rhizobium*, *Agrobacterium* and *Phyllobacterium*.

Keywords: *Rhizobium*; *Acacia cyanophylla*; Nitrogen-fixing trees; Symbiotic efficiency; Principal Component Analysis; 16S rDNA

THE CONCEPT OF TIME: AN INTEGRATIVE OVERVIEW

ABSTRACT

Progression through life knows one consistent measure, although time's true nature still eludes human understanding. Due to entropy, it is the movement from order to disorder that separates past from present and future, hence the forward orientation of the time arrow. Einstein's theories of general and special relativity can prove the existence of a spacetime dimension while the principles of quantum mechanics indicate the same basis of all existence – only the complexity of the systems differs, from the constituents of a remote star to the microbiology of an insect and the sophistication of the human body. The current paper proposes an overview of what the Bible says about time in order to find a realistic congruence between the biblical *timescapes* and the main scientific and psychological theories of time that have been guiding the human world, past and present. As a case study from psychotherapeutic literature, Kazuo Ishiguro's novel *The Buried Giant* debates upon the Christian way of forgiving and forgetting past atrocities as the only solution for a peaceful future while analyzing its characters' temporal impairment. Based on the Bible's temporal views, the present interdisciplinary approach to the distorted nature of time could teach humankind a valuable lesson: that, when embraced with an open heart, time distortion can become a valuable tool for preserving human sanity and orientating human choices, decisions and actions in the right direction, thereby allowing humans to capitalize on the passage of time and restore their own temporality to its healthy distortion.

ABSTRACT

Sedentary life style, nutrition rich products are the elements of the so called "westernization" in migrant Asian-Indians which can encourage excessive insulin resistance and therefore shed light on the increased prevalence of type II diabetes in urbanized and migrant Asian-Indians. Type II diabetes and obesity are characterized via resistance to hormones, perhaps due to attenuated or diminished signaling. Synchronized tyrosine phosphorylation is vital for signaling pathways regulated by insulin and leptin. Arylidene-2,4-thiazolidinedione structure is common in a variety of agents; they differ in side chain modifications which influence their pharmacological actions. Synthesis of arylidene-2,4-thiazolidinedione generally involves reaction between chloroacetic acid and thiourea to form 2,4-thiazolidinedione followed by Knoevenagel reaction between 2,4-thiazolidinedione with suitable aldehyde using a base such as piperidine, sodium acetate. The treatment of compound such as chloroacetic acid in the presence of a base such as potassium carbonate, sodium hydride produces N-substitution. Arylidene-2,4-thiazolidinedione as aldose reductase inhibitor prevent or slow the action of aldose reductase leading to prevention or delay of complications of diabetes. Arylidene-2,4-thiazolidinedione has been evaluated as inhibitors of protein tyrosine phosphatase 1B and is common in a variety of agents; they differ in side chain modifications which influence their pharmacological actions. The therapeutic attestation for arylidene-2,4-thiazolidinedione as antidiabetic, antioxidant, antilipidemic, antiobesity agent has been explored, thus is capable of serving and exploration as biodynamic agent. ÖZƏT

Məlumdur ki, dillərin morfoloji-sintaktik sistemində mövcud olan qrammatik kateqoriyalar qarşılıqlı əlaqədə meydana çıxır. Müəyyənlik və qeyri-müəyyənlik kateqoriyasının da Azərbaycan və türk dillərinin qrammatik quruluşunda mühüm rolu vardır. Bu kateqoriya ilə bağlı dilçilik ədəbiyyatında xeyli araşdırmalar aparılsa da, I növ təyini söz birləşmələrində müəyyənlik və qeyri-müəyyənlik məsələsi ayrıca araşdırılmamışdır. Tədqiqatçılardan A.Həsənov, F.Şiriyev, F.Cəlilov, Y.Seyidov, Q.Kazımov, K.Abdulla, B.Xəlilov, A.Axundov və bir çox türkoloqların bu istiqamətdə bir sıra araşdırmalarına baxmayaraq, mövzunun mahiyyətinin hərtərəfli şəkildə aydınlaşdırılması baxımından bir sıra işlərə ehtiyac vardır. I növ təyini söz birləşmələri türk dillərində ismi birləşmələrin ən qədimi olduğundan onların formalaşmasında xüsusi morfoloji əlamət iştirak etmir. Bu xüsusiyyət türk və Azərbaycan dillərində tamamilə eynidir.. Məsələn, “qısaboy bir gənc” (türk dilində: kısaboyleu bir genç), “yaraşlıqlı bir oğlan” (türk dilində: yakışıklı bir ulan), “dərin bir quyu” (türk dilində: derin bir kuyu), “unudulmaz bir xatirə” (türk dilində: unutulmaz bir hatıra) və s. Qeyd edilən birləşmələrdə söhbətin məhz hansı gəncdən, oğlandan, quyudan, xatirədən getdiyini aydınlaşdırmaq mümkün deyil. Həm də bu birləşmələr qeyri-müəyyənlik bildirdiyinə görə onların əvvəlinə say və yaxud əvəzlilik artırmaq olmur. Məsələn, üç qısaboy bir gənc (türk dilində: üç kısaboyleu bir genç), iki yaraşlıqlı bir oğlan (türk dilində: iki yakışıklı bir ulan), beş dərin bir quyu” (türk dilində: beş derin bir kuyu), bu unudulmaz bir xatirə (türk dilində: şu unutulmaz bir hatıra) tipli birləşmələr qurmaq mümkün deyil, çünki belə birləşmələrin tərəfləri arasına bir ədatı daxil edildiyi üçün onların mənası yoxdur. Bu tip birləşmələrin təyinedici sözündə də heç bir dəyişiklik etmək olmur. I tərəf həmişə olduğu kimi, II tərəfi fərqli cəhətlərdən təyin edir, qeyri-müəyyənlik anlayışı ikinci tərəfə aid olur. Bir sözü hər hansı birləşmənin əvvəlində gəlsə, vəziyyət fərqli olur. Bu baxımdan bir sözünün 3 işlənmə məqamı qeyd edilir. Bir sözü birləşmənin əvvəlində say vəzifəsində (bir yaxşı fikir – iyi bir fikir), ədat kimi (bu zaman kəmiyyət yox, müəyyən qədər qeyri-müəyyənlik, müəyyən qədər də emosional vəziyyəti əks etdirir- bir yaxşı adam – bir iyi kişi), həm say kimi (kəmiyyət), həm də qeyri-müəyyənlik bildirən əlamət kimi (bir gözəl gül – bir güzel gül) düşünülə bilər.

Açar sözlər: müəyyənlik, qeyri-müəyyənlik, say, söz birləşməsi

EXPLORING DUAL TREATMENT IMPACT: CURCUMIN AND STA-9090 IN BREAST CANCER CELLS

ABSTRACT

Breast cancer is one of the most common neoplasms in women and is a significant health problem worldwide. Conventional treatment of breast cancer includes surgical resection, radiotherapy, and chemotherapy. Monotherapy with drugs in conventional chemotherapy is constrained by its restricted efficacy, necessity for high dosages, and prominent adverse effects. Therefore, the combined therapy approach using multiple drugs comes to the fore in cancer treatment. Curcumin is a compound that has been extensively studied in cancer therapy and has proven its efficacy *in vitro* and *in vivo* studies in breast cancer. However, the therapeutic applicability of curcumin remains limited due to its low water solubility and bioavailability. STA-9090, on the other hand, functions as an Hsp90 inhibitor, disrupting protein folding and leading to the degradation of client oncoproteins. In this study, it was aimed to investigate the effects of curcumin and STA-909 alone or in combination in MCF-7 and MDA-MB-231 cell lines. MTT test was applied to determine the effect of STA-9090 and curcumin on cell viability in breast cancer cells. The Chou-Talalay test was performed to evaluate the efficacy of the combination of the two drugs. Individually, curcumin and STA-9090 showed dose- and time-dependent growth inhibition in breast cancer cells. STA-9090 exhibited IC₅₀ values of 15.00 µM (24h) and 8.14 µM (48h) in MCF-7, and 14.01 µM (24h) and 9.68 µM (48h) in MDA-MB-231. For curcumin, IC₅₀ values were observed as 14.12 µM (24h) and 10.96 µM (48h) in MCF-7, and 17.48 µM (24h) and 10.92 µM (48h) in MDA-MB-23. However, concomitant administration of curcumin and STA-9090 resulted in an antagonistic effect in MCF-7 and MDA-MB-231 breast cancer cell lines. The results reveal important implications for elucidating the underlying mechanisms of the combined antagonistic effect of the two drugs and for developing more effective treatment strategies for breast cancer.

ABSTRACT

Introduction: Earthquakes pose a significant threat to human lives all over the world. On February 6th, 2023, Turkey experienced two major earthquakes, the first with a magnitude of 7.7 and the second with a magnitude of 7.6, both centered in the province of Kahramanmaraş. The seismic events resulted in the loss of over 50 thousand lives and inflicted substantial damage on several cities. **Aim:** This study aims to determine the effect of death anxiety on the life satisfaction of individuals living in 11 provinces declared as earthquake zones in Turkey. **Methods:** This study employs a descriptive and correlational research design. The sample size was determined to be 384 individuals, but a total of 442 participants ultimately took part in the study. **Results:** In this study, it was determined that 48.5% of the participants exhibited moderate levels of death anxiety. The participants' average score on the RDAS scale was 53.97 (SD=16.21), and their mean score on the SWLS scale was 12.30 (SD=4.33). The model explained 2.9% of the variance in life satisfaction. The findings of this study indicate a negative association between death anxiety and life satisfaction. **Conclusion:** Healthcare professionals should offer increased psychological and communication support to individuals who have experienced significant disasters like earthquakes.

ABSTRACT

In this paper work, a mathematical modeling of the influence of treatment and vaccination on measles control was developed using a system of ordinary differential equations. Local stability analysis on the disease-free equilibrium was done using the Jacobian matrix approach. The semi-analytical solutions of the model were obtained using the Differential Transformation method and the solutions were plotted using Maple. The result of the findings shows that the Disease Free Equilibrium State (DFE) of the model is stable if $R_0 < 1$. The result of the numerical simulation shows that a reduction in the contact rate with infectious individuals reduces the transmission rate of the disease. The simulation also reveals that at high vaccination rate for the infected individuals, the number of recovered individual's increases. Hence, the combination of treatment and sanitizer

at 75% will curb measles to the barest minimum in less than one year, also effective vaccination will help in preventing those who are susceptible from contacting the disease.

ABSTRACT

The COVID-19 pandemic profoundly impacted the global economy, with a particularly pronounced effect on developing nations like Bangladesh. This study aimed to investigate the repercussions of the pandemic on the community livelihoods of the Oxbow lake (Saganna baor) fisheries in Bangladesh, as well as the pre- and post-pandemic socio-economic status of the fishermen. Additionally, the study delved into the fisheries resources, encompassing fish production and pricing within the context of the pandemic. The research methodology incorporated both primary and secondary data sources. The socio-economic status of the fishermen considered various parameters, including family type, age group, religious status, marital status, educational status, health facilities, women's contribution to various activities, source of drinking water, marketing system, occupation of the respondent, food and nutrition intake, etc. Notably, the COVID-19 pandemic led to significant shifts in the predominant occupations within the Saganna baor area. The study highlighted notable changes in fish pricing before and during the pandemic-

induced lockdown in Bangladesh. The disruption in fish supply chains and the availability of inputs for fish culture could be attributed to factors such as transportation constraints, reduced fish prices, fish shop closures, marketing difficulties, and increased costs for inputs like feed. These challenges had a negative impact on the incomes of those dependent on the fishery sector. This research underlines the intricate interplay between socio-economic factors and pandemic-induced disruptions, it contributes to informed policy formulation and strategic planning for the revival of fisheries-based livelihoods.

ABSTRACT

The study examined the effects of e-governance on efficient service delivery at Local government level in Nigeria. It also identified some of the challenges of e-governance at the Local government level and proffered solutions to the identified challenges. Primary and secondary data were utilised. Primary data were collected through the administration of questionnaire. The study population (266) consisted the senior staff of Yewa South Local Government. 50 percent of the study population were purposively selected. Secondary data were obtained from existing texts, journal and publications. Quantitative data collected were analysed using frequency distribution and percentages. The study revealed that adoption of ICT can boost service delivery and that e-governance is one of the techniques for boosting service delivery at local government level, it also revealed that citizen can access online services from the local government and that e-governance can aid transparency and accountability. Lack of ICT facilities, high level of illiteracy and cost were identified as the challenges facing e-governance at local government. Mass orientation and literacy program and solicit for grants, aid and support to cost can boost acceptance and adoption of e-governance. The study concluded that cordial executive-legislative relationship and healthy relationship between executive and legislative will be of great importance to the local communities and could yield more benefits. The study recommended that positive working relationship between the executive and legislature in the local government should be encouraged.

ABSTRACT

The argan tree (*Argania spinosa* (L.) Skeels), an important species in south-west Morocco, is the mainstay of Morocco's socio-economic development. However, difficult climatic conditions, overgrazing, excessive harvesting of seeds for oil extraction and, above all, embryonic and integumentary dormancy of the seeds have led to a lack of natural regeneration of this species. This work presents the application of recent biotechnological tools for the conservation of this critically endangered species. The aim of our work was to evaluate and improve, for the first time to our knowledge, the germination, rooting and growth capacities of four argan genotypes, namely Bouizakarne, Agadir, Admine and Ighrem, under the control of five pH values using *in vitro* culture. The results showed that a pH between 5 and 7 was more favourable to germination, which varied between 71.87 and 81%. For the development of plants *in vitro*, the highest levels were obtained at pH 4, 5, 5.8 and 10, which showed a rooting rate ranging from 43.18 to 60.98%, a length of main roots, with secondary roots, between 14.35 and 15.99 cm, a length of stems estimated between 4.68 and 5.67 cm and a number of leaves ranging from 5.59 to 8.12. However, pH 7 inhibited rooting and aerial growth in the Ighrem and Bouizakarne genotypes. A high percentage of acclimatisation is of great importance for the possible propagation of this endangered species. As our protocols have solved the major problem of the argan tree by optimising its germination and rooting, they could be recommended for the regeneration of this plant.

ABSTRACT

The bulk density is important parameter to tillage and crop management effects on soil quality. The direct determination of bulk density (Bd) requires expensive laboratory measurement to present adequately soil properties in an area of interest. Moreover, the estimation process is labor and time-intensive due to the difficulties of collecting the soil samples from the field. Hence, innovative methods, such as machine learning techniques, can be an alternative to estimate Bd. This might facilitate agricultural practice and land management which has an impact on food and water security. For this aim, the study presents random forest (RF) to estimate Bd using surface and subsurface soil data in a semi-arid region. This study was conducted over a 64-km² area (16 plots) within the Altınova Agricultural Enterprise, a subsidiary of the General Directorate of Agricultural Farmland (TİGEM). A total of 287 for surface soil samples (0–20 cm) and 258 for subsurface soil samples were collected on a 500 m-spaced grid, and it was determined to particle size distribution, organic matter (OM), pH, electrical conductivity (EC), calcium carbonate equivalent (CaCO₃ equivalent) in all soil samples. The results showed that clay, sand, silt and EC were the most important parameters for estimating soil bulk density values both surface and subsurface soils in the study area. In this study, 80% of the data set was used for training and 20% for testing.

Moreover, for topsoil bulk density prediction with RF was obtained highest R^2 values (0.830) with small mean square error (MSE), mean absolute percentage error (MAPE), mean absolute error (MAE), root mean square error (RMSE) and Lin's concordance correlation coefficient (LCCC) 0.00034%, 0.0036%, 0.0049%, 0.018%, 0.911 respectively. Similarly, for the subsoil bulk density prediction with RF, the highest R^2 values, MSE, MAPE, MAE, RMSE and LCCC were 0.946, 0.00011%, 0.00305%, 0.0041%, 0.0108% and 0.969 respectively. Overall, machine learning algorithms such as RF were able to used estimate bulk density values.

Keywords: Random forest, soil mapping, bulk density, semiarid region

ÖZET

Araştırma bir adet Şam çörek otu genotip ile Balıkesir koşullarında iki yıl süre 2019-2021 yetiştirme sezonlarında tesadüf blokları deneme desenine göre üç tekerrürlü olarak yürütülmüştür. Araştırmada kontrol (gübrelessiz ve bakterisiz) ve altı uygulama [kimyasal gübre, İndol asetik asit (IAA), kinetin (K), IAA+K, iki bakteri (PGPB1 ve PGPB2)] yapılmıştır. Araştırmada farklı uygulamaların Şam çörek otunda bin tane ağırlığı, ham protein oranı, tane verimi, sabit yağ verimi ve uçucu yağ verimi üzerine etkilerini incelemek amaçlanmıştır. Bin tane ağırlığında kimyasal gübre ve iki bakteri uygulamaları (PGPB1 ve PGPB2), ham protein oranında PGPB1 ve IAA uygulamaları, tane veriminde kimyasal gübre ve iki bakteri uygulamaları (PGPB1 ve PGPB2), sabit yağ veriminde PGPB1, IAA+Kinetin ve PGPB2 uygulamaları, uçucu yağ veriminde PGPB1, IAA+Kinetin ve PGPB2 uygulamaları en yüksek değerlere sahip olmuştur. Araştırma sonuçları genel olarak değerlendirildiği zaman tane veriminde kimyasal gübreye en yakın olan PGPB1 ve PGPB2 uygulamaları aynı zamanda hem uçucu hemde sabit yağ verimlerinde diğer uygulamalardan üstün performans sergilemiştir. Sürdürülebilir tarım sisteminde PGPB1 ve PGPB2 bakteri uygulamaları Şam çörek otu yetiştiriciliğinde yüksek tane ve yağ verimleri elde etmek için kullanılabilir potansiyeli taşımaktadır.

Anahtar Kelimeler: *Nigella damascena*, tane verimi, sabit yağ verimi, uçucu yağ verimi, bitki gelişimi teşvik edici bakteri

**INVESTIGATION OF THE EFFECTS OF PLANT GROWTH-PROMOTING
BACTERIA AND HORMONE APPLICATIONS ON SEED AND OIL YIELD IN BLACK
CUMIN**

ABSTRACT

The research was conducted with one genotype of *Nigella damascena* under Balıkesir conditions for two years during the 2019-2021 growing seasons using a randomized complete block design with three replications. In the study, a control (unfertilized and non-bacterized) and six treatments [chemical fertilizer, Indole-3-acetic acid (IAA), kinetin (K), IAA+K, two bacteria (PGPB1 and PGPB2)] were applied. The aim of the study was to investigate the effects of different applications on thousand-grain weight, crude protein content, grain yield, fixed oil yield, and volatile oil yield of *Nigella damascena*. For thousand-grain weight, chemical fertilizer and two bacteria applications (PGPB1 and PGPB2) stood out, while for crude protein content, PGPB1 and IAA applications were significant. In terms of grain yield, chemical fertilizer and two bacteria applications (PGPB1 and PGPB2) were prominent. As for fixed oil yield, PGPB1, IAA+Kinetin, and PGPB2 applications showed the highest values. Regarding volatile oil yield, PGPB1, IAA+Kinetin, and PGPB2 applications yielded the highest values. Overall, considering the research results, among all applications, PGPB1 and PGPB2 treatments, which closely approached the chemical fertilizer in terms of grain yield, also exhibited superior performance in both volatile and fixed oil yields. In the context of sustainable agricultural systems, PGPB1 and PGPB2 bacterial applications hold the potential to be used for achieving high grain and oil yields in *Nigella damascena* cultivation.

Keywords: *Nigella damascena*, plant growth regulator, grain yield, fixed oil yield, essential oil yield Plant Growth Promoting Bacteria.

ÖZET

Araştırma Şam çörek otunda bitkisel özellikler üzerine kimyasal gübre, bitki büyüme düzenleyicileri ve bitki gelişimini teşvik edici bakteri uygulamalarının etkilerini incelemek amacıyla iki yıl süre 2019-2021 yetiştirme sezonlarında tesadüf blokları deneme desenine göre üç tekerrürlü olarak yürütülmüştür. Araştırmada bitkisel materyal olarak Suriye orijinli popülasyondan seçilen Şam çörek otu türüne ait genotip kullanılmıştır. Bu genotipte kontrol (gübresiz ve bakterisiz) ve altı uygulama [kimyasal gübre, İndol asetik asit (IAA), kinetin (K), IAA+K, iki bakteri (PGPB1 ve PGPB2)]'nın bitki boyu, dal sayısı, kapsül sayısı, kapsülde tane sayısı, kapsülde tane ağırlığı ve bitki tane verimi üzerine etkileri araştırılmıştır. Bitki boyu, dal sayısı ve bitkide kapsül sayısı bakımından Kinetin uygulaması, kapsülde tane sayısı ve ağırlığı bakımından PGPB1 uygulaması, bitki tane verimi bakımından kimyasal gübre diğer uygulamalardan üstün olmuştur. Tüm uygulamalar içerisinde en düşük ortalamalar kontrol (gübresiz ve bakterisiz) uygulamasından elde edilmiştir. En önemli bitkisel özelliklerden bitki tane verimi yönünden PGPB1 ve PGPB2 uygulamaları kimyasal gübreden sonra en yüksek değerlere sahip olmuştur. Araştırma sonucuna göre Şam çörek otunu çevre dostu üretim sisteminde yetiştirmek için söz konusu iki bakteri kombinasyonunun önemli potansiyele sahip olduğu tespit edilmiştir.

**EFFECTS OF PLANT GROWTH-PROMOTING BACTERIA AND HORMONE
APPLICATIONS ON PLANT TRAIT IN BLACK CUMIN**

ABSTRACT

The research was conducted over a period of two years, during the 2019-2021 cultivation seasons, using a randomized complete block design with three replications to investigate the effects of chemical fertilizers, plant growth regulators, and plant growth-promoting bacterial applications on plant characteristics in black cumin (*Nigella damascena*). The selected genotype of black cumin, sourced from a Syrian population, was used as the plant material. Within this genotype, a control group (unfertilized and non-bacterized) and six treatments [chemical fertilizer, Indole-3-acetic acid (IAA), kinetin (K), IAA+K, two bacteria (PGPB1 and PGPB2)] were applied, and their impacts on plant height, branch number, capsule number, seed number per capsule, seed weight per capsule, and plant grain yield were investigated. Kinetin application showed significant effects on plant height, branch number, and capsule number. PGPB1 application had a substantial effect on seed number and weight per capsule. Among the treatments, chemical fertilizer exhibited superior performance in terms of plant grain yield. The control group (unfertilized and non-bacterized) resulted in the lowest averages across all parameters. Regarding the crucial plant characteristic of grain yield, PGPB1 and PGPB2 applications achieved the highest values, following chemical fertilizer. According to the research findings, the combination of these two bacterial treatments holds significant potential for cultivating black cumin in an environmentally friendly production system.

ABSTRACT

In this research, hydrothermally synthesized tungsten trioxide (WO₃) nanocomposites doped polyvinylpyrrolidone (PVP) and chitosan (CS) were studied. Various concentrations (3, 6, and 9 wt.%) of PVP were doped into a fixed amount of binary system (CS-WO₃) nanocomposites. PVP/CS polymers showed attractive attention because of their different structure, functionality, and architecture control as dopant to WO₃. The PVP/ CS encapsulates the WO₃ (ternary composite), which controls crystallite size (band gap reduction), rapidly overcomes the recombination electron-hole pairs issues, and generates the active sites, resulting in improved catalytic and antimicrobial activity. The synthesized nanocomposites revealed significant catalytic efficiency and methylene blue (MB) dye depletion of 99.9 % in the presence of reducing agent (NaBH₄) in neutral and acidic media. Antimicrobial effectiveness of produced nanostructures towards *Escherichia coli* (*E. coli*) pathogen at low and high concentrations were investigated by Vernier caliper in mm. Furthermore, to their microbicidal action, docking experiments of CS-doped WO₃ and PVP/CS-doped WO₃ nanostructures for DHFR and FabI of *Escherichia coli* suggested blockage of aforesaid enzymes as the plausible pathway.

Keywords: Polyvinylpyrrolidone, WO₃, methylene blue

ABSTRACT

The Higher Education Curriculum in Indonesia is prepared to advance higher education in Indonesia. One of the curricula in Higher Education is the OBE (Outcome-Based Education) curriculum as a learning approach which focuses not only on delivering material, but focuses on achieving clear and measurable learning outcomes. In simple terms, it emphasizes innovation, skills, effectiveness and interactivity in accordance with real world needs and labor market needs. This research is a qualitative research with a descriptive approach in the Interdisciplinary Islamic Studies Postgraduate of UIN Sunan Kalijaga. The results of this study indicate that the OBE curriculum is running well and students have succeeded in publishing their work in the form of scientific articles published in several national and international journals, both reputable and not.

ABSTRACT

Hepatitis B viral disease is a global health problem. This study developed a binary logistic regression model to assess the risk factors. of Hepatitis B using data collected from gastro clinic, cardiovascular department of Federal medical Centre Gusau Zamfara state. The study revealed that marital status, history of blood transfusion, multiple sex partner, and alcohol consumption has statistical association with Hepatitis – B virus disease while gender, and infected family member were not statistically Assoc.d with Hepatitis – B virus disease. A binary logistic regression model was built with all the predictor (Model 1) and the coefficients were tested for significance, Non-significant predictors were removed and another model (Model 2) with only significant predictors was developed. The Model selection criterion Akaike Information Criterion (AIC) and Bayesian Disease Criterion (BIC) were employed and hence the model with only significant predictors (Model 2) provide a strong likelihood between the observed and model predicted values. The study recommends that community access to and use of health services, notably for hepatitis B and other infectious diseases, must be improved.

Keywords: Hepatitis B, risk factors, logistic mode

ABSTRACT

Introduction: Insulin-induced locally in the injection sites are referred to as lipodystrophy. This adverse-effect may be observed as lipoatrophy or lypohypertrophy of the subcutaneous fatty tissue. Lypohypertrophy is not only a cosmetic flaw, but leads to worsening of glucose control due to impaired absorption of insulin applied. Case: We present a clinical case of a patient with lipoatrophy on the anterior abdominal wall, resulting from long-term insulin injection in one and the same site. A 34 year-old type 1 diabetic male was on analogue insulins in basal-bolus regimen. For the past 6 months, he had gained 4 kg of weight. His blood sugar at home was up to 17 mmol/l. In addition, he recalled unpredictable confirmed episodes of hypoglycemia. He didn't titrate the prescribed dose of insulin, but used a fixed one. On presentation his BMI was 33.5 kg/m² and HbA1c was 8.1 %. There was no clinical evidence of either renal complication or thyroid disease. On physical examination two areas of lypohypertrophy around the umbilicus were observed. The patient was instructed to alternate the injection sites, titrate the fast-acting insulin by himself and not to use the same needle for a long time. At 3 months follow-up, he managed to reduce his daily insulin dose by 10%. His BMI was 32.1 kg/m² and HbA1c was 6.4 %. He had recorded glycemic levels at home only in the target range between

5,2 and 7,4 mmol/l. Conclusion and discussion: The clinical case presents a patient with a local adverse effect of insulin therapy though applying contemporary treatment. In order to minimize this complication, endocrinologists should educate their patients and screen them for lipohypertrophy regularly. Tehnical details as rotation of insulin injection sites and frequent needle change should be emphasized.

ABSTRACT

The process of concurrently recognising and tracking many objects inside a video sequence is referred to as multiple object tracking, or MOT for short. It requires locating the objects of interest and tracking their motion across a series of frames in sequence. The MOT has a wide range of potential applications, some of which include video surveillance, autonomous driving, human-computer interaction, and sports analysis. In this study, a unique strategy is presented that makes use of the quick learning capability, high accuracy, and less network computing complexity of Extreme learning machine (ELM), which is used for training purposes, and discrete wavelet transform (DWT), which is utilised for the purposes of feature learning. Both of these capabilities are utilised in order to get optimal results. The demonstration of efficient monitoring of multiple objects is illustrated by the utilisation of several video sequences, such as the Online Object Tracking (OTB 2013) benchmark dataset, as well as real-time scenarios accompanied by manually constructed ground truth. In order to measure how well the proposed approach tracks, we utilise characteristics like accuracy and centre location error (in terms of standard deviation and mean absolute error) as measures of its efficacy. The approach that was provided is able to properly track several objects in a videos even when there is a lack of ground truth information about some of the objects in the frames, and it generates outcomes that are beneficial for the overall system.

Keywords: Multiple object tracking, haar wavelet transform, computer vision, tracking task, object location, tracking performance.

ABSTRACT

Data Structures and Algorithms (DSA) constitute the bedrock of various computer science applications, providing essential techniques for efficient data management. This study delves into the analysis and comparison of both linear and nonlinear data structures, including linked lists, stacks, queues, and trees. Additionally, the research encompasses a thorough evaluation of various searching and sorting algorithms, shedding light on their relative merits. Furthermore, the paper explores diverse techniques for traversing graphs. By comprehensively examining these fundamental components, this research contributes to a deeper understanding of how DSA principles underpin and optimize a wide array of computational processes.

Keywords: Data Structures, Linked Lists, Stacks, Queues, Trees, Searching Algorithms, Sorting Algorithms, Graph Traversal Techniques, Computational Efficiency.

ÖZET

Ordu içerisinde emir komuta zincirinde ya da emir komuta zinciri dahilinde olmadan yasal yollarla halk tarafından seçilmiş olan iktidarın anti demokratik yol ile düşürülmesi anlamına gelen darbe kelimesi Türk siyasi hayatında sıklıkla kullanılmaktadır. Cumhuriyetin kuruluşu üzerinden elli yıl dahi geçmemişken ilk askeri darbe ile karşılaşan Türkiye 1980'lere kadar neredeyse her 10 yılda bir darbe ya da darbe girişimine tanıklık etmiştir. Türkiye Cumhuriyeti'nde gerçekleşen ilk darbe girişimi 27 Mayıs 1960 darbesi; ikincisi 12 Eylül 1980 darbesidir. Türkiye Cumhuriyeti tarihinde gerçekleştirilen toplam muhtıra sayısı dört; toplam darbe girişimi sayısı ise üçtür. Türkiye'nin istikrarlı siyasal hayata geçmesiyle unutulmuş darbe ve darbe girişimi 15 Temmuz 2016 darbe girişimi ile tekrar gündeme gelmiştir. Alışılmış olan darbe ya da darbe girişimlerinden farklı bir süreç izleyen 15 Temmuz 2016 darbe girişimi Cumhurbaşkanı Recep Tayyip Erdoğan'ın çağrısı üzerine vatandaşların darbe girişimine karşı sağlam duruşları ile kontrol altına alınmıştır. Bu darbe girişimi Türk siyasal hayatında halkın desteğiyle kontrol altına alınan darbe girişimi olması yönüyle ayrı bir önem taşımaktadır. Aynı zamanda farklı siyasal görüşe sahip birçok parti ve parti liderini de bahse konu darbe girişimine ortak tepki göstermişlerdir. Darbelerin etkili olmasında Medya ve Kitle İletişim Araçları (KİA) etkin rol oynamaktadırlar. Türk basın sektöründe faaliyet gösteren Sabah, Habertürk ve Cumhuriyet gazetelerinin ilk sayfalarının darbe girişiminin ertesi günü olan 16 Temmuz 2016; darbe girişimi sonrası ilan edilen Olağanüstü Hal İlanı (OHAL) kararının ertesi günü olan 21 Temmuz 2016; darbe girişimi sonrası birlik ve beraberlik temalı düzenlenen Yenikapı mitinginin ertesi günü olan 8 Ağustos 2016 tarihlerinin belirtilen gazetelerde aktarım ve yorumlanma biçimleri çalışmanın temel amacını ortaya koymaktadır.

Anahtar Kelimeler: 15 Temmuz, Darbe Girişimi, Demokrasi, Medya.

**FROM THE PERSPECTIVE OF NEWSPAPER ANALYSIS AND AFTER THE JULY
15 COUP ATTEMPT**

ABSTRACT

The word coup, which means the anti-democratic overthrow of the government elected by the people through legal means without being in the chain of command or within the chain of command in the army, is frequently used in Turkish political life. Faced with the first military coup, not even fifty years after the foundation of the Republic, Turkey witnessed a coup or a coup attempt almost every 10 years until the 1980s. The first coup attempt in the Republic of Turkey, the May 27, 1960 coup; The second is the September 12, 1980 coup. The total number of memoranda in the history of the Republic of Türkiye is four; The total number of coup attempts is three. The coup and the coup attempt, which were forgotten with the establishment of a stable political life in Turkey, came to the agenda again with the coup attempt on 15 July 2016. The coup attempt of 15 July 2016, which followed a different process from the usual coup or coup attempts, was brought under control by the strong stance of the citizens against the coup attempt, upon the call of President Recep Tayyip Erdoğan. This coup attempt is of particular importance as it is a coup attempt that was brought under control with the support of the people in Turkish political life. At the same time, many parties and party leaders with different political views showed a common reaction to the aforementioned coup attempt. Media and Mass Media (CIA) play an active role in the impact of coups. The first pages of Sabah, Habertürk and Cumhuriyet newspapers operating in the Turkish press sector, on 16 July 2016, the day after the coup attempt; 21 July 2016, the day after the State of Emergency (OHAL) decision declared after the coup attempt; The main purpose of the study is to reveal the main purpose of the study, the way the news of 8 August 2016, the day after the Yenikapı rally, which was held with the theme of unity and solidarity after the coup attempt, was conveyed and interpreted in the specified newspapers.

ABSTRACT

In many countries there is a (significant) mismatch between the number of hours employees prefer to work and the number of hours they actually work. This mismatch is especially pronounced in Turkey where working hours are traditionally long despite marked decrease in the last decade. This study analyzes working hours discrepancies between actual and preferred hours in Turkey and European countries using the sixth wave of European Working Conditions Survey (EWCS) conducted in 2015. The results indicate that actual working hours are 6.7 and 7 hours longer than preferred working hours (41.6 and 36.3 hours) for males and females (respectively) in Turkey. Although preferred hours (37.4 and 32.2 hours) are considerably shorter for the European countries, the mismatch is just 1.6 and 0.4 hours for males and females (respectively) on average (EWCS average excluding Turkey). Moreover, male and female workers who want less hours (with 53.5% shares for both) constitute the majority in Turkey. This share is 29 and 25% for males and females (respectively) for Europe on average and is between 20-30% for most countries. The workers who have exact match between actual and preferred hours constitute the majority in most countries in Europe and the average share stands at 60% for males and 59.1% for females. On the other hand, the share of workers who want more hours are 4 and 5% for males and females (respectively) in Turkey. The European average stands at 11 and 16% and this share is less than 10% and between 10-20% for males and females (respectively) for most countries. The multinomial logit regressions show that a) the likelihood of wanting less hours rather than having exact match is lower for low-income workers and higher for high-income (female) workers relative to middle-income workers, b) as expected, the likelihood of wanting more hours is much higher and the likelihood of wanting less hours is much lower for part-time workers relative to full-time workers, c) the likelihood of wanting less hours is lower for young and old males relative to workers aged 35-44, d) having a young child tends to increase the likelihood of wanting less hours, e) female workers with tertiary education is more likely to be in the “wanting less hours” group relative to high-school graduates, f) partners relative to singles are more likely to be in the “wanting less hours” group, g) education and having a partner have no statistically significant effect on the likelihood of being in the “wanting more hours” group for males.

ABSTRACT

Structural codes and guidelines are the important sources that are taken into account in the design of buildings. Earthquake codes, construction and design rules specifications, load specifications can be given as examples. Parameters such as the seismicity of the area where the building is located, ground conditions, type of structure, service life affect the design. The last two earthquake codes in our country are the 2007 Earthquake Code and the Turkey Building Earthquake Code that came into force in 2019. There are differences in the last code compared to the 2007 code. One of them is the earthquake ground motion level. These Earthquake levels (EL) are in four groups as EL-1, EL-2, EL-3 and EL-4. EL-1 is the largest ground motion considered. EL-2 is the standard design earthquake ground motion. EL-3 is frequent earthquake ground motion with a recurrence period of 72 years. EL-4 is the service earthquake ground motion. In our country, on February 6, 2023, two severe earthquakes were experienced in K. Maraş Center and Pazarcık districts. 11 cities were affected by these earthquakes. There have been many casualties and property losses. In this study, considering the K.Maraş earthquake that took place in our country on February 6, 2023, Trabzon Street, where the destroyed or heavily damaged structures in the center of K. Maraş are located, was chosen as the location, and the examined model was examined according to the ground motion levels. As a result of the analyses, base shear forces and storey drifts were examined and compared. It is thought that the study will give an idea about the effects of earthquake ground motion levels on the base shear forces and translations of the structure.

ABSTRACT

Background: Pregnancy is a physiological condition that predisposes the installation of unfavorable hemodynamic changes, that will impact aortic structures and their functionality, apart from influencing the entirety of the cardiovascular system. **Discussion:** Hypertensive disorder prior to the gestation or recently diagnosed during pregnancy, and pre-eclampsia are the most debated pathological mechanisms, that might preclude aortic acute conditions. Right from the third month until the seventh month of the pregnancy, circulation will undergo an important acceleration, with an increase in the blood volume and in the cardiac stroke as high as 30-50%. Hypertensive complications during pregnancy will be accompanied with endothelial dysfunction, impairing substantially the physiological vasodilatation that will otherwise compensate high values of blood pressure. **Recommendations and conclusions:** A careful selection of cases that should avoid vaginal delivery and perform parturition through cesarean section is necessary. Clinicians should avoid Valsalva maneuvers, which increases substantially intrathoracic pressures. A surgical correction of all previously diagnosed cardiac and aortic conditions before progeny conception is advisable. A vaginal delivery, probably combined with epidural analgesia, is very much possible for pregnant women with cardiac risk factors, here including aortic pathologies. Nonetheless, deliveries should take place inside facilities that offer emergency cardiac surgery; and positive outcomes are possible, in spite of previously diagnosed aortic pathologies.

Keywords: aorta, pregnancy, aortic dilation, dissection, vaginal delivery.

INEQUALITIES FOR LOG-H-CONVEX STOCHASTIC PROCESS

ABSTRACT

In this work we apply well known fractional integral operators such as Riemann-Liouville fractional integral, k -Riemann-Liouville fractional integral, Katugampola fractional operators, conformable fractional integral, Hadamard fractional integrals, etc, on log-h-convex stochastic processes in order to establish new integral inequalities of Hermite-Hadamard type. The stochastic processes is a significant branch of probability theory, it is usually defined as a family of random variables, and thus stochastic processes are used as mathematical models of systems and phenomena that appear to vary in a random manner probabilistic in time. And so the definition of a stochastic process is as follow: being a probability space. A function $X: \Omega \rightarrow \mathbb{R}$ is a random variable if A is measurable. A stochastic processes is defined as function $X: \Omega \times I \rightarrow \mathbb{R}$ where $I \subset \mathbb{R}$ is an interval if for every the function $X(t, \cdot)$ is a random variable. The study of convex stochastic process was initiated by Nikodem in 1980, investigating some regularity properties of convex stochastic process. In 1992 Skowronski managed to obtain some further results on convex stochastic process, later on different types of convexities of stochastic processes were considered to derive new results.

Keywords: Hermite-Hadamard inequality, log-convex stochastic process, Fractional integral.

THROMBOELASTOGRAPHIC EVALUATION OF COAGULATION IN FARM ANIMALS AND ITS CLINICAL USE

Assist. Prof. Dr. Oya ERALP INAN* (ORCID: 0000-0002-4242-8609)
Eskisehir Osmangazi University, Faculty of Agriculture, Department of Animal Science,

Email: oeralp@ogu.edu.tr

ABSTRACT

Thromboelastography (TEG) is a widely used tool for the evaluation of coagulation in human and veterinary medicine. Another commercially available device is the rotational thromboelastogram (ROTEM) and depends generally on the same system like TEG, but have a different nomenclature for the variables. While most of the conventional coagulation tests are performed with plasma, TEG is studied with whole blood. Thus, more components that contribute to coagulation are evaluated. TEG not only detects hypocoagulation and hypercoagulation, but also enables the evaluation of fibrinolysis. Cattle, calves, goats, kids and pigs were noted in studies conducted in farm animals and the TEG measurements included were R (reaction time), K (coagulation time from the end of R till TEG tracings reached a diversion of 20 mm), angle α (the angle of the tracing split), MA (maximum amplitude of the tracing) and G (exponential reflection of MA indicating clot rigidity). Although there are reference studies for some animal species, it is recommended that each laboratory establishes its own reference study. This is not always possible due to costs and comparative studies with the control group are intense. The differences between experimental studies and clinical studies also make evaluations difficult from time to time. It seems that TEG studies with swine actually occur for human disease models. Clinical studies were mainly performed in cattle, calves and goats. Reference studies for cattle and calves allow comparison of TEG results. Species and laboratory based TEG reference ranges are essential for a successful routine clinical use of the TEG. In this study, it was aimed to evaluate the feasibility of clinical use based on the results of TEG studies in farm animals.

Keywords: Thromboelastography, clinical use, farm animals

ÖZET

Bu çalışmada, yem bezelyesi ile arpa ve yulafın farklı oranlarda (%25, %50, %75 ve saf) birlikte yetiştirilmesinin ot verimi ve kalitesi üzerine etkisi incelenmiştir. Bitki materyali olarak tek yıllık baklagil yem bitkilerinden Taşkent yem bezelyesi çeşidi ile tek yıllık serin iklim tahıllarından Akhisar-M6 arpa çeşidi ve TL576 yulaf çeşidi kullanılmıştır. Araştırma, Kahramanmaraş koşullarında 2021-2022 yılları arasında tesadüf blokları deneme desenine göre 3 tekrarlamalı olarak yürütülmüştür. Araştırmada bezelye bitki boyu, tahıl bitki boyu, yeşil ot ve kuru ot verimi, HP (ham protein), NDF (nötr deterjanda çözünmeyen lif), ADF (asit deterjanda çözünmeyen lif), SKM (sindirilebilir kuru madde), KMT (kuru madde tüketimi) ve NYD (nispi yem değeri) incelenmiştir. Araştırma sonuçlarına göre; karışım oranlarının yem bezelye bitki boyunu, tahıl bitki boyunu, yeşil ot verimini, ADF oranını ve SKM oranını etkilemediği buna karşılık kuru ot verimini, ham protein oranını, NDF, KMT ve NYD değerini istatistiki olarak önemli derecede etkilediği belirlenmiştir. Araştırma sonuçlarına göre arpanın yulaf bitkisine kıyasla ot veriminin yüksek olduğu belirlenmiştir. Öte yandan, %25 arpa ile + %75 yem bezelyesi yetiştiriciliği ile yüksek HP ve NYD değeri, düşük NDF değerinin elde edildiği belirlenmiştir.

Anahtar Kelime: Yem bezelyesi, yulaf, arpa, NYD değeri

**IMPACT ON YIELD AND QUALITY OF DIFFERENT RATES OF CULTIVATION
OF CERTAIN WHEAT CROPS WITH FODDER PEA IN EASTERN
MEDITERRANEAN CONDITIONS**

ABSTRACT

In this study, the effect of intercropping fodder pea with barley and oats at different ratios (25%, 50%, 75% and pure) on forage yield and quality was investigated. The plant material were used from one-year legume forage crops, a variety of Taşkent fodder pea, and an annual cool climate grain of Akhisar-M6 barley variety and TL576 oat variety. The research was carried out in Kahramanmaraş conditions the years 2021-2022 according to the completely randomized block design with 3 replications. The harvest is made when 50% of the fodder pea reaches the flowering period. In the study, fodder pea plant length, grain plant length, green forage and hay yield, crude protein (CP) ratio, NDF (nötr detergent fiber), ADF (acid detergent fiber), DMI (dry matter intake), DMM (dry matter digestibility) and RFV (relative fed value) were investigated. According to the results of the study, the ratio of the mixture has not influenced the fodder pea length, grain length, green forage yield, ADF ratio and DMM ratio, while it has statistically important affected the hay yield and the protein ratio as well as the NDF, DMI and RFV values. The results showed that the barley hay yields higher than the oat plant yield. In addition, higher CP, RFV and lower NDF values were obtained with 25% barley + 75% fodder pea mixture.

Keywords: Fodder pea, oat, barley, RFV value

ABSTRACT

Because it unites the fields of physics and mathematics, biology and medicine, and the earth and environmental sciences, chemistry is frequently referred to as the "central science." Chemistry is a central science that has three modes of representation (visible, invisible and symbolic) that were learned in the classroom and laboratory. The invisible mode, mostly called submicroscopic, is difficult to learn and teach for both students and teachers due to its abstract nature. But technological advancements led the University of Colorado, in 2002, to invent interactive simulation resources for learning science virtually. But chemistry, being the "central science," has about 30 out of 125 simulations in the virtual tool called PhET. Since then, many researchers have used PhET interactive simulation to virtually aid in the learning of difficult chemical concepts. Thus, the study investigated the chemistry teachers' judgements about whether PhET interactive simulation is reliable in virtually learning abstract submacroscopic chemical processes. The study adopted a survey research design in which a population of 800 teachers sampled 623 people as the study's respondents. The study considered only 344 respondents who are aware that PhET interactive simulation can be used for learning abstract submacroscopic chemical processes to determine the reliability of the virtual learning tool. The result indicated that the PhET interactive simulation is reliable for virtually learning abstract submacroscopic chemical processes. The University of Colorado has done an outstanding and laudable job of developing a PhET interactive simulation for the entire science and making it available to teachers and students all over the world. Learning abstract submacroscopic chemical processes is now easier without having to visit a real laboratory thanks to PhET interaction simulation.

ABSTRACT

A 70-year-old male presented with a swollen left leg with an abscess. Upon close investigation the patient informed that he had an iron sheet injury from a local transport bus 8 days prior. He neglected the injury and got infected on site. His chief complaint was left leg redness, swelling, pain with weakness. To rule out a connection between a swollen leg and kidney failure, we evaluated his kidney function at the initial survey. His kidney function was normal, but an infection was suspected since his ESR was very high. Random blood sugar levels were also elevated. A Tetanus shot on the day of arrival was given to stop further spread. A three-dose IV infusion of NS, diclofenac 75mg, Dexamethasone 8mg, Amikacin 500ml, and ceftriaxone 1g was also prescribed, but no improvement was noticed. Then we made the decision to switch to stronger antibiotics, thus we started giving patients piperacillin and tazobactam 4.5g for 3days BD starting on the third day. By injecting pantoprazole 40mg daily for three days in the morning before stronger antibiotics, a specific precaution was taken for gastritis. Since the illness was serious, we additionally gave Gentamicin 80mg once a day for three days to prevent the spread of gram-negative bacteria. The anterior foot was pierced later on the fourth day after the liquid had gathered there, allowing the abscess to drain. On the 6th day all complain were resolved.

Discussion: This case illustrates the prompt action to save a patient from amputating his legs. Piperacillin and Tazobactam plus Gentamicin proved to be life changing therapy in these highly resistant Staphylococcus strains and other gram-negative bacteria, as we discovered above during the microbiological examination of abscess. One should avoid excess fluid in case of abscess.

Keywords: BD, Piperacillin and Tazobactam, ESR

**DESIGN AND EVALUATION OF SUSTAINED-RELEASE LIPID-PLGA HYBRID
NANOPARTICLES FOR ENHANCED ANTICANCER EFFICACY OF 5-
FLUOROURACIL**

Maryam ANWAR
Quaid I Azam University

Safiullah KHAN
Quaid I Azam University

ABSTRACT

The current study focuses on the preparation and optimization of lipid PLGA hybrid nanoparticles of 5-fluorouracil (5-FU-LPHNs) using a three-factor, three-level Box-Behnken design for sustained release and enhanced *in-vitro* anticancer efficacy. The morphology of the developed 5-FU-LPHNs was spherical and found in the range of 155.7–316.4 nm, entrapment efficiency (80%–92%), polydispersity index (0.11–0.19) and zeta potential (–19.7 mV to –29.4 mV) depicting nano-sized and stable nanoparticles. The XRD and DSC investigations showed the absence of characteristic peaks of 5-fluorouracil in the developed formulations indicating amorphization and successful encapsulation of 5-fluorouracil in the developed LPHNs. The *in-vitro* release showed a biphasic release pattern with an initial burst release pursued by sustained release up to 72 h. The *in-vitro* cytotoxicity studies of the developed 5-FU-LPHNs were found more cytotoxic than the free drug solution in HT-29 and HCT116 cancer cell lines. In both cell lines, the half maximal inhibitory concentration (IC₅₀) values of 5-FU-LPHNs were approximately 2.06-fold and 1.83-fold, less than that of the 5-FU solution ($p < .05$). These results suggest that the developed LPHNs can be used as a potential drug delivery approach for the effective delivery of 5-fluorouracil with enhanced anticancer efficacy to colorectal tumors.

Keywords: Hybrid nanoparticles, 5-fluorouracil, XRD

**ETHICAL DILEMMA, MODELS, AND SOLUTION PROCESS IN
PSYCHOLOGICAL COUNSELING**

ABSTRACT

Ethics is a field of study that deals with human values, behaviours and relationships regarding what is right and wrong, and examines the elements of a virtuous life. Ethics can also be considered as a guide that aims to reach universal moral values rather than cultural and moral values. Ethics can be seen as a necessary phenomenon in professional life. It includes guiding principles and standards about what employees should and should not do in professional life. Field workers engaged in consultancy activities may encounter conflicting situations based on ethical principles and rules at the point of different client profiles, stories, and interventions they encounter and may experience ethical dilemmas. At the point of dealing with these dilemmas, there are various ethical decision-making models that are distinct from each other but similar in essence. It is stated that in the case of an ethical dilemma, five ethical principles consisting of autonomy, utility, harmlessness, justice, and truthfulness should be taken as a basis. In the Social Constructivist Model, the solution of ethical problems is divided into four steps and it is stated that reality should be based on a relational perspective, despite the lack of decision-making models. Similarly, the Rational Model, Feminist Model, Cross-Cultural Integrative Model and Collaborative Model suggest step-by-step stages for the solution of ethical dilemmas. Although the models presented by the researchers for the solution of ethical dilemmas are different models, they are largely similar in terms of solutions such as defining the problem, reviewing ethical principles, consulting colleagues or experts, preparing a new plan and implementing this plan, and applying the ethical standards of institutions and organizations. Mental health professionals can make healthy decisions in cases of ethical dilemmas by examining the models mentioned and the ethical standards of the associations and organizations they are affiliated with.

Keywords: Ethics, ethics dilemma, ethical decision-making models.

ÖZET

1999 yılında Musab el-Zerkavi'nin liderliğinde Afganistan'da "Cemaat el Tevhid vel Cihad" adıyla kurulan İŞİD, 2001 yılında Kuzey Irak'a yerleşerek ABD karşıtı eylemler gerçekleştirmeye başlamıştır. 2004 yılında El-Kaide Örgütüne katılarak "Irak el-Kaide"si adını almıştır. 2006 yılına gelindiğinde küçük grupları bünyesine aldıktan sonra "Mücahidler Şura Konseyi", 2006 yılından itibaren de "Irak İslam Devleti" adını kullanmaya başlamıştır. Aynı yıl, lideri Zerkavi'nin öldürülmesiyle birlikte yeni lideri Ebubekir el-Bağdadi olmuştur. Arap Baharı'nın Suriye'de yarattığı otorite boşluğundan faydalanarak Suriye'ye yayılmış ve 2013 yılında adını "Irak-Şam İslam Devleti" olarak değiştirmiştir. 2014 yılından bu yana ise "İslam Devleti" adını kullanmaktadır. Şeriat kanunlarıyla yönetilen bir İslam Devleti ve Müslümanları kapsayan Hilafet kurmak gibi iki ana amacı olan Örgüt, her ne kadar kullandığı yöntem bakımından cihadçı olarak tanımlansa da pratiği bakımından terör yöntemlerini uygulamıştır. Bu çalışmada İŞİD'in ideolojisi, insan kaynakları ve örgütsel yapısından bağımsız olarak, gerçekleştirdiği terör eylemlerinin analizine odaklanılmıştır. Bu kapsamda 2013 ile 2023 Nisan ayları arasında sorumluluğunu üstlendiği terör eylemleri esas alınmıştır. Terör eylemlerinin taraması ve eylemlere ilişkin veriler, CNN International'dan elde edilmiştir. Analizde; terör eylemlerinin niteliği, coğrafi dağılımı ve can kayıpları değerlendirme kriteri olarak seçilmiş ve her bir kriter dünya üzerinde haritalandırılmıştır. Böylelikle İŞİD eylemlerinin dünya ölçeğindeki terör haritasının çıkarılması amaçlanmıştır.

Anahtar Kelimeler: İŞİD, Terör, Terör eylemleri

MAP OF TERROR: ISIL/ISIS

ABSTRACT

Founded in 1999 under the leadership of Musab al-Zarqawi under the name of "Jamaat al-Tawhid wal Jihad" in Afghanistan, it settled in Northern Iraq in 2001 and started to carry out anti-US actions. It joined the Al-Qaeda Organization in 2004 and was named "Iraqi al-Qaeda". In 2006, after incorporating small groups, it started to use the name "Mujahideen Shura Council", and since 2006 it started to use the name "Islamic State of Iraq". In the same year, with the assassination of its leader Zarqawi, its new leader was Abu Bakr al-Baghdadi. Taking advantage of the authority vacuum created by the Arab Spring in Syria, it spread to Syria and changed its name to "Islamic State of Iraq-Sham" in 2013. Since 2014, it has been using the name "Islamic State". The Organization, which has two main aims, such as establishing an Islamic State governed by Sharia laws and a Caliphate covering Muslims, has applied terrorist methods in terms of its practice, although it is defined as jihadist in terms of the method it uses. In this study, it is focused on the analysis of terrorist acts carried out by ISIS, regardless of its ideology, human resources and organizational structure. In this context, terrorist acts for which he assumed responsibility between 2013 and 2023 April were taken as basis. The screening of terrorist acts and the data on the acts were obtained from CNN International. In analysis; The nature, geographical distribution and loss of life of terrorist acts were chosen as evaluation criteria and each criterion was mapped around the world. Thus, it is aimed to draw the terror map of the ISIS actions on a world scale.

İKLİM DEĞİŞİKLİĞİ İLE MÜCADELEDE MERKEZ BANKALARININ ROLÜNE İLİŞKİN TARTIŞMALAR

Dr. Öğr. Üyesi Nagehan KESKİN (ORCID: 0000-0003-3217-2686)

Dokuz Eylül Üniversitesi, İktisadi ve İdari Bilimler Fakültesi, İktisat Bölümü, İzmir-Türkiye,
Email: nagehan.keskin@deu.edu.tr

ÖZET

Bu çalışmada literatürdeki farklı görüşlerden hareketle, iklim değişikliği ile mücadelede merkez bankalarının rolüne ilişkin tartışmalar ele alınmaktadır. İklim değişikliği, insanlığın geleceğini tehdit eden çağımızın en önemli sorunlarından biridir. İklim değişikliğinden kaynaklanan belirsizlik ve risklerin reel ekonominin yanı sıra merkez bankalarının temel hedefleri olan fiyat istikrarı ve finansal istikrarı da etkileyebilmesi, iklim değişikliğine ilişkin gelişmelerin merkez bankaları tarafından takip edilmesi ve bu risklerin para politikası çerçevelerine dahil edilmesi için güçlü bir gerekçe sağlamaktadır. Bu çerçevede başta gelişmiş ülke merkez bankaları olmak üzere giderek artan sayıda merkez bankası, iklim değişikliğinin yol açtığı makro-finansal risklerin dikkate alınması ve para politikası tasarımına entegre edilmesine yönelik çalışmalar yapmaya başlamıştır. Ancak merkez bankalarının iklim değişikliğini gündemlerine almaları, çok yönlü yeni tartışmaları da beraberinde getirmiştir. Bu bağlamda tartışmalardan biri, iklim değişikliği ile mücadelede merkez bankalarının rol almasının gerekli olup olmadığı ile ilgilidir. Son yıllarda merkez bankalarının iklim değişikliği ile mücadelede rol alması gerektiği konusunda bir fikir birliği oluşmuş olmakla birlikte, merkez bankalarının bu süreçte nasıl bir rol (pasif veya aktif) üstlenmeleri gerektiği ve iklim değişikliğinden kaynaklanan riskleri operasyonel çerçevelerine ne ölçüde dahil etmeleri gerektiği ile ilgili tartışmalar devam etmektedir. Bu durum, iklim değişikliği ile mücadelede merkez bankalarının yapabileceklerinin, büyük ölçüde kurumsal yapıları ve mevcut yetkilerine bağlı olmasından kaynaklanmaktadır. İklim değişikliği ile mücadelede pasif bir rol üstlenmeleri durumunda, merkez bankalarının eylemlerinin, temel hedefleriyle uyumlu olduğu ve bu nedenle mevcut yasal görevlerinde değişiklik yapılmasına gerek olmaksızın iklim değişikliği ile mücadeleye katkıda bulunabilecekleri kabul edilmektedir. Merkez bankalarının iklim değişikliği ile mücadelede aktif bir rol üstlenebilmesi için açık bir yasal yetkiye sahip olmaları gerekmektedir. Ancak pek çok merkez bankasının yetkilerinin içinde “sürdürülebilirlik” hedefi açık olarak yer almamaktadır. Bazı merkez bankaları, hükümetlerinin politika hedeflerini desteklemek şeklinde, sürdürülebilirlikle ilgili dolaylı bir yetkiye sahiptir. Bu durumun, iklim değişikliği ile mücadelede, merkez bankaları açısından; hedeflerin çatışması, meşruiyet sorunu, yetkilerinin aşırı genişlemesi, piyasa tarafsızlığı ilkesinin ihlali ve bağımsızlık ve itibar kaybı gibi riskler yaratabileceği literatürde yoğun olarak tartışılmaktadır. Merkez bankalarının iklim değişikliği ile mücadeleye nasıl katkıda bulunabileceğine dair temel bir çerçeve oluşturabilmek için daha fazla araştırmaya ihtiyaç olduğu muhakkaktır. Bu tür çalışmaların, günümüzde merkez bankalarının görev ve yetkilerinin ne olması gerektiği ile ilgili daha genel bir sorgulamaya da katkı sağlayabileceği düşünülmektedir.

Anahtar Kelimeler: İklim Değişikliği, Merkez Bankaları, Fiyat İstikrarı, Finansal İstikrar

DISCUSSIONS ON THE ROLE OF CENTRAL BANKS IN FIGHTING CLIMATE CHANGE

ABSTRACT

In this study, the debates on the role of central banks in the fight against climate change are discussed, based on different views in the literature. Climate change is one of the most important problems of our age, threatening the future of humanity. The fact that the uncertainties and risks arising from climate change can affect price stability and financial stability, which are the main targets of central banks, as well as the real economy, provides a strong justification for central banks to monitor climate change developments and to include these risks in monetary policy frameworks. In this context, an increasing number of central banks, especially the central banks of developed countries, have started to work towards taking into account the macro-financial risks caused by climate change and integrating them into the monetary policy design. However, the central banks' putting climate change on their agenda has brought along new multi-faceted discussions. In this context, one of the debates concerns whether it is necessary for central banks to play a role in the fight against climate change. Although there has been a consensus in recent years that central banks should play a role in fighting climate change, discussions continue about what role central banks should play (passive or active) in this process and to what extent they should include the risks arising from climate change into their operational frameworks. This is due to the fact that what central banks can do in the fight against climate change largely depends on their institutional structures and current mandates. It is accepted that, if they take a passive role in the fight against climate change, the actions of central banks are in line with their basic objectives and therefore they can contribute to the fight against climate change without the need for changes in their current legal mandates. In order for central banks to take an active role in the fight against climate change, they must have a clear legal mandate. However, the "sustainability" target is not explicitly included in the mandate of many central banks. Some central banks have an indirect mandate regarding sustainability in support of their governments' policy goals. This situation, in the fight against climate change, in terms of central banks; It has been extensively discussed in the literature that it can create risks such as conflict of objectives, legitimacy problem, overstretching of mandates, violation of the principle of market neutrality, and loss of independence and reputation. It is certain that more research is needed to establish a basic framework on how central banks can contribute to the fight against climate change. It is thought that such studies can contribute to a more general inquiry about what the duties and mandates of central banks should be today.

ABSTRACT

Sustainability has three main columns: environment, economy and society. There are many ways to assess groundwater sustainability and indices have main role in this assessment. Economic and social indices are two important parts of the groundwater sustainability assessment so in this research we concentrate on more practical indices in these two fields. We categorized 7 criteria in the field of economy with 18 indices. On the other hand, there are 6 criteria in social field with 14 indices. Then we introduce some more important indices as water poverty index and human poverty index and the relationship between these indices and groundwater sustainability. Finally, we categorized some institutional indices which are very practical and useful in the field of groundwater sustainability assessment.

ABSTRACT

Controlled release tablets are used for prolong duration of action with minimal therapeutic effect and formulated with natural high intense polymer to achieve controlled release of API with loading dose and maintenance dose. The aim of the research was to formulate and evaluate controlled release tablet by using natural polymers. The Direct compression method was used for the preparation of controlled release tablet. In this study, there was 7 formulations were prepared (F₁ to F₇), among all formulations F₃ formulations shows better performance, it consists of ketorolac, and combination of polymer (almond gum and guar gum) having ratio (1:1). The all parameters of F₃ formulation was angle of repose (23.53⁰), tapped density (0.477g/ml), bulk density (0.402g/ml), compressibility (11.19%), Hausner's ratio (1.101), weight variation 299±0.99mg, drug content (98.68±0.13%), hardness (4.48±0.31), thickness (3.52±0.05mm), friability (0.29±0.25rpm), drug release (88.06±1.49%). DSC and FTIR result shows no interaction between drug and excipients. The drug content studies showed uniform and homogeneous distribution of drug into the tablet and also shows good drug release for 8 hrs. Hence, it indicates similar quantity of polymers required to prepare controlled release tablet of ketorolac. The release data of the controlled release tablet best fit korsmeyer-peppas model with (n=0.693) value. It conclude that controlled release tablet of ketorolac is formulated and evaluated and prepare for marketed use.

ABSTRACT

AI can be implemented in pharma ranging from drug discovery to product management. Future challenges related to AI and their respective solutions have been expounded. Artificial Intelligence (AI) has recently started to gear-up its application in various sectors of the society with the pharmaceutical industry as a front-runner beneficiary. This review highlights the impactful use of AI in diverse areas of the pharmaceutical sectors viz., drug discovery and development, drug repurposing, improving pharmaceutical productivity, clinical trials, etc. to name a few, thus reducing the human workload as well as achieving targets in a short period. Crosstalk on the tools and techniques utilized in enforcing AI, on-going challenges, and ways to overcome them, along with the future of AI in the pharmaceutical industry, is also discussed.

Keywords: Drug discovery, drug development, drug repurposing

**STYLISTIC AND IDEOLOGICAL DIFFERENCES IN THE PORTRAYAL OF TWO
MOTHERS IN AMMA DARKO'S FACELESS (2003)**

ABSTRACT

This paper aims to analyze how two mothers (Maa Tsuru and Kabria) are portrayed in Amma Darko's *Faceless* (2003). Drawing its theoretical insights from stylistics (Fowler, 1967; 1977; 1986, Freeborn, 1996; Leech and Mick, 2007; Simpson, 2004; Leech, 2013; Toolan, 2013; Mick, 2013) informed by an eclectic grammatical approach and coupled with the quantitative and qualitative research methods, this article seeks to examine how the narrator's or the implied author's language depicts each mother in her social world. To reach this goal, two texts wherein these mothers are (re-)presented for the first time in their social worlds are selected from the novel and described quantitatively in consonance with the eclectic grammatical approach and the findings thereof are presented and discussed qualitatively. In addition, this study attempts to compare the linguistic features inferred from the analysis with a view to highlighting the stylistic and ideological differences that they intrinsically encode in the fiction.

Keywords: Mothers, portrayal, social world, stylistics, stylistic and ideological differences

**GELECEĞİN AKILLI MEKÂNLARINDA DUYGUSAL YAPAY ZEKADAN
FAYDALANILMASI: KİŞİSELLEŞTİRİLMİŞ ETKİLEŞİMLİ MEKÂN

ÖZET

Akıllı bir mekân, teknolojik sensörler kullanarak alanı kullanıcılar için analiz etmektedir. Günümüz akıllı mekânları daha çok teknolojik aletlerle donatılmıştır ve bu aletler otomatik ayar, sesli komut veya telefon uygulamaları ile yönetilmektedir. İnsan, mekânın yapı taşıdır ve mekânsal konforu sağlayacak ihtiyaçları belirlemektedir. Yapay zekâ teknolojisinin ilerlemesi ile birlikte mekânlarda insan etkileşimi arttırılmaya çalışılmaktadır. Ancak akıllı mekânlar henüz bağımsız olarak insan duygu ve davranışına göre şekil alamamaktadır. İnsanlar duygularını, yüz ifadeleriye, ses tonlarıyla ya da hareketleriyle çeşitli tepkiler vererek ifade etmektedir. İnsan duygularını algılayan ve yorumlayan teknolojiye “duygusal yapay zekâ” denir. Çalışma “duygusal yapay zekânın” mimari bir mekândaki insan duygu durumunu, davranışını anlaması ve buna göre kişisel mekânsal konfor sağlayabilmesini temel almaktadır. Özellikle mekânsal tasarımlarda, kendini ifade etmekte güçlük çeken hasta bireylerin, engellilerin ve yaşlıların duygu durum analizlerine göre mekânsal konforlarının sağlanabilmesinin önemli bir ihtiyaç olduğu gözlemlenmiştir. Ayrıca literatürde, mekâna yansıtılması hakkında yeterli bir çalışmanın olmadığı saptanmış bu alanda araştırma yapılmasının gerekli olduğu düşünülmüştür. Bu nedenle insan duygu durumunu, davranışını anlamının mekânlara nasıl katkı sağlayacağı sorusuna cevaplar aranmıştır. Bu makale “duygusal yapay zekâ” alanında yapılan çalışmaları incelemiş, gelecekteki akıllı mekânların insan duygularını anlayabileceği ve ihtiyaçlarını karşılayabileceği gösterilmek istenmiştir. Hasta, yaşlı ve engellilere de yardımcı olacağı düşünülen kişiselleştirilmiş etkileşimli mekân modelleri önerilmiş, mekân tasarım ve konforuna etkileri değerlendirilmiştir.

Anahtar Kelimeler: Duygusal yapay zekâ, Akıllı mekânlar, Kişiselleştirilmiş etkileşimli mekânlar

**UTILIZING EMOTIONAL AI IN FUTURE SMART SPACES: PERSONALIZED
INTERACTIVE SPACE RECOMMENDATIONS**

ABSTRACT

A smart space analyzes the space for users by using technological sensors. Today's smart places are mostly equipped with technological devices and these devices are managed with automatic adjustment, voice command or phone applications. Human is the building block of the space and determines the needs that will provide spatial comfort. With the advancement of artificial intelligence technology, it is tried to increase human interaction in spaces. However, smart spaces can't yet take shape independently according to human emotion and behavior. People express their emotions by various responses to facial expressions, tones of voice or movements. Technology that detects and interprets human emotions is called "emotional artificial intelligence". The study is based on the ability of "emotional artificial intelligence" to understand human emotional state and behavior in an architectural space and provide personal spatial comfort accordingly. Especially in spatial designs, it has been observed that it is an important need to provide spatial comfort according to mood analysis of sick individuals, disabled and elderly people who have difficulty in expressing themselves. In addition, it has been determined that there is not enough work in the literature about it's reflection on the space, and it is thought that it is necessary to conduct research in this area. For this reason, answers have been sought to the question of how understanding human emotional state and behavior will contribute to spaces. This article examines the studies in the field of "emotional artificial intelligence" and aims to show that future smart spaces can understand human emotions and meet their needs. Personalized interactive space models, which are thought to be helpful to the sick, elderly and disabled, are suggested, and their effects on space design and comfort are evaluated.

Keywords: Emotional artificial intelligence, Smart spaces, Personalized interactive spaces

**INVESTIGATION OF THE EFFECTS OF STUD BEAMS ON STOREY DRIFTS AND

ABSTRACT

Stud beams are seen as auxiliary elements according to 2018 TEC. Considering the earthquakes and the building stock in our country, the main importance of the use of stud beams emerges. It is known that especially in cases where stud beams are manufactured without considering appropriate architecture-engineering and qualified workmanship, it causes very serious negativities in structures exposed to earthquake effects. In structural engineering projects, stud beams play a crucial role, and their accurate design is critical for the safety and resilience of the building. Therefore, careful consideration must be given to the dimensions, material selection, and placement location of stud beams. In the literature review, it becomes evident that there has been insufficient examination of stud beams. In this study, analyses were conducted on a 4-story building model with 3-bay frames oriented in the x and y directions, which serves as the reference configuration. Stud beams were placed in different regions of the floor plan, and their effects on storey drift ratios natural vibration modes were investigated. The finite element analysis software SAP2000 was employed for the analyses. The analysis results for configurations with regular and irregular stud beams were provided comparatively. The obtained results are significant in demonstrating the impact of commonly used stud beams in our country on the dynamic behavior of structures during seismic events.

ABSTRACT

The issue of environmental management and its impact on human health remains a major concern. This research aims to contribute to a better knowledge of the relationship between environment and health of children under 0 to 5 years old in the district of Hêvié. The methodological approach used is based on documentary research, field surveys of 175 people, data processing and analysis of the results using the Pressure State Impacts Responses model. The results obtained showed that despite the existence of a company (SGDS-GN) which takes care of the pre-collection of solid waste free of charge, 30% of households refuse to entrust their waste to it and do the traditional management. Among those who do traditional management, 63% throw waste (solid and liquid) around homes, 23% bury them and 14% burn them. Similarly, 52% of households surveyed do not have latrines. These various basic sanitation problems are sources of three (3) childhood ailments: malaria (52%), ARI (34%) and diarrheal diseases (14%). In response to these childhood diseases, the populations of the district of Hêvié resort to traditional medicine (54%) and modern medicine (46%). Faced with such a situation, suggestions have been made to reduce environmental degradation and mitigate health risks in the district of Hêvié.

Keywords: Hêvié, environment, health, children from 0 to 5 years old

ABSTRACT

This paper investigates the enhancement of emitted power transmission from light emitting diodes (LEDs) using Gallium arsenide (GaAs) and Gallium phosphide (GaP) quantum dots as the active layer material for LED structure. The energy bandgap of the two semiconductor quantum dots materials have been studied using the Brus Equation and the mathematical models developed shows temperature dependence of LED lifetime decay factor. Optical power and performance decay rate of LED were compared using GaAs and GaP quantum dots. The results show more decay rate reduction in GaAs than GaP which increases power efficiency. Improvement in power reduction will enhance revolutionary changes in LED devices in the near future.

Key words: Quantum Dots, power emission, LED, Gallium arsenide and Gallium phosphide

**OFFER THE MONETARY TYPES OF ASSISTANCE IN PAKISTAN THROUGH
CASH BANKING A SURVEY BY DR FAISAL**

ABSTRACT

Dark Offering monetary types of assistance in Pakistan, similar to some other nation, requires cautious preparation, administrative consistence, and a careful comprehension of the neighborhood market. Here are the general advances you ought to consider while offering monetary administrations in Pakistan. Figure out the nearby monetary scene, socioeconomics, financial circumstances, and potential client base. Recognize holes in the current monetary administrations market and evaluate the interest for your contributions. Decide the particular monetary administrations you intend to offer, like banking, protection, microfinance, venture, or fintech arrangements. Foster an unmistakable and extensive strategy illustrating your administrations, ideal interest group, estimating techniques, and income projections. Research and comprehend the administrative structure overseeing monetary administrations in Pakistan. The State Bank of Pakistan is the essential administrative expert for banking and monetary establishments. Acquire fundamental licenses and endorsements from pertinent administrative specialists. Lay out associations with neighborhood accomplices, partners, and industry relationship to explore the nearby market successfully and gain validity. Set up the necessary actual foundation, for example, office spaces and branches if relevant. Create or coordinate innovation stages and frameworks for offering computerized monetary administrations, particularly given the developing significance of fintech in Pakistan. Execute vigorous gamble the executives and consistence cycles to guarantee adherence to nearby guidelines and worldwide prescribed procedures. Lay out strategies for client an expected level of investment, hostile to tax evasion, and know-your-client prerequisites. Advertising and Client Securing. Foster a showcasing methodology to make mindfulness about your monetary administrations and draw in potential customers. Utilize both conventional and computerized promoting channels to arrive at your ideal interest group. Give astounding client assistance to construct trust and devotion among your clients. Offer multilingual help if essential, as English probably won't be the essential language for all possible customers. Invest in nonstop preparation and improvement for your staff to guarantee they have the important abilities and information to convey top notch monetary administrations. Separate your administrations by offering one of a kind incentives, cutthroat loan costs, inventive innovation arrangements, or customized client encounters. Screen your monetary exhibition, adjust to changing economic situations, and change your business techniques likewise to guarantee long haul maintainability and development. It's essential to take note of that the monetary administrations area is intensely managed, and the particular advances you really want to take can differ contingent upon the kind of administrations you mean to give. Counseling lawful and monetary specialists with skill in Pakistan's administrative climate is critical to guarantee you are working inside the legitimate structure.

ABSTRACT

In electric transmission lines, the insulators must be able to endure transient over voltages caused by lightning, operational shocks, and sandstorms on the insulating surface, as well as electrical strains during typical operating circumstances (over a broad range). This investigation examines the behavior of pollution on the surface of a high-voltage cap and pin insulator (175CTV) used by Algeria's National Electricity and Gas Company. It is done by numerical modeling. The methodology used and the findings in this paper offer up a number of avenues for modeling and numerical simulation of physical processes impacting high voltage transport and distribution line insulators under humid circumstances (rain, dew, etc.). The 2D/3D results are compared to demonstrate that the numerical simulation always provides an accurate sense of variance.

Keywords: 175CTV insulator, electric field, electric potential, numerical simulation

ABSTRACT

The method used here is the critical analysis of published materials available to me about the international laws used about our ethnic history. Ethnic nation is in our language called eri. It is written and pronounced in exactly that way in ancient so-called Sumerian and Akkadian materials millennia ago. 'Erovne bav, ghvtis madli khar' - The Idea of Eri- you are the gift of the God-wrote Iliia Tchavtchavadze in the 19th century being the representative of our ethnicity in the Duma of the Russian Empire. The abuse of our ethnic history by its diminution and/or by the infiltration of foreigners is an activity against the law of God. Teachers in our land taught that God distributed lands to various ethnicities and their obligation is to maintain that situation. Contrary to this, several wicked persons act as devils inventing ethnic histories by publishing lies by distortion of the reality. Recently foreigners infiltrate our land with an idea that Krishna is the God of the Universe including the planets, the Milky Way etc. This presentation is planned by me in order to reveal published or archival unpublished materials that will improve the existing handbooks used in Tbilisi, Batumi, Moscow, Paris, London, Chicago etc. What I have noticed is that Ivane Javakhishvili has not used efficiently findings of Mose Janashvili and that is a great drawback that needs to be improved by adding that material to new publications about Aiakolkheti. In Ivane Javakhishvili's archive kept in Tbilisi at the Center of Manuscripts situated on Alexidze Street near the Republican Science Library I have read a large text copied by Dimitry Gulia and I guessed, noticed that it was copied from Prof. Mose Janashvili's text about Aiakolkheti. Mose Janashvili was not mentioned there, to the shame of the copyist Gulia and his teacher Javakhishvili. That text is necessary to be included in modern publications about the ethnic Juridical history of our nation as a work made by Mose Janashvili. Neither Valerian Metreveli, nor Levan Alexidze, nor their modern followers use it and that is a great drawback. Akad. Levan Alexidze himself discovered a drawback and thought about the international law and Georgia Republic. He criticized several terms of international law used/misused in the views published by Prof. Ivane Javakhishvili - a famous historian that worked in Tbilisi in the 20th c. Levan Alexidze wrote about it in his book published in 2012 in Tbilisi when he was 85 years old. Levan Alexidze was the main person that wrote informational materials delivered to foreign specialists of the international law at the United Nations Organization, at the OSCE, ODIR etc. I shall speak about his biography stressing that he worked for decades in Tbilisi at the University based in 1918. I have suggestions to improve several moments in L. Alexidze's writings. His misinformation is caused mainly by his real ethnicity being foreign, causing his personal unfriendly relation to the affairs of our ethnicity. Anthropologically he looked like a mix of several foreign ethnicities. He talked fluently in Russian, but talked with difficulty in our language that was not his mother tongue. He died years ago but

his colleagues, students of law and history faculties at several institutions may improve his publications containing misinformation. After that the improved materials may be widely used by public at large. First of all, I suggest that it is necessary to add to his publications the well-known facts that are not mentioned there: the area where he lived and where we live is officially called Sakartvelos Resoublika in our language, it is called Georgia in English, Gurcistan in Osmani/Turkish language and Gruzia in Russian. I am sure it is the blame of our scholars, including Acad. Levan Alexidze that our millennia-old political unit does not have now ONE name in every language used today. His book on the title-page stresses that it is considering topics concerning times 'from antiquity to present'. This promise is not fulfilled: he starts his book with affairs of the first century and mentions our area as Iberia, absolutely omitting the history of Aia/Kolkheti and Kardu/Kardunia/Kartu kingdoms that flourished in former millennia in the world' as one of the world's best ruled area. The omission of that brilliant period of our ethnic political cultural history from Alexidze's book is gross misinformation wickedly affecting the decisions adopted by the international organizations about our ethnicity. This is mainly the reason that our ethnicity was considered as 'drastically diminished' by the UN. Since then the situation of our ethnicity in our republic Sakartvelo has worsened by infiltration and settlement of more foreign persons of various ethnic elements and various aggressive religions. Drastic situation calls for the drastic measures for the survival of our multimillennial ethnic culture and history.

**MODELING OF BLOOD FLOW IN A STENOTIC ARTERY USING
NANOPARTICLES**

Monisha Mridha MANDAL

University School of Chemical Technology, Guru Gobind Singh Indraprastha University, New
Delhi – 110078, India

Email: monishamridha1@ipu.ac.in

ABSTRACT

This study investigates the blood flow through a stenotic artery using a nanofluid using nanoparticles. The aim is to explore the effect of metallic nanoparticles on blood flow. The Navier-Stokes equations and the energy equation were solved to model the heat transport and blood flow processes using Comsol Multiphysics software. The stenotic artery's contours of blood flow and temperature were investigated and reported here. Different models for modeling the viscosity of blood flow were studied. This study may help in the modeling of drug delivery in the future.

Keywords: Nanoparticles, future, blood flow

BIOCONVECTION ANALYSIS OF TANGENT HYPERBOLIC NANOFUIDS ON A STRETCHING DEVICE: A DARCY-FORCHHEIMER MODEL

Department of Mathematical Sciences, University of Delaware, USA

ABSTRACT

To improve heat transfer efficiency in engineering systems like heat exchangers and cooling systems, it is vital to have an in-depth understanding of the dynamics of bioconvection and nanofluids as they flow across a stretching device. So, the current study uses the Darcy-Forchheimer model to examine thermal analysis in bioconvection magnetized tangent hyperbolic nanofluids over a two-dimensional stretching sheet. The mathematically developed model incorporates temperature-dependent thermal conductivity, Brownian motion, thermophoretic force, and Joule heating effects. The transformed ordinary differential equations initially formulated as partial differential equations were solved using the spectral quasilinearization method. Parametric analysis is carried out with various graphs and tables, which are discussed effectively in the flow and thermal fields for proper prediction. The investigation outcomes reveal that the thermal distribution improves in the system with higher magnitudes of the magnetic field, Brownian motion, thermophoresis, and radiation parameters, but the velocity profiles diminish with the porosity parameter, material, and magnetic field terms. In addition, heat transmission enhances with the Prandtl number but depreciates with the Darcy number.

ABSTRACT

The in silico evaluation of 27 p-aminosalicylic acid derivatives, also referred to as neuraminidase inhibitors was the focus of the current study. To search and predict new potential neuraminidase inhibitors, this study was based on the ligand-based pharmacophore modeling, 3D QSAR, molecular docking, ADMET studies. The data was generated from recently reported inhibitors and divided into two groups, one of these group has 17 compounds for training and the second group has 10 compounds for testing purpose. The generated pharmacophore has known as ADDPR_4 was found statistically significant 3D-QSAR model owing the high trust scores ($R^2 = 0.974$, $Q^2 = 0.905$, $RMSE = 0.23$). Moreover external validation was also employed to evaluate the prediction capacity of the built pharmacophore model ($R^2_{pred} = 0.905$). In addition, in silico ADMET, analyses were employed to evaluate the obtained hits for drug likeness properties.

ABSTRACT

In this study, Si et al. investigated the production of monophasic gismondine-Na zeolite (GIS-NaP) of type P from a natural bentonite fraction $>2 \mu\text{m}$ ($\text{Cf} > 2 \mu\text{m}$). The goal was to develop a cost-effective method for large-scale production of zeolites in the industry. The raw $\text{Cf} > 2 \mu\text{m}$ was initially activated through alkaline fusion at 750°C in a 1:1.2 ratio of $\text{Cf} > 2 \mu\text{m}$: NaOH. Subsequently, the crystalline pure GIS-NaP zeolite was successfully synthesized in a one-step hydrothermal activation process using the supernatant obtained from the Na-Cf fusion-water treatment at a 1:4 ratio of Na-Cf $> 2 \mu\text{m}$: H₂O. The presence of $\text{Cf} > 2 \mu\text{m}$ was confirmed using X-ray diffraction (XRD), while the supernatant was analyzed using inductively coupled plasma optical emission spectrometry (ICP-OES). The synthetic products were characterized through XRD, scanning electron microscopy (SEM), energy-dispersive spectroscopy (EDS), and Fourier-transform infrared spectroscopy (FT-IR). The study found that a high-order crystallinity polymorph P1 was formed under Si/Al ratio of 1.47 within 18 hours of hydrothermal treatment. The content of Na-P1 zeolite significantly increased with the extension of the hydrothermal time from 18 to 36 hours, reaching its peak crystallization at 36 hours with a Si/Al ratio of 1.34. The N₂ adsorption data indicated a mesoporous nature of Na-P1 at its climax, exhibiting a BET surface area and pore size of $41.76 \text{ m}^2\cdot\text{g}^{-1}$ and 8.2 nm, respectively. Additionally, a polymorph P2 with a Si/Al ratio of approximately 1.81 was spontaneously formed after 6 days of crystallization (interzeolite transformation) from the same supernatant. These findings provide an experimental basis for utilizing the clay fraction $>2 \mu\text{m}$ in the synthesis of P-type zeolites, which could prove valuable for future applications.

ABSTRACT

A major consequence of diabetes mellitus known as diabetic nephropathy (DN) causes gradual kidney damage and impairment. The prevalence of DN remains a major problem despite improvements in diabetes control. Natural substances like protocatechuic acid (PCA) and ferulic acid (FA) have demonstrated promise in reducing diabetes complications. This study examines the individual and combined effects of FA and PCA in a rat model of experimental diabetic nephropathy. Five groups of male Wistar rats were created: the control, diabetic control, FA (100 mg/kg, p.o.), PCA (100 mg/kg, p.o.), and FA + PCA groups. Streptozotocin injection (55 mg/kg, i.p.) was used to induce diabetes, and for eight weeks, oral administration of FA, PCA, or their combination was given to the treatment groups. oxidative stress indicators, renal function, and histological alterations were analysed at the end of study duration. In the diabetic control group, renal tissues displayed histopathological anomalies impaired renal function, and raised oxidative stress. There was a considerable improvement in renal function after treatment with FA, PCA, and FA + PCA, demonstrated by lower levels of serum creatinine, blood urea nitrogen, and albumin in the urine. Furthermore, these therapies lessened oxidative stress indicators and restored the activity of antioxidant enzymes. When FA and PCA were combined, the outcomes were more obvious than when they were administered individually, boosting kidney function and histological changes suggesting renoprotective effects of FA and PCA in diabetic nephropathy.

ABSTRACT

In order to create novel Rosemary Essential Oil (REO) dispersion-loaded biodegradable plastic coacervates, the "Dispersive Coacervation (D-Coac)" was researched as a new approach in this study. To develop vector systems and drug delivery matrices, the active principle (REO) was coated utilizing the D-Coac model technique. The Benzyl cellulose acrylate coacervates, which are made in the dispersion aqueous phase utilizing the Williamson green etherification process of cellulose. The proposed chemical structures were confirmed by the recorded results on the vibrational (FTIR-ATR), nuclear resonance (^1H NMR and ^{13}C NMR-APT) and X-ray diffraction patterns. In addition, the contact angle results showed the extreme modifications of the Cac hydrophilic to BC hydrophobic character, where the contact angle increased from 15° to 90° , respectively. On the other hand, the structural results were in good agreement with that showed by SEM-images and EDX-spectra of samples.

DYNAMIC BIOMETRIC FEATURES FOR DIGITAL SECURITY SYSTEMS

Tanshen Mahamud SAIMU

University of Rajshahi, Faculty of Engineering, Information and Communication Engineering

ABSTRACT

The goal of this project is to create a dynamic biometric algorithm that can accurately confirm a person's physical presence continuously by analyzing biometrics features including head length, eye blinking, iris tracking, head movements. If someone has problem in the eyes, there is lips movement also. Although facial recognition software is readily available, 2D images or movies can trick it. On the other hand, dynamic biometric features provide ongoing authentication, access to more behavioral data, protection from spoofing attempts, and application in circumstances when other options are unfeasible. The growing demand for digital security and the susceptibility of static biometric traits, such as fingerprints and facial features, to hacking and impersonation serve as the driving forces behind this initiative. This technology has the potential to improve security in a number of areas, including immigration services, military operations, and healthcare monitoring, by providing a trustworthy approach to evaluating physical appearance. In order to track iris and pupil motions and ascertain whether a person is physically present in front of a system, the proposed approach involves watching the movement of a ball on a screen to check the watching direction pattern. Computer vision and mathematical concepts are used to implement this system. This project's overall goal is to use dynamic biometric features to enhance security and prevent unauthorized access to digital systems.

Keywords: Digital security, Biometric features, Computer vision

STUDY AND DIAGNOSIS OF THE RELIABILITY OF AN INDUSTRIAL SYSTEM

Dr. Khammar FARIDA

Mechanical Engineering Department, Laboratory of Research on Electromechanical and Dependability Lresf, University of Souk Ahras, Algeria

Dr. Handel NAOUAL (ORCID:0000-0002-5711-9999)

Civil Engineering Department, Infrases Laboratory, University of Souk Ahras, Algeria

ABSTRACT

An industrial company interacts with its environment: markets for selling manufactured products, suppliers, labor market, competition, legislation in force, geographical location, etc. Since this environment evolves, the company is condemned to adapt or disappear. In particular, the company is condemned to adapt to technological progress and to acquire new technologies so that it remains competitive in the market. The absence of reliable data and effective tools for processing this data has reduced the maintenance function to troubleshooting tasks, and by extension, to a function whose costs are constantly increasing and whose contribution to the business performance is unclear. This work concerns an attempt to study the FMD (reliability, maintainability, availability), and to develop an adequate maintenance policy for the Ingersol drilling rig. The approach envisaged consists of highlighting the system under study, with all its specificities, with a view to making it familiar and subsequently defining priorities in its management. This work must be based on prior knowledge of the behavior of the machine in operation operating experience feedback. The identification of the most failing organs and those responsible for the breakdown of the assembly makes it possible to remedy them and to establish the best strategies to ensure longevity and good reliability, as well as the optimization of productivity.

**MEASUREMENT OF HORN EVENTS BY VEHICLES: A MAJOR CAUSE OF NOISE
POLLUTION IN RAJSHAHI CITY, BANGLADESH**

Md. Alamgir HASAN

Institute of Environmental Science (IES), Rajshahi university, & OSD, Assist. Prof., Directorate
of Secondary and Higher education (DSHE), Bangladesh

Prof. Dr. Md. Abul Kalam AZAD

Institute of Environmental Science (IES), Rajshahi University, Bangladesh

ABSTRACT

Rajshahi has earned a reputation as a green city for its effective management of air pollution and tree plantations. But with the rapid growth of urbanization, traffic-induced noises are becoming more prevalent in this city. Honking is treated as the major contributor to abnormal noise during traffic congestion. The current study deals with the measurement of horn events by vehicles. For this purpose, traffic volume along with honking events of various categories of vehicles were counted manually every 15 minutes at three busy road intersections from July to August 2023 in Rajshahi, Bangladesh, during specified times of the morning, afternoon, and evening. The findings revealed that between 67% and 74% of vehicles honked their horns, with three-wheeled autorickshaws accounting for the majority of these (62% to 67% of all incidents) and two-wheeled motorbikes (24% to 30%). The evening hours produced the greatest amount of honking. Traffic noises are the most prevalent in Rajshahi despite its lack of an industrial city. The peaceful environment that was meant for the study area was really disturbed by these horn events in the green city. To make developing cities safer, the research findings might be applied.

Keywords: Horn, Noise pollution, Rajshahi city, Traffic-induced noises

**SYNTHESIS AND CHARACTERIZATION AND BIOLOGICAL POTENTIAL STUDY
OF SCHIFF BASE TRANSITION METAL COMPLEXES DERIVED FROM
CEPHALOSPORIN'S DRUG**

University of Education, Department of Chemistry, Township campus, Lahore-Pakistan

ABSTRACT

A series of transition metal (II) complexes of new Schiff base were synthesized by the condensation of sulphonamides and aromatic aldehyde. The Schiff base ligand and its transition metal complexes were characterized by using different instrumental techniques like microanalysis, thermogravimetric analysis and spectroscopy. The synthesized ligand and metal complexes were subjected to biological studies. The studies showed the enhance activity of metal complexes against one or more species as compared to the uncomplexed ligand. The data showed that transition metal complexes have significant improved antibacterial activity than parent drug. Anti-inflammatory were found in copper complex.

ABSTRACT

Surfactant-based removal of reactive red 195 (RR-195) from synthetic waste water has been reported in this research work. Micellar enhanced flocculation technique was applied and optimized for the said purpose. The mixture of anionic surfactants, obtained from a bio-degradable source (base soap), has been found to have great potential to solubilize dye molecules. The polyvalent salts are able to flocculate the micelles and help in their subsequent removal. The removal of dye was analyzed using UV/Visible spectrophotometer. Different factors such as the effect of change in concentration, pH, temperature, contact time, and electrolyte were studied to evaluate the adsorption characteristics and removal efficiency of the process. The data obtained was further used to study the mechanism of adsorption with the help of various models e.g., Langmuir, Freundlich, Temkin, and Dubinin–Radushkevich (D-R). The kinetic parameters were also calculated by employing pseudo-1st and pseudo-2nd order kinetic models. Furthermore, thermodynamic calculations were performed to determine the change in Gibb's free energy (ΔG°), enthalpy (ΔH°), and entropy (ΔS°). The results make it evident that the micellar flocculation-based adsorptive removal is an excellent and sustainable approach for the treatment of wastewater.

ABSTRACT

Ceramic waste exhibits promising potential as a new construction material in concrete. Its utilization contributes to the preservation of natural resources and environmental protection. In this experimental study, we examined the physical and mechanical characteristics of ceramic powder-based concrete. Three types of concrete were produced: ordinary concrete, concrete with 10% of cement replaced by ceramic fillers, and concrete with 15% of cement replaced by ceramic fillers. The mechanical properties of the concrete, such as compressive and tensile strength, as well as their durability, including capillarity, mass water absorption, and hydraulic shrinkage, were characterized. The experimental results demonstrated the beneficial effects of the filler percentage used in the concrete compared to ordinary concrete.

ABSTRACT

It has been generally well-known that most people faced problems in learning English as a second or foreign language in non-English speaking countries. The present research study aimed at to investigate the causes of low achievement in English at secondary level in District Vellore, Tamilnadu, India. In this study effort was made to collect information about the causes which effect the students' achievement and provide the guide line for the educationists to improve the educational system. The study was a survey type of study. The data was collected from rural government secondary school students through Questionnaire. The students were from different schools and the total number of students was 142. To identify the causes' data was collected by random sampling techniques by using questionnaire as data collection tool. The questionnaire contains 20 items using 5 point likert scale. The questions were asked about the causes of low achievement in English language learning. The collected data was tabulated and analyzed with the help of percentage formula. The main purpose of this study was to determine the factors that affect students' English learning as a second language or a foreign language.

Email: Aderini2002@gmail.com, aderinsolaK@dut.ac.za

ABSTRACT

Many researchers have documented the positive impacts of postdoctoral fellowship on academia in the diaspora. Academics in the African diaspora have contributed immensely to academic development at the continental level. Because of the arduous and strenuous challenges of doctoral studies, most PhD holders in Africa especially in Nigeria hardly venture into the postdoctoral programmes. Acquiring skills and international experiences during postdoctoral studies break new ground and give room for research beyond the scope of someone specialization. It is essential that doctoral graduates venture into postdoctoral studies in the diaspora will avail the opportunity for international experiences such as collaborative work, enhanced research ability in international perspectives in another field and gives an opportunity for international influence. A qualitative approach was adopted for the study. Ten purposively sampled postgraduate students from public universities in Oyo State, Nigeria, participated. Therefore, this study investigates the view of postgraduate students on postdoctoral studies in the diaspora.

ABSTRACT

Parallel to the plant analysis, soil samples were collected from the Cap Three Forks (CTF) area and subjected to extensive testing. The soil study aimed to assess mineral composition by X-ray diffraction (XRD) method, structure, and other important parameters. It encompassed certain physicochemical characteristics such as particle size distribution (texture) determined by the Robinson pipette method, pH, and organic matter by the Walkley-Black method, as well as calcium carbonate by the Bernard Calcimeter method. Our results showed that the CTF soil is characterized by a sandy to sandy-loamy texture with a high percentage of sandy fraction reaching 80.5% and a portion of loamy fraction ranging between 10.3% and 45%. An alkaline pH varies between 7.85 and 8.61, with total limestone levels for both 0-30 cm and 30-60 cm deposits. Organic matter levels are high, ranging from 0.28 to 3.6%. The available phosphorus content is significant (5-183.88 mg/kg) and varies from the 0-30 cm depth to the 30-60 cm depth. The diffractograms of the natural, glycolated, and calcined treatments corresponding to different clay fractions of Cap des Trois Fourches have shown a distinct composition, with the presence of irregularly interstratified illite-smectite, smectite, illite, and kaolinite, as well as quartz and feldspar as accessory minerals.

ABSTRACT

The gender pay gap in India remains a pressing and multifaceted issue, reflecting deep-rooted societal norms, economic disparities, and workplace biases. Such a pay gap is often measured as the difference in earnings between men and women, which persists across industries and sectors in India. A complex interplay of cultural norms and traditional gender roles contributes to this disparity. Women are frequently relegated to lower-paying, less prestigious positions, while men dominate leadership roles. Additionally, the burden of unpaid care work, such as household and childcare responsibilities, disproportionately falls on women, limiting their opportunities for career advancement. Addressing the gender pay gap in India requires a comprehensive approach. Legislative measures, such as enforcing pay transparency and strengthening anti-discrimination laws, are essential to create a more equitable work environment. Employers must proactively implement diversity and inclusion initiatives, including mentorship programs and bias training, to challenge ingrained stereotypes and promote women's leadership. It can be said that the gender pay gap in India is a multifaceted issue stemming from a complex interplay of cultural norms, economic disparities, and workplace biases. The methodology employed in this study to analyse the gender pay gap in India involved a comprehensive review of existing literature, statistical data, and relevant reports from governmental and non-governmental organizations. The current study provides a concise overview of the key factors contributing to the gender pay gap in India and potential avenues for addressing this inequity.

ÖZET

İnsanlık tarafından inşa edilmiş olan şehirler sosyal, kültürel ve ekonomik yapılardan biridir. Kentlerde meydana gelen endüstrileşme, nüfus artışı kentlerin ekonomik, sosyal ve çevresel anlamda sürdürülebilirliğini tehlikeye düşürmekte ve beraberinde birçok sorunu ortaya çıkarmaktadır. Bu sorunlara çözüm bulmak ve yeni sorunların ortaya çıkmasını engellemek adına şehir uygulamaları geliştirilmeye başlanmıştır. Çalışmanın ana konusunu oluşturan “akıllı şehir” uygulamaları da bu kapsamda değerlendirilmektedir. Şehirlerin sürdürülebilirliğini sağlamak, artan nüfusa karşılık toplumun ihtiyaçlarına daha kalıcı çözümler sunabilmek önemlidir. Çünkü şehir hizmetlerinin sunumunda bilgi iletişim teknolojilerinden yararlanmak artık tercih değil, bir zorunluluk haline gelmektedir. Akıllı şehirler temelde “akıllı ekonomi”, “akıllı vatandaş”, “akıllı yönetim”, “akıllı çevre”, “akıllı yaşam” ve “akıllı mobilite” gibi toplamda altı bileşenden oluşmaktadır. Bu çalışmanın amacı Türkiye ve Dünya’daki akıllı şehir uygulamalarının mevcut durumunu ve uygulanan projeleri kıyaslama yaparak değerlendirmektir. Ayrıca akıllı şehirleri başarılı kılan etmenlerin neler olduğunu ve hangi özelliklere sahip olması gerektiğini ortaya koymaktır. Bu amaçla akıllı şehir uygulamasına yönelik literatür incelemesinden yararlanılmıştır. Yapılan inceleme sonucunda Tokyo, Amsterdam, Paris, Londra, Barselona ve Seul’un akıllı şehir uygulamalarında öncü şehirler olduğu gözlemlenmiştir. Türkiye’den ise akıllı şehir olma yönünde İstanbul, Ankara, İzmir, Antalya, Bursa, Eskişehir, Kocaeli, Denizli, Konya ve Kayseri şehirlerinin yönetimleri önemli atılımlar gerçekleştirmektedir. Ancak Dünya’daki öncü ülkelerin illeriyle kıyaslandığında Türkiye’deki diğer illerin yönetimlerinin de akıllı şehir uygulamalarının etkinliğini göz önüne alarak gerekli planları oluşturup uygulaması gerektiği düşünülmektedir.

Anahtar Kelimeler: Akıllı Şehir, Sürdürülebilirlik, Yönetimler, Türkiye

**EVALUATION OF THE EFFECTIVENESS OF SMART CITY APPLICATIONS IN
SUSTAINABLE CITY SYSTEMS**

ABSTRACT

Cities built by humanity are one of the social, cultural and economic structures. Industrialization and population growth in cities jeopardize the economic, social and environmental sustainability of cities and bring many problems along with them. In order to find solutions to these problems and to prevent the emergence of new problems, city applications have started to be developed. The "smart city" applications, which constitute the main subject of the study, are also evaluated within this scope. It is important to ensure the sustainability of cities and to offer more permanent solutions to the needs of the society in response to the increasing population. Because benefiting from information and communication technologies in the provision of city services is no longer a choice but a necessity. Smart cities basically consist of six components in total such as "smart economy", "smart citizen", "smart governance", "smart environment", "smart life" and "smart mobility". The aim of this study is to evaluate the current status of smart city applications in Türkiye and the world and the implemented projects by making comparisons. In addition, it is to reveal what factors make smart cities successful and what features they should have. For this purpose, literature review for smart city application was used. As a result of the examination, it has been observed that Tokyo, Amsterdam, Paris, London, Barcelona and Seoul are the leading cities in smart city applications. In Türkiye, the administrations of the cities of İstanbul, Ankara, İzmir, Antalya, Bursa, Eskişehir, Kocaeli, Denizli, Konya and Kayseri are making important breakthroughs towards becoming a smart city. However, when compared with the provinces of the leading countries in the world, it is thought that the administrations of other provinces in Türkiye should also create and implement the necessary plans, taking into account the efficiency of smart city applications.

ABSTRACT

Nowadays, individuals have started to use social media more actively and the modern culture of speed has led to the widespread use of short-term videos. The fact that short-term videos can be consumed quickly and mobilise emotions has made them highly preferred. These videos can be shared and watched with everyone through applications such as Tiktok, Instagram, Facebook, Twitter and Whatsapp. Individuals' experiences of watching short videos may turn into behavioural addiction after a certain point and may lead to negative consequences on individuals. Psychometric measurement tools are needed to prevent these negative consequences and to diagnose problems related to short video watching. Short video flow and short video addiction scales have been developed to meet this need. However, there is no scale related to short video watching and short video addiction in Turkey. The aim of this study is to adapt the short video flow and short video addiction scales developed by Ye et al. (2022) to Turkish culture. Therefore, the data collected from 309 high school students were analysed. According to the CFA results, $\chi^2/sd=3.71$, IFI=.90, RMR=.08, GFI=.90 and CFI=.90 for the Short Video Flow Scale items; $\chi^2/sd=3.33$, GFI=.88, CFI=.86 and RMR=.09 for the Short Video Addiction Scale items. Cronbach's alpha reliability coefficients were calculated as .87 for the Short Video Flow Scale and .82 for the Short Video Addiction Scale. These results reveal that both scales have a high level of reliability.

ABSTRACT

Phosphorus (P) deficiency is known to limit crop production in most tropical and temperate soils. Using an incubation study and a pot experiment, this research work evaluated Phosphorus mineralisation and agronomic potential of some organic fertilizers. The incubation study evaluated the P release pattern of some P fertilizer sources [organic fertilizer - OF (2.52 %P₂O₅), Biochar (1.60 %P₂O₅), Sokoto RP (36.10 %P₂O₅) and SSP (18 % P₂O₅)]. The pot experiment was employed to assess the agronomic potential of the P sources on *Abelmoschus esculentus* growth and yield. All treatments were replicated four times in completely randomized design (CRD). The dynamics of pH and available P were assessed in the incubation study. Growth parameters (plant height, stem girth and number of leaves), yield parameters (fresh and dry fruit weight) and Relative Agronomic Efficiency (RAE) as well as P uptake were determined in the pot experiment. Analysis of variance (ANOVA) was used to analyze the experimental data and means were separated by LSD at p < 0.05. In the incubation study, soil samples treated with biochar had the highest pH range (6.0 - 7.3) throughout the incubation periods. Available P was also different at all the incubation periods, except for 6 weeks after incubation (WAI), with P-release peak for SSP and SRP being at 4WAI, while that of Biochar was at 6WAI and OF released highest at 8WAI. In the final pot experiment, fruit yield and RAE of the fertilizer material tested decreased in the order: SSP>Biochar>SRP>OF>control. Phosphorus uptake was highest when SSP was applied. It was evident that Biochar, OF and SRP improve P availability and uptake by *Abelmoschus esculentus*.

ABSTRACT

Introduction: Anthropometry has a vital role in the identification of skeletal remains in the field of forensic anthropology. **Aim:** The study determined the anthropometric features of the femur bones in Anatomy museum, Delta State University Abraka, Nigeria. **Materials and Methods:** The following parameters were measured; Length of femur; Femoral head diameter; Length of femoral neck; Femoral neck thickness; Femoral neck diameter; Cervicodiaphyseal angle. Digital vernier calliper, osteometric board and goniometer was used in measuring the anthropometric variables of the femur. All measurements were taken twice and average readings were utilized. The data obtained were tabulated and statistically analyzed using the Statistical Package for Social Sciences version 23. Data were expressed in Mean \pm S.D. Chi-square test was used in testing the statistical difference in left and right femur. **Results:** Findings showed that the femur length ranges from 40.30 to 55.05 cm with a mean of 48.26 ± 2.58 cm. The mean for the femur head diameter was 45.851 ± 2.79 mm with range from 41.43 to 55.58 mm. The femur neck length ranged from 30.20 mm to 40.93 mm with a mean of 35.31 ± 2.75 mm. The femur thickness ranged from 20.90 mm to 33.00 mm with a mean of 26.73 ± 2.27 mm. The femur neck diameter had a mean of 37.88 ± 4.79 mm, ranging from 26.34 mm to 48.63 mm. The Cervico diaphyseal angle had a mean value of $122.16 \pm 4.52^\circ$ with range from 111.80° to 132.50° . There was no statistical difference ($p > 0.05$) in the mean values of all parameter measured for the left and right sides, with exception to the Cervico-diaphyseal angle in which a statistical difference was observed ($p < 0.05$). **Conclusion:** Anthropometric characteristics of the femur varies across populations.

ÖZET

24 Şubat 2022’de başlayan ve halen devam etmekte olan Rusya-Ukrayna savaşı sürecinde Avrupa Birliği ülkelerinin izlemiş oldukları Rusya karşıtı politikalar, enerji ihracatçısı konumunda bulunan bu ülkenin birlik ülkelerine yönelik enerji tedarikini azaltmasına yol açmıştır. Bu durum Avrupa Birliği ülkelerinin beklenmedik bir anda büyük bir enerji krizi ile karşı karşıya kalmalarına neden olmuştur. Enerji kaynaklarına bağımlı olan birlik ülkelerinin tüm çaba ve girişimlerine rağmen enerji tedariki sorununa çözüm bulamamaları ise söz konusu krizin daha da derinleşmesine sebebiyet vermiştir. Bu çalışma, Avrupa Birliği ülkelerinin yaşamakta olduğu enerji krizinin temel sebeplerini incelemeyi amaçlamaktadır. Çalışmada, Ukrayna savaşının Avrupa Birliği ülkelerinin yaşamakta olduğu enerji krizine doğrudan ya da dolaylı bir etkisinin olup olmadığı sorusuna cevap aranmaktadır. Çalışmanın hipotezi ise; “24 Şubat 2022 tarihinde Rus ordularının Ukrayna topraklarını işgale başlaması üzerine meydana gelen Ukrayna savaşı sürecinde cereyan eden gelişmeler, doğrudan doğruya Avrupa Birliği ülkelerinin büyük bir enerji krizinin içerisine sürüklenmesine neden olmuştur.” şeklinde formüle edilmiştir. Yukarıda ifade edilen soruya cevap verebilmek adına takip edilecek yol haritası şu şekilde olacaktır. Öncelikle araştırılan konunun tahlil edilmesini kolaylaştırmak amacıyla ilk olarak Ukrayna savaşı sürecinde meydana gelen askeri ve siyasi gelişmeler üzerinde durulacaktır. Ardından yapılacak değerlendirmelerin daha iyi anlaşılmasını sağlamak için Avrupa Birliği ülkelerinin yaşamakta olduğu enerji krizinin seyri ve sonuçları ortaya konulacaktır. Daha sonra sözü edilen savaşın Avrupa Birliği ülkelerinin yaşamakta olduğu enerji krizine olan etkisi ayrıntılı bir biçimde analiz edilecektir. Son olarak elde edilen bütün bulgular sistematik bir bütünlük içerisinde gözler önüne serilecektir.

UKRAINE WAR AND EUROPEAN UNION ENERGY CRISIS

ABSTRACT

The anti-Russian policies followed by the European Union countries during the Russia-Ukraine war, which started on February 24, 2022 and is still ongoing, caused this energy-exporter country, to restrict its energy supply to the Union countries. This situation has caused the European Union countries to face a major energy crisis unexpectedly. Despite all the efforts and initiatives of the Union countries, which are dependent on energy resources, the inability to find a solution to the energy supply problem caused the crisis in question to deepen. This study aims to examine the main causes of the energy crisis that the European Union countries are going through. In the study, an answer is sought to the question of whether the Ukraine war has a direct or indirect effect on the above-mentioned energy crisis or not. The hypothesis of the study is; “The developments that occurred during the Ukraine war, which took place after the Russian armies began to occupy the territory of Ukraine on February 24, 2022, directly caused the European Union countries to be dragged into a great energy crisis.”. The roadmap to be followed in order to answer the aforementioned question will be as follows: First, in order to facilitate the analysis of the researched subject, the military and political developments that took place during the Ukrainian war will be emphasized. In order to provide a better understanding of the evaluations to be made afterwards, the course and consequences of the energy crisis that the European Union countries are going through will be presented. Next, the effect of the mentioned war on the energy crisis that the European Union countries are experiencing will be analyzed in detail. Ultimately, all the findings will be revealed in a systematic coherence.

ABSTRACT

Vehicle accidents related to occupational health and safety in Turkey have similar characteristics with other traffic accidents. Passenger car accidents in public institutions can occur particularly during work-related trips, service deliveries, and fieldwork conducted by public officials. Most of these accidents can be attributed to various factors such as human error, carelessness, speeding, fatigue, or vehicle malfunctions. Public institutions aim to reduce traffic accidents by raising awareness among employees about occupational health and safety, promoting adherence to traffic rules, and regularly reviewing safety measures. However, to completely prevent traffic accidents, continuous measures need to be taken, and employees must be consistently educated on this matter. There are many solutions to reduce public passenger car accidents. In order to reduce these vehicle accidents, the number of in-service training should be increased, and the driving skills of the drivers should be checked more frequently in the light of scientific data. On the other hand, the theoretical and practical course hours of the training given in the driving courses should be increased. In addition to the measures to be taken in public institutions, regular health checks of the drivers of public vehicles, having spare drivers on long journeys, allocating suitable vehicles to drivers, shortening the validity period of the license, making advanced driving training compulsory, re-taking the drivers involved in the accident to a certain course, Measures can be taken, such as not being allowed to exceed the age.

ÖZET

Bu çalışma, mercimek unu ile farklı düzeylerde buğday unu takviyesinin, buğday bazlı ürünlerin fonksiyonel özelliklerini etkileyen kritik bir parametre olan Solvent Tutma Kapasitesi (SRC) üzerindeki etkisini araştırmaktadır. SRC yöntemi, un numunelerinin dört temel kalite parametresinin tek bir testte ölçülmesini sağlar: su emilimi, glutenin, pentosan ve zedelenmiş nişasta işlevleri. Mercimek (*Lens culinaris*), yüksek protein ve lif içeriği de dahil olmak üzere sağlık açısından çok sayıda fayda sunan, besin açısından zengin bir baklagildir. Temel bir tahıl olan buğday (*Triticum aestivum*), çeşitli gıda ürünlerinde yaygın olarak kullanılmaktadır. Bu iki bileşenin birleştirilmesi, ürünlerin besleyiciliğini ve işlevselliğini geliştirme potansiyeline sahiptir. Bu araştırmada, iki farklı mercimek unu, buğday unuyla farklı oranlarda (%0, %10, %20 ve %30) ikame edilmiştir. Dört farklı çözücü, su, süzkroz, sodyum karbonat ve laktik asit uygulanmıştır. Bu solventler, %0, 10, 20 ve 30 seviyelerinde mercimek unu katkılı unun farklı özellikleri hakkında fikir vermektedir. Bulgular, mercimek unu katkı düzeyi arttıkça SRC_{laktik asit} değerlerinin düştüğünü ortaya çıkarmıştır. Bu sonuç, mercimek ununun katkı oranı arttıkça, un örneklerinin gluten işlevselliğinin azaldığını göstermektedir. Ayrıca mercimek unu ilavesi arttıkça SRC_{süzkroz}, SRC_{su} ve SRC_{sodyum karbonat} değerlerinin de arttığı görülmüştür. SRC_{süzkroz}, SRC_{su} ve SRC_{sodyum karbonat} değerlerindeki artışlar, mercimek unu ilavesi arttıkça un örneklerinin pentosan işlevselliğinin, su absorpsiyon değerinin ve zedelenmiş nişasta işlevselliğinin arttığını göstermektedir. Mercimek unu takviyesinin optimal seviyesi istenilen ürün özelliklerine göre değişiklik gösterebilir. Bu çalışma, daha sağlıklı ve daha fonksiyonel gıda ürünleri geliştirmek için mercimek-buğday unu karışımlarının potansiyeline ilişkin gıda endüstrisi ile daha iyi besin kalitesi arayan tüketicilere veriler sunmaktadır.

Anahtar Kelimeler: SRC, buğday, mercimek, kalite

EFFECTS OF LENTIL FLOUR SUPPLEMENTATION WITH WHEAT FLOUR AT VARIOUS LEVELS ON SOLVENT RETENTION CAPACITY

ABSTRACT

The present study investigates the impact of lentil flour supplementation with wheat flour at different levels on Solvent Retention Capacity (SRC), a critical parameter influencing the functional properties of wheat-based products. The SRC method enables the measurement of four key quality parameters of flour samples in one single test: water absorption, glutenin, pentosan and damaged starch functionalities. Lentil (*Lens culinaris*) is a nutritionally rich legume that offers numerous health benefits, including high protein and fiber contents. Wheat (*Triticum aestivum*), a staple cereal, is commonly used in various food products. Combining these two ingredients may have the potential to enhance the nutritional profile and functionality of flour-based products. In this research, two different lentil flours were blended with wheat flour at varying levels (0%, 10%, 20%, and 30%). Four different solvents, water, sucrose, sodium carbonate and lactic acid were applied. These solvents provide insights into various aspects of flour supplemented with lentil flours in the levels of %0, 10, 20 and 30. The findings revealed that as the level of lentil flour supplementation increased, $SRC_{\text{lactic acid}}$ values decreased. It means that the supplementation level of lentils increased, gluten functionality of flour samples decreased. Besides, as the level of lentil flour supplementation increased, SRC_{sucrose} , SRC_{water} and $SRC_{\text{sodium carbonate}}$ values increased. These increases at SRC_{sucrose} , SRC_{water} and $SRC_{\text{sodium carbonate}}$ indicated that with the increasing level of lentil flour supplementation, pentosan functionality, water absorption value and damaged starch functionality of flour samples increased. The optimal level of lentil flour supplementation may vary depending on the desired product attributes. This study provides valuable insights into the potential of lentil-wheat flour blends for developing healthier and more functional food products, with implications for the food industry and consumers seeking improved nutritional quality in their diets.

ABSTRACT

This research work was carried out to determine the effect of *Cucumeropsis mannii* seed oil (CMSO) on levels of hemoglobin and packed cell volume of cisplatin induced toxicity in wister albino rats. A total of 36 albino rats were randomly assigned into six experimental groups. Group1 (normal control) was fed on pellet and allowed free access to water; Group2 (cisplatin only) received 20mg/Kg body weight of cisplatin only; Group3 (treated group) received 20mg/Kg body weight of cisplatin and 5ml/Kg b.w. of CMSO; Group4 (treated group) received 20mg/Kg body weight of cisplatin and 2.5 ml/Kgb.w. of CMSO; Group5 (treated group) received 20mg/Kg body weight of cisplatin and 7.5ml/Kg b.w. of CMSO; Group6 (CMSO only) received 5ml/Kg body weight of CMSO only. All the animals were allowed free access to water and feed without restriction. The administrations were done by oral intubation once daily for three weeks. The results showed that administration of cisplatin to albino rats showed a significant ($p<0.05$) decrease in the levels of hemoglobin and PCV in relation to controls. However, administration of cisplatin and CMSO showed a significant ($p<0.05$) reversal in the trends of these parameters to a level comparable to the level observed in the normal control group when compared to group that received cisplatin alone. The result also revealed that there was no significant ($p>0.05$) difference in the group administered CMSO only when compared with the normal controls. It's recommended that *Cucumeropsis mannii* seed oil could be used to manage hemoglobin and PCV imbalance caused by cancer medications.

ABSTRACT

Effect of *Cucumeropsis mannii* seed oil on levels of bicarbonate and chloride ions of Cisplatin induced Toxicity in Wister Albino Rats was done using standard method of analysis. After adaptation, total of 36 albino rats were randomly divided into six experimental groups of 1-6 ($N = 6$). Group 1 (normal control): rats were fed on pellet and allowed free access to water; Group 2 (cisplatin only): the animals received 20 mg/Kg body weight of cisplatin only. Group 3 (cisplatin + 5 ml/Kg b.w. of CMSO): the rats received 20 mg/Kg body weight of cisplatin and 5 ml/Kg b.w. of CMSO; Group 4 (cisplatin + 2.5 ml/Kg b.w. of CMSO): the rats received 20 mg/Kg body weight of cisplatin and 2.5 ml/Kg b.w. of CMSO; Group 5 (cisplatin + 7.5 ml/Kg b.w. of CMSO): the rats received 20 mg/Kg body weight of cisplatin and 7.5 ml/Kg b.w. of CMSO; Group 6 (CMSO): the animals received 5 ml/Kg body weight of CMSO only. The result gotten after the experiment shows that administration of Cisplatin to Albino Rats revealed a significant ($p < 0.05$) increase in the levels of chloride and bicarbonate ions and significant ($p < 0.05$) decrease in the levels of sodium and potassium ions when compared to controls. However, administration of Cisplatin and CMSO showed significant ($p < 0.05$) reversal in the trends of these parameters to a level comparable to the level observed in the control group when compared to group that received Cisplatin alone. The result also revealed that there was no significant ($p < 0.05$) difference in the group administered CMSO only when compared with the normal controls. In conclusion, this study proves that the potential use of CMSO in the management of cisplatin toxicity, thus buttressing the traditional use of this plant in treatment of disease conditions and in production of drugs.

ABSTRACT

The engineering courses have a great appeal to young people who intend to pursue higher education, but they are also the ones that experience high dropout rates in many subjects in their curriculum. This scientific article presents an analysis of failure and dropout rates in Calculus I for engineering students. For this purpose, a study was conducted using a qualitative-qualitative approach, divided into four parts. In the first part of the project, a survey was conducted among students enrolled at the Federal Institution of Bahia during the academic periods of 2022.1 and 2022.2, selecting all students who took the Differential and Integral Calculus I course. The second stage involved conducting a two-week pre-calculus mini-course for the three engineering programs, aimed at providing relevant knowledge to improve success in the CDI-I discipline. The third stage involved the development of an interactive handbook targeted at incoming students, presenting teaching and study techniques to help build an effective study routine. Finally, in the fourth stage, weekly tutoring sessions were held for both of the aforementioned subjects for all engineering programs, starting on March 23, 2023, and projected to end on July 4, 2023, the end of the first semester. The results showed that in the 2022.1 semester, there was a failure rate of 60.3% in CDI, while in the 2022.2 semester, this rate increased to 77.8%. Dropout was also identified as a problem, with 29 out of 76 failed students dropping out of the course. The data

analysis indicates the relevance of the interventions of the MATECA project, including tutoring, the pre-calculus mini-course, and the interactive handbook, as key elements for improving the reduction of failure and dropout rates, as well as the students' performance.

ABSTRACT

This article investigates the impact of participation in sports activities on the learning process and academic performance of students enrolled in the electrical engineering course. Using a comprehensive methodological approach, we examined the benefits of sports practice for both the physical and mental health of the participants, as well its influence on the ability to concentrate, improve memory and reduce stress. The project was implemented in collaboration with the Federal Institute of Education, Science and Technology of Bahia (IFBA), transforming *Atlética Revoltada* into an extension initiative, with the purpose of expanding access to sports facilities and the necessary resources. The theoretical basis for this study was obtained through a detailed bibliographic review, while an online survey was conducted with the students in order to understand their perception of the importance of sport for quality of life. With the introduction of the sports modalities of volleyball and futsal, later integrated into the official teams of the institution, small-scale internal championships were also organized. The implementation of this sports routine revealed positive impacts on both academic performance and mental health of students, thus highlighting the relevance of sports practice as an integral component of their academic development. We wish to express our sincere gratitude to the IFBA for making the necessary facilities and resources available, as well as to all dedicated and committed members of the Revolted Athletic Association. This study provides valuable insights that can contribute to the promotion of a more comprehensive and healthy education, emphasizing the importance of fostering participation in sports activities among students of the electrical engineering course.

ABSTRACT

High dropout rates in engineering courses, especially during the first semesters, are a widely recognized and debated issue. One of the prevailing hypotheses nowadays suggests that these indices are a result of the accentuated complexity of the courses, combined with the additional challenge of new students, especially those coming from public schools, who often face gaps in their mathematical background and have no prior experience in independent studies, away from the step-by-step monitoring of teachers. It is in this scenario that emerges the Multimedia Program of Elementary Mathematics to Calculus – PROMATECA, with the fundamental mission of providing valuable support to these students. Through the application of the theory of learning channels and using a video platform such as YouTube, the Project seeks to create short videos aimed at solving problems. These videos are designed with a dynamic approach and informative subtitles, resulting in content that is easy to understand, more accessible and inclusive for students. The objective of the project is to thoroughly investigate the concrete impact of PROMATECA in the context of the teaching of the disciplines of Differential and Integral Calculus. For this, it relies on the detailed analysis of data obtained through the Google Analytics tool. The study aims to evaluate the breadth and reach of the video channel, insightfully how these audiovisual resources

contribute positively to student performance in these disciplines, facilitating the understanding and assimilation of complex concepts.

ABSTRACT

Analysis is one of the greatest achievements in the history of mathematics. The achievement opens a new era of mathematical progress and plays an important role in the development of physics, astronomy, signal processing and other disciplines. At the end of the 19th century, mathematicians deduced many properties of continuous functions on closed intervals, which undoubtedly promoted the development of analytical theory. Bolzano's Function Theory gives the earliest proofs of the Boundedness theorem and the Extreme value theorem and Weierstrass proved the Extreme value theorem in Berlin lecture. The Intermediate value theorem was first proved in 1817 by Bolzano, and then Cauchy gave a proof in 1821. The definition of uniform continuity is proposed by Heine, and he published a proof of the Uniform continuity theorem. There are some important properties of continuous functions on closed intervals including Weierstrass second theorem: Boundedness theorem, Weierstrass first theorem: Extreme value theorem, Bolzano-Cauchy second theorem: Intermediate value theorem, Cantor theorem: Uniform continuity theorem. Continuous functions have four fundamental properties on closed intervals: Boundedness theorem, Extreme value theorem, Intermediate value theorem, Uniform continuity theorem. These theorems are the basis of mathematical analysis and the direct expression of real number theory in functions. In 2018, Samer Al Ghour and Kafa Mansur introduced and studied the notions of w_s -open sets as a new class of sets which lies strictly between open sets and semi-open sets. They introduced w_s -continuous functions as a new class of functions between continuous functions and semi-continuous functions and obtained some characterizations of w_s -continuous functions. We introduce new classes of functions called w_s -open function and w_s -closed function and investigate several properties and characterizations of these mappings in topological spaces.

Mathematics Subject Classification (2020): 54C05, 54C08, 54C10.

Keywords: Topological space, w_s -open set, w_s -closed set, w_s -interior set, w_s -closure set, w_s -open function, w_s -closed function

ABSTRACT

Most references on topological spaces seem to define a compact space in terms of open coverings of a space having finite sub coverings. Formally, we say that a collection of open sets $\{U_i : i \in I\}$, indexed by some set I , is an open covering of a topological space K if $K \subseteq \bigcup_{i \in I} U_i$. We define K to be compact if there exist finitely many open sets $U_{i_1}, U_{i_2}, \dots, U_{i_n}$ in the open covering such that $K \subseteq \bigcup_{j=1}^n U_{i_j}$. There exists a number of equivalent definitions of a compact space, which we briefly mention here. A topological space K is compact if and only if K has the finite intersection property: if $\{E_i : i \in I\}$ is a collection of a closed sets indexed by a set I such that, for any finite subset $I_0 \subseteq I$, $\bigcap_{i \in I_0} E_i \neq \emptyset$, then $\bigcap_{i \in I} E_i \neq \emptyset$. Another equivalent definition is in terms of nets. A topological space K is compact if and only if every net $(x_\alpha : \alpha \in \Lambda)$ in K has a convergent subnet. In 2018, Samer Al Ghour and Kafa Mansur introduced and studied the notions of w_s -open sets as a new class of sets which lies strictly between open sets and semi-open sets. They introduced w_s -continuous functions as a new class of functions between continuous functions and semi-continuous functions and obtained some characterizations of w_s -continuous functions. We will extend the concept of compactness via w_s -open sets by introducing w_s -compact space in topological space and will investigate its characterizations by making use of mappings including w_s -continuous functions and w_s -irresolute functions. The objective of this paper is to introduce the new concept called w_s -Lindelof space and investigate fundamental properties and characterizations of this new notion of space in topological spaces.

ÖZET

Canlandırma sineması tarihsel süreç içinde teknolojik gelişmelere paralel bir biçimde gelişme göstermiştir. Canlandırma alanının ilk dönemlerinde fotoğraf alanındaki gelişmeler alana yön vermiştir. Daha sonraki dönemlerde ise bilgisayar alanında yaşanan gelişmeler doğrudan canlandırma sinemasına etkide bulunmuştur. 3D baskı sistemleri ise tasarım ve canlandırma alanı başta olmak üzere birçok alana katkı sağlayan ve yeni bir döneme yön veren bir gelişmedir. 3D baskı teknolojileri söz konusu yenilikçi yönü bu teknolojinin yeni bir sanayi devrimi olarak görülebilmesine neden olabilmektedir. 3D yazıcılar genel olarak sanal ortamda tasarlanmış bir ürünün katı olarak üç boyutlu bir şekilde baskısının yapılmasını ifade etmektedir. 3D yazıcılar ile sanal olarak tasarlanan herhangi bir ürün gerçek hayatta kullanım için basılabilmektedir. Canlandırma alanında da özellikle de stop motion tarzında canlandırma filmi üretim süreçlerinde 3D teknolojisinden yararlanılmaktadır. Uzun çalışma süresi içinde Stop motion animasyon filmleri kare kare çekilerek yaratılmaktadır. Doğal olarak bu durum animasyon filmde yer alan her karakterin yüzlerce pozunun çekilmesi anlamına gelmektedir. Zaman içinde 3D baskı alanında yaşanan gelişmeler stop motion animasyon alanına da önemli katkı sağlamıştır. Böylece animasyon filminde kullanılacak yüzlerce benzersiz parçayı 3D olarak basabilmek, stop motion animasyon filmlerinin kalitesinin artmasını sağlarken, stop motion animasyonların üretim maliyetlerini de düşürmüştür. Bilgisayar grafik destekli canlandırma filmlerinin ortaya çıktığı çağımızda kökü 19. yüzyıla dayanan eski bir canlandırma tekniği olan stop motion canlandırma filmlere olan ilgi devam etmektedir. Özellikle de 3D baskı teknolojisi bu tür canlandırma filmlerin üretim sürecini kolaylaştırması da bu alanda yaşanan önemli bir gelişmedir. Çalışmada bu kapsamda 3D baskı teknolojisinin Stop Motion canlandırma sinemasındaki önemi ve katkısı araştırılarak, konu çeşitli örnekler üzerinden tartışılacaktır.

USE OF 3D PRINTING TECHNOLOGY IN STOP MOTION ANIMATION MOVIES

ABSTRACT

In the course of history, animation film has advanced concurrently with technological advancements. The advancements in photography gave direction to the field of animation throughout its early stages. The advancements in computer technology had a direct impact on animation film in later eras. On the other hand, 3D printing systems are a development that influences numerous industries, particularly design and animation, and ushers in a new era. Due of its revolutionary nature, 3D printing technology has the potential to spark a new industrial revolution. A product produced in a virtual environment is often printed in three dimensions as a solid using a 3D printer. Any item virtually created using 3D printers can be printed for usage in. In the field of animation, 3D technology is used, especially in the production processes of stop motion animation films. Movies with stop motion animation are produced frame by frame over an extended period of time. Naturally, this entails photographing each animation figure in a large number of poses. The field of stop motion animation has greatly benefited from the advancements achieved in the 3D printing industry throughout time. As a result, the quality of stop motion animation films has improved while production costs have decreased thanks to the ability to 3D print hundreds of distinctive elements for use in animation movies. The popularity of stop motion animation movies, a classic animation style that dates back to the 19th century, persists in our modern era when computer graphics-supported animation films first appeared. An significant advancement in this area is the use of 3D printing technology to make the production of such animated movies easier. The significance and contribution of 3D printing technology to Stop Motion animation film will be examined in this context, and the topic will be presented using a variety of examples.

ABSTRACT

Endüstriyel makinelerin ve ekipmanlarının mekanik sağlığı hakkında bilgi edinebilmek ve oluşabilecek potansiyel arızaların erken tespiti ve önlenmesi amacıyla rulman titreşimlerinin analizinden yararlanılmaktadır. Çalışma, sanayi ortamlarında yaygın olarak kullanılan motor mekaniği içindeki kusurları tespit etmek için derin öğrenme algoritmalarının rulman titreşimini analiz etmek üzere kullanılmasına odaklanmaktadır. Bu çalışmanın amacı, titreşim verilerinin analizi yoluyla mekanik sorunların erken tespiti ile üretim verimliliğini artırmaktır. Bu amaç doğrultusunda öngörücü bakım ve hata tespiti alanında yaygın olarak kullanılan Case Western Reserve University (CWRU) rulman veri kümesi kullanılmıştır. Bu veri kümesi, sağlıklı sınıf haricinde üç farklı uzunluğa ait mil için üç farklı kusur olan bilye, iç yuva ve dış yuva zaman serisi olarak on sınıf içermektedir. Verilerin dört farklı şekilde kullanılması amacıyla ilk olarak orijinal titreşim verileri kullanılmıştır. Daha sonra ham titreşim verilerinden ilgili özelliklerin çıkarılmasıyla verideki karmaşıklık azaltılmış ve anlamlı bilgi çıkarımı yapılmıştır. Veri dönüşümünde sinyalleri frekans alanına dönüştürerek zamana bağlı özellikleri yakalama ve kusurlarla ilgili desenleri ortaya çıkarmak amacıyla orijinal verilere STFT uygulanmıştır. Analiz için verinin temsiliyetini potansiyel olarak artırmak için STFT uygulanan verilerden özelliklerin çıkarımı yapılmıştır. Çalışmanın yönteminde K-En Yakın Komşu (KNN), Destek Vektör Makineleri (SVM) gibi makine öğrenimi algoritmaları ve 1D Dalgalet Ayrıştırılmış Evrişimli Sinir Ağı (1D WDCNN) gibi yöntemler, 1-D veri alanına uygulanmıştır. 2D veri için ayrıca STFT dönüşümü, 2-D veri alanına (zaman-frekans temsili) uygulanmıştır. Bu alanda EfektifNetB0, EfektifNetB1, ResNet18 ve 2D WDCNN gibi derin öğrenme yöntemleri kullanılarak analiz yapılmıştır. Çalışma sonucunda 2-D alanda %100 doğruluk elde edilmiştir. Bu sonuç derin öğrenme modellerinin farklı kusur sınıfları arasında etkili bir şekilde ayırım yapabildiğini göstermektedir. Çalışma, motor mekaniği içindeki kusurları titreşim sinyallerinin analizi yoluyla tespit etmek için derin öğrenme yöntemlerinin etkinliğini göstermektedir. Özellikle dönüştürülmüş 2-D veri alanına (STFT temsili) uygulandığında elde edilen %100 doğruluk, bu yöntemlerin gerçek dünya sanayi uygulamalarında, mekanik sorunları erken tespit ederek üretim verimliliğini artırmak için umut vaat ettiğini göstermektedir.

DEEP LEARNING BASED FAULT DETECTION FROM BEARING VIBRATION DATA

ABSTRACT

The analysis of bearing vibrations is harnessed to acquire insights about the mechanical health of industrial machines and equipment, aiming to facilitate early detection and prevention of potential failures. This study focuses on employing deep learning algorithms for analyzing bearing vibrations, specifically within motor mechanics, which are widely employed in industrial settings. The objective of this research is to enhance production efficiency through early detection of mechanical issues via vibration data analysis. To achieve this goal, the Case Western Reserve University (CWRU) bearing dataset, commonly utilized in predictive maintenance and fault detection, is employed. This dataset encompasses ten classes of time-series data, including healthy states and three distinct faults (ball, inner race, and outer race faults) for bearings of three different lengths. In the pursuit of comprehensive analysis, various approaches are employed for data utilization. Initially, the original vibration data is utilized, followed by feature extraction from raw vibration data to reduce complexity and extract meaningful insights. Short-Time Fourier Transform (STFT) is applied to the original data to transform signals into the frequency domain, aiming to capture time-dependent features and reveal patterns related to faults. Feature extraction from the STFT-transformed data is performed to enhance data representation for analysis. Machine learning algorithms like K-Nearest Neighbors (KNN), Support Vector Machines (SVM), and the 1D Wavelet Decomposed Convolutional Neural Network (1D WDCNN) are employed within the 1D data domain. Additionally, for 2D data, STFT transformation is applied to represent the data in the time-frequency domain. Deep learning methods including EfficientNetB0, EfficientNetB1, ResNet18, and 2D WDCNN are employed for analysis. The study culminates in achieving 100% accuracy within the 2D domain. This outcome underscores the effective differentiation capabilities of deep learning models among different fault classes. The research showcases the efficacy of deep learning methods in detecting faults within motor mechanics through the analysis of vibration signals. Notably, the achieved 100% accuracy when applied to the transformed 2D data domain (STFT representation) demonstrates the promising potential of these methods to enhance real-world industrial applications by enabling early detection of mechanical issues and thereby improving production efficiency.

ABSTRACT

With the globalizing world economy, the importance of domestic and foreign trade balances between countries is increasing day by day. Countries that want to benefit from both raw material supply, productivity increase and cost advantage develop various strategies related to economic policies. In this context, the development of foreign trade relations is of great importance for countries. Developed countries use foreign trade as a tool to find markets for their relatively excess output, while developing and underdeveloped countries use foreign trade as a tool to procure raw materials and resources that they do not have. Turkey has opened its doors to the world market with the industrialization and foreign trade policies it has pursued from past to present and has been expanding its foreign trade volume day by day. With the structural reforms implemented and the removal of barriers to foreign trade over time, Turkey has been increasing the number of trade partners both to find new markets for its goods in the world market and to supply the raw materials and intermediate goods required for production. In this study, the country groups with which Turkey conducts the most foreign trade are analyzed with the gravity model. In the analysis based on annual data for the period 2013-2022, 5 countries with the highest exports (Germany, USA, Iraq, UK, Italy) and 5 countries with the highest imports (Russian Federation, China, Germany, Switzerland, USA) were selected. In this study, where exports and imports are analyzed separately, first fixed effects and random effects tests are conducted and then Hausman test is used to determine the appropriateness of the tests. According to the empirical findings of the study, Turkey's GDP has a statistically significant and positive effect on both exports and imports. The other independent variables used in the analysis (real effective exchange rate, distance between countries and population of countries) are not statistically significant in explaining the foreign trade relationship between Turkey and the selected countries.

ABSTRACT

This study sought to determine the prevalence of hepatitis B surface antigen (HBsAg) amongst students attending Muhammad Shehu Kangiwa Medical Center in Kaduna, Nigeria. A total of 201 students aged 15-35 attending the medical centre were recruited for the study. A one – time venous blood sampling was used to collect 5 ml of blood from each participant. The samples were tested for HBsAg using a commercially available enzyme-linked immunosorbent assay (ELISA) kit. The results showed that the overall prevalence of HBsAg amongst the participants was 4.0%, with a higher prevalence in males (6.6%) compared to females (2.4%). the prevalence of the HBsAg was higher in students aged 21-25 years (7.4%) compared to those aged 15-20 (1.4%) and 26-30 (6.4%). These findings suggest that there is an increased in risk of HBsAg amongst male students of varying ages, and that targeted interventions may be needed to reduce the spread of this infection. Overall, this suggests that there is a low prevalence of HBsAg amongst students attending Muhammad Shehu Kangiwa Medical Center. It is likely that the risk factors associated with HBsAg such as poor sanitation, overcrowding and poor hygiene practices are contributing this prevalence. The findings of this study highlight the need to improved health education and sanitation practices amongst male students of Kaduna Polytechnic. Interventions should also be implemented to improve the surveillance of HBsAg and other infectious diseases amongst Students of the Kaduna Polytechnic in order to prevents further spread of the diseases.

ABSTRACT

Going green has created significant enthusiasm across society and green entrepreneurial intention is still at the evolving stage. The main objective of this study was to assess the green entrepreneurial intention, events and fear of environmental management trainees in Nigeria. A cross-sectional survey was conducted through a structured questionnaire among the environmental management trainees. A multi-staged sampling technique was used to select 240 respondents. The findings of the results revealed that a majority of the respondents (79.2 %) had a family size of less than or equal to 6 while the mean family size of the respondents is approximately 5 persons. A majority of the respondents (49.2 %) are between the ages of 21 to 25 years of age while the mean age of the respondents is approximately 22 years, received a student's monthly stipend (52.2 %) of between ₦ 10,000 and ₦ 20,000 while the mean students' monthly allowance was ₦ 16,017.70. The entrepreneurial intention (3.32), entrepreneurial event (3.13) and entrepreneurial fear (3.18) of the respondents were on average. The result of the study seeks to provide information to the stakeholders to explore opportunities for green entrepreneurial ventures among environmental management trainees. Colleges may offer adapted academic courses, or training programs to trigger the green business initiative among the students and this will be beneficial for the students in learning the essentials of green entrepreneurial intention, thus enhancing a better entrepreneurial experience and reducing entrepreneurial fright.

ABSTRACT

In this study, we explored the quantitative correlation between the anti-NSCLC (Non-Small Cell Lung Cancer) biological activity and the molecular structure within a series of 38 derivatives of cyclohexane-1,3-dione-dimidone. To achieve this, we utilized molecular descriptors computed through DFT-B3LYP/6-31G, along with topological and physicochemical analysis. The outcomes of the QSAR models developed herein using MLR and MNLN techniques exhibit the robust predictive capability of these models. Specifically, the linear model yielded an R² value of 0.913 (R²CV = 0.85, R²test = 0.934), while the nonlinear model achieved R² values of 0.991 (R²CV = 0.82, R²test = 0.997). Leveraging the predictions derived from the QSAR model, novel molecular structures were designed and subsequently assessed for their anti-NSCLC activity. Furthermore, significant interactions between these molecules and the human c-Met protein were forecasted. Integrating projections from the QSAR models, molecular docking analyses, and in silico ADMET property evaluations, we pinpointed one out of the 16 newly developed molecules as a potential drug candidate for NSCLC.

Keywords: QSAR, ADMET, Molecular Docking, NSCLC, C-met

ABSTRACT

In this study, we explored the quantitative correlation between the effectiveness against non-small cell lung cancer (NSCLC) and the molecular configuration of a set of 38 derivatives based on cyclohexane-1,3-dione-dimidone. To achieve this objective, we employed molecular characteristics determined through DFT-B3LYP/6-31G calculations, along with topological and physicochemical analysis. The outcomes of the assessments for the QSAR models developed in this research using MLR and MNLR techniques reveal the substantial predictive capacity of these models. For the linear model, the coefficients of determination were ($R^2 = 0.913$; $R^2_{CV} = 0.85$; $R^2_{test} = 0.934$), and for the nonlinear model, they were ($R^2 = 0.991$; $R^2_{CV} = 0.82$; $R^2_{test} = 0.997$). Leveraging predictions stemming from the QSAR model, novel molecular structures were conceptualized. Their efficacy against NSCLC was gauged, and the principal interactions between these molecules and the human c-Met protein were anticipated. The amalgamation of forecasts from the QSAR models, molecular docking, and the evaluation of in silico ADMET properties indicated that one out of the sixteen newly conceived molecules holds potential as a prospective drug for NSCLC.

Keywords: QSAR, ADMET, Molecular Docking, NSCLC, c-Met

VAZO RESİMLERİ ÜZERİNDE YER ALAN SUNAK TASVİRLERİNDEN HAREKETLE MÖ 6. VE 5. YÜZYIL SUNAKLARININ YAPISAL ÖZELLİKLERİ

Dr. Öğretim Üyesi Aslıhan ÖZBAY (ORCID: 0000-0002-8519-5665)

ÖZET

MÖ. 8. yüzyılda Kıta Yunanistan'dan Batı Anadolu'ya yerleşen kolonistlerin faal yürüttükleri deniz ticaretiyle birlikte bölgede başlayan kültürel ve ekonomik yükselme MÖ 6. yüzyılda doruk noktasına ulaşmıştır. İonia bölgesinin altın çağı olarak anılan bu yüzyılda özellikle Akdeniz kültürleri ile kurulan ticari ilişkilerin etkileri kendini maddi kültür üzerinde belirgin olarak gösterir. Bu dönemde İonia bölgesinde ortaya çıkan ve İon düzeni olarak isimlendirilen mimari düzen Yunan kültürünün yayılım gösterdiği tüm coğrafyalarda kabul görmüştür. Anıtsal tapınak mimarisinde görülen bu değişimle eş zamanlı ve bağıntılı olarak bölgede iki yeni sunak tipi ortaya çıkmıştır. MÖ 6. yüzyılda ilk örnekleri İonia'da görülen yuvarlak ve dörtgen sunaklar ortaya çıktıkları tarihten itibaren kesintisiz olarak Roma dönemine değin kullanılmıştır. Yuvarlak ve dörtgen sunakların form ve yapısal özelliklerinde Klasik Dönemden Hellenistik Döneme değin minimal düzeyde değişim görülmesine karşın sunakların kullanım amacında dikkate değer bir fark görülür. Arkaik ve Klasik Dönemde salt Olympos tanrılarına sunu için kullanılan sunaklar Hellenistik Dönemle birlikte şehir kurucuları, yöneticiler ve din adamları gibi kentin önde gelen kişilerinin mezar yapılarının bir parçası haline gelmiştir. Roma Dönemine gelindiğinde ise sunakların özgür Roma vatandaşlarının mezarlarında kullandıkları görülür. Nekropolis alanlarından ve mezar yapılarıyla birlikte ele geçen sunaklardan hareketle Hellenistik ve Roma Dönemi sunaklarının gerek yapısal özellikleri gerekse kullanım amaçlarına ilişkin detaylı bilgi sahibi olmamıza karşın sunakların ortaya çıktıkları MÖ 6. ve MÖ 5. yüzyıldaki yapısal ve bezeme özelliklerine ilişkin veriler oldukça kısıtlıdır. Bu çalışmanın ana amacı siyah ve kırmızı figür vazo resimlerinde kurban ve sunu sahnelerinde sıklıkla kullanılan sunakların erken dönem tasvirlerinde görülen form ve bezeme özelliklerinin belirlenmesi ve somut örneklerle ortak özelliklerinin saptanmasıdır.

Anahtar Kelimeler: Yuvarlak sunaklar, Volüt sunaklar, Arkaik Dönem, Klasik Dönem, Kurban ve sunu tasvirleri

**BASED ON THE ALTAR DESCRIPTIONS ON THE VASE PAINTINGS
STRUCTURAL FEATURES OF 6 TH AND 5 TH CENTURY BC ALTARS**

ABSTRACT

The cultural and economic rise, which started in the Ionia region with the maritime trade carried out by the colonists who settled in Western Anatolia from Continental Greece in the 8th century BC, reached its peak in the 6th century BC. In this century, which is known as the golden age of the Ionian region, the effects of the commercial relations established with the Mediterranean cultures show themselves clearly on the material culture. The architectural order that emerged in the Ionia region during this period and was called the Ionic order was accepted in all region where Greek culture spread. Simultaneously and in conjunction with this change in monumental temple architecture, two new altar types emerged in the region. Round and rectangular altars, the first examples of which were seen in Ionia in the 6th century BC, were used continuously from the date of their emergence until the Roman period. Although there is minimal change in the form and structural features of round and rectangular altars from the Classical Period to the Hellenistic Period, there is a remarkable difference in the use of the altars. Altars, which were used solely for offerings to the Olympian gods in the Archaic and Classical Periods. In Hellenistic Period altars became a part of the tomb structures of prominent people of the city, such as city founders, administrators and clergy. When it comes to the Roman Period, it is seen that altars were used in the graves of free Roman citizens. Although we have detailed information about the structural features and intended use of the Hellenistic and Roman Period altars based on the altars unearthed from necropolis areas and tomb structures, data on the structural and decorative features of the altars in the 6th and 5th centuries BC, when they emerged, are quite limited. The main purpose of this study is to determine the form and decoration features seen in the early depictions of altars, which were frequently used in sacrifice and offering scenes in black and red figure vase paintings, and to determine their common features with concrete examples.

ÖZET

Giriş: Dişeti büyümesi çoğunlukla plakla ilişkili inflamatuvar prosesler sonucu ortaya çıkan, lokalize ya da generalize olarak gözlenen büyümelerdir. Enflamatuvar durumlar haricinde, bazı ilaçların kullanımının da dişeti büyümesi yaptığı bildirilmiştir. Çalışmamızda diş hekimleri arasında dişeti büyümesi yapan ilaç farkındalığının araştırılması amaçlanmıştır. **Materyal-Method:** Anket çalışmamıza toplamda 164 diş hekimi katıldı. Katılımcıların dişeti büyümesi yapan ilaç farkındalığının değerlendirmek için self-reported bir anket formu oluşturuldu. Anket formu Google forms üzerinden online olacak şekilde hazırlandı. Anket çevrimiçi olduğundan, anketin dağıtılması ve tanıtılması yöntemi sosyal ağ üzerinden (facebook) ve Apple store'dan (WhatsApp) yapıldı. **Bulgular:** Diş hekimlerine dişeti büyümesi yapan ilaç grupları, hekimlerin dişeti büyümesi şikayeti ile gelen hastaya yaklaşımları ve dişeti büyümesine neden olan ilaçlarla ilgili bilgileri nereden edindiklerine dair sorular yöneltildi. Antibiyotiklerin ve antienflamatuvar ilaçların dişeti büyümesi yapmadığı konusundaki farkındalıkları yüksek olmakla birlikte, bir grup diş hekimi ise antidepresanların dişeti büyümesi yaptığını yönünde fikir beyan etti. "Etiyolojisinde ilaçlar olan, dişeti büyümesi şikayetiyle başvuran hastaları siz mi tedavi edersiniz yoksa diş eti hastalıkları uzmanına mi yönlendirirsiniz?" sorusuna verilen cevaplarda hekimlerin çalıştığı kurumlar açısından anlamlı bir fark vardı ($p<0.001$). Özel hastanedeki doktorlar yüksek oranda "tedavi ederim" cevabını verirken, devlet hastanesindeki doktorlar (92%) yüksek oranda uzman diş hekimine yönlendirmeyi tercih etmiştir. Yukarıdaki soruya verilen cevaplarda diş hekimin mesleki tecrübesinin de etkili olduğu gözlemlendi ($p=0.044$). Mezuniyet tarihinden itibaren 5 yılda daha az mesleki tecrübesi bulunan hekimlerin dişeti büyümesi olan hastaları kendileri tedavi etmeyi tercih oranı, 15 yıl'dan uzun süre önce mezun olanlardan fazlaydı. Dişeti büyümesi yapan ilaçlarla ilgili bilgileri hekimlerin çoğu (%74) kongrelerden takip ettiğini bildirmiştir. **Sonuç:** Literatürde diş hekimlerinin farkındalığını ve dişeti büyümesi olan hastalara yaklaşımlarını inceleyen çeşitli çalışmalara rastlanmıştır. Çalışmamızda genel olarak diş hekimlerinin dişeti büyümesi yapan ilaçlara karşı farkındalığının yüksek olduğu gözlemlenmiştir. Ama dişeti büyümesi yapmayan ilaçlar konusunda hekimlerde bilgi eksikliği olduğu görülmüştür.

Anahtar Kelimeler: Diş hekimi, dişeti büyümesi, farkındalık, anket

EVALUATION OF DRUG-INDUCED GINGIVAL OVERGROWTH AWARENESS AND TREATMENT APPROACHES AMONG DENTISTS

ABSTRACT

Introduction: Gingival enlargement is a localized or generalized growth that usually occurs as a result of plaque-related inflammatory processes. Except from inflammatory conditions, the use of some drugs has also been reported to cause gingival enlargement. Our study aimed to investigate the awareness of drugs that cause gingival enlargement among dentists. **Material-Method:** A total of 164 dentists participated in our survey study. A self-reported survey form was created to evaluate the participants' awareness of drugs that cause gingival enlargement. The survey form was prepared to be online via Google forms. Since the survey was online, the method of distribution and promotion of the survey was through social network (facebook) and Apple store (WhatsApp). **Results:** Questions were asked to dentists about the drug groups that cause gingival enlargement, dentists' approach to patients complaining of gingival enlargement, and where they obtained information about drugs that cause gingival enlargement. Although there is a high awareness that antibiotics and anti-inflammatory drugs do not cause gingival enlargement, a group of dentists stated that antidepressants cause gingival enlargement. There was a significant difference in the answers given to the question "Do you treat patients with gingival enlargement complaints whose etiology is drugs or do you refer them to a gum disease specialist?" in terms of the institutions where dentists work ($p < 0.001$). While doctors in private hospitals responded "I will treat" at a high rate, doctors in public hospitals (92%) preferred to refer them to a specialist dentist at a high rate. It was observed that the dentist's professional experience was also effective in the answers given to the above question ($p = 0.044$). Dentists with less than 5 years of professional experience from the date of graduation were more likely to choose to treat patients with gingival hyperplasia themselves than those who graduated more than 15 years ago. Most dentists (74%) reported that they follow information about drugs that cause gingival enlargement from congresses. **Conclusion:** Various studies have been found in the literature examining dentists' awareness and their approach to patients with gingival enlargement. In our study, it was observed that dentists were generally aware of drugs that cause gingival enlargement. However, it has been observed that dentists lack knowledge about drugs that do not cause gingival enlargement.

ABSTRACT

Objective: In the base of the skull, near the pituitary gland, there is a depression known as the sella turcica. The sella turcica bridging and the ossified caroticoclinoid ligament are two significant anatomical differences. Known to be related to dental anomalies is sella turcica bridging, which is the fusion of the anterior and posterior clinoid processes. The ligament that connects the middle and anterior clinoid processes is referred to as the "ossified caroticoclinoid ligament." The internal carotid artery may get compressed if this ligament becomes ossified. We aimed to determine the frequency of these variations in the adult population, as well as any potential relationships between age and sex. **Methods:** We evaluated 1600 head computed tomography (CT) images in the past. The patients were separated into four age groups: 18–33, 34–48, 49–65, and >65. For each age group, we specify the prevalence of the variations and any possible correlations. **Results:** Sella turcica bridging was prevalent in 0,192men (154/800), 0,21 women (168/800), and 0,201 people overall. It was bilateral in 212 cases (212/322, 0,6583). Ossification of the caroticoclinoid ligament was present in 9.12 percent (73/800) of men, 9.37 percent (75/800) of women, and 9.25 percent (148/1600) of the population overall. 114 instances (114/148, 77,02 percent) had bilateral variation. No statistically significant association between the variations and sex was found. With older ages, both variations were more frequently found. **Conclusion:** We establish a correlation between age and the variations. Additionally, prevalence statistics can be utilized to raise awareness of these variations and their clinical importance.

ABSTRACT

This study was conducted to evaluate the hydrocarbon remediating potentials of some tropical plants growing in the vicinity of automobile workshops (AW) in parts of Niger State, Nigeria. This involved a preliminary survey to major AW in Minna, Bida, Suleja and Tegna in Niger State to identify spent engine oil (SEO) tolerant plants growing in the vicinity of the AW. The microorganisms in the rhizosphere and non-rhizosphere were enumerated using the spread-plate method on standard media and were identified using morphological, biochemical and molecular techniques. Besides, the microorganisms were screened for SEO utilization using spectrophotometric analysis. The physicochemical properties of the SEO polluted soil were determined using standard methods. The bioremediation potential of *Melissia officinalis* (Lemon balm) and *Urena lobata* (Caesar weed) were assessed by monitoring the Total Petroleum Hydrocarbon, heavy metal content, GCMS analysis of residual oil and the generation of plant exudates during the phytoremediation process. The experimental setup was conducted at the biological garden of the Federal University of Technology, Minna. The results of the total aerobic heterotrophic bacterial counts in SEO contaminated soil within the various workshops showed that the counts were generally low when compared to the counts from both rhizosphere and non-rhizosphere soils in the AW vicinity. The mean bacterial counts of the AW were more in Tegna ($2.37 \times 10^6 \pm 4.01 \times 10^6$ cfu/g), while Bida had the lowest bacterial counts ($1.56 \times 10^5 \pm 2.13 \times 10^5$ cfu/g) when compared to Minna ($2.03 \times 10^6 \pm 3.44 \times 10^6$ cfu/g) and Suleja ($1.36 \times 10^6 \pm 2.28 \times 10^6$ cfu/g). However, statistical analysis revealed that there were no significant differences ($p > 0.05$) in bacterial counts among the stations. The total fungal counts of soil within the AW were low as compared to the rhizosphere and the non-rhizosphere soils, with Bida having the highest counts ($1.36 \times 10^6 \pm 2.26 \times 10^6$ cfu/g) while Tegna and Minna had the lowest counts ($3.41 \times 10^5 \pm 5.71 \times 10^5$ cfu/g). Microorganisms isolated in the study were *Bacillus subtilis*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Aspergillus niger*, *Penicillium notatum* and *Fusarium oxysporium*. Species of *Bacillus*, *Staphylococcus* and *Aspergillus* were more consistently isolated and constituted 9.16- 9.83%. *Bacillus subtilis* strain EE681738 and *Aspergillus niger* strain

HQ659967 were the most efficient spent engine oil utilizers. The residual total petroleum hydrocarbon in *M. officinalis* treated soil was 56.61%, while it was 50.55% in *U. lobata* treated soil after seven months. The physicochemical properties of SEO polluted soil remediated with *M. officinalis* and *U. lobata* revealed that after seven months of bioremediation, nitrogen, organic matter, potassium and phosphorus contents gradually increased. GCMS analysis of the hydrocarbons revealed that 9H-Fluorene, Diphenylacetylene, Tritriacontane, Nonahexacontane, Hentriacontane, Octatetracontane, Ethanone, Carbonic acid were completely degraded while the following compounds, Phenyleamine, Pyrimidine, Carbonic acid, Coumarin, Acetic acid, Naphthalene, 4-Chlorophenoxy were found in the exudates secreted by *M. officinalis* and *U. lobata*. The results obtained suggest that plants found within the vicinity of AW particularly, *M. officinalis* and *U. lobata* are good candidates for phytoremediation of SEO polluted soil in the tropics.

ABSTRACT

Background and aim: Divorce is an emotionally challenging experience that can take a significant toll on one's mental health. According to a study by the American Psychological Association, individuals who have gone through a divorce are more likely to experience symptoms of depression, anxiety, and stress compared to those who have not. Furthermore, divorce can also lead to the development of negative self-beliefs, such as feeling inadequate, unwanted, or unlovable. These psychological factors of divorce can have long-lasting effects on individuals if not properly addressed through therapy or counseling. **Study Aim:** the present study aims to study the psychological factors leading to the divorce. **Materials and method:** A cross sectional adopted using a structured questionnaire to conduct this study. A hundred eighty purposive sample was used by selecting the divorced couples in Mosul City from 4th October, 2022 to 1st April, 2023. **Results:** The study shows that the majority of the participants were aged (26-30) followed by age group (31-35) years old equaled respectively (25.6 %, 22.2 %). The highest respondents rates was (66.84 %) for an emotional vacuum aspect. While the lowest aspect was rating (44.62 %) for compulsory living with the spouse. For the social reasons, the study concludes that (61.7%) of the respondents had social reasons for divorce. Most of these reasons were the negatively interfere of parents in the spouses' lives and one of the spouse had promiscuity. **Conclusions:** The study concludes that the most divorced couples were young with one to three children. Most of these couples was their marriage age only two years. The most important conclusion was there are a crucial psychological factors leading to divorce must be taken into account to decrease the rates of divorce. **Recommendations:** the study recommends to holding seminars, dialogues and meetings for those about to get married to introduce them to the importance of marriage, marital life and the role of the family in raising children and enhancing the role of the social workers in the court and depending on their analysis and decisions before getting the divorce.

ÖZET

Son yıllarda dünyada ve ülkemizde suyun öneminin artmasıyla birlikte özellikle maden işleme tesislerinde kuru prosesler ön plana çıkmıştır. Ancak öğütme yardımcı kimyasallarının kuru işlemlerde kullanılması, öğütme verimini artırma, su kullanımını azaltma, malzeme akışkanlığını iyileştirme, enerji tüketimini azaltma, öğütme ürünlerinin tane boyutunu küçültme gibi bazı avantajları da beraberinde getirmektedir. Genellikle saf halde ve/veya ticari karışımları halinde kullanılan bu kimyasallar ayrıca bir maliyet kalemi oluşturmaktadır. Son yıllarda farklı sektörlerden atık ve yan ürünlerin değerlendirilmesine yönelik araştırmalar yapılarak alternatif öğütme yardımcılarının kullanımına yönelik çalışmalar literatürde yerini almıştır. Bu kapsamda farklı sektörlerden elde edilen melas, gliserol, lignin, melas ve formaldehit karışımları, atık gliserin, atık yemeklik yağlar ve pirina yağı gibi atık ve yan ürünler çimento ve endüstriyel hammadde proseslerinde kullanılmıştır. Bu çalışmada söz konusu atık ve/veya yan ürünlerin mineral endüstrisinde kullanımı araştırılmıştır. Bu değerlendirmelerin yapılması çevresel etkileri azaltan ve alternatif öğütme yardımcı ürünlerin kullanımını artıran uygulamaların önünü açacak ve yeni çalışma-iş birliklerine ışık tutacaktır.

Anahtar Kelimeler: Öğütme yardımcıları, Atık ve Yan Ürünler, Kuru Prosesler

**INVESTIGATION OF THE POTENTIAL OF WASTE AND BY-PRODUCTS FROM
VARIOUS INDUSTRIES AS GRINDING ADDITIVES**

ABSTRACT

In recent years, with the increasing importance of water in the world and in our country, dry processes have come to the fore, especially in mineral processing plants. However, the use of grinding additive chemicals in dry processes brings some advantages, such as increasing grinding efficiency, reducing water use, improving material flowability, reducing energy consumption, and reducing the particle size of grinding products. These chemicals, which are generally used in their pure form and/or in their commercial mixtures, also constitute an extra-cost item. In recent years, studies on the use of alternative grinding additives have taken their place in the literature by conducting research on the evaluation of waste and by-products from different sectors. In this context, waste and by-products obtained from different sectors, such as molasses, glycerol, lignin, molasses and formaldehyde mixtures, waste glycerin, waste cooking oils and olive pomace oil were used in cement and industrial raw material processes. In this study, the use of the aforementioned waste and/or by-products in the mineral industry has been investigated. Making these evaluations will pave the way for practices that reduce environmental impacts and increase the use of alternative grinding additive products, and will shed light on new collaborations.

ABSTRACT

Strengthening structural elements emerges as a requirement to increase load-bearing capacity due to factors such as poor material quality, insufficient design safety, changing usage requirements, construction errors, damage occurrence, and exposure to corrosion. In this study, the effectiveness of the strengthening method of filling different magnitudes of locally buckled square hollow section (SHS) columns with concrete and covering the external surface with concrete was investigated by numerical studies. For this purpose, the results of the strengthened and plain SHS column analyses were compared. Numerical models in this scope were created using ABAQUS software, and for numerical analysis, the dynamic implicit solver with quasi-static application was used. The column models were stub columns, and the column height was determined at 400 mm, considering four times the section width (100 mm). Except for the 55 mm region between the lower and upper supports of the column, the 290 mm part in the middle part was strengthened. The distance between the outside of the concrete covering and the corner of the SHS was 25 mm, which is the effective covering thickness. The main investigation parameters were the local buckling damage magnitudes identified by outward local buckling and the nominal wall thickness of the SHSs. The outward local buckling magnitude was considered separately for 6 to 24 mm with a 6 mm increment. Besides, to determine the effect of the wall thickness on the axial load-bearing capacity after the strengthening process, 2.50 mm and 5.0 mm nominal wall thicknesses were considered. The findings showed that the maximum effect of local buckling magnitude on load-bearing capacity after strengthening was limited to approximately 5% for both wall thicknesses. According to the load-bearing capacity of the plain undamaged column, the increase in capacity after strengthening is approximately 26% and 10%, according to the 2.50 mm and 5.0 mm wall thicknesses, respectively. In addition, the numerically obtained damage modes showed that local buckling damage in unstrengthened parts that were close to the support reduced the effectiveness of the strengthening method. For effective strengthening, the strengthening method should be applied not only to the deformed parts but also to the entire column.

INCURSIONS INTO THE SOCIOLOGICAL STUDY OF SLEEP

PhD Ramona MARINACHE

University of Bucharest

Email: Ramona.marinache@gmail.com

Professor Valentina MARINESCU

University of Bucharest

Email: valentina.marinescu@unibuc.ro

ABSTRACT

Present throughout the entire human history, sleep is barely present in the first decades of sociological investigations. We all know how to practice sleep, but it is hard to explain it as the object is missing and we only remember our dreams, if we remember them. A look into the sociological research reveals that in the beginning of this science the focus was placed on the study of everyday life, night remaining a hidden chapter for social endeavours. Sleep as main theme for sociological investigation has emerged in 1959, through the contribution of Vilhelm Aubert and Harrison White and their two parts article called “Sleep: A Sociological Interpretation” published in the journal Acta Sociologica, but the sociological study of sleep recognized as a distinct domain has materialized in the beginning of the 21st century. The purpose of our presentation is to understand the reasons why sleep has entered late in the focus of sociologists and to draw in rough lines the theoretical foundations of the sociology of sleep.

**COLONIALITY OF CONFLICT, RESOURCE WAR AND CONTENDING
GEOPOLITICAL ISSUES SURROUNDING THE 2023 NIGER COUP**

Joseph Chinedu OFOBUIKE

Department of Philosophy, Faculty of Arts, Nnamdi Azikiwe University, Awka

Email: jofobuike@gmail.com

ABSTRACT

Following the coup carried out by the Niger military against their democratically elected president and the threat by ECOWAS, the regional umbrella body of West African states to use war to restore democracy, many have questioned the sincerity of such intervention and its implications for the region as a whole. This state of affairs has raised question like; is the threat to dislodge the coup in Niger and restore democracy in African interest or is it another manifestation of Western interest pitching Africans against each other for their gain and benefit of few African elites? This wouldn't be unusual as African contact with the West is replit with such stories of Africans being used to fight themselves for the ultimate gain of the West, especially in regards to African natural resources. Using an analytical approach, this paper will endeavor to explore the conflict situation in Niger from the point of view of coloniality of conflict and resource war. It is hoped that this would help draw out it's political, economic and security implications for the people and land of Africa.

Keywords; Coloniality, Resource War, Democracy, Coup, ECOWAS

ABSTRACT

Gram-negative bacteria isolated from the abattoir effluent were *Escherichia coli*, *Klebsiella* spp, *Proteus* spp, *Salmonella* spp, *Shigella* spp, *Pseudomonas* spp and Gram-positive bacterium isolated were *Enterococcus* spp and *Staphylococcus* spp. The presence of *Escherichia coli* indicates possible faecal contamination. The results revealed that bacterial load was within the accepted maximum limit by WHO (2004); nevertheless, the disease causing bacteria pose threat to human health when water from the river is consumed without treatment.

ABSTRACT

This paper presents a novel fractional differential equation model to study the interactions between a plant, a pest, and a natural enemy, incorporating infection and transmission dynamics. Our model considers that the natural enemy can become infected by feeding on infected Pests. We derive the model equations and use numerical methods to analyse the system's behaviour. Our simulations reveal that the natural enemy plays a critical role in controlling the pest population and that its effectiveness depends on its infection rate and the strength of its predation on the pest. We also show that introducing infection can significantly affect the system's dynamics, leading to complex and unpredictable behaviours. Furthermore, our work makes a valuable contribution to the field of mathematical ecology by demonstrating the utility of fractional differential equations in modelling complex ecological systems. These results emphasize the importance of using advanced mathematical tools to better understand and manage ecological dynamics.

ABSTRACT

Introduction: Emergency department visits encompass a wide spectrum of ocular complaints, ranging from minor issues that can be managed with prescriptions to critical scenarios necessitating emergency surgeries. Emergency physicians are tasked with assessing and addressing diverse conditions, including superficial foreign bodies, minor corneal abrasions, dry eyes, and conjunctivitis. Yet, cases involving severe ocular injuries, deep corneal foreign bodies, chemical exposures, and sudden vision loss warrant consultation with ophthalmology specialists. This study aims to evaluate the necessity of ophthalmology consultations among patients presenting with ocular emergencies. **Results:**The study included a total of 465 patients. Simple conditions such as superficial foreign bodies and minor corneal scratches accounted for 55% of admission complaints. Among these cases, 77% were managed by removing superficial foreign bodies and addressing corneal irritations. Due to limitations in the emergency department, interventions were performed within the eye service where biomicroscope examinations are possible. Eye trauma complaints were identified in 15.2% of cases, with 86% of trauma patients being medico-legal cases. An additional 28.8% presented with complaints like dry eyes and conjunctivitis. Notably, ophthalmology consultation was requested for 81% of the patients. **Discussion:**In cases of uncomplicated ocular complaints, if visual acuity and other findings are normal during slit lamp examination, and a superficial foreign body is detected by the emergency doctor, they should attempt removal. It's remarkable that out of 465 patients, 377 were requested for consultation in our study. Among these consultations, hospitalization decisions were made for three patients presenting sudden vision loss and pain complaints. Moreover, ten of the 71 trauma patients were classified as experiencing simple trauma and thus were not referred for consultation. Due to the unavailability of biomicroscope examination in our hospital's emergency department, comprehensive patient evaluations are hindered, potentially leading to unnecessary eye consultations. **Conclusion:**Ensuring the accurate and prompt evaluation of patients with ocular complaints in the emergency department is crucial. Providing adequate training and resources to emergency medicine staff will enable them to make well-informed decisions. Preventing unnecessary consultations will optimize resource utilization and contribute to the efficient delivery of healthcare services.

ABSTRACT

Objective: - Oral drug delivery (ODD) is the most preferred and convenient route of drug administration due to high patient compliance, cost-effectiveness, least sterility. All orally administered drugs must dissolve in the aqueous medium of the gastrointestinal tract before being absorbed. According to the Biopharmaceutical Classification System (BCS), low solubility and low bioavailability are problems for Class II drugs. Low solubility, rather than osmosis, is the rate-limiting step of absorption. The present investigation was carried out with an objective of Incorporating Glimepiride within the carrier in the form of GLM-MS Adsorbate to improve the solubility. **Method:** - Central composite design was adopted to optimize the ratio of GLM (X1) and mesoporous silica as a carrier (X2) and the effect of different ratios was studied on percent drug loading, and percent drug release. X-ray powder diffraction and differential scanning calorimetry studies were performed to investigate any possible interaction between GLM and mesoporous silica. **Results:** - Obtained results of GLM-MS adsorbate dissolution show that lesser the amount of carrier taken for adsorption more the drug loading & drug release in lesser time. **Conclusion:** - The conclusion of the present study indicated that the adsorption of GLM on mesoporous silica carrier (GLM-MS adsorbate) was a promising carrier for solubility enhancement of poorly water-soluble drugs. Due to increase in solubility and dissolution, it was confirmed that Mesoporous silica carrier can be an alternative approach for increasing the solubility of BCS class II drugs which, might show increase in bioavailability also.

ABSTRACT

To develop and evaluate effervescent mucoadhesive tablet for vaginal route. HPMC K4M and Carbopol 934 were used as mucoadhesive polymers. Effervescent was incorporated into the formulations as a disintegration agent. The tablets were prepared by direct compression method and effervescent was incorporated into formulations to enhance swellability of mucoadhesive tablet. The amount of polymer blends and effervescent mixture was optimized using 3^2 full factorial design. For various drug-free formulations, the effect of effervescent on polymers swelling characteristics was investigated. Swelling, mucoadhesive property and drug release study of the tablets with different proportions of mucoadhesive polymer in formulations were conducted. The ex-vivo mucoadhesion was determined by self-developed modified mucoadhesion assembly. The ex-vivo mucoadhesion time was carried out by modified USP dissolution test apparatus. A good sustained effect and a moderate mucoadhesion were obtained with the tablets containing 400 mg of mucoadhesive polymers HPMC K4M: Carbopol 934 (1:1) and effervescent mixture (3:1) seemed to be the optimum one for the tablet. This result concludes that the incorporation of effervescent agent into the mucoadhesive tablet leads to increase swellability and the rate of drug release but the adhesion could be decreased. *Ex-vivo* retention studies justified the prolong retention of the tablet inside the vaginal tract.

ABSTRACT

Primitivist address in Human Resource Management features autocratic regimentation and pays no good service to building a thriving communal or corporate climate. Leaning on such a postulation, the current article consists of a contrastive critical analysis of two Nigerian play: *Kongi's Harvest* (Wole Soyinka) and *The Gods Are Not to Blame* (Ola Rotimi). Such pragmatics-inherent tools as Politeness Principles and Cooperative Principles are applied to scrutinize selected fragments from either play. Findings from *Kongi's Harvest* include frontal and regimenting language yielding a social climate marked with mistrust, fear, threat, cowardice and distantiating of the populace from their king, Kongi. Reversely, King Adewale's language in *The Gods Are Not to Blame* functions to build a participative management style, grease and foster his leadership. The overall tuition leaking from the study is that alert communication skill is a central asset to all modern socio-political power handling and does need minding.

Keywords: communication; regimentation; cooperative, participative management; leadership

**INVESTIGATION OF SEARCH BEHAVIOR FOR SOCIAL ASSISTANCE AND
SOCIAL WORK IN BY GOOGLE TRENDS IN DISASTER PERIODS**

ABSTRACT

Disasters are phenomena that seriously disrupt the functioning of the society or cause loss of life, economic and environmental losses in the society, exceeding the capacity of those affected to cope with their own resources. Although the focus of the social work profession is social problems, they play an important role in solving the problems that may arise in the post-disaster process. The need for social work comes to the fore, especially considering the new inequalities and disadvantage groups that disasters can cause. In disaster periods, social assistance provides an important contribution to social workers in meeting the basic needs of disaster victims. During disaster periods, people often act with the instinct of charity and solidarity, there may be a positive increase in social assistance behaviour. Google Trends can be used as an important indicator in terms of these changes. For example, when a disaster strikes, people may search for related words and terms to learn more or to help. In this case, terms such as the name of the disaster, the region name, charities can become popular. In this study, it is aimed to examine the search behaviours related to social assistance and social work in Google Trends during disaster periods in Turkey. Research data is limited to searches made on Google Trends between August 1, 2018 and August 1, 2023. In this context, searches for the words "social assistance + social work", "disaster" and "social assistance" were carried out on Google Trends. It has been observed that the word "earthquake" peaked in Google Trends in the week of "February 5-11, 2023" due to the Kahramanmaraş earthquakes in the past year. Looking at the historical distribution of searches with the word "disaster" in the last 5 years, it has been determined that there are "2019 Düzce Flood, 2019 Istanbul earthquake, 2020 Elazığ earthquake, 2021 West Black Sea flood disaster, 2022 Disaster Year Announcement, 2023 Kahramanmaraş earthquakes". Surprisingly, no findings related to the Covid-19 pandemic were found in the searches made with the term "disaster". When the data were examined, it was observed that the search behaviors in the words "social assistance + social work" and the words "disaster + earthquake" were not related. On the other hand, it has been understood that the searches for the words "social assistance + social work" and the word "pandemic" are in a parallel course. As a result, it can be said that the concept of disaster is sought by earthquake and flood in searches over Google Trends and does not affect the search for social assistance. In addition, it can be stated that the behavior of seeking social help is more intense in the pandemic.

ABSTRACT

The rapid advancement of artificial neural network technologies has significantly broadened its applications in biomedical research. Multilayer perceptron neural networks are particularly instrumental in medical data analysis, especially in the realms of cell physiology, pathology, and microscopy. These machine learning (ML) models can be trained using data from textural analyses of digital micrographs or other signals related to cellular structure and function. In recent years, significant emphasis has been placed on employing fractal analysis and gray-level co-occurrence matrix analysis (GLCM) of cell nuclei, contemporary computational methods that may provide input data for ML training. We present our recent research efforts to use both fractal and GLCM features as potential input parameters for the creation of multilayer perceptrons. Some of the features that can potentially increase the discriminatory power of the model include the values of fractal lacunarity, textural uniformity (angular second moment), local homogeneity (inverse difference moment of texture) and textural contrast. There are some indications that such models can identify *Sacharomyces cerevisiae* yeast cells that have been exposed to harmful external conditions. Additionally, we explore the potential of combining these inputs with features derived from nuclear discrete wavelet transform to further enhance the classification accuracy of the model. We also highlight the pros and cons of artificial neural networks based on multilayer perceptrons in comparison to alternative models like other network types, random forests, support vector machines, and principal component analysis.

ÖZET

Glikolize hemoglobin A1c plazma (HbA1c) glikozunun ortalama konsantrasyonunu ölçüm tarihinden iki ila üç ay öncesini gösteren bir hemoglobin formudur. HbA1c seviyeleri tanı konmamış diyabetli (DM) veya diyabet gelişme riski yüksek hastaları tanımlamak için bir tanı aracı olarak önerilmektedir. Diyabet hastalarının izleminde önemli bir parametre olup mikro-makrovasküler komplikasyonların gelişmesini öngördüğü bilinmektedir. Hemoglobin A1c testi özel bir hazırlık gerektirmeden, günün herhangi bir saatinde yapılabilir. Dünya çapında yaygın kullanılan güvenilir bir test olmakla birlikte DM'li hastalarda etkili bir glukoz kontrolü için HbA1c ve glukoz ölçümünün 2 komplementer metod olduğu bilinmektedir. Diyabet tedavisinin HbA1c düzeyini esas alması ve insülin dozlarının kan glukoz düzeylerine göre ayarlanıyor olması bunu desteklemektedir. HbA1c, hemoglobinin N-terminal kısmına non-enzimatik olarak glukoz bağlanmasıyla oluşmaktadır. Gliko-hemoglobin oranı, kan glukoz seviyesiyle korele olmakla birlikte 8-12 haftalık glukoz değerlerini yansıtmaktadır. HbA1c ölçümü HPLC ve immunassay gibi yöntemlerle ölçülmektedir. Diyabetes mellitus tanı ve takibinde HbA1c düzeylerini kullanırken yaş, ırk, cins ve hemoglobinopatiler gibi faktörlerin önemi bilinmektedir. Bununla ilişkili olarak HbA1c değerlerinin yaşa göre değişimini görmek amacı ile yapılan bu çalışmada hastanemiz polikliniklerine ayaktan başvuran hastalar esas alındı. 2023 yılı içerisinde ilk 7 aydaki (Ocak-Temmuz) başvurular retrospektif olarak taranarak referans aralığının üstünde olan HbA1c verileri toplandı. HbA1c değerleri ile yaş istatistiksel olarak karşılaştırıldı ve HbA1c değerleri ile yaş arasında anlamlı bir ilişkinin olduğu bulundu. Sonuç olarak DM tanısında HbA1c'nin kullanımı için tüm dünyada standardize uygulamalara ihtiyaç olduğu bilinmektedir. Yaş, ırk ve cinse bağlı gelişebilecek farklılıklar tanısal uygulamalarda dikkatle değerlendirilmelidir.

Anahtar Kelimeler: HbA1c, Glukoz, Diyabetes Mellitüs

VARIATION OF HbA1c TEST BY AGE

ABSTRACT

Glycosed hemoglobin A1c is a form of hemoglobin that displays the mean concentration of plasma (HbA1c) glucose two to three months before the measurement date. HbA1c levels are recommended as a diagnostic tool to identify patients with undiagnosed diabetes (DM) or at high risk of developing diabetes. It is an important parameter in the follow-up of diabetic patients and is known to predict the development of micro-macrovascular complications. The hemoglobin A1c test can be performed at any time of the day without any special preparation. Although it is a widely used and reliable test worldwide, it is known that HbA1c and glucose measurement are two complementary methods for an effective glucose control in patients with DM. The fact that diabetes treatment is based on HbA1c level and that insulin doses are adjusted according to blood glucose levels supports this. HbA1c is formed by non-enzymatic binding of glucose to the N-terminal part of hemoglobin. The glyco-hemoglobin ratio correlates with the blood glucose level and reflects 8-12 week glucose values. HbA1c measurement is measured by methods such as HPLC and immunoassay. The importance of factors such as age, race, gender and hemoglobinopathies is known when using HbA1c levels in the diagnosis and follow-up of diabetes mellitus. In this study, which was carried out to see the change in HbA1c values according to age, patients who applied to the outpatient clinics of our hospital were taken as the basis. In 2023, applications in the first 7 months (January-July) were scanned retrospectively and Hba1c data above the reference range were collected. HbA1c values and age were compared statistically, and a significant relationship was found between HbaA1c values and age. As a result, it is known that standardized applications are needed all over the world for the use of HbA1c in the diagnosis of DM. Differences that may develop due to age, race and gender should be carefully evaluated in diagnostic applications.

ABSTRACT

The Mediterranean fruit fly, *Ceratitis capitata* Wiedemann, is a damaging insect that affects fruit production throughout the world. Entomopathogenic nematodes are a promising biocontrol tool that could potentially replace insecticides for control of the Mediterranean fruit fly. From this angle, this work focuses on isolating entomopathogenic nematode (EPN) indigenous to center-west of Morocco and the selection of the most effective against *Ceratitis capitata*. To achieve this objective, soil samples were taken from orchards attacked by pests in the center of Morocco. Isolation of entomopathogenic nematode was carried out using the bait method. Eight isolated EPN strains were tested against larvae and pupae of this pest in Petri dishes under laboratory conditions. Entomopathogenic nematodes were isolated from eight soil samples taken from different crops. Morphological identification of all these isolates showed that they belong to *Heterorhabditis* spp. Third instar *C. capitata* larvae are susceptible to all the nematode strains tested, with mortality rates varying according to strain. *Ceratitis* pupae treated with nematode strains showed low susceptibility compared to larvae. The mortality rate caused by these strains does not exceed 35%, and generally, there is no significant difference between the mortality rates. These encouraging results indicate that this native entomopathogenic nematode might be used as a promising environmentally friendly biological control agent against *C. capitata*.

Keywords: entomopathogenic nematodes, *Ceratitis capitata*, Morocco

BIMETALLIC NANOPARTICLES: GREEN SYNTHESIS AND APPLICATION

Assist. Prof. Dr. Sandeep KUMAR

Department of Chemistry Akal University, Talwandi Sabo, Bathinda, Punjab, India

Email: sandeepchem83@gmail.com

ABSTRACT

Metallic nanoparticles have been widely employed for their use in different research fields such as engineering (optics, sensors and semiconductors), health care (medicines), biological application, environment remediation (removal of pollutant and waste water treatment), and catalysis etc. owing to their great potential for enhancing the efficiency and yield of various catalytic processes. Further, the bimetallic nanoparticles owing to their synergistic properties have great potential for various chemical and physical applications, due to their high stability, ease of synthesis, biocompatibility, and less toxicity. The recent advances in utilizing the greener sustainable approach for the synthesis of bimetallic nanoparticles have enhanced its significance in various organic transformation reactions. The high selectivity of these bimetallic nanoparticles not only enhances the yield of overall reaction, but also reduces waste products that are having adverse effects on the environment. This work will provide a comprehensive discussion on recent advances in methods of synthesis of bimetallic nanoparticles (with emphasis on green approach), stabilities of bimetallic nanoparticles, and their role in various organic transformation reactions.

ÖZET

Amaç: Endodontik tedavilerde kök kanallarında kırılan eğeler en yaygın görülen komplikasyonlardan biridir. Kırık kanal aletleri genellikle apikal bölgeye ulaşmayı engelleyerek tedavinin postoperatif başarısını azaltabilmektedir. Bu olgu sunumunun amacı kök kanallarında kırılan eğelerin ultrasonikler yardımıyla çıkarılmasını sunmaktır. **Gereç Ve Yöntem:** Birinci hastamız 15 yaşında ve ikinci hastamız ise 50 yaşında kök kanallarında kırılan eğeler için kliniğimize yönlendirilmiştir. Radyolojik muayenede birinci hastanın 46 numaralı dişin meziolingual kanalının orta üçlüsünde, ikinci hastanın ise 25 numaralı dişin apikal üçlüsünde kırık ege olduğu tespit edildi. Her iki vakada da rubber dam ile izolasyon sağlandıktan sonra tüm aşamalar dental mikroskop (Zumax, Öncü Dental) kullanılarak gerçekleştirildi. Kırık eğelere rahat bir ulaşım ve görüşün sağlanması için kanal ağızlarından kırık parçaya kadar düz giriş oluşturuldu. Birinci hastada 15 numaralı K tipi kanal eğesi ile kırık parça by-pass edildikten sonra ultrasonik uçlar (Woodpecker) ile hareket ettirilerek çıkarıldı. İkinci hastada da ultrasonik uçlar ile kırık parça hareket ettirilerek çıkarıldı ancak kırık parça daha apikalde yer aldığından işlem daha uzun sürdü. Kırık eğeler çıkarıldıktan sonra %2,5 NaOCl ve %5 EDTA kullanılarak irrigasyon tamamlandı. Ardından kök kanal dolumu soğuk lateral kompaksiyon yöntemi ile tamamlandı. **Sonuçlar:** Kırık kök kanal enstrümanlarının kök kanallarından çıkarılması için birçok teknik ve cihaz tanımlanmış olmasına rağmen, başarılı bir şekilde çıkarılması için standart bir prosedür bulunmamaktadır. Kırılan kök kanal aletleri uzaklaştırırken dişe ve çevre dokulara en az hasarı oluşturarak gerçekleştirilmelidir. Vakalarımızda da uyguladığımızı gibi kök kanalında kırılan aletler çıkarılırken dental mikroskop ile yeterli bir görüntü sağlamak ve kırık parçaya koronal olarak ulaşmak başarıyı arttırmaktadır.

Anahtar Kelimeler: Dental Mikroskop, Kırık Ege, Ultrasonik

**REMOVAL OF BROKEN INSTRUMENTS IN ROOT CANALS USING ULTRASONIC
METHODS: 2 CASE REPORTS**

ABSTRACT

Aim: One of the most prevalent complications in endodontic treatments is the breakage of files within root canals. The presence of broken canal instruments often hampers access to the apical region, thereby diminishing the overall postoperative success of the treatment. This case report aims to demonstrate the successful removal of broken files from root canals through the utilization of ultrasonic techniques. **Materials and Methods:** Our study involved two patients, a 15-year-old and a 50-year-old, both referred to our clinic due to broken files within their root canals. Radiographic assessments revealed that the first patient had a fractured file situated in the middle third of the mesiolingual canal of tooth 46, while the second patient had a broken file in the apical third of tooth 25. In both instances, comprehensive procedures were carried out under the guidance of a dental microscope (Zumax, Öncü Dental). An unobstructed pathway was established from the canal entrances to the broken fragment, facilitating easy access and clear visualization of the fractured files. In the case of the first patient, the fractured piece was skillfully bypassed using a number 15 K-file, and subsequently, ultrasonic tips (Woodpecker) were employed to dislodge and remove the fragment. Similarly, in the second patient, the broken piece was extracted with ultrasonic tips; however, due to its deeper apical location, the procedure required more time. After the successful removal of the broken files, thorough irrigation was accomplished using 2.5% NaOCl and 5% EDTA solutions. The root canals were then filled using the cold lateral compaction technique. **Conclusions:** While various techniques and devices have been proposed for the extraction of fractured root canal instruments, a standardized approach for their successful removal remains elusive. During the extraction procedure, utmost care should be taken to minimize any potential damage to the tooth and its surrounding tissues. As demonstrated in our cases, employing a dental microscope to enhance visualization and accessing the fractured segment coronally significantly contributes to the overall success of broken instrument retrieval.

ÖZET

Amaç: Travma, eksternal rezorpsiyon, periapikal patolojiler, taşkın kök kanal preparasyonu gibi apikal daralımın bozulduğu ve konvansiyonel tedaviler ile apikal daralımın sızdırmazlığını sağlayamadığımız durumlarda apeksi açık olan dişlerde MTA materyali ile uygulanan apeksifikasyon tedavisini sunmayı amaçladık. **Gereç Ve Yöntem:** Kliniğimize renklenme, ağrı ve rutin endodontik tedavi için başvuran üç hastada radyolojik muayene sonucu daimi dişlerin apekslerinin açık olduğu tespit edilmiştir. Alınan anamnez sonucunda birinci hastada travma hikayesine, ikinci hastada incelenen KIBT görüntüsü sonucu geniş periapikal lezyona rastlanılmıştır. Üçüncü hastada ise taşkın preparasyon sonucu apikal daralımın bozulduğu tespit edilmiştir. Her üç vakada da dişler ilk seansta rubber dam ile izole edildi, giriş kavitesi açıldıktan sonra çalışma boyu radyografik olarak belirlendi. Kök kanallarında minimal düzeyde preparasyon yapılarak ve %2 'lik sodyum hipoklorit kullanarak dentin dokusu artıkları uzaklaştırıldı. Ardından medikament olarak kök kanallarına kalsiyum hidroksit yerleştirildi. İki hafta sonra ikinci seansta dişler tekrar rubber dam ile izole edildi. %5'lik EDTA, %2 'lik sodyum hipoklorit ve distile su ile final irrigasyonu yapıldı. Kök kanallarını paper point ile kuruttuktan sonra MAP Sisteminin uygun taşıyıcısı ile apikal üçlüye MTA yerleştirildi. Kökün geri kalan kısımları ise sıcak vertikal kompaksiyon tekniği ile dolduruldu. Daha sonra diş kompozit rezin ile restore edildi. **Sonuçlar:** Apikali açık daimi dişlerde başarılı tedaviler yapabilmek için dezenfeksiyonun yanında apikalde sızdırmaz bir bariyer oluşturulması gerekmektedir. Biyouyumlu ve sızdırmazlık özelliği iyi olan MTA ile apikal bariyer oluşturarak uygulanan apeksifikasyon tedavisi geleneksel tedavi yöntemlerine göre hem klinik ve radyografik olarak daha başarılı bulunduğu hem de tedavi süresini kısalttığı bu vakalarda gösterilmiştir.

**APEXIFICATION TREATMENT OF PERMANENT TEETH WITH OPEN APEX WITH
MTA: 3 CASE REPORTS**

ABSTRACT

Aim: Our objective was to present the apexification treatment applied using MTA material in cases of teeth with open apex, where apical narrowing is impaired due to factors such as trauma, external resorption, periapical pathologies, protruding root canal preparation, and where conventional treatments fail to seal the apical narrowing. **Materials and Methods:** As a result of radiological examinations, three patients who visited our clinic with concerns of discoloration, pain, and routine endodontic treatment were found to have open apices in their permanent teeth. Among these cases, the first patient had a history of trauma, the second patient exhibited a large periapical lesion as identified through CBCT imaging, and the third patient's apical narrowing was impaired due to excessive preparation. In all three cases, the teeth were isolated with a rubber dam during the first session, and after accessing the cavities, radiographic imaging was used to determine the working length. Dentin tissue remnants were gently removed from the root canals, and 2% sodium hypochlorite was employed. Subsequently, calcium hydroxide was placed as a medicament. After two weeks, the teeth were isolated again, and the final irrigation was performed using 5% EDTA, 2% sodium hypochlorite, and distilled water. The root canals were dried using paper points, and MTA was applied in the apical third using the appropriate MAP System carrier. The remaining root portions were filled using the hot vertical compaction technique, followed by tooth restoration with composite resin. **Conclusions:** To achieve successful treatment outcomes in cases of permanent teeth with open apices, it is essential to establish an impermeable apical barrier in addition to thorough disinfection, as demonstrated in these cases.

ÖZET

Eritrosit membranı protein, lipit ve karbonhidrattan oluşur ve bu nedenle karmaşık bir yapıya sahiptir. Yapısal bozukluk ve protein eksikliği, membran stabilitesini ve esnekliğini etkileyerek hemolitik anemilere neden olur. Orak hücreli anemi, yaşam boyu süren hemolitik anemi ile karakterizedir. Oraklaşma bozukluklarının vazo-oklusif belirtileri muhtemelen yüksek konsantrasyonda Hb S içeren eritrositlerin değişen reolojik özelliklerinden kaynaklanmaktadır. Bu çalışmada orak hücreli anemi olgularında, hemolitik krizde, eritrosit membran protein değişimine bakmak istedik. Orak hücreli anemi hastalarından hemolitik kriz sırasında ve şikayetlerin olmadığı dönemde alınan tam kan örneklerinden Dodge yöntemine göre eritrosit membran örnekleri elde edildi. %8,3 SDS-PAGE yöntemiyle ayrıştırılan eritrosit membran proteinlerinin düzeyi densitometrik olarak belirlendi. Her iki dönemdeki olguların örneklerine ait veriler incelendiğinde, Spectrin ve band 3 gibi membran proteinlerinin yanı sıra bazılarında ankirin ve band 4.1 proteinlerinin düzeylerinde de kontrol grubuna göre azalma olduğu görüldü.

Anahtar Kelimeler: orak hücreli anemi, hemolitik kriz, eritrosit membran proteinleri

**ERYTHROCYTE MEMBRANE PROTEIN CHANGE IN HEMOLYTIC CRISIS IN
SICKLE CELL ANEMIA CASES**

ABSTRACT

The red cell membrane is composed of protein, lipid and carbohydrate and so has a complex structure. The structural defect and the deficiency of protein effects the membrane stability and flexibility cause hemolytic anemias. Sickle cell anemia is characterized by a life long hemolytic anemia. The vaso-occlusive manifestations of the sickling disorders probably result from the altered rheologic properties of red cell containing a high concentration of Hb S. In this study we want to look erythrocyte membrane protein change in hemolytic crisis with sickle cell anemia cases. Erythrocyte membrane samples which is ghost were obtained according to the Dodge method in whole blood samples taken from sickle cell anemia patients during hemolytic crisis and in the absence of complaints. The level of erythrocyte membrane proteins separated by %8,3 SDS-PAGE method was determined densitometrically with Cliniscan densitometer. When the data of the samples of the cases in both periods were examined, it was observed that the levels of membrane proteins such as Spectrin and band 3, as well as ankyrin and band 4.1 proteins in some of them, were also decreased according to control group.

ABSTRACT

Aliphatic Alcohols are an incredibly toxic pollutants to the atmosphere. Thus a rapid and sensitive detection method is important for toxicological assessment, ecological protection and human health. In this work, Zn_2SnO_4 and their composite with GO and RGO were synthesized by a simple hydrothermal method. The influences of reaction conditions on the formation of Zn_2SnO_4 and their composite with GO and RGO were investigated in detail. The one pot hydrothermal synthesized Zn_2SnO_4 and their composite with GO and RGO exhibited a cube like structure with the average size of 20~25nm. The structural characterization exhibiting the diffraction peaks are well matched to JCPDS cards 73-2384 and 71-2184. The cyclovoltammetry and linear sweep analysis were used to describe the electrochemical sensing behavior of hydrothermal synthesized Zn_2SnO_4 and their composite with GO and RGO nano materials towards the detection of Aliphatic Alcohol

ABSTRACT

One of the most significant problems facing the environment is caused by the presence of contaminants in aqueous solution, most notably dangerous heavy metals. In rural places, hardness and chlorides are two of the most dangerous toxins in groundwater or surface water. It is largely because excessive quantities might cause sickness that it is controlled in terms of the quality of drinking water. Because of its alkaline nature, water may be irritating to the eyes, respiratory system, and skin problems, and the higher its concentration of hardness and chlorides, the greater the risk of these irritations. The dosage and concentrations depending on the nature of biological effects of hardness and chlorides the following acute exposure in humans. Both the amount that is absorbed into the body and the length of time that it is exposed to the substance both has a role in these effects. Biosorption is a naturally occurring physiochemical mechanism that enables specific biomass to passively bind toxins to its cellular structure. This allows the biomass to remove the contaminants from its environment. It does not need any kind of energy, and the amount of pollutants that a sorbent is able to remove is governed by the kinetic equilibrium of the sorbent's cellular surface as well as the chemical composition of the sorbent's surface molecules. In this study, five distinct biosorbents, including rice husk, rapeseed straw, parthenium, sawdust, and egg cell, were manufactured in the laboratory. With regard to the removal of hardness and chlorides from water, the parthenium biosorbents demonstrate the highest level of effectiveness among the five biosorbents. After identifying the most effective biosorbents, we optimized their parameters and gathered water samples from a variety of sources. We then determined the percentage of chlorides and alkalinity removed from water by the various biosorbent applications. After eliminating the chlorides and hardness ions from the utilized biosorbents, the biosorption process may be made more cost-effective by regenerating and recycling the biosorbent.

ABSTRACT

Among the permanent magnet materials strontium and barium M-type ferrites are highly used because of their low cost, chemical stability and good magnetic properties. However, there is less experimental information about calcium hexaferrite which leads us to discuss their structural properties. In this study, we prepared M-type calcium hexaferrite powders with composition $\text{Ca}_{1-x}\text{La}_x\text{Fe}_{12}\text{O}_{19}$ ($x=0$ and 0.4) annealed at temperatures between $800\text{ }^\circ\text{C}$ and $1250\text{ }^\circ\text{C}$ for 5h to investigate the effect of annealing temperature on their structural properties, as well as the effect of Lanthanum substitution. It was found that the unsubstituted samples did not crystallize in the M-type phase and only showed $\alpha\text{-Fe}_2\text{O}_3$ and CaFe_2O_4 phases under the temperature of $1100\text{ }^\circ\text{C}$, and $\alpha\text{-Fe}_2\text{O}_3$ and CaFe_4O_7 in the sample annealed at $1200\text{ }^\circ\text{C}$, on the other hand, the lanthanum substituted samples formed the M-type phase starting from $1200\text{ }^\circ\text{C}$ with the apparition of $\alpha\text{-Fe}_2\text{O}_3$ peaks which their intensity was noticed to decrease by the increase of annealing temperature. Lattice parameters, cell volume and strain of synthesized lanthanum-substituted calcium

hexaferrite are calculated and it was shown that they were comparable with literature results of various M-type hexaferrites, and a c/a ratio under 3.9 confirmed the obtention of the M-type structure.

ABSTRACT

Ca–Al co-doped strontium hexaferrite powder, with a cation composition of $\text{Sr}_{0.54}\text{Ca}_{0.46}\text{Fe}_{6.5}\text{Al}_{15.5}\text{O}_{19}$, was synthesized via both the solid-state reaction and the sol-gel autocombustion method. The powder underwent preparation and calcination at varying temperatures (1200 °C, 1250 °C, 1300 °C, and 1350 °C) for 24 hours in the case of the solid-state reaction, while for the sol-gel autocombustion method, calcination was carried out at 1200 °C. Structural and morphological properties of the samples were investigated using X-ray diffraction (XRD) and scanning electron microscopy (SEM). The hexagonal structure was confirmed by the XRD results. The crystallite size, as determined from the XRD data, was found to be smaller in samples prepared via the solid-state method compared to those prepared via the sol-gel autocombustion method.

ABSTRACT

We report on the effect of Carbon insertion on the microstructure and magnetic properties of nanocrystalline Pr₂Co₇C_x (x ≤ 1). The Pr₂Co₇C_x were characterized by X-ray diffraction (XRD), transmission electron microscopy (TEM) and physical property measurement system (PPMS9)

Quantum Design. Mean field theory was utilized to depict the temperature dependence of magnetization and deduce the exchange interactions. The approach to saturation magnetization was as well used. The results were interpreted in the framework of random magnetic anisotropy model. From such analysis, some fundamental parameters were extracted.

Keywords: Magnetic alloys; nanocrystals; mean field theory; random magnetic anisotropy

ABSTRACT

Applying the method of solid-state reaction, gadolinium (Gd³⁺) ion-activated SrY₂O₄ phosphors with different concentrations of Gd³⁺ ions were created at calcination temperatures of 1000°C and 1250°C during sintering in an environment of air. The orthorhombic structure of the material was discovered by X-ray diffraction (XRD), and the generated phosphors were examined using FTIR techniques. The photoluminescence spectra of the synthesized phosphors have been recorded in order to analyze their luminescence behavior. The material showed a band in the narrow band UV spectral regions at 315 nm (⁶P_{7/2} → ⁸S_{7/2}), when excited at 275 nm. Because of their strong emission at 315 nm, phosphors shown potential as a source of narrow-band UV light. TL performed an analysis on the material using a range of UV exposures (5 – 25 min). The peak temperature of the sample is clearly resolved at 214°C, showing a satisfactory thermoluminescence dosimeter peak, and the intensity of the matching TL rises as more time is spent in the UV light. To calculate the

kinetic parameter, we used both the peak-shape and CGCD approaches. The findings point to the potential usefulness of Gd³⁺ doped- SrY₂O₄ phosphors for UV-emitting phototherapy lamp applications.

ÖZET

Bireyin tanrı imajını etkileyen olası psikolojik faktörleri araştıran önceki çalışmalar, ebeveyn imgesi, bağlanma örüntüleri, benlik saygısı ve çocukluk çağı travmaları gibi faktörlere odaklanmışlardır. Erken dönem uyum bozucu şemalar ile tanrı imajı arasındaki ilişkiyi ele alan araştırma sayısı ise Hıristiyan kültürde yapılan birkaç araştırma ile sınırlıdır. Bu nedenle, bu çalışmada erken dönem uyum bozucu şemalar ile tanrı imajları (İlgisiz, Korkutan, Seven, Seven-Korkutan) arasındaki ilişki Müslüman bir örneklem üzerinden incelenmiştir. Araştırmada, online anket tekniği kullanılarak İslam dinine inanan, 18 yaş üstü 356 katılımcıya ulaşılmıştır. Uygunluk ve kartopu örnekleme yöntemi ile erişim sağlanan katılımcılara, Demografik Bilgi Formu, Young Şema Ölçeği-Kısa Form 3 ve Tanrı Tahayyülleri Ölçeği uygulanmıştır. IBM SPSS 22 kullanılarak yapılan korelasyon analizi sonuçları, erken dönem uyum bozucu şemalar toplam puanı ile İlgisiz Allah ve Korkutan Allah imajları arasında pozitif yönlü anlamlı, Seven Allah imajı ile negatif yönlü anlamlı bir ilişki olduğunu göstermiştir. Erken dönem uyum bozucu şemalar toplam puanı ile Seven-Korkutan Allah imajı arasında anlamlı bir ilişki gözlenmemiştir. Tanrı tasavvurlarını yordayan şemaları tespit etmek için, demografik değişkenler (yaş, cinsiyet, eğitim düzeyi ve aylık gelir) kontrol edilerek Hiyerarşik (Sıralı) Çoklu Regresyon Analizi yapılmıştır. Analiz sonuçları, Sosyal İzolasyon/Güvensizlik şema boyutunun İlgisiz Allah imajını pozitif yönde anlamlı olarak yordarken, Başarısızlık şema boyutunun İlgisiz Allah imajını negatif yönde anlamlı olarak yordadığını göstermiştir. Kusurluluk, Yüksek Standartlar ve Cezalandırılma şema boyutlarının ise Korkutan Allah imajını pozitif yönde anlamlı olarak yordadığı gözlenmiştir. Ayrıca, Kendini Feda şema boyutunun Seven Allah imajını, Kendini Feda ve Cezalandırılma şema boyutlarının ise Seven-Korkutan Allah imajını pozitif yönde anlamlı olarak yordadığı görülmüştür. Manevi danışmanlık, şema temelli klinik uygulamalar ve din eğitimi açısından mevcut bulguların imaları tartışılmış ve yeni araştırma önerileri sunulmuştur.

Anahtar Kelimeler: Erken dönem uyum bozucu şemalar, tanrı imajı, seven tanrı imajı, ilgisiz tanrı imajı, korkutan tanrı imajı

THE RELATIONSHIP BETWEEN EARLY MALADAPTIVE SCHEMAS AND GOD IMAGE

ABSTRACT

Previous studies investigating the possible psychological factors that might influence the individuals' god images have mainly focused on parental images, attachment styles, self-esteem and childhood traumas. Research on the relationship between early maladaptive schemas and god images are limited to a few studies conducted in Christian culture. For that reason, in this study, we investigated the relationship between early maladaptive schemas and god images with a Muslim sample. Using online survey technique, we reached 356 Muslim participants over the age of 18. Demographic Information Form, Young Schema Scale-Short Form 3 and God Imaginations Scale were delivered to the participants who were reached through the convenience and snowball sampling methods. Correlation analysis conducted with IBM SPSS 22 showed that total early maladaptive schema scores were positively and significantly correlated with Dismissive and Frightening god images but negatively and significantly with Loving god image. The relationship between early maladaptive schema total scores and Loving-Frightening god image was not significant. Controlling for the demographic variables (age, gender, education level and monthly income), a Hierarchical (Sequential) Multiple Regression Analysis was conducted to identify the schemas predicting god images. Results demonstrated that while Social Isolation/Mistrust schema dimension significantly predicted Dismissive god image in a positive way, Failure schema dimension significantly predicted Dismissive god image in a negative way. In addition, Defectiveness, Unrelenting Standards and Punitiveness schema dimensions predicted Frightening god image in a positive way. Finally, while Self Sacrifice schema significantly and positively predicted Loving god image, Self-Sacrifice and Punitiveness schemas significantly and positively predicted Loving-Frightening god image. We discussed the implications of the current findings in relation to spiritual counseling, schema-based clinical practices and religious education. We also presented some recommendations for the future research.

Keywords: Early maladaptive schemas, god image, loving god image, dismissive god image, frightening god image

**THE MEDIATING ROLE OF BRAND TRUST BETWEEN INFLUENCER
CREDIBILITY AND PURCHASE INTENTION OF MUM CONSUMERS: A PATH
ANALYSIS**

Email: sena.altin@kayseri.edu.tr

ABSTRACT

With the widespread use of the internet and mobile technologies, consumers have the opportunity not only to obtain information but also to interact with brands, share their experiences and purchase products on online platforms. Especially some of the mothers with young children can follow influencer mothers on Instagram and make their purchasing preferences according to them. In this context, the study focuses on how brand trust plays a mediating role in the relationship between influencer credibility and purchase intention. Since direct and indirect relationships between variables are desired to be explained within the scope of the study, the relational research model, one of the quantitative research approaches, was used. The research group was determined by criterion sampling method and consists of 453 female consumers between the ages of 24-45 based on criteria such as having children between the ages of 0-3 and being an influencer follower. Data were collected by questionnaire method and questions including demographic information, influencer credibility, brand trust and purchase intention scales were used in the questionnaire. Descriptive statistics were used to evaluate the data and path analysis of structural equation modelling was used to test the hypotheses. According to the findings, a significant positive relationship was observed between influencer credibility, brand trust and purchase intention, and each point increase in influencer credibility was significantly associated with an increase in brand trust $a = 0.596$ (S.H. = 0.05). It was also observed that influencer credibility was significantly related to consumers' purchase intention $c' = 0.171$ (S.H. = 0.01) regardless of its relationship with brand trust. As a result, trust in the influencer and trust in the brand promoted by the influencer play an important role in the purchase of baby products by mothers. Additionally, women's trust in the influencer increases purchase intention through trust in the brand.

ABSTRACT

Turkish series, which are loved and watched by millions of people from many countries, have a significant soft power potential as popular culture products in the countries they are exported to. Like all around the world, Turkish series are also popularly watched in Serbia, which has a shared history of 500 years with Türkiye and is known for its biases against Türkiye. Especially since 2010, Turkish series that have gained popularity in Serbia have played an important role in introducing Turkish culture and language to Serbia. Serbia's interest in the Turkish series can also be seen from the numerous fan groups created for these series on Facebook and the large number of Serbian members in these groups. In the research, the interaction of Serbian fans with Turkish culture in their daily lives was examined in the context of participatory culture through these fan groups. Thus, the relationship between fandom culture and soft power was discussed based on the experiences of Serbian fans regarding Turkish culture in their daily lives. In line with this purpose, an online survey method was employed to measure the habits of Serbian fans watching Turkish series, their engagement in producing and consuming content related to these series on social media, their level of fanhood for these series, and the extent to which they applied in certain Turkish cultural practices into their daily lives. The findings indicate that fans who create and consume more content about Turkish series develop a stronger sense of fanhood for them and, therefore, tend to experience with Turkish language, media, products, music etc., in their daily lives. The results reveal that Türkiye, through the fan groups opened for the Turkish series, has created a cultural impact on Serbia and other Balkan countries and has therefore developed a soft power.

ABSTRACT

Many drivers of wetlands were explored but how far the de-linking of tie channels connecting floodplain rivers to the wetlands is caused by the areal and hydrological transformation of a wetland has not received enough attention. This paper tried to do this in reference to the wetland dominated confluence reach of the Dwarka and Brahmini rivers in Moribund deltaic India. Areal and hydrological evolution were assessed in reference to (1) area dynamics (2) consistency of water presence, (3) hydro-period (HP), (4) water depth (WD), and (5) integrated water richness (WR) status. Machine learning approaches were applied for water richness mapping. Tie channel evolution was digitized from the Survey of India (SOI) toposheet (1974) and historical Google Earth images. The result revealed that the tie channel witnessed morphological and hydrological degradations. De-linking of channels, channel piracy, frequent cross embanking, source narrowing, closure due to the embankment, channel clogging due to deposition etc. were some identified processes of tie channel loss. In relation to this, floodplain wetlands failed to receive water from rivers via tie channels. The total wetland area declined from 44.89 km² to 16.86 km² from 1991 to 2021. The rate of areal loss, shallowing WD, growing inconsistency of water presence, narrowing HP, and weakening WR was found high in recent times due to strong de-linking of tie channels. Wetland-wise differences in modification rate were found correlated with the intensity of tie channel loss. So, re-linking the tie channel would be a good policy for wetland restoration.

Keywords: hydro-period, water depth, integrated water richness

**WORK AND FOREIGN LANGUAGES: THE INTERSECTIONAL CHALLENGES FOR
BRAZILIAN WOMEN**

Panche Motta RIBEIRO

Candido Mendes University, Rio de Janeiro, Brazil

Email: panchemotta@gmail.com

ABSTRACT

This paper aims to investigate the causes and economical impacts of non-completion of English Language courses by Brazilian black women. The relation between structural racism and inequality (Gonçalves, 2018) in the country, as well as the studies on social mobility through education (IBGE, 2013) are concerns of recent academic debate that this paper tries to resume. Based on studies in inequalities (Almeida, 2019) and the social question discussion in Brazil (Moura, 1988), considering that the formation of the Brazilian society took place on the basis of a slavery system, where policies to deny black citizens access to the Welfare State, we argue that white and black women have different opportunities to participate in the wealth distribution. In order to develop our ideas, we will analyse the employment vacancies published by companies that have the proficiency in English as a requirement. Also, based on the intersectionality of the analyses where women of colour stand, we shall analyse narratives to acquire the factors which cause black women to dropout the English courses, and study what could be done in order to stimulate their course completion. By these means, it is expected to conclude that among black women, when compared to other sectors of society, we find lower income and underemployment placement due to the lack of access to education, specially the non-completion in the English language courses, making them lower in the competitive labour market and, therefore, maintaining their position of reserve of the reserve army.

Keywords: structural racism, social issue, black women

**BUSINESS PERSPECTIVES OF FLEET MANAGEMENT SYSTEMS FOR

ABSTRACT

Fleet management systems offer significant business advantages in the realm of agricultural operations. These systems integrate technology to optimize the management of agricultural vehicles and equipment, enhancing efficiency, productivity, and cost-effectiveness. Such systems enable real-time tracking and monitoring of vehicles and machinery, ensuring their optimal usage and reducing downtime. By providing insights into fuel consumption, maintenance schedules, and operational patterns, fleet management systems empower businesses to make better informed decisions, ultimately lowering operational costs. Furthermore, improved logistics and route planning through these systems minimize travel times and reduce fuel consumption, leading to increased operational efficiency and reduced carbon footprint. Enhanced safety features, such as driver behavior monitoring and alerts, contribute to safer operations, protecting both equipment and personnel. In this light, adoption of fleet management systems in agricultural operations ensures streamlined logistics, reduced costs, enhanced productivity, and improved safety, making them a pivotal investment for modern agricultural businesses. Towards this direction, a real-time, context-aware fleet management system for agricultural operations, namely Agri.Aware, has been developed in the framework of the V-Agrifleet project. The system offers a number of functionalities that position it in the forefront of the relevant business sector. More specifically, functionalities such as real-time fleet location, real-time fleet status, can bus independence, navigation capability, route optimization, situational awareness, and central / local decision-making support, coupled by its fully voice-operational capability, provision Agri.Aware system's

unique value proposition. In this work, the system's business perspectives are thoroughly explored and analyzed.

This work has been co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call Research – Create – Innovate (project acronym: V-Agrifleet; project code: T2EAK-03960).

ABSTRACT

The global energy crises and environmental degradation are the two main hurdles in achieving the energy shortage; and to achieve this end photocatalysis can be used. For this purpose, the use of graphitic carbon nitride (g-C₃N₄) may be a better option but their photocatalytic activities need to be improved and this can be done by making its nanocomposite with other semiconductors. Likewise, using solar energy to decompose H₂O on photocatalysts is a huge challenge for researchers to produce zero-emission fuels. H₂ has been regarded as a promising chemical fuel substitute for fossil fuels. Similarly, a pollutants free environment is also a huge challenge for the survival of living organisms. In order to achieve these objectives, g-C₃N₄ and metal oxides such as Fe₂O₃, Ag₂O and ZnO will be synthesized and characterized in first phase. In the next phase, some binary/ternary nanocomposites of g-C₃N₄ nanoparticles with other semiconductors/metallic oxides such as Fe₂O₃, Ag₂O and ZnO etc., will be prepared and characterized. In the third phase, their potential catalytic/photocatalytic and environmental applications will be explored and the effect of chemical composition/additives on the structural, physicochemical, and photoactive properties of these binary and ternary nanocomposites will be investigated in detail. Similarly, the nanocomposites, so obtained, will be characterized for their structural and chemical and physicochemical properties while using UV-Visible and FTIR spectroscopies, SEM, TEM, XRD, EDS, TGA and some other accessible techniques. After detailed physicochemical studies, the Z-

scheme heterojunction nanocomposite materials that exhibit the best performance will be reported under different sets of parameter for potential energy production and environmental applications.

FRACTIONAL NEUTRAL SYSTEM WITH A SINGLE DELAY

Mustafa AYDIN (ORCID: 0000-0003-0132-9636)

Van Yuzuncu Yil University, Muradiye Vocational School, Department of Medical Services and
Techniques, Van-Türkiye
Email: m.aydin@yyu.edu.tr

ABSTRACT

A fractional neutral system consists of both a fractional system which is obtained from using fractional order derivatives instead of integer order derivatives in an ordinary differential system and a neutral singled-delay system which is composed of the state variable and its derivative under the same delay. In this paper, we will examine such a system in the Parabhakar sense. We investigate its solution, show its existence and uniqueness on a closed interval, discuss the mentioned system's Ulam-Hyers stability by means of the fixed point approach and lastly demonstrate its relative controllability by putting some circumstances into place.

Keywords: neutral system, fractional system, existence uniqueness, stability, relative controllability

AN ONLINE SYSTEM FOR HEALTH CARE APPOINTMENT MANAGEMENT

Asst. Prof. Dr. Özgür ÜNSAL (ORCID: 0000-0001-9524-3459)

Industrial Engineering Department Gebze Technical University, Kocaeli, Türkiye

Email: ozgurunsal@gtu.edu.tr

ABSTRACT

Appointment scheduling (AS) systems are the important components of any health care organization (hospitals, clinics, etc.) as they affect the resource management decisions as well as the patients' timely access to the health care services, including primary care, specialty care, and preventive screening centers. In the last decade, the use of online appointment systems has become prevalent, such as MHRS in Türkiye and NHS e-referral system in United Kingdom. In addition to these centralized governmental institutions, most of the university hospitals and even small private clinics implement and operate their own online systems. Accordingly, in this study, considering the population's increased access to online services and thus the increasing prevalence of online systems, we designed a novel appointment scheduling system that integrates mathematical optimization into dynamic decision-making process. For this purpose, we develop a novel simulation optimization model with an embedded mixed integer programming formulation that iteratively books a group of patients with respect to an objective function that maximizes overall satisfaction of the patients. To test the operational performance of the newly proposed appointment scheduling system and to generate the necessary input data regarding patients' arrivals, we designed a detailed computational study that takes various configurations into account. Computational experiments showed that the new AS system not only improves the patients' satisfaction, but also increases the utility of the clinic. In this study, based on the results of the simulation study, we also presented a few valuable managerial insights as well as gave some suggestions for increasing the implementability of the proposed system.

**A MIXED INTEGER PROGRAMMING APPROACH FOR MULTI-COMMODITY
FACILITY LOCATION PROBLEM**

Asst. Prof. Dr. Özgür ÜNSAL (ORCID: 0000-0001-9524-3459)

Industrial Engineering Department Gebze Technical University, Kocaeli, Türkiye

Email: ozgurunsal@gtu.edu.tr

ABSTRACT

In this study, we present a novel mixed integer programming (MIP) formulation to tackle the variant of a challenging Multi-Commodity Facility Location Problem (MCFLP). The related problems can be classified into two as capacitated uncapacitated, and in this study, we deal with the capacitated version. Accordingly, the capacitated MCFLP involves determining the optimal placement of facilities to serve multiple commodities to demand points (e.g., customers) while considering various constraints such as fulfilling all the customer demand while taking capacity of each facility for each type of commodity into account. The objective of the problem is to minimize the sum of facility setup costs (i.e., fixed costs) and transportation costs (i.e., variable costs). Locating facilities is a strategic decision problem that finds applications in diverse fields including supply chain management, transportation planning, and network design. Strategic decisions refer to the long-term decisions that are hard to change once they are made. As one can easily observe, making a change in facility location planning decisions, making would be very costly, even impossible in most cases. Therefore, making the best possible decisions in this context is also essential and that is why we preferred an exact approach (i.e., optimization). Accordingly, in this study, we developed a mixed integer programming formulation which is strengthened by three problem specific valid inequalities. The effectiveness of the proposed mixed integer programming is demonstrated through a set of experiments conducted on benchmark instances. The results indicated that the formulation is indeed very strong, thus can even cope with real world sized instances, thanks to the valid inequalities developed.

ABSTRACT

In population growth have led to the serious problem of water stress as our national water sources have now entered an era of scarcity. The purpose of this project is to design a water distillation system that can purify water from nearly any sources, a system that is relatively cheap, importable and depends only on renewable solar energy. The motivation for this project is the limited availability of clean water from solar energy conversion. Distillation is one of many process that can be used for water purification. Solar radiation can be the source of energy. When solar energy is used directly for evaporating inside a device basically termed as 'solar still". To study the performance as pyramid shape solar still and compare with conventional solar still. For this purpose both stills were fabricated and the experiment were conducted on both stills for a water depth of 2 cm at uniform conditions. In this work a solar still with basin area of 1m^2 and glass cover in form of pyramid has been designed and compared. Finally we concluded that the performance of pyramid shaped solar still gives better performance than conventional solar still, due to reduction in shading effect.

ABSTRACT

Many literatures show the spatial resolution effect on wetland mapping and they found that fine-resolution images are more appropriate than coarser-resolution images. The present study proposes that, Is Sentinel images are more appropriate than Landsat images for delineating ox-bow lakes and analyzing the inundation frequency. Number of years water appears in a pixel determines the inundation frequency. With respect to objectives, the present study used the existing conventional spectral indices like Normalized differences water index (NDWI), Modified NDWI (MNDWI), Re-modified NDWI (RmNDWI), and ensemble Vegetation inclusive aggregated water index (ViAWI). For analyzing the inundation frequency, we used the water presence frequency (WPF) approach. Results found that MNDWI index was more appropriate for mapping the ox-bow lakes. But in the case of vegetation cover ox-bow lakes the ViAWI index was more appropriate. Inundation frequency revealed that around 70% area is consistent in water presence. The present study found that sentinel images are more useful in mapping ox-bow lakes and analyzing inundation frequency. However, the accuracy between Landsat images and Sentinel images was minimal. Therefore, the present study recommends the use of Landsat images alternatively to Sentinel images.

ABSTRACT

Visitor counting is simply a measurement of the visitor traffic entering and exiting offices, malls, sports venues, etc. Counting the visitors helps to maximize the efficiency and effectiveness of employees, floor area and sales potential of an organization. Visitor counting is not limited to the entry/exit point of a company but has a wide range of applications that provide information to management on the volume and flow of people throughout a location. A primary method for counting the visitors involves hiring human auditors to stand and manually tally the number of visitors who pass by a certain location. But human-based data collection comes at great expense. This work is based on the design of a bi-directional visitor counter using the microcontroller. The main concept behind this project is to measure and display the number of persons entering in any room like seminar hall, conference room and so on. LCD (Liquid Crystal Display) is placed outside the room displays number of person inside the room. This project can be used to count and display the number of visitors entering inside any conference room or seminar hall. This works is in a two way. That means counter will be incremented if person enters the room and will be decremented if a person leaves the room. Applications of these systems are essential in various rooms like seminar hall, where the capacity of room is limited and should not be exceeded. The system will display the actual number of persons inside the room and future improvement to the system include adding a voice alarm system to indicate when the room is full and people can no longer enter inside.

ABSTRACT

For agricultural production and sustainability, it is essential to determine the productivity and capacity of the soil. This study focuses on revealing the changes in soil productivity characteristics of hazelnut fields in the micro-agricultural basins located within the boundaries of Carsamba district in Samsun province between the years 2005 and 2022 through distribution maps. Within the scope of the study, 44 soil samples were collected from hazelnut fields within the 52,608 ha basin area in 2005 and 2022 from the same coordinated points at a depth of 20 cm, and productivity analyses were conducted. Soil properties such as organic matter, soil reaction, electrical conductivity, calcareous content, available phosphorus and potassium, texture, and bulk density were determined from the soil samples taken from the hazelnut fields. Geostatistical methods were utilized in creating distribution maps of the data. When the soil productivity parameters for the year 2005 were examined in this study, the organic matter ranged from 1.3 to 4.5, with the majority of the samples having a moderate level of organic matter. For the year 2022, organic matter ranges from 1.2 to 5.4, and the median value has increased from 2.4 to 2.7. There is no salinity issue in hazelnut fields, and the soil reaction has increased from 7.2 to 7.4, but it does not pose a problem for agricultural production. Significant increases in soil available phosphorus levels were observed in 2022. The average value of available phosphorus, which was 3.5 kg/ha in 2005, has increased to 6.4 kg/ha in soil samples taken in 2022, indicating a shift from low to moderate levels of available phosphorus. Within the framework of this study, the comparison of soil productivity parameters in hazelnut fields with historical and current data is essential for understanding the long-term outcomes of farmers' agricultural activities and chemical inputs.

“Al. I. Cuza” University of Iași, Faculty of Economics and Business Administration, Department
of Economics and International Business, Iași, Romania

Email: lauradiaconu_07@yahoo.com

ABSTRACT

When discussing the determinants of the entrepreneurial intentions, many studies have debated the role of the socio-cultural environment in which a person develops. However, if the education and religion benefited from deep investigations, the family support has a more limited approach. The purpose of our paper is to investigate the role the family support in shaping the entrepreneurial intentions. The family support is analysed from two perspectives: the emotional one, which involves the ability of listening and empathy, and the instrumental support, which refers to the financial and social capital of the family. The research methodology was based on a survey. The sample included 350 students enrolled in one of the master programs offered by the “Alexandru Ioan Cuza” University of Iasi, Romania. Our results underline that the social capital of the family is positively associated with the intention of starting a business. This finding is not surprising, since it is known that having entrepreneurial parents positively influences the entrepreneurial intentions of the children. However, surprisingly, the family financial capital does not influence the entrepreneurial initiatives of our respondents. Meanwhile, the family emotional support is positively and strongly associated with the intention of starting a business and, as stated in the literature, it seems to amplify the effect of family social capital. This study may be developed in future research, by using a larger sample that would include students from other Romanian universities.

Keywords: family support, entrepreneurial intentions, Romanian young people

**IS THE REMOTE WORK MORE EFFICIENT? A SURVEY ON ROMANIAN
EMPLOYEES**

Prof. Dr. Laura DIACONU (MAXIM) (ORCID: 0000-0001-5745-3850)

“Al. I. Cuza” University of Iași, Faculty of Economics and Business Administration, Department
of Economics and International Business, Iași, Romania

ABSTRACT

As the COVID-19 pandemic has rapidly spread all over the world, the national governments issued work restrictions, mostly involving the remote work. Even if initially it was considered that this would be only a temporary situation, the nowadays reality proves that the remote work still characterizes various business environments. In this context, it is important to understand how employees adjust to the remote work. During the last years, several studies have been conducted in order to identify the potential advantages and disadvantages of the remote working. Some of them found positive outcomes, such as higher job satisfaction, autonomy and better work performances. Meanwhile, there were some other researches that showed some negative effects, including social isolation, dissatisfaction and stress due to a negative impact of digital technology use and, thus, a lower productivity. Considering these aspects, the purpose of our study is to analyse the employees' productivity in the context of the remote work and to underline the factors that might positively or negatively influence it. In order to achieve our goal, we have conducted a survey on 293 Romanian workers that reported spending at least half of their time working at home or remotely during the COVID-19 pandemic. The results of our study helped us find responses at the three research questions we developed based on the literature review. The first question intended to find out if employees perceive the remote work less or more intense than at the workplace and on which dimensions. The second research question was directly focused on the remote workers' productivity and on their perception regarding the necessity of having a different style of supervision to thrive remotely. Thirdly, we wanted to find out if the organizational values and social interaction are important to the engagement and performances of the remote workers.

ABSTRACT

In religious countries such as Pakistan and other neighbors' countries, the infertility is not only a medical issue, but also a social concern in various ethnic groups. Folk medicines are being used in developing and developed countries from last many centuries due to development in nutraceutical products. So, this research work was carried out to explore the impact of *Epimedium grandiflorum* on reproductive system of experimental animals. Phytochemical constituents of *Epimedium grandiflorum* and their antioxidant activities have been screened by standard protocols. HPLC, FTIR spectroscopy and AAS results were found significant ($p < 0.05$) for various phenolic constituents, active functional groups, and essential trace elements, respectively. Moreover, hemolysis study against RBCs was found non-significant ($p > 0.05$), while clot lysis potential was found significant ($p < 0.05$). Furthermore, when protective effects on sperm parameters viz viability, total motility and progressive motility were evaluated, results revealed significant ($p < 0.05$) activities of selected medicinal plants. Male albino rats were used to explore the fertility restoration capacity of *E. grandiflorum* along with CCl₄ intoxication. At the end of trial significant ($p < 0.05$) improvement in baseline selected blood parameters like oxidative stress markers, LFTs and RFTs were found. The results of sex hormones like LH, FSH, testosterone, prolactin, estradiol, and progesterone were analyzed by ELISA method and found significantly ($p < 0.05$) improved on treatment. It was also observed that histological architecture of testis was improved significantly ($p < 0.05$). The expression of selective enzyme like CYP17A1; receptors including ER α , AR; and neuropeptides viz kisspeptin, K1R (GPR54) and GnRH in the testis tissues sections were studied using immunohistochemical (IHC) stains which revealed potential impact of natural herb. It could be concluded that selected medicinal plant has significant therapeutic response to address the healthcare problems particularly of impotency.

ABSTRACT

This study examines the women's inheritance in eastern Nigeria in the light of the Daughters of Zelophelad narrative in Numbers 27:1–11. According to God's original decree, the promised land was to be apportioned according to the "number of names" of members of the second generation; since only men were counted in the census, Zelophehad's five daughters would be left without an inheritance. When they appeal this regulation, God agrees to implement their proposal. The story of the five daughters of Zelophehad provides legitimation for the limited right of Israelite women to inherit land. Bringing this to bear in the eastern Nigerian context, women are not permitted to inherit their husbands' or fathers' property—financial and landed—especially when the woman fails to bear a child or fails to give birth to a male child. Some fathers, in their wisdom, share their properties with their children and wives while they are alive, irrespective of their sexes, but the custom reduced the female children to slavish status in Igboland This has really affected women's self esteem and increased gender inequality in eastern Nigeria. The themes that the Zelophedad's narrative brings to bear in eastern Nigeria context include, right to life, right to own property, had no fear in them, and they were focus. This study utilised content analysis through a phenomenology approach. As part of the recommendations, no matter the circumstances of the birth of a female child, such a child is entitled to an inheritance from her late father's estate.

ÖZET

06.02.2023 tarihinde Türkiye’de 11 ili etkileyen Kahramanmaraş merkezli meydana gelen depremlerden sonra enkazların kaldırılması esnasında İş Sağlığı ve Güvenliği daha önemli bir hale gelmiştir. Enkaz kaldırma sürecinde insan sağlığını etkileyen çeşitli riskler ortaya çıkmaktadır. Bu çalışmada, Türkiye’nin güneydoğu bölgesinde yer alan Adıyaman/Gölbaşı’nda deprem enkaz kaldırma çalışmaları sırasında meydana gelebilecek fiziksel, kimyasal, biyolojik ve ergonomik risk etmenleri tespit edilmeye çalışılmıştır. Bu risklerin değerlendirilmesi, çalışanların ve depreme maruz kalan insanların sağlığını ve güvenliğini korumak açısından hayati önem taşımaktadır. Risk değerlendirmesi için Fine Kinney Yöntemi kullanılacaktır. Bu yöntem, olası tehlikeleri belirlemeyi, risklerin olasılığını ve etkisini değerlendirerek risklerin önem derecesine göre sıralanması sağlayarak acil önlemlerin alınmasına yardımcı olacaktır. Enkaz kaldırma çalışmaları sırasında oluşan risk etmenlerini belirleyebilmek için çalışmalar sırasında gözlem yapılarak, farklı açılardan fotoğraflar çekilerek değerlendirilmeye çalışılmıştır. Enkaz kaldırma esnasında çalışanların güvenliğini sağlamak için kişisel koruyucu donanımların seçilmesi ve kullanılması kritik öneme sahiptir. Bu çalışmada, Fine Kinney risk değerlendirmesi yapılarak çalışanlara uygun kişisel koruyucu donanımlar önerilmiştir amaçlanmıştır. Yapılan risk değerlendirmesine göre fiziksel risk etmenleri skorunun daha yüksek olduğu belirlenmiştir. Sonuç olarak, çalışma alanında kask, toz koruyucu maskeler, koruyucu eldivenler, kulak koruyucular, göz koruyucular, koruyucu elbiseler ve çelik burunlu ayak koruyucular gibi kişisel koruyucu donanımlar önerilmiştir. Bu donanımlar ile enkaz altında çalışanların vücutlarının olası tehlikelere karşı korunması ve yaralanma riskinin azalması sağlanacaktır.

Anahtar Kelimeler: Fine Kinney, Deprem, Risk Değerlendirmesi, Kişisel Koruyucu Donanımlar, Adıyaman/Gölbaşı

**RISK ASSESSMENT OF DEBRIS REMOVAL USING FINE KINNEY METHOD AND
THE IMPORTANCE OF PERSONAL PROTECTIVE EQUIPMENT IN REDUCING
POTENTIAL RISKS: A CASE STUDY OF THE ADIYAMAN/GÖLBAŞI
EARTHQUAKE**

ABSTRACT

Occupational Health and Safety has become more important during the removal of the debris after the Kahramanmaraş-centered earthquakes that affected 11 provinces in Turkey on 06.02.2023. Various risks that affect human health emerge during the debris removal process. In this study, physical, chemical, biological and ergonomic risk factors that may occur during earthquake debris removal activities in Adıyaman/Gölbaşı, located in the southeast region of Turkey, were tried to be determined. The assessment of these risks is of vital importance in safeguarding the health and safety of both workers and individuals exposed to the earthquake. The Fine Kinney Method will be used for risk assessment. This method will help identify potential hazards, evaluate the likelihood and impact of risks, and rank the risks in order of importance, helping to take immediate action. To identify risk factors during debris removal operations, observations were made and photos were taken from different angles during the operations. The data was then evaluated to assess the risks. The selection and use of personal protective equipment is critical to ensure the safety of workers during debris removal. In this study, it is aimed to recommend appropriate personal protective equipment to employees by performing a Fine Kinney risk assessment. According to the risk assessment, it was determined that the physical risk factors score was higher. As a result, personal protective equipment such as helmets, dust protective masks, protective gloves, ear protectors, eye protectors, protective clothing and steel-toed foot protectors have been suggested in the work area. With these equipment, the bodies of those working under the debris will be protected against possible dangers and the risk of injury will be reduced.

ÖZET

Merkez bankaları, resmi para otoriteleri olarak yetki ve sorumlulukları çerçevesinde para politikası uygulamalarına başvurmakta, reel ve finansal sektör faaliyetlerini doğrudan veya dolaylı olarak yönlendirmektedir. 21. yüzyılın krizleri olarak adlandırılan Küresel Finans Krizi, COVID-19 pandemisi ve Ukrayna-Rusya savaşının küresel ekonomide yarattığı sorunlar göz önüne alındığında merkez bankalarının üstlendikleri rol/fonksiyonların daha da önem kazandığı görülmektedir. Bununla birlikte, son dönemlerde küresel ekonomide ortaya çıkan enflasyonist baskılar karşısında merkez bankalarının politika faizlerinde önemli artırımlara gitmeleri ve bunun olası sonuçları gündemdeki yerini korumaktadır. Bu bağlamda politika faizinin finans sektörüne etkilerinin irdelenmesi politika yapıcılarının karar süreçleri için önemli bir bilgi deseni oluşturma fırsatı sunacaktır. Çalışmada, 2010-2022 dönemi çeyreklik verilerle seçilmiş gelişmiş/gelişmekte olan ülkeler için politika faizinin finans sektörüne etkilerinin panel veri analizi yöntemiyle incelenmesi amaçlanmıştır. Finans sektörünü temsilen borsada işlem gören ulusal firmaların toplam piyasa değerini ifade eden piyasa kapitalizasyonu, bankalar tarafından ve bankalar dahil tüm finansal kuruluşlar tarafından firmalara sağlanan krediler bağımlı değişken, enflasyondan arındırılmış politika faizi oranı ve reel faizin negatif olduğu dönemler bağımsız değişken olarak ele alınmaktadır. Bulgular, reel politika faizindeki değişimlerin, borsada işlem gören ulusal firmaların toplam piyasa değerini negatif, negatif düzeylerdeyken piyasa değerini pozitif etkilediğini göstermiştir. Bu durum, negatif politika faizi dönemlerinde faiz geçişkenliğine göre mevduat faizlerinin de düşük veya negatif seviyelere gerilemesi, tasarruf sahiplerinin hisse senetleri gibi diğer yatırım araçlarına yönelmelerinin sonuçları olarak değerlendirilmektedir. Diğer taraftan, reel politika faizinin bankalar tarafında firmalara verilen kredileri pozitif etkilediği ve reel faizlerin negatife döndüğü durumlarda bu etkinin daha da arttığı belirlenmiştir. Bununla birlikte, bankalarla diğer kredi veren kuruluşlar da dikkate alındığında, firmaların kullandığı kredilerin reel politika faizinden pozitif etkilendiği, negatif olduğu dönemlerde ise negatif etkilendiği bulgulanmıştır. Bu durum, banka dışı finansal kuruluşların negatif faiz dönemlerinde firmaların finansman ihtiyaçlarına yeterli düzeyde cevap vermediğini, dolayısıyla finansmana ihtiyaç duyan firmaların daha fazla banka kredilerine yöneldiklerini göstermektedir.

Keywords: Politika faizi, piyasa değeri, kredi, panel veri analizi

**THE EFFECT OF POLICY RATE ON FINANCIAL SECTOR:
MARKET CAPITALIZATION AND CREDIT MARKET**

ABSTRACT

Central banks, as official monetary authorities, utilize monetary policies within the framework of their authority/responsibilities to directly/indirectly influence real and financial sector activities. Given the challenges of the 21st century, like Global Financial Crisis, COVID-19, Ukraine-Russia conflict, central banks' roles/functions have become even more critical. However, in recent times, central banks' decisions to raise policy interest rates in response to global inflationary pressures remain a key concern. Thus, assessing the effects of policy interest rates on the financial sector is critical for informing policymaking decisions. This study purposes to analyse the effects of the policy interest rate on the financial sector for selected developed/developing countries using quarterly data in 2010-2022 through panel data analysis. Market capitalization, which represents total market value of companies traded on stock exchange, loans provided to companies by banks and all financial institutions including banks, are considered as dependent (representing the financial sector), inflation-adjusted policy interest rate and real interest's negative periods are considered as independent variables. The findings indicated that the changes in real interest affect market capitalization negatively and positively affect the market value when the rate is negative. This is interpreted as the results of deposit rates falling to low/negative levels according to the interest rate pass-through in negative real interest, and tendency of savers to other investment instruments such as stocks. Additionally, it has been determined that the real policy rate has a positive effect on the loans given by the banks to the companies and this effect increases even more when the real interest turn negative. However, when non-bank financial institutions are considered, loans to firms are positively influenced by the rate but negatively by negative periods. This implies that non-bank financial institutions inadequately meet financing needs during negative interest rate periods, increasing reliance on bank loans.

ABSTRACT

The chestnut fruit holds significant economic value due to its widespread use in the food, pharmaceutical, and cosmetic industries. However, the chestnut's shell is often treated as waste material. Research focusing on the utilization of chestnut shells has increased in recent years, yet comprehensive investigations into the components of chestnut shells and their functional properties remain insufficient. Neglecting the assessment of potential substances within chestnut shells and their possible applications constitutes a notable issue. This study hypothesizes that waste chestnut shells contain substantial amounts of protein and that these proteins, when isolated under appropriate conditions, hold potential for use as functional materials in the fields of food and biotechnology. To explore this, the study involves the isolation of chestnut shell proteins through alkaline extraction and acid precipitation processes. The functionality of these isolated proteins, including functional attributes like water-holding capacity, fat-binding capacity, emulsion formation, and foam creation, was investigated. Hexane extraction yielded a fat content of 2.8% in chestnut shells. From the defatted chestnut shells, a protein content of 26.6% was obtained. These proteins exhibited a water-binding capacity of 1.16 g/g and a fat-binding capacity of 1.17 g/g. Furthermore, the emulsification capacity of the extracted chestnut shell proteins was found to be 58.2%, with an emulsion stability of 26.5%. Additionally, the foam-forming capacity and foam stability were observed to be 27.2% and 3.2%, respectively. Functional property results indicated that chestnut shell proteins bear values comparable to other plant-derived waste proteins such as sunflower, olive, and black cumin seed, which have garnered increased research attention in recent years. In conclusion, further studies investigating the effects of different processing conditions could potentially facilitate combining chestnut shell proteins with other plant proteins, offering an alternative to animal-based protein supplements.

ÖZET

Yapay zekâ, felsefe disiplini açısından diğer alanlara göre çok farklı bir anlam sahasına sahiptir. Bir şeyi tanımlamak, onu anlamak bakımından bilginin kesinliği, tamlığı ve kusursuzluğu çeşitli verileri belirli bir sistematik içerisinde bir araya getirebilmektir. Bu beceri başlangıçtan beri insan olmanın özsel unsuru olarak belirlenmiş ve bu yeti konusunda uzmanlaşmış kimselere filozof payesi verilmiştir. Ayrıca henüz felsefi araştırmanın başlangıcında bu cevher ruhla ilişkili ele alınmış ve bedenle ilişkisi her zaman koparılmaya bile pamuk iplene bağlı bir biçimde kurgulanmıştır. Daha nadir bir görüş olarak materyal düşünce beyin ve sinir sistemi üzerinden değerlendirmelerde bulunmamış değildir. Sonraki dönemlerde dil üzerinden, dil becerisi, şeyleri tam olarak ifade etmek ve dil dünya ilişkisini belirli bir kesinlik zemini üzerinde kurmak olarak anlaşılmıştır. Fakat felsefe bu argümanların yol açtığı krizlerle baş etmeye çalışmaktadır. Bu krizlerden felsefi anlamda en önemlisi bir bilgelik olarak felsefi idealin yerini paroloji ve dil çözümlerine bırakmasıdır. Klasik felsefede olduğu gibi bir düşünürün pek çok alanda bilgiye sahip olamaması bu idealin önündeki en ciddi engeldir. Paradoksal görünebilir ama bu sorunlarla ilgilenmek, yeni araştırma biçimleri ve yolları keşfedebilmek adına yapay zekâ felsefe disiplini için de önemli bir katkı ögesi olabilir.

Yapay zekânın felsefeye dönüşü felsefedeki yeni kriz nedeniyle olmaktadır. Felsefe, felsefi düşüncenin eksikliğini tamamlamak için teknik düşünceye önem vermelidir. Felsefenin "dile dönüşü" ve bu doğrultuda "yapay zekâ dönüşü" dile dayanmaktadır. Paradigma değişimi aynı zamanda "bilinci", "zekâyı" ve "özneliği" geleneksellik tarzında tanımlayabilmemizdir. Yapay zekâ teknolojisinin gelişmesiyle birlikte bizim de teknolojinin gelişimini "estetik akılla" yönlendirmemiz, bilim ve teknoloji ile doğa, insan ve sanat arasındaki uyumu teşvik etmemiz gerekmektedir. Bu perspektiften bu çalışmanın amacı; bilim, teknoloji ve özellikle yapa zekâ çalışmaları ışığında, temel felsefi problemleri ve duyguları, inançları, eylemleri ve güdülerini ve zihnin niteliklerini araştırmanın değerini felsefi açıdan değerlendirmek ve halen önemli bir insani mezyet olan eleştirinin biricikliğine işaret etmektir.

Anahtar Kelimeler: Felsefe, bilim, teknoloji, yapay zekâ

**CURRENT AND FUTURE OF PHILOSOPHY WITHIN THE FRAMEWORK OF
SCIENTIFIC DEVELOPMENTS AND ARTIFICIAL INTELLIGENCE STUDIES**

ABSTRACT

Artificial intelligence has a very different meaning field in terms of philosophy discipline compared to other fields. To define something, to understand it, the precision, completeness and perfection of knowledge is to bring together various data in a certain systematic. This skill has been determined as the essential element of being human from the very beginning, and people who specialize in this skill have been given the rank of philosopher. In addition, at the beginning of the philosophical research, this substance has been considered in relation to the soul and has been constructed in a way that is tied to a cotton thread, even if its relationship with the body is not always broken. As a rarer view, material thought has not made evaluations on the brain and nervous system. In the following periods, language skill was understood as expressing things exactly and establishing the language-world relationship on a certain ground of certainty. But philosophy tries to cope with the crises caused by these arguments. The most important of these crises in the philosophical sense is that the philosophical ideal as a wisdom is replaced by parology and language analysis. The lack of knowledge in many areas of classical philosophy is the most serious obstacle to this ideal. It may seem paradoxical, but it can also be an important contribution to the philosophy discipline of artificial intelligence in order to deal with these problems and explore new forms and ways of research. The return of Artificial Intelligence to philosophy is due to the new crisis in philosophy. Philosophy should give importance to technical thinking to make up for the lack of philosophical thought. Philosophy's "return to language" and "artificial intelligence return" are based on language. The paradigm shift is also that we can define "consciousness", "intelligence" and "subjectivity" in the style of conventionality. With the development of artificial intelligence technology, we need to direct the development of technology with the "Aesthetic mind" and encourage the harmony between technology and science and nature, human and art. From this perspective, the aim of this study is; In the light of science, technology and especially artificial intelligence studies, it is to evaluate philosophically the value of researching basic philosophical problems and emotions, beliefs, actions and motives and the qualities of the mind, and to point out the uniqueness of criticism, which is still an important human virtue.

ABSTRACT

Several battery modules are created by connecting more than 100 cells in series or parallel to form the larger battery pack seen in electric automobiles. A battery management system (BMS) continuously analyses Current, Voltage, and Temperature data in order to activate control algorithms such cell balance and thermal management via wireless communication. The cloud is then used to store and analyse this data in real time. The most common type of battery utilized in an electric vehicle was used in this investigation, a lead-acid battery. These batteries are essential in combating against the damaging effects of fossil fuels, such as pollution and rising costs. The battery has to be properly inspected to ensure that it performs at its peak level in every circumstance. Battery systems must have their functioning under control in order to be secure, dependable, and efficient overall. A more structured battery management system has to be implemented in order to monitor the battery's performance. The Internet of Things (IoT) is used to collect and track battery information, which are then analysed. The user is then provided wireless transmission access to the gathered data. By using the Internet of Things (IOT), which transmits data and exposes circumstances to the driver, the problem could be discovered before it's too late. We have incorporated a Machine Learning (ML) algorithm that predicts the battery's lifespan using information obtained from the controller so that the user may be aware of its endurance. For our task, we'll utilize a Raspberry Pi and an embedded sensor to read battery temperature, voltage, and current. The gathered data is sent to a machine learning program for battery forecasting and temperature control. Energy efficiency advancements in battery thermal management systems (BTMS) can increase battery electric vehicle (BEV) range and reduce well-to-wheel pollution. The potential of a predictive BTMS that utilized convolutional neural networks (CNN) was examined in this study. CNN made predictions about battery temperature based on input data from both the previous and next drive stages. Based on a weighted sum of the costs for derating, aging, and battery cooling that were established by the quantile projections, the predictive control was developed to choose battery cooling thresholds. We investigated the adaptation of the predictive BTMS to different future paths, the tuneability of cost weights, and resilience to input uncertainty.

ABSTRACT

When we start thinking about the "city" as a social space, we can say that it is primarily a physical area that encompasses all the historical, cultural, economic and political lives of individuals, groups and societies. In addition to this, it also has a role in shaping memory, along with cultural patterns and perception based on communication. In this context, the "city" is a physical and socially constructed space that interacts with human experiences. The discipline of social work, which focuses on human needs, human rights and social justice, is fundamentally an urban profession. It aims to empower individuals in the face of compelling stress factors created by social changes in urban areas. In this respect, marginalized social groups are an important subject of thought for social work. While social work evaluates marginalized social groups in the context of the effects of the urban ecosystem in which they live, it also asserts that their individual and unique needs should be seen and given importance. In this context, it will be important to (1) psychosocially support individuals at risk of exclusion in urban areas after experiential crises, (2) develop multidimensional and sectoral interventions against the risk of stigmatization caused by spatial segregation, (3) increase the transitivity of urban spaces to improve social awareness, and (4) support the participation of marginalized social groups living in the peripheries of cities in decisions to be taken for them.

**UTILIZING MACHINE LEARNING FOR EFFECTIVE TRAFFIC CONGESTION
MANAGEMENT-A REVIEW**

Assist. Prof. Dr. Jogendra KUMAR

Department of Computer Science and Engineering

G. B. Pant Institute of Engineering and Technology, Ghurdauri Pauri Garhwal Uttarakhand, India

Email: jogendra.gbpiet@gmail.com

ABSTRACT

This review paper provides an in-depth analysis of the application of machine learning techniques in addressing traffic congestion. As urbanization continues to accelerate and the number of vehicles on the road increases, efficient traffic management becomes paramount. Machine learning, with its ability to process vast amounts of data and adapt to dynamic traffic conditions, has emerged as a promising tool for improving traffic congestion management. This paper presents an overview of the key machine learning approaches employed in this context, discusses their strengths and limitations, and explores recent advancements and challenges. The review also highlights case studies and real-world applications, shedding light on the potential impact of machine learning in transforming the way we manage traffic congestion.

TOLERANCE INTERVAL SEMIGRAPH

Abdur ROHMAN

Bodoland University, Kokrajhar, Research Scholar, Department of Mathematical Sciences, India
Email: abdurrohman239@gmail.com

ABSTRACT

Semigraph is a generalization concept of graph theory. Intersection graphs are very essential in analytical as well as application point of view. Interval graphs have engaged the attention of researchers for over sixty years. They are extensively been studied and revealed their practical relevance for modeling problems arising in the real world. One main reason for this increasing interest is that many real-world applications involve solving problems on graphs which are either interval graphs themselves or are related to interval graphs in a natural way. So here we introduced this concept into a generalized structure (semigraph) of graph to increase the interest of researchers in this field to extend the knowledge. This paper introduced the interval semigraph and tolerance interval semigraph. Here some basic results are also established related to these concepts.

ABSTRACT

Switched Reluctance Motors (SRM) are gaining popularity as a result of their numerous benefits. On both the stator and rotor, the SRM has salient poles. The stator has concentric windings, whereas the rotor has no windings or permanent magnets. The SRM features a simple design that offers excellent reliability fault tolerance, and low manufacturing costs. The key disadvantages of SRM are the high torque ripples, running vibrations, and acoustic noise. This study proposes combining a PID, neural networks, and fuzzy controllers to control the speed of a switching reluctance machine. The goal of this project is to address the issues mentioned above. The advantages of this technique are then demonstrated, including fast convergence time and low error between the desired and true speeds. The efficiency of the suggested controller was demonstrated using MATLAB-Simulink simulation.

**CHEMICALLY REACTIVE EFFECTS ON MHD FLOW OF MAXWELL FLUID
THROUGH A POROUS CHANNEL WITH THE IMPACT OF RADIATION**

K. SUDARMOZHI

Department of Mathematics, Saveetha School of Engineering, SIMATS, Chennai, Tamil Nadu,
India

Email: sudarmozhik1033.sse@saveetha.com

ABSTRACT

This investigation aims to provide numerical analyses for a complex problem involving magnetohydrodynamic flow, chemical reactivity, and heat transfer of a Maxwell fluid within a porous channel. The governing equations for momentum, concentration, and energy are transformed into ODEs for concentrated analysis using a similarity transformation. Dimensionless velocity, temperature and concentration fields corresponding to steady motions of Maxwell fluid over a channel are numerically recognized using the fourth-order Runge-Kutta scheme. We validated our results with existing work to check the gained results and got an excellent agreement. The impact of physical parameters on fluid motion is plotted and debated. The study reveals that as the Deborah number surges, both velocity and temperature experience enhancement while the concentration within the fluid diminishes. The outcomes indicate that concentration distribution declines with the introduction of a chemical reaction and a higher Schmidt number. Additionally, the impact of the magnetic parameter is observed, resulting in reduced velocity and temperature profiles, while concentration profiles exhibit an increase across the entire domain. Furthermore, the rise in the Reynolds number corresponds to an escalation in the temperature outline.

Email: gvrr1976@kluniversity.in

ABSTRACT

In this study, the impacts of magnetohydrodynamics (MHD) and viscous dissipation were examined in the context of Casson and Walters-B viscoelastic nanofluid flow via a vertical penetrable plate. Flow terms included heat generation, radiation, Soret, chemical reaction, and Dufour mechanism. A group of non-dimensional partial differential equations (PDE) are the equations that describe the model. The use of non-dimensional quantities allows for the dimensionless type reduction of these equations. The Runge-Kutta method and firing approach are used to numerically solve problems in their dimensionless form. Because boundary layers are heated, induced thermal radiation and heat generation have a significant impact on fluid temperature and thermal layer. Increasing radiation term reduces the velocity at the ambient vicinity because the boundary layer's hot region causes it. However, the applied magnetic field produces a Lorentz force that slows the flow position and causes the velocity to degenerate. Blood is the Walters-B type of fluid, whereas the Casson liquid used in this investigation was methyl methacrylate. In the layer above the vertical penetrable plate, these two non-Newtonian fluids flow. The nanoparticles are found in an area that is heated at the layers.

ABSTRACT

The dividend puzzle has intrigued stakeholders in the last five decades in India. The study aims to explore the impact of firm-level and macro-level determinants on the dividend policy of Indian firms in the light of rapidly changing macro-economic and regulatory policies of India. This study uses regularization-based machine learning techniques consisting of ridge regression, five forms of lasso (Cross Validation, Adaptive, Plugin, BIC and Square-root lasso) and elastic net regression on the data of 2288 listed Indian non-financial companies spanning over 17 years from 2006-2022 with a large set of variables capturing the holistic perspective of the dividend policy. This study also used cross-fit partialing-out with instrumental variables and double selection techniques of lasso regression for obtaining inferential statistics of the selected firm-level and macroeconomic factors. The study finds that larger and more mature companies pay higher dividends. Past dividends, current year's profitability and earnings, investment opportunities, effective tax rate, better audit quality and state and institutional ownership result in an increase in dividends. Market risk, firm liquidity, bank monitoring and liquidity of shares of the firm have a negative impact. Macroeconomic factors such as income velocity of money and rise in new project announcements increase dividends while rise in monetary policy rates, debt and equity issues result in the reduction of dividends. The study can help the investors and managers to understand the significant factors and its mechanisms leading to dividend payments for making investment decisions to achieve their expected objectives. Corporate managers can adapt their dividend policies according to the current state of determinants and also work on the influencing variables to achieve the desired direction of dividend policy and quantum of dividends to suit the objectives of the firm.

ABSTRACT

The article is devoted to the specifics and structure of building a student portfolio in a basic school in the context of social change. The relevance of the problem under study is substantiated by the fact that social changes in Ukraine related to quarantine restrictions and martial law have led to increased attention of scientists and practitioners to the use of methods of individualization of the analysis of students' interests and needs. This has led to the introduction of a student portfolio, which is seen as the ability to summarize and analyze one's own learning activities. It is emphasized that portfolio analysis is a complex process of a teacher's work on identifying values and vision of learning outcomes, social and personal achievements of students, which allow to recognize the problems of the student community when planning work with the class. The scientific achievements in the works of domestic and foreign scientists on portfolio analysis are analyzed. A portfolio for middle school students has been developed, which contains five generalizing modules that are combined in content and require the completion of certain tasks and checking the level of development of systemic and critical thinking. The modules include the following: "All about me", "My achievements", "My hobbies, me and leisure", "I am a citizen of my city and my country", "Thoughts out loud". An experimental study of the analysis of students' portfolios in an educational institution was conducted. The influence of the portfolio on the formation of the student's educational trajectory; work planning, mutual evaluation, self-evaluation, analysis of their achievements is determined. It is proved that the portfolio contributes to the formation of reflective thinking of students and is an appropriate motivator in educational activities and social life, encourages their activity and develops the skills of reflective and evaluative activities of students. Portfolios allow to activate the stimulating, motivational and educational functions of assessment; determine the trend of development of the student's educational trajectory, reflect the emotional state of the child at school and contribute to the understanding of his/her psychological profile.

ABSTRACT

Transfection methods play a pivotal role in biomedical research, enabling the introduction of exogenous genetic material into target cells. Lipofectamine and electroporation are two widely utilized transfection techniques; however, their potential impact on cellular fate remains inadequately explored. K562 cells, which are well known for their erythroid differentiation potential, provide an excellent model to explore the effects of these transfection methods on cellular differentiation. In this study, K562 cells were subjected to various conditions of Lipofectamine and electroporation, and their erythroid differentiation potential was assessed after 48 hours using benzidine staining assay. Intriguingly, our results revealed that both Lipofectamine and electroporation induced erythroid differentiation, even when applied under their recommended and presumed safe conditions. Notably, Lipofectamine emerged as a more potent inducer of erythroid differentiation compared to electroporation. Nevertheless, further investigation is required to precisely elucidate the mechanism by which these transfection methods induce erythroid differentiation and promote hemoglobin accumulation in K562 cells. This study highlights the significant impact of transfection methods on cellular fate, emphasizing the importance of taking these effects into account when interpreting experimental data.

ECONOMIC PROTECTION AND SOCIAL SECURITY THROUGH INSURANCE

Prof. Dr. Ram Prahlad CHOUDHARY
Department of Commerce University of Calcutta
Email: rpccom@caluniv.ac.in

ABSTRACT

In a socialistic economic system, the state has to provide social security. But under the capitalistic economic system this is a personal responsibility. The constitution of our country, as per *Article 41*, states that the state has to provide means within its economic capabilities in such a way that citizen can find employment, education, assistance for a happy life with regard to old age illness, disability etc. There is no denying the fact that our life is full of competition and completely unpredictable. Thus the indispensability of taking life insurance policy cannot be denied. Every family must have economic protection. The life insurance gives that protection and social security which cannot be expected from other form of investment. Only insurance has power and ability to lessen the intensity of the losses that occur due to any kind of accidents. But, it is observed that even highly educated people do not come forward to take insurance term-plan policy. They feel the premium paid for term-plan policy is wastage of resources where as fact is that if one can opt for term-plan policy in their early life i.e. just at the time of entering into earning phase of life cycle, it will be too small financial obligation to cover a huge amount equivalent to their life value. It is very pertinent to note that premium increases as the age increases, i.e. lower premium is charged at the lower age. Technically it is termed as mortality charges. Under the situation Financial Planning, which is the process of setting specific financial goals to be accomplished in Human Life Cycle, may be an effective tool in the hands of individuals having their own individualized financial plan in their life. It is natural that too many events are to happen in individual's life and they should identify those events with their financial requirements and accordingly insurance policies should be taken by them. The majority of policyholders do not know which policy they have bought and what different features of that policy are. This is a common phenomenon for agents to sell those policies which attract maximum commission without considering the needs of a client. Here comes the role of individuals in setting their appropriate financial plans through selecting appropriate insurance policies matching with their financial goals in their life. The most successful person is those who arrange the finance not only in terms of right amount but also in right time. Therefore, inclusion of life insurance policy in the financial planning is very responsible step to provide security to our life. Taking life insurance policy is indispensable to give financial and social security to our family members in our absence. That is the only appropriate way of making financial planning for human life cycle and offering a happy, peaceful and secured life.

ABSTRACT

This innovative project embarks on a transformative journey in waste management and environmental sustainability by introducing a pioneering concept: the conversion of food waste into Bio Cement. This revolutionary material not only promises ecological advantages but also offers practical solutions to address pressing issues related to solid waste management and food resource utilization. Traditional cement production processes involve the combustion of materials like calcium carbonate (CaCO_3), releasing substantial amounts of carbon dioxide (CO_2) into the atmosphere. In stark contrast, Bio Cement redefines this norm by adopting an environmentally conscious approach. Instead of burning materials, this project employs a unique process that centers on the dehydration and pulverization of food waste. This innovation results in a significant reduction in CO_2 emissions, making Bio Cement a commendable contributor to environmental sustainability. The project's core concept revolves around the collection of food waste, primarily sourced from public gatherings, and subjecting it to a meticulous treatment process. The food waste is dehydrated, resulting in fine granules. These granules are then mixed with water and seasoning, forming a versatile mixture that can be pressed under high heat and load to create durable sheets. Remarkably, these Bio Cement sheets exhibit impressive strength, withstanding forces of up to 30 kilograms. However, the project's significance extends beyond waste reduction and enhanced material strength. One of its key objectives is to reduce pollution, particularly in the context of carbon emissions associated with traditional cement production. For every ton of calcium carbonate burned, approximately half a ton of CO_2 is released. When accounting for emissions stemming from raw material extraction and fuel consumption, the overall carbon footprint of conventional cement production becomes apparent. Bio Cement's innovation challenges this status quo, offering an eco-friendly alternative that minimizes carbon emissions. Moreover, the application of Bio Cement as a raw material in concrete holds substantial promise. Preliminary research indicates that it can enhance the strength of concrete up to fourfold compared to conventional methods. This heightened strength not only makes concrete more resilient but also opens new avenues for sustainable construction practices. In summary, this project not only addresses pressing environmental concerns but also underscores the potential for sustainable innovation. By converting food waste into Bio Cement, it offers a holistic approach to waste reduction, pollution mitigation, and enhanced material performance. Through its multidimensional impact, this initiative takes significant strides towards a more sustainable and eco-conscious future.

ABSTRACT

The global conventional reserves of fossil fuels are progressively diminishing, thus presenting increasingly intricate challenges for the future of energy resources. Promising alternatives in the form of biofuels have been identified to supplant the depleting fossil fuel reserves. However, the conversion of edible vegetable oils into biodiesel through the use of homogeneous acids and base catalysts is currently regarded as untenable for the future. This is mainly due to the conflict between utilizing food crops for fuel production and other environmental concerns associated with the catalyst system and raw materials. This analysis has delved into the advancement in research and development pertaining to heterogeneous catalysts employed in the production of biodiesel using lower quality feedstocks. Heterogeneous base catalysts have demonstrated their efficacy in biodiesel synthesis, albeit with the drawback of susceptibility to high levels of free fatty acids (FFA) or when processing inferior quality feedstocks. Alternatively, solid acid catalysts exhibit the capability to convert these lower grade feedstocks into biodiesel, facilitated by active acid sites. The article provides a comprehensive appraisal of the performance of solid acid catalysts on low grade feedstocks, encompassing their categorization, properties, benefits, limitations, and potential strategies to mitigate their drawbacks in the context of biodiesel production.

ABSTRACT

In this article, the "Dispersive Coacervation (D-Coac)" was examined as a novel approach to develop new Rosemary Essential Oil (REO) dispersion-loaded biodegradable plastic coacervates. The D-Coac model approach was used to coat the active principle (REO) in order to create vector systems and drug delivery matrices. The proposed chemical structures were characterized with Fourier-transform infrared spectroscopy (FTIR), X-ray diffraction (XRD), scanning electron microscopy (SEM), energy dispersive X-ray spectroscopy (EDS), thermogravimetric analysis (TGA). FTIR results complemented with SEM images and XRD measurements confirmed the successful of reaction. Additionally, the contact angle results showed the extreme modifications of the Cac hydrophilic to BC hydrophobic character, where the contact angle increased from 15° to

90°, respectively. However, the structural results were in good agreement with that showed by SEM-images and EDX-spectra of samples.

ABSTRACT

This study was conducted to evaluate effect of feedstock mixture and fermentation time on physicochemical and sensory properties packaged castor- moringa fermented condiment (*ogiri*). *Ogiri* samples were produced from castor oil and moringa seeds, which translated into two set of experiments (feedstock mixture and fermentation time) consisting of 9 design point. Each point was packed in three different packaging materials (*uma* leaves, aluminum foil and plastic container). The total numbers of experimental runs were twenty-seven (27). The 100% castor *ogiri* served as control. The Response Surface Methodology (RSM) was adopted to study the effects of feedstock mixture and fermentation time on proximate (moisture, protein, ash, fat, fibre and carbohydrates), antinutritional factors (tannin saponin, phytate and ricin), vitamins (provitamin A and vitamin B₂), minerals (magnesium, calcium, zinc, iron, sodium and potassium), physical properties (pH and temperature) and sensory properties (colour, taste, after taste, odour and overall acceptability). The models were developed and appropriate statistical analysis such as F-value at $p < 0.05$, coefficient of determination R^2 , adjusted R^2 and coefficient of variation (CV) were adopted to test the adequacy of the models. The response surface 3D graphs were generated from models that showed significant ($p < 0.05$) effect. The result revealed that the generated regression model represented the relationship between the independent variables and responses. The result also showed that some linear models, quadratic and interaction terms had significant ($p < 0.05$) effect on ash fibre, fat, protein, ricin, temperature and pH.

ABSTRACT

Fructooligosaccharides (FOS) are fructose oligomers, composed of kestose, nystose and β -fructofuranosylnystose, with a high world demand for the manufacture of healthier foods. FOS are low-calorie sugars, prebiotic, non-cariogenic, which can be safely consumed by diabetic people

and, since they are not hydrolyzed by the gastrointestinal enzymes, they promote bacterial selectivity in the gut microbiota, assisting in the elimination of pathogenic microorganisms and in colon cancer prevention. These sugars can be produced by the transfructosylation of sucrose molecules, catalyzed by fructosyltransferase (FTase, E.C.2.4.1.9) enzymes, which present high transfructosylation activities, high selectivity and non-toxicity. Nevertheless, these enzymes, in the soluble state, present low operational stability and cannot be reused. Therefore, several techniques and support materials for FTase immobilization must be studied aiming at obtaining stable biocatalysts for FOS production. The immobilization of enzymes by adsorption on inert and insoluble materials has been prominent for its simplicity, low cost and applicability on various supports. The catalytic performance of the enzymes immobilized by this method is directly related to the characteristics of the support material, and they can be optimized from different materials by the synthesis of composite materials, with specific properties for enzyme immobilization. This work evaluated the application of a composite of poly (lactic acid), a renewable biopolymer of easy processing, and clay, an inert material and of high thermal resistance, as the support material for the immobilization, by adsorption, of the FTase from *Aspergillus oryzae* IPT-301 aiming at the synthesis of FOS.

ABSTRACT

Heat exchangers are designed to transport heat energy into heating process and out of a system during cooling process. Heat transfer fluid, which is a medium used to absorb heat energy from a system or release heat from a system, was thought to be a standard fluid, and subsequently researchers have been synthesizing fluids of enhanced heat transfer properties (nanofluid). Nanofluid is composed of nanoparticles suspended in a base fluid. Although nanofluids increased heat transfer rate when compared to standard heat transfer fluid, they have a disadvantage in that the nanofluid's stability is restricted, resulting in sedimentation. Surface functionalization of nanoparticles, among many other ways, have been utilized to boost the stability of nanofluids by employing standard inorganic materials. To promote environmental aspects, a carbon-based bio-functionalized nanofluid was synthesized and characterized using the current approach. In this study, clove functionalized multi-walled carbon nanotube (CMWCNT) nanofluid at the concentrations of 0.025 wt.%, 0.05 wt.%, and 0.1 wt.% were synthesized using a two-step method, characterized for their stability and thermophysical properties, and then used in a square pipe flow test rig under constant heat flux boundary condition to investigate their heat transfer coefficient and frictional pressure loss. A UV-Vis spectrophotometer was used to analyze the dispersion of CMWCNT nanoparticles in the base fluid for stability, and it was stable for 14 days with no evidence of sedimentation at all the concentrations. At 30°C, 0.1 wt.% CMWCNT nanofluid had the largest enhancement in thermal conductivity (7.12%), viscosity (5.19%), and density (0.13%) compared to the other lower concentrations of the CMWCNT nanofluids. The experimental setup was confirmed using distilled water, and the experimental water values were compared with the data from the standard equations and found good agreements. The CMWCNT was validated using pure water after the experimental setup was calibrated. In the experimental, nanofluids were employed. The results showed a rising trend in heat transfer coefficient and Nusselt number as flow rate increased. At 0.1 wt.%, the CMWCNT nanofluid demonstrated the greatest improvement in the heat transfer coefficient, and at the maximum flow rate of 8L/min, the Nusselt number was

approximately 32.52% higher than the water data. The frictional pressure loss reduced as the flow rate increased, such as at 0.1 wt.% showed the greatest negative enhancement of 15.94% at the lowest flow rate, which is not desired. As a result, the clove treated MWCNT nanofluid might be employed to improve the efficiency of the heat exchangers and could be used in specific requirement.

ABSTRACT

This study was conducted to generate and refine Avicelase, sourced from *Bacillus sp.*, which serves the purpose of breaking down cellulose. Avicelase comprises a catalytic domain at its C-terminus, affiliated with family E, a central domain with an as-yet-undisclosed function, and an N-terminal domain responsible for binding substrates. The enzyme was extracted due to its broad utility across industries such as stone-washing denim, household and laundry detergents, and animal feeds. The predominant avicelase enzyme is synthesized by aerobic, mesophilic bacteria. The production of avicelase was accomplished using both the shake-flask technique and a fermentor. Subsequent purification of the resultant enzyme involved ammonium salt precipitation, dialysis, and column chromatography. Through SDS PAGE analysis, the molecular weight of the enzyme was determined to be 84 kDa.

Keywords: *Bacillus sp.*, Avicelase, shakeflask, SDS PAGE

**THE IMPLICATIONS OF ARTIFICIAL INTELLIGENCE ON THE DIGITAL

ABSTRACT

In the conditions of digitalization, a significant number of users actively use the Internet in everyday life. Modern companies, in accordance with existing trends, use innovative approaches to identify the target audience and transform them into loyal customers. Optimization of marketing strategies in the digital environment involves the involvement of innovative tools, among which artificial intelligence is beginning to play an important role. Artificial intelligence allows to generate various types of content that can be used to implement effective marketing strategies in the digital environment. The development of cloud technologies and specialized software leads to the intensification of their use in various spheres. Specialists in the field of digital marketing are focused on the use of artificial intelligence in order to strengthen communications with the target audience in the long term. Taking into account the characteristics of modern users, it is advisable to use the presented technology to generate a variety of content. To create a text that can be placed on the company's web resources, as well as in the process of communicating with potential customers, it is advisable to use the chatbot with artificial intelligence ChatGPT. Realizing the prospects of the mentioned technology, products from technology companies were also introduced to the market, first of all it is necessary to pay attention to Bard (Google), Bedrock (Amazon), Bing AI (Microsoft). The generation of images and video content is possible thanks to the use of DALL-E 2. In the process of implementing the marketing communication policy in the digital environment, artificial intelligence algorithms will allow to identify the target audience and generate unique content. The personalized models construction of interaction with consumers and the identification of their urgent needs allows to form an idea of an individual approach for a specific client and helps to increase the loyalty level.

ABSTRACT

By the end of 2019, the world has known the wide largely pandemic of Covid 19 disease which resulted from the transmission of the SARS-CoV-2 virus from the animal to human. In the life cycle of this virus, an important main protease called M^{Pro} (3 Chymotrypsin like protease 3Cl^{Pro}) is used to cleave the polyprotein responsible of the viral activity into 11 small proteins. The cleavage process starts when the cysteine 145 of the catalytic site of the M^{Pro} is covalently bound to the target polypeptide releasing the free active proteins. Up to date, despite extensive research efforts, Covid-19 medication is still very limited. In fact, as of January 2023, a few number of drugs have been approved to treat this disease, such as remdisivir, Acterna (Tocilizumab) and Olumiant (Baricitinib). Thus, developing small molecules as inhibitor agents of SARS-CoV-2 is an interesting approach to combat the transmission of this virus. In this communication, we will present the synthesis, characterization and biological activity of small molecules as anti-SARS-CoV-2 M^{Pro}. The most active analogues were obtained with IC₅₀ values ranging between 6.65 and 7.8 M.

MECHANISM OF THE OXIDATION OF ACETOFERROCENE AND (1-HYDROXYETHYL) FERROCENE

Assoc. Prof. Dr. Rozina KHATTAK

Department of Chemistry, Shaheed Benazir Bhutto Women University, Peshawar 25000,
Pakistan

Email: rznkhattak@yahoo.com; rznkhattak@sbbwu.edu.pk

ABSTRACT

The oxidation of acetoferrocene and (1-hydroxyethyl) ferrocene was studied and compared in mixed solvent system consisting of 20% dioxane in water. The reactions were studied at constant ionic strength and the order of reactions was determined corresponding to each reactant. Each ferrocene derivative was oxidized by Fe (III) based mixed ligand complex such as ferricyphen. Each reaction followed complex kinetics with parallel reactions pathway. The oxygen of acetylferrocene played a key role in the parallel reaction. The effect of several parameters including reactants concentration, pH, ionic strength, dielectric constant and temperature were revealed to propose the rate law for each reaction.

Keywords: oxidation, Fe (III), ionic strength

**TETRAETHYLRHODAMINE DYE REMOVAL FROM WATER FOR
ENVIRONMENTAL REMEDIATION**

Assoc. Prof. Dr. Rozina KHATTAK

ABSTRACT

Tetraethylrhodamine dye is one of the synthetic organic dyes that is widely used in the textile, paper, leather, and several other industries. Before releasing it into aquatic streams, it is crucial to either remove it or limit its concentration in order to lessen or restrict the cause of many ailments. Diverse physical and chemical approaches have been developed to remove pollutants/dyes from wastewater, however adsorption is one of the finest ones currently in use due to its high efficacy and low cost. In this instance, we removed tetraethylrhodamine from water using a plant-based biosorbent, and under optimal conditions, tetraethylrhodamine adsorption reached over 86%. Kinetic studies suggest that biosorption happens via pseudo-second-order kinetics.

INVESTIGATION OF FAKE DETECTION TECHNIQUES IN FACE RECOGNITION

Chithra R.

K, S, Rangasamy College of Technology
Email: chithra@ksrct.ac.in

ABSTRACT

The advent of deepfake technology has ushered in a new era of synthetic media, raising concerns about its misuse for malicious purposes, including misinformation, identity theft, and fraud. Existing deepfake detection methods struggle to keep pace with the rapid advancements in deep learning, leaving both humans and machines vulnerable to the persuasive influence of deepfakes. Furthermore, the rise of deepfake technology has intensified concerns regarding its malicious applications, encompassing misinformation, identity theft, and fraud. Existing detection techniques face challenges in keeping up with the swift advancements in deep learning. Nevertheless, recent literature provides valuable insights into crucial aspects of this predicament. Notably, the MORPH Database, spanning individuals from adulthood to old age, plays a pivotal role in advancing face recognition research. Studies focusing on wrinkles underscore their substantial impact on perceived facial age, adding complexity to age estimation algorithms. Additionally, the utilization of weakly labeled data, such as age differences observed in image pairs, proves to be a promising avenue for enhancing age estimation. Furthermore, the introduction of Batch Normalization emerges as a pivotal technique to address the internal covariate shift within deep neural networks, expediting the training process and simplifying parameter management. The amalgamation of these insights forms a comprehensive and multifaceted approach to fortify deepfake detection, a necessity in countering the adverse consequences of synthetic media within our interconnected digital landscape.

ABSTRACT

Water is an invaluable resource, and understanding the dynamics of watersheds is crucial for effective water resource management. This study embarks on a comprehensive exploration of watershed delineation in the vibrant and ecologically diverse region of Ankara, Turkey, leveraging the powerful capabilities of ArcGIS. Ankara, known for its intricate network of rivers and streams, holds immense significance for water supply, agricultural practices, and environmental conservation. Employing state-of-the-art geospatial analysis tools within ArcGIS, this research delves into the intricate details of watershed delineation. A wealth of geospatial data, including digital elevation models (DEMs), land cover maps, and hydrological datasets, is skillfully integrated to create accurate and high-resolution watershed boundaries. The study encompasses a range of scales, from small tributaries to large river basins, ensuring a comprehensive understanding of the region's hydrological landscape. The research goes beyond mere delineation and offers in-depth insights into the characteristics and behaviour of these watersheds. Various hydrological parameters, such as flow accumulation, slope, and stream networks, are analysed to provide a holistic view of water drainage patterns. Furthermore, the impact of land use changes and human activities on watershed dynamics is thoroughly examined, shedding light on the potential challenges and opportunities for sustainable water resource management. The outcomes of this study have far-reaching implications for Ankara and its surrounding areas. Precise watershed delineation is indispensable for flood risk assessment, water quality monitoring, and the sustainable allocation of water resources. The findings will serve as a valuable resource for local authorities, environmental agencies, and researchers, facilitating evidence-based decision-making and strategies for preserving Ankara's delicate water ecosystems. In conclusion, this research, powered by ArcGIS, unveils the hidden intricacies of Ankara's watersheds, offering a detailed and data-driven perspective on their morphology and behaviour. Such insights are invaluable for safeguarding this vital natural resource and ensuring a sustainable and resilient future for Ankara, Turkey.

ABSTRACT

Climate change is one of the most pressing global challenges of our time, with far-reaching consequences for natural ecosystems. This study delves into the intricate web of interactions between climate change and ecosystems, focusing on the unique context of Turkey. Positioned at the crossroads of Europe and Asia, Turkey's diverse ecosystems, from its Mediterranean coasts to its mountainous interiors, are under the influence of complex climatic patterns, making it an ideal case study to assess the impacts of climate change. This research embarks the effects of climate change on Turkey's ecosystems. A comprehensive analysis of temperature trends, precipitation patterns, and extreme weather events reveals a changing climate landscape. The study highlights shifts in seasonality, alterations in rainfall regimes, and the increasing frequency of heatwaves and droughts, all of which have profound implications for ecological dynamics. The impacts of these climatic shifts are felt throughout Turkey's ecosystems. Terrestrial ecosystems, including forests, grasslands, and wetlands, are undergoing noticeable transformations in species composition and distribution. Alpine ecosystems are especially vulnerable, with rising temperatures leading to the retreat of glaciers and changes in high-altitude flora and fauna. Aquatic ecosystems, encompassing rivers, lakes, and coastal zones, face challenges such as sea-level rise, ocean acidification, and altered migration patterns of marine species. Beyond ecological changes, this study also explores the cascading effects on ecosystem services crucial for human well-being. These include alterations in water availability, agricultural productivity, and the emergence of new challenges in disease vectors and pest populations. Furthermore, the study examines the potential for ecosystem-based adaptation and mitigation strategies to enhance resilience and combat climate change. The findings of this research provide vital insights for policymakers, conservationists, and local communities in Turkey. Understanding the intricate relationship between climate change and ecosystems is essential for formulating adaptive strategies and preserving biodiversity. By shedding light on the specific challenges and opportunities faced by Turkey's unique ecosystems, this study contributes to a holistic approach to climate change mitigation and adaptation, ultimately safeguarding the nation's natural heritage for future generations.

ARABIC SIGN LANGUAGE DATASETS REVIEW AND IMPROVEMENT

Alaa Jalal TAMIMI

Master of Intelligent systems Palestine Polytechnic University PPU Hebron, Palestine

Email: ajtamimi@ppu.edu

ABSTRACT

The research on Arabic sign language recognition has increased dramatically in the last decade, which required the availability of high-quality datasets. This paper reviews and analyzes the available Arabic sign language datasets according to seven quality metrics where possible. Then this paper improves the best dataset according to the quality metrics by enhancing its labeling information and expanding the dataset using the augmentation method. The review results show that there are twelve datasets with only one available dataset for public research which is called ArASI2018. Further, ArASI2018 is improved in terms of attributes and expansion. The enhanced labeling gives the ability to apply the statistical analysis while expansion increases the accuracy as verified by the results. Finally, this improved dataset was used to train CNN Model and illustrate the white and colored noise effects on the prediction of real time images.

**QUASI-ANALYTICAL DESIGN OF SINGLE-IRIS TECHNOLOGY WAVEGUIDE
FILTERS FOR KU-BAND APPLICATIONS**

Neetirajsinh CHHASATIA

Charotar University of Science and Technology (CHARUSAT)

Email: neetiraj.n.c@ieee.org

ABSTRACT

This research introduces a novel approach to Ku-band filter design using iris technology waveguides with a strategically placed single iris. A quasi-analytical methodology is employed to rigorously examine the impact of the single iris on frequency selectivity, providing new insights into the intricacies of waveguide filter design. The study explores the complex relationship between the angle of the single iris slit and its influence on the waveguide's filtering performance. This detailed analysis underscores the precise control that can be exerted over frequency selectivity, demonstrating the potential for tailored filtering solutions. Furthermore, the study delves into the broader implications of this solitary iris, elucidating its capacity to introduce customized characteristics into the waveguide structure. Remarkably, experimental results validate the exceptional performance of the proposed filter design, exhibiting an insertion loss of less than 0.03 dB and a return loss exceeding 35 dB across the passband. These results underscore the robustness and efficacy of this innovative approach in Ku-band filtering applications. Beyond its outstanding filtering performance, this research provides invaluable contributions to the field of microwave filter design. It not only showcases the potential of iris technology waveguides but also contributes to a deeper understanding of the intricate interplay between design parameters and filtering outcomes. This innovative approach represents a significant advancement in microwave filter technology, offering tailored solutions for Ku-band applications and highlighting opportunities for further research in advanced waveguide filter design.

ABSTRACT

Ferroelectric materials have an inherent spontaneous polarization that can be changed by the application of an external electrical field. Excellent physical features, such as dielectric responsiveness, pyroelectricity, piezoelectricity, electro-optics, and nonlinear optical phenomena, are displayed by ferroelectric materials when spontaneous polarization is switched back and forth by an applied electric field. All of these physical characteristics have found widespread applicability in numerous real-world situations. Rochelle salts were where ferroelectricity was first identified, and a number of other molecular systems followed. However, it wasn't until the discovery of ferroelectricity in perovskite oxides like BaTiO_3 and $\text{Pb}(\text{Zr,Ti})\text{O}_3$ that the field began to rapidly advance. Because of their greater polarization and piezoelectric coefficients, these oxide ferroelectrics are more desirable for applications, but because they typically contain heavy metals, they are not environmentally benign. They cannot be processed at the current microelectronic temperatures because they need a high processing temperature. They cannot be employed in flexible devices since they are frequently fragile. However, organic materials are typically clearer, lighter, more flexible, and easier to process. They are perfect for uses in flexible and portable electronics. Two-dimensional (2D) organic-inorganic hybrid perovskites have become a significant family of ferroelectrics in recent years. This 2D class of ferroelectrics allows for the coexistence and/or coupling of various functions, which makes them a perfect platform for the development of new multifunctional candidates. They also benefit from unusual structural compatibility and tunability.

ABSTARCT

In radiotherapy planning computerized tomography (CT) scans, objects with high atomic numbers, such as metallic prostheses cause undesirable image distortions(artifacts).To prevent this, artifact-reducing algorithms have been used in CT simulators in recent years.In our study, the effect of metal artifact reduction (MAR) algorithm used during planning tomography scans on contouring and dosimetry in patients who underwent vaginal cuff brachytherapy was investigated.Twelve early-stage endometrial cancer patients who underwent adjuvant vaginal cuff brachytherapy were included in the study.A total of 21 Gy of intracavitary brachytherapy in 3 fractions was applied to the patients with ovoid applicators.General Electric Discovery RT model device was used for planning CT.Artifacts caused by the metallic parts of the ovoid applicators were reconstructed with the MAR algorithm in the CT software, and artifact-free images were obtained.A total of 72 images of 12 patients, with and without the MAR algorithm, were transferred to the Eclipse treatment planning system(V16.0).In both sets of images, the rectum, bladder, and sigmoid were contoured as organs at risk.Shifts in the X-Y-Z axis and the Dice coefficient were used to determine contour differences in organs at risk.For dosimetric evaluation, the total doses received by 2cc of the rectum, sigmoid and bladder were compared with the Wilcoxon test.In the contouring, the volume change was observed the most in the first fraction for bladder and rectum, and in the third fraction

for sigmoid. However, there was no significant difference found between mean Dice coefficients. Shifts in the X-Y-Z axes, the most changes were found in the Y-axis for the bladder (-0.03 cm), and in the Z-axis for the rectum and sigmoid (-0.62 cm) and (0.42 cm), respectively. In the dosimetry, no significant difference was detected between D2cc doses. There was no significant effect of correction of CT images with the MAR algorithm on organs at risk doses and contouring in patients.

ABSTRACT

The key role in genetic monogerm hybrid sugar beet breeding is played by Owen type (Owen type) plants, which are called O-type plants. For this reason, one of the most important and laborious stages in hybrid variety development studies in which cytoplasmic male sterility is used is the detection of O-type plants that ensure the continuity of sterility. In the detection of O-type plants, progeny tests should be carried out with polling crosses. Because in classical breeding methods, progeny testing is the only way to distinguish perpetuating plants from non-perpetuating plants. To conduct progeny tests, stable CMS plants (sterile) and monogerm fertile plants used as pollinators should be crossed to determine the percentage of sterile plants in the offspring. For this purpose, each monogerm fertile plant is crossed separately with sterile plants in isolated environments, and the seeds are coded and harvested separately. In the next growing period, the sterile plant percentages are determined by examining the flowers on the plants obtained from the hybridized plants planted in separate rows. Monogerm fertile plants pollinating hybrid rows with a sterile plant ratio of 95% and above are considered O-type. Monogerm fertile plants pollinating the plants in the rows with a sterile percentage of 70% and above are taken into progeny tests again considering isolation-related problems.

ABSTRACT

Today, drones are used for many purposes like to take images from inaccessible places, to organize races, to spray pesticides or for hobby purposes. Thanks to autonomous flight and image processing algorithms, drones can perform tracking and recording operations over the camera. These processes are managed by the flight control cards and additional artificial intelligence devices in the drone. One of the biggest problems for drones is flight time. As the motors consume power in drones, the consumption of control cards is also very high. To consider with a solution to this, the electronics and software of a flight control card (FCC) and the electronic speed control cards (ESCs) were developed. At the same time, it is aimed to achieve the best battery efficiency and the longest flight time with a central control application integrated with the battery management system (BMS) of these cards. Moreover, it is aimed to ensure that the designed cards are not affected by the noise of other signals in the environment, with filtering methods and the sensors to work stably by being least affected by noise. As the signal noise is reduced, the number of measurements will be reduced. In this way, the processor will process less and power consumption will decrease. Flight control boards have GPS, tilt sensor, speed sensor, etc. After the data received from these sensors, it is ensured that the drones fly more stably and perform a controlled flight in autonomous flights. Regardless of the flight pattern, data is continuously taken from each sensor and the flight of the drone is dependent on these sensors. In case of failure of any sensor, the drone is removed from autonomous flight and brought back to its starting point. The worst scenario, in case of sensor failure, the drone falls directly. Each sensor data has an effect on autonomous flight. However, when every sensor data does not receive properly, it should not affect the flight and your task

should be completed. In order to achieve this, a common decision mechanism is made by collecting data from all sensors and the command is transmitted to the drone in this way. In cases where some of them break down, the sensitivity decreases, but a control application has been carried out so that the flight can continue. In this way, it is aimed to take precautions against all possibilities. Therefore, the sensor, which is likely to fail, should be placed in such a way that it is fed from different places. Each sensor data works in loop. Continuous processing of sensor data increases accuracy. Power consumption always increases when sensitivity increases. The proposed study aims to increase efficiency by reducing power consumption as much as possible. While doing this, it is also aimed not to interfere with the sensitive measurement process of the sensors. It is planned to reduce power consumption by operating the sensors asynchronously. For example, an agricultural imaging drone does not need any data other than the tilt sensor and GPS. The use of the all received data such as speed sensors, pressure sensors, accelerometers increases power consumption. Using them for different purposes according to each task will increase efficiency. Control cards that have been produced and software developed in this way will come to the fore with their features that work more efficiently and consume less power compared to other studies in the literature. Another output of the proposed study is the development of a Li-ion package with a battery management system (BMS) that will minimize the high-power consumption faced by the drone. With the battery pack to be developed, the drone will be on duty for longer periods and mission efficiency will be increased. In order to achieve this, an energy management system algorithm design study is carried out in the BMS system.

ABSTRACT

Battery management system (BMS) has started to be used with the development of battery technology in order to provide maximum performance from the battery. One of important functions of BMSs is the determination of the battery State-of-Health, SoH [1]. The concept of SoH can be defined as the maximum usable capacity of the battery. Depending on the usage and environmental conditions, the battery capacity decreases over time, in other words, the battery health condition worsens. In cases such as too long-term non-use or storage in adverse environmental conditions, the battery may become completely unusable. In addition, Li-ion batteries, which are the most preferred batteries for Unmanned Aerial Vehicles (UAVs), can be exposed to harsh aging conditions during their use, SoH of the batteries deteriorates due to reasons such as overcharging - discharging, overheating in general and can cause events up to explosion. In this study, the charging status of the battery of a quadcopter in a certain area were determined. The following parameters were performed that are altitude, wind condition, wind speed, battery voltage, battery current, angular velocity, acceleration and load. The study to be carried out processed the batteries used in unmanned aerial vehicles according to SoH estimation methods and this study were carried out using the following steps. [1] Analysis of power consumption in UAVs. Obtained data from the battery after any operations have been filtered and retrieved from a wide variety of information in the dataset (GPS information, altitude information, voltage, current, acceleration, etc.). Thus, the power consumption of the UAV is determined depending on different location, wind speed, altitude information. [2] Analysis of power consumption and creation of test algorithms. The improved dataset includes charge, discharge, SoH analysis, amount of current drawn, etc. during the operation of the UAV such as state of charge analysis (SoC) were analyzed and an algorithm were designed for the battery test system. After analysis, many tests of the batteries were carried out experimentally.

[3] Application of test algorithms. The Battery Test System and the behavior of the battery samples under these conditions were determined as a result of the wide analysis of data of the UAV operations and containing charge-discharge, current, voltage, temperature information. The previous studies in the literature were repeated with more samples and the SoH information of the samples were extracted with the obtained information in order to compare with the proposed achieved results.

Publicity, Sivas-Türkiye

Email: hasansaf@cumhuriyet.edu.tr

ABSTRACT

The concept of nostalgia refers to the longing for a house, home, place or country that never existed or no longer exists. However, the concept is based on the possibility of living the past from the present or bringing it into the present. Today, the desire to live the past appears more as a criticism of modernism. Nostalgia has been adopted by the masses and individuals and even peoples have started to remember the good days of the past as a criticism of today's problems. Nostalgia for the good old days has been instrumentalized in political life, political communication and used in discourses. This situation is mostly encountered in populism. Ideologically constructed nostalgia discourse is an indispensable feature of anti-establishment populism. Nostalgic discourse helps to oppose elites and the economic and cultural values associated with them. The feelings of anxiety, rage and anger felt by the masses are met with the nostalgic discourses used in populism and political communication activities are carried out. As can be seen, with populist discourses developed for different purposes, the past has been celebrated and the masses have been tried to be influenced. The examination of nostalgic populism, which is based on the idea that the past was better, more beautiful and prosperous than the present, constitutes the subject of this study. The aim of the paper is to investigate the use of nostalgic discourses in populism. From this point of view, the study focuses on the Alternative for Germany (AfD), a far-right party operating in Germany. The communication activities of the AfD on its official website and Facebook during the 2019 Thuringia State Elections were analyzed considering the one-month period before the elections. First, fifty-five studies were subjected to qualitative content analysis and categorized according to their themes. As a result of this categorization, it was observed that the studies contained themes such as nostalgic discourses, in-group dynamics, homeland, anti-elitism, the others, change and crisis, and lost values. When the studies containing nostalgic discourses were re-examined, it was seen that nostalgic discourses were formed under the themes of restorative nostalgia, which sees the past as a structure that needs to be corrected, emotional nostalgia, which aims to develop emotional ties with the past, and historical reference, which is based on referring to the past. Thus, the use of different dimensions of nostalgic discourses in populism has been revealed.

ABSTRACT

In today's world, Lithium-ion (Li-ion) battery systems are widely used in various applications such as electric vehicles, unmanned aerial vehicles, and spacecraft. These systems are often subjected to dynamic charge-discharge processes. During a dynamic cycle, when current is drawn from the battery, heat is generated due to the internal resistance of the battery. This heat generation varies depending on the current drawn from the battery and the voltage difference. In this study, the effects of three types of dynamic cycles (rectangular, sinusoidal, and triangular) and static cycle on the temperature of battery cells were investigated numerically. In the analysis, dynamic cycles were modeled for two different maximum discharge rates, 5C and 7C. Two different battery pack configurations, one with phase change material (PCM) and one without PCM, were considered. The battery cell temperature changes were compared by applying these cycles for 1000 seconds. The results showed that in the system with PCM, the battery cell temperature did not reach the critical temperature (60 °C) for the determined dynamic cycling types at the 5C discharge rate. However, at the 7C discharge rate, it reached the critical temperature in rectangular and static cycles in 650 and 337 seconds, respectively. In the system without PCM, at the 5C discharge rate, the battery reached the critical temperature in rectangular, sinusoidal, triangular, and static cycles in 194, 267, 323, and 137 seconds, respectively. At the 7C discharge rate, the times were 67, 137, 145, and 67 seconds for the same cycling types. As a conclusion of this study, the use of PCM led to a significant increase in the working time. The effect of the cycling type on the working time and battery temperature was demonstrated, particularly at high discharge rates.

ABSTRACT

Tungsten (W) is a refractory metal with the highest melting point of all metals. Due to its strength at high temperatures, good thermal conductivity and low thermal expansion, it is used in the defense, aerospace, medical and nuclear industries. The characteristics of W have made it a valuable material in a wide range of industries with diverse applications. The production of complex parts with traditional manufacturing methods is quite limited. For this material, the additive manufacturing method comes to the fore. Since the raw material of the additive manufacturing method is spherical metal powders, powder production from Tungsten material has gained importance. Today, metal powders required by the additive manufacturing sector are produced by gas atomization (GA) or plasma atomization (PA) methods. Both methods have advantages and limitations compared to each other. In this study, the effective aspects of plasma atomization and gas atomization methods were taken and numerical modeling was performed as hybrid atomization. Numerical studies were carried out in ansys fluent environment according to the determined parameters. The study's results indicate that the plasma gun operates at a temperature sufficient to disintegrate the tungsten material. The resulting irregular pieces can then be converted into smaller, spherical shapes with the assistance of the gas atomization nozzle positioned at the tip of the gun. With this method, which will be presented to the literature as a new method, it is possible that materials with high melting temperatures can be produced with less energy. Numerical studies will be expanded with subsequent experimental studies.

ÖZET

Enerji sektöründe, farklı malzeme türlerinin birleştirilerek kullanılması gereken birçok alan bulunmaktadır. Temel amaç enerjinin daha verimli kullanımı, üretim maliyetlerinin azaltılmasıdır. Son yıllarda araştırmalar, ürünlerin ağırlıklarından tasarruf edip daha düşük maliyetle yorulmaya ve korozyona dirençli malzemelerin nasıl üretileceği üzerine yoğunlaşmaktadır. Bu amaçla yapılan birleştirme işlemlerinde bimetalik malzeme kavramı kullanılmaktadır. Bimetalik malzeme basit olarak farklı mekanik özelliklere veya mühendislik özelliklerine sahip iki malzemenin fiziksel veya metalürjik olarak birbirine bağlanması sonucu elde edilen malzemedir. Bu malzemelerin tercih sebebi olmasını sağlayan başlıca özelliklerden biri homojen ve dayanıklı bir birleşim ara yüzüne sahip olması, diğeri ise malzemeyi oluşturan her bir metalin kendi özelliklerini koruyup nihai bir ürün oluşturmalarıdır. Bimetalik uygulamalarda birçok birleştirme yönteminin kullanılması zor ve sorunludur. Bu nedenle farklı tipteki malzemelerin birleştirilmesinde yeni ve çevreci bir yöntem olan Mekanik Kilitleme Yöntemi (MLM) kullanılarak pratikte karşılaşılan birçok problemin önüne geçilebilmektedir. Mekanik kilitleme yöntemi ile farklı kimyasal ve fiziksel özelliklere sahip malzemeler birleştirilebilir. Bunlar arasında demir, demir dışı metaller ve seramik malzemeler gibi birçok malzeme türü yer almaktadır. Bu çalışma kapsamında; geleneksel yöntemlerle birleştirilmesi neredeyse imkânsız olan farklı kimyasal bileşime ve fiziksel özelliklere sahip AISI 1040 ve CuZn39Pb3 metal çiftleri mekanik kilitleme yöntemi ile birleştirilmiştir. Birleştirme işlemlerinde bağlantı kalitesini doğrudan etkileyen kanal derinliği sırası ile 8, 9 ve 10 mm olması durumunda oluşan mikroyapı ve mekanik özellikler araştırılmıştır. Diğer bağlantı parametreleri ise bağlantı açısı sabit 7°, sabit sürtünme hızı 1400 rpm, sabit ilerleme 25 mm/dak olarak kullanılmıştır. Çalışma sonucunda 10 mm kanal derinliğine sahip S3 no'lu numunede 240,14 MPa değer ile en yüksek mekanik özellikler elde edilmiştir. Kanal derinliğindeki artışın mekanik özellikleri olumlu etkilediği görülmüştür. Bu durumun bağlantıyı gerçekleştiren flanş oluşumu için yeterli derinliğin elde edilmesi ve buna bağlı düzenli malzeme akışının sağlanması sonucunda ortaya çıktığı tespit edilmiştir. Çalışmanın sonuçlarına göre farklı malzeme çiftlerinin birleştirilmesinde MLM yönteminin önemli bir potansiyele sahip olduğu görülmüştür.

**ANALYSIS OF MICROSTRUCTURAL AND MECHANICAL PROPERTIES
DEPENDING ON CHANNEL DEPTH IN JOINING DIFFERENT METAL PAIRS**

ABSTRACT

In the energy sector, there are many areas that need to be used by combining different types of materials. The main purpose is to use energy more efficiently and to reduce production costs. In recent years, research has focused on how to produce fatigue and corrosion resistant materials at a lower cost while saving the weight of products. For this purpose, the concept of bimetallic material is used in the joining processes. Bimetallic material is simply the material obtained as a result of the physical or metallurgical bonding of two materials with different mechanical or engineering properties to each other. One of the main features that makes these materials the reason for preference is that they have a homogeneous and durable joint interface, and the other is that each metal that makes up the material preserves its own properties and creates a final product. In bimetallic applications, the use of various joining methods is difficult and problematic. Therefore, in joining materials of different types, a new and environmentally friendly method called the Mechanical Locking Method (MLM) can be used to overcome many practical problems. With the mechanical locking method, materials with different chemical and physical properties can be joined, including various types of materials such as iron, non-ferrous metals, and ceramic materials. AISI 1040 and CuZn39Pb3 metal pairs, which have different chemical composition and physical properties, which are almost impossible to join with traditional methods, were joined by mechanical locking method. The microstructure and mechanical properties of the jointing processes, which directly affect the joint quality, were investigated when the channel depth was 8, 9 and 10 mm, respectively. Other connection parameters are fixed 7° connection angle, constant friction speed of 1400 rpm, constant feed 25 mm/min. As a result of the study, the highest mechanical properties were obtained with a value of 240.14 MPa in the sample no. S3 with a channel depth of 10 mm. It has been observed that the increase in the channel depth has a positive effect on the mechanical properties. It has been determined that this situation occurs as a result of obtaining sufficient depth for the flange formation that makes the connection and ensuring a regular material flow accordingly. As a result, it has been seen that the MLM method has an important potential in joining different material pairs.

ABSTRACT

Process mining is an important analytical tool to understand and improve the complex and dynamic nature of the business world today. The studies in this field combine data mining techniques with business process data to provide positive effects on the automation, efficiency and effectiveness of business processes. The methods used in process mining facilitate the understanding of the activities and relationships in business processes. Using event logs and business process data, the actual state of the workflows is visualized and analyzed. These analyses are used to identify bottlenecks, leaks, delays and improvement opportunities in the process. PM4Py is a Python-based process mining library that aims to facilitate the analysis and improvement of business processes. This open source library is a powerful tool for researchers and professionals who want to understand business processes using data mining techniques. The library offers a comprehensive workflow that includes extracting data from business processes, cleaning this data, creating process models and analyzing processes. Visualization tools provide a great convenience to understand the flow of business processes and the relationships between activities. This paper aims to explain how business processes are analyzed with PM4Py library by addressing the concept and importance of process mining. The basic steps of process mining, data collection, data preprocessing, process modeling, analysis and result interpretation stages will be explained using Python and PM4Py. PM4Py library is a valuable tool that makes the analysis and improvement of business processes more accessible.

WOMEN'S ECONOMIC EMPOWERMENT IN INDIA: A ROADMAP

Prof. Harpreet KAUR

Principal, Mata Sundri College for Women, University of Delhi, Delhi-110002, India

Email: harpreetjaswal5@gmail.com

ABSTRACT

Women's economic empowerment is a critical aspect of achieving gender equality and sustainable development. This paper presents a roadmap for advancing women's economic empowerment in India, outlining key strategies and interventions across various domains by emphasizing the importance of education and skill development, aiming to enhance access to quality education for girls and women while promoting vocational and technical training. Financial inclusion is identified as another crucial pillar, highlighting the need to improve financial literacy and expand access to affordable financial products and services. Additionally, this paper emphasizes the promotion of entrepreneurship and business support, including tailored training programs, incubators, and networking opportunities for women entrepreneurs. Creating more employment opportunities and implementing gender-sensitive workplace policies is another essential component. Equal pay for equal work, non-discriminatory practices, and leadership representation are emphasized. Legal and policy reforms are deemed crucial, focusing on addressing gender-based violence, discrimination, and harassment while ensuring effective implementation and enforcement of existing laws. The roadmap recognizes the significance of challenging societal norms and mindsets. The Sustainable Development Goals (SDGs) must be achieved in order to invest in the economic empowerment of women. It establishes a clear course for achieving gender parity, the end of poverty, and inclusive economic growth. Large gender discrepancies in economic opportunities and results still exist across all countries and regions, notwithstanding the significant progress made in these areas. There are several schemes and initiatives in India aimed at empowering women through startups and the industrial revolution. These programs provide support, resources, and opportunities to women entrepreneurs to start and scale their businesses. Through a variety of planned interventions, the Indian government has taken numerous measures to guarantee social, educational, economic, and political empowerment. Several government initiatives, including The National Skill Development Policy, stand-up India, Pradhan Mantri MUDRA Yojana, Women Entrepreneurship Platform, Mahila e-Haat, Atal Innovation Mission, Biotechnology Industry Research Assistance Council (BIRAC) - Women Entrepreneurship Program, Stree Swabhimani Initiative, skill India, Start-Up India etc, particularly for the most vulnerable members of society, and that they have the necessary facilities to meet their needs. In addition, the government has created enabling regulations that permit women to work in unconventional fields like fighter pilots in the Indian Air Force, Commandos, Central Police Forces, and Sainik Schools, among others. These schemes and initiatives, along with the broader industrial revolution, play a significant role in empowering women in India by creating an enabling environment for their entrepreneurial ventures. It is important for women entrepreneurs to stay informed about these programs and leverage the resources and opportunities they offer to drive their business growth and contribute to the country's economic development. Overall, this roadmap

offers a comprehensive and multidimensional strategy to foster women's economic empowerment in India, ultimately contributing to a more inclusive and equitable society.

ABSTRACT

It is obvious how crucial zero carbon buildings (ZCBs) are to a sustainable future. Nearly 30% of the world's energy-related greenhouse gas emissions come from buildings. Fortunately, reducing energy demand in buildings also stands as the most economical method of combating climate change, and better buildings can also add significant co-benefits like enhancing residents' and workers' quality of life and health. The World Green Building Council (WorldGBC) estimates that the global construction industry is responsible for 50% of resource consumption, 38% of energy consumption, and 35% of energy-related carbon emissions. According to the WorldGBC, a bold strategy is required to lessen this impact. Deep collaboration across the entire value chain, a radical change in how buildings are created, used, and deconstructed, new business models that support circularity, the reuse of construction materials and buildings, whole life cycle thinking, high performance operations, and ultimately a move away from fossil fuels are all necessary for this. SDG 7 offers a solid framework for sustainability and promotes infrastructure growth and technological advancements. Policymakers have demonstrated how SDG 7 fosters hope for India's energy sector by incorporating renewable energy sources. But right now, the problem is with carbon, not with energy. We also have a carbon budget, which sets a limit on how much carbon dioxide (CO₂) and its equivalents, such as refrigerants and other greenhouse gases, can be released into the atmosphere. If we want to even have a chance of keeping the increase in global temperature to less than 2.7 degrees Fahrenheit, we must cut emissions in half by 2030 and to zero by 2050. (1.5 degrees Celsius). It is commendable that India is in line with Sustainable Development Goal 7 (SDG 7). Through investments in green hydrogen, sustainable energy transitions, and a bio-economy, it has made modern, affordable energy available to everyone. India has been making efforts to combat climate change as a leader in sustainable economic models for emerging markets. SDG 7 offers hope for India's energy sector with goals of achieving net zero emissions by 2070 and supplying 50% of its electricity needs through renewable sources by 2030.

ABSTRACT

Introduction: Methotrexate (MTX) is used in the treatment of cancer and psoriasis. It causes hepatotoxicity, neurotoxicity, and nephrotoxicity. Alamandin (ALA) is a new protective member of the renin-angiotensin system. The studies showed that ALA exhibits cardioprotective and renoprotective effects through antioxidant, anti-inflammatory, and antiapoptotic mechanisms. We aimed to investigate the possible protective effects of ALA against MTX-induced hepatotoxicity.

Materials-Methods: 28 female Sprague Dawley rats were divided into groups by simple randomization: 1. Control group (n=8): The vehicle solution was administered intraperitoneally (i.p.) between days 1-10. 2. MTX group (n=10): The MTX (20 mg/kg single dose) was administered i.p. on day 5 and vehicle solution was administered i.p. between days 1-10. 3. ALA+MTX group (n=10): The MTX (20 mg/kg single dose) was administered i.p. on day 5 and 50 µg/kg ALA was administered i.p. between days 1-10. On day 11 of the study, the rats were euthanized with i.p. 225 mg/kg of ketamine and 24 mg/kg of xylazine. Liver tissue was removed and blood was harvested by intracardiac route. Liver tissue was examined histopathologically. Malondialdehyde (MDA), glutathione (GSH), catalase (CAT), and superoxide dismutase (SOD) activities in liver tissue; Aspartate aminotransferase and alanine aminotransferase levels in serum were biochemically measured. **Results:** In the ALA+MTX group, a reduction in the size of inflammatory infiltration areas in the liver parenchyma and a significant decrease in the number of apoptotic cells was observed compared to the MTX group. There was an increase in MDA level and a decrease in SOD and CAT activities and GSH levels in the MTX group compared to the Control group. In the ALA-administered group, these changes were partially limited. **Conclusion:** ALA showed protective effects against MTX-induced hepatotoxicity via its antioxidant, anti-inflammatory, and antiapoptotic effects. This study was supported by TUBITAK 2209-A Program (Application number: 1919B012102156).

ÖZET

Günümüzde özellikle viral enfeksiyöz hastalıklar, ölüme neden olmaları, tedavi ve kontrollerindeki güçlükler nedeniyle tutsak psittacine kuşlarında en sık görülen klinik problemlerdir. Muhabbet kuşlarında bu viral hastalıklardan en yaygınlarından biri Gammapolyomavirus avis (Muhabbet kuşu yavru kuş hastalığı virüsü/BFDV)'tir. BFDV enfeksiyonu, yavru kuşlarda % 100'e varan yüksek ölüm oranıyla sonuçlanırken, yetişkinler yalnızca hafif tüy distrofileri (Fransız tüy dökümü) gibi semptomlarla kendini gösterir. Gammapolyomavirus avis; *Polyomaviridae* ailesinin Gammapolyomavirus genusunda yer alan, 40-45 nm çapında, zarfsız, ikozahedral simetrik DNA viruslarıdır. Çift iplikli ve dairesel yapıdaki genom yaklaşık 5.000 nükleotidden oluşur. Bu çalışma, 2022 yılı içerisinde farklı zaman dilimlerinde yavru muhabbet kuşlarında ölüm şikâyeti ile Viroloji Anabilim Dalımıza getirilen kuşlarda tespit edilen BFDV un moleküler tespiti ve genomik karakterizasyonu amacıyla yapılmıştır. Bu amaçla, Sivas ilinde BFDV enfeksiyonu tespit edilen üç farklı amatör yetiştiriciye ait 10-20 çift kuştan oluşan sürüler çalışma materyalimizi oluşturdu. Yavru ölümleri görülen her 3 sürüden beşer çift yetişkin muhabbet kuşundan (toplam 30 adet) kloakal swab örnekleri ile 10 adet yavru kuştan doku örnekleri alındı. Swab örnekleri steril PBS solüsyonu ile 1/10 oranında seyreltildi ve santrifüj edildi. Doku örnekleri ise steril havanda ezilip homojenize edildikten sonra 1/10 oranında sulandırıldı ve santrifüj işlemine tabi tutuldu. Elde edilen süpernatantlardan, ticari DNA ekstraksiyon kitiyle viral DNA'lar saflaştırıldı. Elde edilen DNA örnekleri, bu çalışma için tasarlanan ve BFDV'un VP1 ve T antigen genlerini hedef alan primer setleriyle çoğaltıldı. PCR ürünleri, etidium bromid ile boyanan % 1,5 agaroz jelde elektroforez işlemine tabi tutuldu. Elde edilen 456 bp VP1 ve 404 bp T antigen gen bölgelerinin kısmi dizin analizi gerçekleştirildi. Sonuç olarak, bu çalışma ile yavru muhabbet kuşu kayıpları yaşayan amatör yetiştiricilere ait muhabbet kuşu sürülerinde bu kayıpların sebebinin BFDV olduğu moleküler yöntemlerle gösterilmiştir. Ayrıca BFDV a ait VP1 ve T antigen genlerinin kısmi sekans analizleri yapılarak Türkiye'de gözlenen BFDV izolatlarının moleküler karakterizasyonu gerçekleştirilmiştir.

Anahtar Kelimeler: BFDV, VP1 gen, T antijen gen, moleküler karakterizasyon

**MOLECULAR DETECTION AND SEQUENCE ANALYSIS OF
GAMMAPOLYOMAVIRUS AVIS (BUDGERIGAR FLEDGLING DISEASE VIRUS)
FROM BUDGERIGARS IN SIVAS PROVINCE**

ABSTRACT

Nowadays, especially viral infectious diseases are the most common clinical problems in captive psittacine birds due to their mortality, difficulties in their treatment and control. One of the most common of these viral diseases in budgerigars is Gammampolyomavirus avis (Budgerigar fledgling disease virus/BFDV). BFDV infection results in a high mortality rate of up to 100% in nestling birds, while adults only present with symptoms such as mild feather dystrophies (French moult). Gammampolyomavirus avis; non-enveloped, icosahedral DNA viruses with a diameter of 40-45 nm, belonging to the Gammampolyomavirus genus of the *Polyomaviridae* family. The double-stranded and circular genome consists of approximately 5.000 nucleotides. This study was carried out for the molecular detection and genomic characterization of BFDV detected in budgerigars brought to our Virology Department with the complaint of death in baby budgerigars in different time periods in 2022. For this purpose, flocks of 10-20 couples birds belonging to three different amateur breeders with BFDV infection detected in Sivas province constituted our study material. Cloacal swab samples were taken from five couples of adult budgerigars (30 in total) and tissue samples from 10 nestling birds from each of the 3 flocks with offspring. Swab samples were diluted 1/10 with sterile PBS solution and centrifuged. Tissue samples, on the other hand, were crashed and homogenized in sterile mortar, diluted 1/10 and subjected to centrifugation. Viral DNAs were purified from the obtained supernatants with a commercial DNA extraction kit. The obtained DNA samples were amplified with primer sets designed for this study targeting the VP1 and T antigen genes of BFDV. PCR products were electrophoresed on a 1.5% agarose gel stained with ethidium bromide. Partial sequence analysis of the obtained 456 bp VP1 and 404 bp T antigen gene regions was performed. As a result, in this study, it has been shown by molecular methods that the cause of these losses is BFDV in the flocks of amateur breeders who have lost nestling budgerigars. In addition, partial sequence analyzes of VP1 and T antigen genes of BFDV were performed and molecular characterization of BFDV isolates observed in Türkiye was performed.

Keywords: BFDV, VP1 gene, T antigen gene, molecular characterization

YAPAY ZEKANIN TAKLİT BECERİSİNİN İNSAN BİLİNCİ İLE İLİŞKİSİ ÜZERİNE FELSEFİ BİR İNCELEME

Dr. Öğr. Üyesi Muammer AKTAY (ORCID: 0000-0001-6103-5598)

Sivas Cumhuriyet Üniversitesi, Edebiyat Fakültesi, Felsefe Bölümü, Sivas-Türkiye

Email: maktay@cumhuriyet.edu.tr

ÖZET

Yapay zeka destekli makine geliştiricilerinin, insanı taklit etmeye yönelik insanbiçimci bakış açısı geliştirmeye çalıştıkları görülmektedir. Çağımızda birçok alanda yapay benlik, yapay bilinç, yapay zeka, yapay duygusal zeka gibi kavramlar hakkındaki problemlerle ilgili çalışmalar yürütülmektedir. Tabii ki bu çalışmaların temelindeki farklı sorular birçok spekülatif felsefi tartışmalarla ilişkilidir: Bilincin, yapay zeka destekli makinelerdeki gelişmiş uygulamalarla inşa edilebileceği düşünebilir mi? Eğer bunu düşünebilirsek, taklit, hesaplanabilirlik, zeka üzerinden oluşturulacak örüntüler, bilinç ve benliği oluşturabilir mi? Yapay zeka destekli makineler taklitten sıyrılıp duyarlı, istekli ve motivasyon temelli algoritmalarla etkin hareket edebilirler mi? Bu gibi soruların temelindeki taklit ve bilinç ilişkisini farklı argümanlardan yola çıkarak tartışmak önemlidir. Aritmetik açıdan insan zekasına gerek olmadan çalışan mekanik bir hesap makinesi geliştiren Pascal, evrensel dil arayışını ön plana çıkaran Leibniz, evrensel bir makine hakkında ilk araştırma yapan düşünürlerden biri olan Alan Turing, dijital bilgisayarın öncülerinden biri olan Babbage, insan yerine düşenecek makine fikrini ortaya atmaktadırlar. Bunun temelinde, makinenin zeka temelli başlangıç durumunu taklit, öğrenimini ilkel aşamaya benzeterek üst düzey seviyeye geçmek için süreçsel değişimler üzerinde durmaktadırlar. John Searle, Hubert Dreyfus gibi düşünürler ise yapay zeka ile ilgili taklit, zeka gibi ifadelerin bilinç açısından gerçeklik, benlik, öznel nitelik ve içsel nedensel süreçlerle bağlantılı olmadıklarını ortaya koymaktadırlar. Yapay zekânın taklit becerisi ve insan bilinci karşılaştırması, yaşam hissi ve yapay bilinç arasındaki tartışmayı da gündeme getirmektedir. Bu çalışmadaki amacımız, yapay zekânın taklit becerisi ve insan bilinci arasındaki ilişkinin boyutları ile ilgili bir analiz yaparken, gelecekte düşünülen üst düzey yapay zekâ makinelerinin bellek ve bedensellik tartışmaları hakkındaki epistemolojik ve ontolojik eleştirilere değinmeye çalışmaktır. Nihayetinde, yapay zekâyâ yönelik bilinç inşa denemelerinde, “yapmak” ve “olmak” arasındaki ikileme dikkat çekmeye odaklanmaktadır.

Anahtar Kelimeler: Yapay Zeka, Bilinç, Taklit Becerisi, Benlik, İnsanbiçimcilik

A PHILOSOPHICAL INVESTIGATION ON THE RELATIONSHIP OF ARTIFICIAL INTELLIGENCE'S IMITATION SKILLS WITH HUMAN CONSCIOUSNESS

ABSTRACT

It is seen that the developers of AI-supported machines are trying to develop an anthropomorphic perspective to imitate humans. In our age, studies are carried out on problems about concepts such as artificial self, artificial consciousness, AI, artificial emotional intelligence in many fields. Of course, the different questions underlying these studies are associated with many speculative philosophical debates: Is it conceivable that consciousness can be constructed through advanced applications in AI-supported machines? If we can think about this, can we create consciousness and self with patterns that will be created through imitation, computability, intelligence? Can artificial intelligence-supported machines, which avoid imitation, act effectively with sensitive, eager and motivation-based algorithms? It is important to discuss the relationship between imitation and consciousness on the basis of such questions, starting from different arguments. Pascal, who developed a mechanical calculator that works without the need for human intelligence in terms of arithmetic, Leibniz, who emphasized the search for a universal language, Alan Turing, one of the first thinkers to research about a universal machine, Babbage, one of the pioneers of the digital computer, put forward the idea of a machine that would replace humans. On the basis of this, they focus on processual changes to move to a higher level by emulating the machine's intelligence-based initial state, likening its learning to the primitive stage. Thinkers such as John Searle and Hubert Dreyfus reveal that expressions such as imitation and intelligence related to AI are not related to reality, self, subjective quality and internal causal processes in terms of consciousness. The comparison between AI's ability to imitate and human consciousness brings up the debate between the sense of life and artificial consciousness. Our aim in this study is to try to address the epistemological and ontological criticisms about the memory and corporeality discussions of high-level AI machines that are considered to be planned in the future while conducting an analysis about the dimensions of the relationship between AI's imitation skills and human consciousness. Ultimately, our will focus on drawing attention to the dichotomy between "doing" and "being" in attempts to construct consciousness for AI.

ABSTRACT

Advertising speech is a speech that reaches the mind, emotion and soul and it is based on linguistic and stylistic means and strategies intended to lobby and influence the recipient by recruiting all the possibilities of language to display ideas and visions through persuasive mechanisms included in the advertising link as it carries a psychological function, making the speaker focus on the recipient and works to lure him with convincing logical evidence from his reality of his living environment and dominates the horizon of his waiting, making his senses closed and his thought so busy that he does not see anything other than what was directed to him of speech. It is noticeable that the advertising discourse in the Holy Qur'an achieves the goals of utilitarianism which is characterized by being one-sided aim and is not intended to achieve the benefit of the public, but on the contrary, the first and last beneficiary is the recipient as the Almighty editor of the Quranic discourse broadcast ideas with the intention of attracting the attention of the recipient and convince him with full conviction of what is offered to him of the messages that raise his thinking with the intention of change and direction the destination that he wants Almighty displays symbolic signs have dynamic interpretations to keep pace with all times, environments, minds and cultures to be clear features in front of his eyes based on arguments and mental, logical sensory and realistic proofs that is referred to by God from the recipient's environment, culture and social traditions to be with multiple functions, including warning or guidance and then gives him enough space of freedom restricted somewhat by the principle of reward and punishment to choose anywhere he goes and put himself.

ABSTRACT

Effect of variable viscosity on thermal convection of nanofluid in porous medium for more realistic boundary conditions is investigated theoretically. For porous medium the Darcy model is considered. The model used incorporates the effect of Brownian diffusion and thermophoresis. The eigen value problem is solved by employing the Galerkin weighted residuals method. The influence of the variable viscosity parameter, Lewis number, nanoparticle Rayleigh number, modified diffusivity ratio and porosity parameter on the stationary convection studied analytically and found that variable viscosity parameter, Lewis number, modified diffusivity ratio and nanoparticle Rayleigh number destabilizes while porosity parameter stabilize the stationary convection.

Keywords: viscosity, Lewis number, nanofluid

ABSTRACT

Problems: This project aims to replace plastics which are found everywhere these days. It is found littered around the roads, dams, rivers, beaches, washrooms, dustbins, etc., the rate at which these plastics are accumulating is higher than its rate of decomposition. This is because of plastics are made up of non-biodegradable materials that require long term degrade in the environment. As these plastics accumulate to harm the fertile soil and environment. Moreover, a plastic takes up a large area and prevents other waste material to undergo degradation efficiently due to lacks of space. We want to contribute towards plastic reduction and a cleaner environment, by synthesizing biodegradable products from Traditional plants. These kinds of plant source will abundantly make natural materials that can undergo natural biodegradation. The organic gel bandage is non-toxic and biodegradable, and is thus expected to be more environment-friendly than conventional synthetic bandages. **Objective:** To produce a product that should save the environment free from pollution. Our innovation will be toward solving it partially by needs of the population. One of the advantages in this method is using of *Cissus quadrangularis* plant which is most predominantly available in our southern part of TamilNadu. In Ayurveda, it is used as Pachana (digestive aid), Sara (relieves constipation), Athiyuk (strengthening bones), Vrushya (Aphrodisiac), etc. In Unani, it is used to treat gastritis. A variety of pharmacological studies of aerial parts of this herb by different extracts have demonstrated analgesic, anti-inflammatory, anticonvulsant, antimicrobial, anti-cancer, anti-osteoporotic activity, and other bone-related disorders to justify its name as Hadjod. The market opportunity seems to cheaper and reachable to all class of people. In order to revolutionize, this method suits more well to produce biodegradable products to make clean environment. **SAVE THE ENVIRONMENT!** It will protect the environment and replacement of synthetic bandages 1.The potential markets for commercial use for Pharma industries.2. Obtained fibre acts as a perfect agent which binds with any kind of substrate provided, as it contains collagen as its primary component 3. Using of Traditional medicinal plants for the application of natural biodegradable bandages.

Keywords: *Cissus quadrangularis*, anti-osteoporotic activity, biodegradable bandages

**EXAMINING THE OPPORTUNITIES AND CHALLENGES OF NATURAL LANGUAGE
PROCESSING MODELS IN HIGHER EDUCATION: IS EMERGENCE OF CHAT GPT
AN OPPORTUNITY OR CHALLENGE?**

Idris Lawal BAGIWA

Department of Computer Studies, Hassan Usman Katsina Polytechnic P.M.B. 2052, Katsina
State, Nigeria

Email: lawal.idris.bagiwa@hukpoly.edu.ng

ABSTRACT

In the recent decades, the globe has seen significant transformation and is still changing. The Chat GPT has sparked a great deal of speculation among academic stakeholders, not the least of whom are academics and teaching personnel. A Natural Language Processing (NLP) model called Chat GPT was created by OpenAI, and it makes use of a sizable dataset to produce text answers to questions, comments, and prompts from students. It can mimic interactions with students to offer comments, respond to inquiries, and offer help. It could help students maintain their interest in the course subject and feel more connected to their educational experience. The quick adoption of sophisticated NLP models, such as Chat GPT by OpenAI or Bard by Google, also presents a number of challenges. In this post, I'll cover a variety of issues that face higher education, as well as possibilities and difficulties. I'll also draw conclusions that, ideally, highlight knowledge gaps, inspire new research directions, and eventually advance the conversation around NLP in higher education.

ABSTRACT

The study aimed at assessing the implication of sand mining on environment and socioeconomic activities along Watari River. The study utilizes mixed method; where both qualitative and quantitative methods were used. Both primary and secondary sources of data were used. On the other hand, multi-stage sampling technique was used for this research. Descriptive Statistics (Univariate description) was used for data analysis where tabulation, percentage, bar chart and so on were used. On the other hand, the study reveals that majority of the respondents believed that they receive social benefit from sand mining activities, but all of them stated that they do not benefit from sand mining activity environmentally. Though, economically, majority of the respondent believed that they earn some income through engaging in sand mining activity. It is also identified that the most common social challenge that people face in the study area is death because of falling into some gullies or having accident as a result bad terrain they are having because of sand mining activity. The study recommended that It is recommended that the government should intervene directly into sand mining business by regulating the amount of sand should be mined every year in order to minimize the effect of creating gullies. Government should also enforce the compliance with environmental agencies in order to protect the environment and life of people living in the area.

ABSTRACT

We present a highly efficient and site-selective palladium-catalyzed oxidative arylation of substituted 1*H*-indazoles with a diverse array of arenes and heteroarenes as coupling partners. The key to the success of this method lies in the strategic placement of electron-withdrawing groups (EWG) at the C4 position of the 1*H*-indazole, which enables precise C7 arylation. Our approach delivers the desired products in moderate to good yields, capitalizing on 4-NO₂ or 4-CO₂Me substituted 1*H*-indazoles in conjunction with various (hetero)aryls as coupling partners.

The catalytic system comprises Pd(OAc)₂ as the catalyst, phenanthroline as the ligand, Ag₂CO₃ as the oxidant, and NaOH as the base. Notably, this method exhibits excellent regioselectivity, resulting in the exclusive arylation at the C7 position of 1*H*-indazole. To further elucidate the underlying reaction mechanism, we conducted density functional theory calculations, enhancing our comprehension of this transformation. Overall, our methodology offers a highly effective, direct, and atom-economical approach for the construction of C7-(hetero)arylated 1*H*-indazole compounds. This innovation in selective C7 functionalization of 1*H*-indazole provides a valuable tool for the synthesis of diverse and biologically relevant molecules, with potential applications in drug discovery and material science.

ABSTRACT

Air-stability is one of the most important considerations for the practical application of electrode materials in energy storage devices, ranging from solar cells to rechargeable batteries. The promising P2-layered sodium transition metal oxides (P2-NaxTmO2) often suffer from structural/chemical transformations when contacted with moist air. However, these elaborate

transitions and the evaluation rules towards air-stable P2-NaxTmO2 have not yet been clearly elucidated. Herein, taking P2-Na0.74CoO2, as key example, We unveil the comprehensive structural/chemical degradation mechanisms of P2-NaxTmO2 in ambient atmosphere by using various microscopic/spectroscopic characterization: Fourier-transform infrared (FTIR), spectra, X-Ray Diffraction (XRD), inductively coupled plasma–optical emission spectroscopy (ICP-OES), Scanning Electron Microscopy (SEM), Energy Dispersive X-ray analysis (EDX) and Raman scattering.

ABSTRACT

The objective of this study is to evaluate the impact of thickness and number of layers on model for layered composite plate. The proposed model gives an accurate solution for stresses, strains and displacement on AS4D/9310 composites. the objective of this study is to compare between the results obtained after variations in the number of layers and the thickness of each ply. the results are obtained by using ANSYS APDL 18.2 simulation software. the results shown an increase of von-Mises stress, displacement and strain. for low strain in composite laminates, number of layers must be decreased and to obtained high von mises stress we must be increased the number of layers. we concluded that number of layers, fiber orientation and thickness of each layers play an important role on these results obtained.

ABSTRACT

Recent advancements in artificial intelligence and machine learning have significantly impacted healthcare education by improving efficiency, accuracy, and standardization in patient data analysis. The effects of self-efficacy and test anxiety on academic achievement using machine learning-based analysis have attracted attention in many studies. This justifies that more research is needed to examine and predicate the real impact of test anxiety on academic achievement. A machine learning method based on the feedforward artificial neural network, the multi-layer perceptrons (MLPs), is used. The study identified five crucial factors for attaining meaningful academic achievement: having a positive mindset, a well-thought-out plan, being accountable for progress, acknowledging potential stress and negative emotions, and monitoring and evaluating one's achievements and efforts. The results showed that having a positive mindset (AR1) was the most important factor for success, with an important rate of 0.997. Monitoring and evaluating one's achievements (AR5) and a well-thought-out plan (AR2) were also essential factors, with significant rates of 0.996 and 0.981, respectively. The study also identified five factors related to test anxiety and academic achievement. The other important factor was AT1 - the visible signs of nervousness (sweaty palms, shaky Hands, etc.) before a test mainly impacts academic achievement with a rate of .146. This was followed by AT7, which stated that some students are more prone to nervousness during exams, ultimately affecting their performance, with an important rate of 0.126. The study also used machine learning to identify distinct patterns in academic resilience and test anxiety factors that affect academic achievement in different student groups. The findings form part of a 'blueprint' to inform the development of targeted interventions that cater to the unique needs of student populations and lead to improved academic outcomes. A prediction model has been created to forecast the relevant data and analyze future conditions.

ABSTRACT

Approximate computing is tentatively applied in some digital signal processing applications which have an inherent tolerance for erroneous computing results. The approximate arithmetic blocks are utilized in them to improve the electrical performance of these circuits. Multiplier is one of the fundamental units in computer arithmetic blocks. Moreover, the 4-2 compressors are widely employed in the parallel multipliers to accelerate the compression process of partial products. In this brief, a novel approximate 4-2 compressors is proposed and utilized in 8-bit multipliers. Meanwhile, an error-correcting module (ECM) is presented to promote the error performance of approximate multiplier with the proposed 4-2 compressors. The number of the approximate 4-2 compressor's outputs is innovatively reduced to one, which brings further improvements in the energy and area efficiency. This Design is implemented using Verilog HDL and simulated by ModelSim 6.4a and synthesized by Xilinx tool. The proposed Sobel edge detection algorithm uses approximation methods to replace the complex operations. This design is done by MATLAB and ModelSim using hddameon, This proposed multipliers are replaced in the Sobel operator based image Edge detection.

ABSTRACT

The research work aims to develop new data security techniques. Data security is very important in the industry to transfer the data between machines/devices. Most of the industries avoided the internet connectivity to transfer the data between machines due to security issues. Currently DCS (Distributed Control System) based system architecture is playing the major role to monitor and to control industrial sensors and machines. Our proposed system consists of simple microcontroller and local server based storage techniques. We can use these techniques with or without internet. With internet the proposed system can store the data using ORACLE, MySQL, PHP Admin etc. Without internet we can store the history of data in the local server. The proposed system reduces the implementation cost due to DCS architecture is replaced by simple microcontroller based architecture. This work is implemented in the TNPL paper industry.

ABSTRACT

Dividend policy puzzle has continuously changed its shape over time. This study uses a multipronged approach to decode it by capturing the dividend trends in India during 2006-2022, use of machine learning methods to find out the most parsimonious determinants from an exhaustive list of 45 probable determining variables, use of these determinants in logit models to study their impact on propensity to pay dividends and finally using six classification data mining-based machine learning models to predict the dividend policy changes for binary and multinomial scenarios. The 45 probable determinants capture firm-level characteristics, macro indicators and global crisis shocks. The findings suggest that percentage of dividend payers has decreased whereas non-payers have increased over the last two decades. Quantum of dividends as a percentage of net worth and profits declined during 2006-2022. Payers were mostly from manufacturing and service sector. It was found that larger, older, mature and profitable firms with higher past year dividends, current year earnings, stronger bank monitoring are more likely to pay dividends. GDP, income velocity of money, equity issues, listings, gross fixed assets formation and new project announcements increase while greater investment opportunities, share liquidity and debt decrease the propensity to pay dividends. Random forest and decision tree achieved more than 90 percent and 80 percent accuracy in prediction for binomial and multi-class categories. Their performance scores were substantially better than Support Vector Machine, K Nearest Neighbor, Linear Discriminant Analysis and Logistic Regression models. The findings can be very helpful for higher level management to devise optimal dividend policies and other market participants such as portfolio managers and retail investors to formulate investment strategies suiting their preferences for dividends and investment objectives in a more proactive manner.

ABSTRACT

Differentiation therapy is an approach that aims to induce or promote the maturation and specialization of abnormal or undifferentiated cells into more mature and functional cell types. This therapeutic strategy demonstrates substantial potential for cancer treatment. In this study, we focus on drug-induced erythroid differentiation of K562 cells through targeting inosine monophosphate dehydrogenase (IMPDH) using mycophenolic acid, ribavirin (which are IMPDH catalytic inhibitors), and trichostatin A (an acetylation modulator). The erythroid differentiation and accumulation of hemoglobin within K562 cells were examined by the benzidine staining assay. The results demonstrated that these pharmaceutical agents facilitate erythroid differentiation through their influence on IMPDH, which plays a key role in cellular metabolism and differentiation. It's noteworthy that this enzyme possesses a secondary function beyond its involvement in guanine synthesis; it also acts as a transcriptional factor that binds to DNA and modulates the expression of genes with various roles in cellular processes. The results indicate that the drug-induced differentiation of K562 cells to erythroid lineage via mycophenolic acid, ribavirin, and trichostatin A may hold promise as potential strategies for the treatment of leukemia and other hematological disorders.

Keywords: Erythroid differentiation, IMPDH, Mycophenolic acid, Ribavirin, Trichostatin A

ABSTRACT

This article emphasises the influence of Greek literature on Sigmund Freud's life, career, and psychoanalytical concepts. It highlights the convergence between Greek literary themes and Freudian concepts, including the Oedipus complex, the role of tragic heroes, symbolism, and exploration of the unconscious. The main aim of this study was to analyse the significant impact of Greek literature on Freudian psychoanalytical concepts. Greek myths were the names given by Freud to numerous characters from Greek tales who served as inspiration for his personality-based notions used in psychoanalysis. Drawing on a qualitative research design, this study utilised purposive sampling to select specific sections of text for analysis. Through techniques such as content analysis and thematic analysis, this article reveals insights into identifying the parallel connections between Greek myths and Freudian concepts. This study emphasises the ongoing and transformational influence of Greek literature on the fundamental concepts of psychoanalysis, while acknowledging the multifaceted nature of Freud's influence. In particular, this essay uses Greek myth to explain the origins and development of Freud's Oedipus syndrome and narcissism. In their writings, researchers discussed the relationship between literature and psychology.

Keywords: Greek myths, literature, narcissism, Oedipus complex, psychoanalysis

INTRODUCTION

The word literature was coined from the Latin word “Literatura.” Literature is a form of art that gives people a lot of pleasure. It displays the author’s perspective and knowledge in his works. It reflects life, in a way. In the past, literature was a necessary component of life. Literature helps to distinguish between different social, class, and ethical cultures. It includes almost all of what you see, hear, and read. Literature serves as a barrier between various populations. Poetry, theatre, prose, non-fiction, and media literature all fall into one of five categories. A fictional story or scenario that isn’t entirely true or historical is referred to be fiction. The author’s mind created it. We are motivated, intrigued, terrified, and given the opportunity to engage with novel concepts by fiction.

Greek Literature

Greek literature had an impact on countless generations over the whole of Europe, not only on its Roman neighbours to the west. Greek poets brought poetry, tragedies, comedies, and western philosophy to the world. One of the earliest poets in Greece, Hesiod (Hesiod Greek, Hesiod Latin), is frequently referred to as “the father of Greek didactic poetry.” He thrived around 700 BC. Two of his complete epics have survived, including Theogony, which recounts rural life and includes tales of the gods, works, and days. In addition to the issues explored in the writings, ancient Greek literature is regarded as global because it foreshadowed the forms of plays and later epic poetry, both of which were developed by Homer.

The systematic study of psychology and understanding of various psychological diseases like depression or a lack of libido were both advances made by the Ancient Greeks. Aristotle is indeed credited with establishing the foundations of psychology. It is not surprising that Aristotle combined psychology and a philosophy of mind, and that his empirical method served as the precursor to modern mental approaches, given that Greek theorists investigated how personality and human character manifest as components of empirical and rational processes or as corrupted illogical procedures.

The Etymology of the Word Psychology

Even the word “psychology” was made by fusing two Greek words. The first word, psyche, originally meant “breath,” later adding the additional meaning “soul,” because breathing was thought to indicate that the soul had not yet left the body, and then expanding its meaning to include “mind.” The second Greek word is called logos, and while it originally

meant “word,” it later came to mean “discourse” and then “science.” As a result, psychology literally means “the study of the mind,” as its Greek roots would indicate.

The soul is personified in later Greek mythology as Psyche, a young woman who is beloved by the god of love. Eros offers to marry her on the condition that she is forbidden from ever seeing his face and that they exclusively spend time together at night. Psyche was compelled by her envious sisters to light an oil lamp one night as Eros slept, and she instantly fell in love with him. However, she was so entranced by his beauty that she mistakenly spilled some oil on his shoulder, awaking him and making him desert her. In her quest to win him back, Psyche faces many challenges and dangers, but in the end she is changed into a goddess and united with Eros in heavenly bliss. In this tale, Psyche stands in for the human soul, going through hardship and conflict in life but emerging in a better form after dying, much like a worm that transforms into a butterfly. This explains why Psyche is frequently portrayed as having butterfly wings or just being a butterfly in artwork.

Review of Literature

The term “literature” refers to important works that have already been published that are relevant to the researchers’ specific area of study and it discusses published content in that area. It ultimately comes down to giving a brief rundown of secondary sources. A literature review’s primary objective is to help readers better understand the topic under investigation.

according to Fabre and Henry’s *Encyclopaedia of Psychology*, Volume 2. It is thought that narcissism is a social and cultural problem. In their work, Fibre and Jean Henri discuss the grandiose sense of self-importance as well as narcissism as a psychological disease. This investigation investigates the impact of grandiose narcissism. Grandiose narcissism is among the most significant types of narcissism. People that have this illness behave in an entirely different way from how other people do. Grandiose narcissists aim for leadership roles, exhibit excessive confidence in their judgement, and never learn from their mistakes. Narcissism has two faces, according to Paul Wink’s book *Two Faces of Narcissism*. In this essay, the concept of narcissism and its two varieties—grandiose narcissism and vulnerable narcissism—are described. A person with grandiose narcissism is always looking for ways to increase their power, such becoming a politician or star. In contrast to grandiose narcissists, vulnerable narcissists are more constrained while yet having a strong sense of enlightenment. Paul Wink asserts that narcissism has a negative impact on a person’s life.

Eliza Ronningstan wrote a paper titled “Disorder of Narcissism Diagnostic Clinical and Empirical Implications,” in which she defines the term narcissism as “an interest in or

concern with the self along a board continuum from healthy to pathological... including such concepts as self-esteem, self-system self-representation, and true or false self” (Ronningstam 53). The definition of narcissism has changed over time. One sort of mental disorder is narcissism. In their book *The Narcissism Epidemic*, Jean and Keith Campbell outline the traits of a narcissist and how narcissism is related to fantasies of success and power. They want to show how narcissists are continuously in love with themselves and prefer to live in a fantasy world.

The Oedipus Complex is a psychoanalytic hypothesis established by Sigmund Freud, which is based in part on Sophocles’ tragedy. Freud’s impact on succeeding writers led them to look for indications of Hamlet’s Oedipus Complex in his relationship with Gertrude. According to the theory, all children experience sexual impulses for their opposite-sex parent as well as the death of their same-sex parent, and it is currently regarded to emerge exclusively in very young children.

MATERIAL and METHOD

Researchers’ analysis of Sigmund Freud’s psychoanalytical theory’s behavioural principles was done using the qualitative research approach. In order to analyse a topic that was not clearly specified in the previous study, researchers utilised the explorative research method to observe characters. To do this, they gathered secondary research materials from a variety of sources. In this study, the researchers’ theories were improved using the exploratory research methodology. It helps with the generation of fresh knowledge that results in a resolution to the issue. The explorative method helps identify all potential solutions to a problem and works with novel notions. This method is employed by researchers to focus on their primary factors. Primary research, which is the first type of study, and secondary research are the two categories into which exploratory research can be split. Direct information from the subject is acquired through primary research techniques such direct interviews, observation, focus groups, and surveys. Secondary research, on the other hand, is mostly concentrated on research problems for which we already have the necessary data thanks to literature evaluations of previously published studies.

DISCUSSION

Sigmund Freud's Psychoanalysis

Psychoanalysis emphasised motives, emphasising concealed or veiled causes, which help readers understand literature in two stages: the standard of the writing itself and the extent of character interaction in the text. The goal of psychoanalysis is to explain how psychological and social factors affect meaning and identity while concentrating on the situation at hand.

The link between the conscious and unconscious parts of the mind has been studied in psychoanalysis as a means of treating mental disorders. Our most private worries and social meanings are studied by psychoanalysis, which offers us a perspective on this process. Since we live in a post-Freudian era, it is inevitable that our perspectives on human life differ from those of earlier generations. Literature cannot always be sufficiently psychoanalytic and has a tendency to be reductive; therefore, psychoanalysis is crucial from a conceptual standpoint.

Psychoanalytic theory was promoted by Sigmund Freud. In his clinic's inquiry and therapy, Freud was first and foremost a physician. He understood that both his patients and his long-standing commitment to this field were mentally ill. His interest in psychology, particularly the psychology of the unconscious mind, grew over time.

According to Freud, our mind is divided into three parts. He estimated that the psychoneurosis' psychology, nightmares, witticisms, and what he called common psychopathology as tongue slips and pens represented psychoneurosis.

Third is a conscious system, whereas the second is an unconscious system. His thoughts were initially introduced in the field of dream interpretation (1900). It has frequently been assumed that his dream research provides support for these beliefs. Thinking is what gathers, combines, and organises all of our positive and negative experiences.

There are several theories that make up psychoanalysis. The three main theories of psychoanalysis are the Freudian theory, the Lacanian theory, and the subject-related theory.

Influence of Greek Literature: Freud's Psychoanalysis

In order to treat spiritual ills, the study of the individual unconscious is important to psychoanalysis. Psychoanalysis is not just a branch of medicine or psychology; it also helps us understand society, theology, ideologies, and, above all, literature. Psychoanalysis was established in 1897 as a result of Sigmund Freud's self-analysis. His admiration of Egyptian, Greek, and Latin antiquities, which was exquisitely depicted in the collections that surrounded him in his own home, had major parallels to Freud's approach to studying the human mind.

Literature also played a role in criticising Freud for his role in a person's sexual development at a psychological level.

Borrowed Sources

All of the main European authors, including Sophocles, Virgil, Shakespeare, Goethe, and Heine, who produced works of international literature, convinced Sigmund Freud of the truth of his theories. He has appropriated the Greek word "dipus" to describe the profound crisis that a boy child goes through when his love-longing draws him to his mother, breaking the father's law restriction. The epigraph of his most important work, *The Interpretation of Dreams*, which was published in 1899, is a line from Virgil that amplifies the distinctiveness of his approach.

Dream interpretation was one of the most intriguing critical techniques and treatments employed by the ancient Greeks to comprehend particular human worry in Freud's formative years. After travelling and collecting people's accounts of their dreams and determining whether what would be considered their outcomes fit their dreams by some type of logic, the Greek philosopher Artemidorus wrote *Oneirocritica* in the second century CE, which is the first Greek book on dream interpretation.

Plato, Aristotle's teacher, gained mental insights. He believed that the psyche clearly separated the mind from the soul. The goal of Plato's Theory of Forms was to understand and examine how people thought and form impulses.

Modern theory that is used in the literature is given two accepted definitions. It is a method of treating people with mental problems, to start. Second, theories on the complexity of the human mind are crucial.

In support of psychoanalytic theory, Sigmund Freud. First active in the research and therapy at his clinic, Freud was a medical professional. He understood that his patients had mental illnesses despite his years of dedicated to this field. He gradually developed a greater interest in psychology, particularly the psychology of the unconscious mind. Numerous theories make up psychoanalysis. The three main theories of psychoanalysis are subject-related theory, Lacanian theory, and Freudian theory.

Freud's Oedipus Syndrome

The Oedipus complex by Freud is called after a man who unintentionally killed his father and had a sexual relationship with his mother. He asserts that a boy develops an innate obsession with his mother while simultaneously fearing that his father will be a rival. This takes place in a boy's unconscious mind. The Electra complex is a comparable struggle

experienced by females. A woman with an unresolved Electra complex can look for a man who treats her like their father.

The Oedipus complex is a theory that was developed by Sigmund Freud. Freud employed the Oedipus storey, which is the prototypical storyline of the psychoanalytic storey, as a model narrative. In order to support his idea of the Oedipus complex, Freud looked at Sophocles' Oedipus Rex. The Greek myth Oedipus the King served as inspiration for the idea.

Laius, the king of Thebes, made the decision to murder his son after receiving warnings that the boy would kill him and have an affair with his wife. He sent his son away and told his servant to kill his infant. However, the son is given to the unmarried Polybus, the King of Corinth. Years later, after being labelled as a liar, Oedipus consulted Apollo's oracle for guidance. He will kill his father and wed his mother, the oracle predicts. Oedipus left for Thebes, but he was instructed to stop along the way so that a carriage might pass. Oedipus was struck for his intransigence. He mistakenly thought all the guards were the guy, so he killed them. When he got to Thebes, he found the answer to the Sphinx's question. The populace greeted him. The king's vacant throne and Jocasta, the widow, were given to Oedipus. Over the course of several years, Oedipus and Jocasta had four kids together. Oedipus learned that he had killed Laius, his biological father, and had an affair with Jocasta. He fled from Thebes after forcing his eyes out of fear.

Narcissism

Havelock Ellis, a British author and physician, identified narcissism as a mental disorder in 1898. Exaggerated self-perception, a concern with the imaginary, as well as unusual tranquillity and serenity that are disturbed are characteristics of narcissism. Only when narcissistic pride and an inclination to mistreat or abuse others are threatened. Narcissism, in accordance with Sigmund Freud, is a normal aspect of childhood development but develops into a problem throughout adolescence.

The Greek myth of Narcissus served as the inspiration for the name "narcissism," which was first used around the tail end of the nineteenth century. The name of the disease is derived from Narcissus, a mythical figure who fell in love with his own reflection. The son of the river god Cephissus and the nymph Liriope, according to Greek myth, is Narcissus. He had a reputation for being beautiful. According to the third book of Ovid's *Metamorphoses*, Tiresias, a blind seer, advised the mother of Narcissus that her son would live a long life provided he never realised he was himself. He rejected the nymph Echo on the other side.

Eventually, he sank into the water and changed into a flower; the flower that bears his name came up where he died. He had fallen in love with his own reflection in the water pool.

Paranoia is the central feature of a group of psychotic disorders characterised by systematic delusions, as well as of the nonpsychotic paranoid personality disorder. Similar to how the term “insanity” is used today, the ancient Greeks used the term “paranoia” to describe this condition. At the end of the nineteenth century, it came to mean a delusional psychosis in which the delusions gradually develop into a complicated, intricate, and logically built system, without hallucinations or general personality disorder.

CONCLUSION

Ancient thought offers crucial insight into the state of humanity, and its importance shouldn't be discounted just because it doesn't match the facts of the current. Greek literary classics have only been preserved on papyrus. Before transcribing the writing, a papyrologist must first decipher various styles of handwriting, taking into account errors, misspellings, and other issues. A papyrus text must either be filled in with assumptions or left blank because it is frequently damaged, with perforations or torn-off sections.

Ancient writers give us tales and concepts about the mind's functioning, how to improve it, and how to guide it toward greatness. Even if we don't ultimately accept these stories as true, just engaging with them is therapeutic in and of itself.

In light of the results of the previous study, we have come to the conclusion that psychoanalysis is a very powerful tool for analysing Greek literary texts critically. The work acquires a sense of “legitimacy” due to its impact on Greek literary innovation. The goal of this study was to show how to analyse Greek literary writings using Freudian concepts, connecting the text with the “psyche,” maybe of the author, and giving us a thorough understanding of the writer's unconscious. The study has attempted to create a connection between psychology and Greek literature and has subsequently shown how “literature” uses “psychoanalysis” for creative goals, which, in turn, raises the legitimacy and quality of the Greek literary work as a result of the connection. It is possible to alter our cognitive processes and internal self-concepts through reading. Psychoanalytic critique can adequately describe this transformation, which ultimately enables us to consider new approaches to reading, studying, and teaching literature.

ABSTRACT

Economic growth is the key word for every economy. Mainly, economic growth has been based on consumption, remittances, investments, exports, etc. With the transition from a centralized economy to a free market economy after the 1990s, the volume of income from remittances in Albania has increased significantly. Remittances are a primary source of income for many households in developing countries and are important to study since they affect the general welfare of many people around the world. They are one of the most important variables, besides FDI, that contribute to the economic development of the country. Remittances provide resources for households in the countries of origin of migration, although they do not have the same role as FDI. This paper studies the economic importance of remittances for a developing country like Albania, where the per capita income is still low (6,802.8 dollars in 2022) compared to other European countries (World Bank, 2023). Also presented will be statistics about the evolution of remittances over the years.

Keywords: Albania, Emigrant’s remittances, Economic growth

INTRODUCTION

The International Organization for Migration (IOM) estimated that there were approximately 281 million international migrants in the world in 2020, which constituted 3.6 percent of the global population. Remittances have increased in recent decades, from \$126 billion in 2000 to \$702 billion in 2020. Also, 78% of international migrants were of working age (between 15 and 64 years of age) (World Migration Report, 2022, p. 27).

During COVID-19, migrants faced several problems. So according to the OECD (2020), because of the effects of COVID-19 and the mobility restrictions put in place, there were less stable employment conditions. The immediate lockdowns caused fewer resources, the closure of immigrant integration courses, etc. IOM (2022) reports that the first country receiving remittances is India and the first country sending remittances is the USA, respectively at 83.15 billion USD and 68.00 billion USD in 2020 (World Migration Report, 2022, p. 41).

Albania declared its independence from the Ottoman Empire in 1912. For about 50 years (from 1944 until 1991), the country had a totalitarian regime and self-isolation, which passed into a pluralistic regime. This period of isolation caused poverty, a lack of products and services, and low income from wages because the private activities of production were not allowed.

Taking into consideration the economic situation of Albania, the political instability, the high level of unemployment, the low level of wages, the low exports, and the people's educational aspirations for a better quality of life, people continue to migrate and find better living conditions, even trying illegal ways of passing the state borders.

In March 1991, more than 24,000 Albanians landed on Italy's shores in only a few days. Also, because of the socio-economic crisis and civil unrest caused by pyramid scheme failures in 1997, more than 30,000 migrants landed in Italy and 40,000 migrated to Greece (Misja, 1998).

One of the main characteristics of migration in Albania is that it has affected the working-age population and the young population, and it is more prevalent among males. Secondly, family members join the individual migrant after an initial period of living abroad. At last, remittances from Albanian migration have an influence directly on the quality of life of the family members that still live in our country and indirectly on the overall economy (IOM, 2023).

In this study, the same research by different authors related to remittances, reports, and statistics from national and international institutions were used.

The rest of the paper is organized as follows: Chapter 2 provides a review of the literature on migration and development, including the studies on remittances; chapter 3 highlights the trends in remittances in Albania; and chapter 4 presents conclusions and recommendations.

Literature Review

There is empirical evidence that remittances positively influence economic growth because they have a positive impact on consumption, savings, or investments. According to Catrinescu et al. (2006), remittances can also have a negative impact because they can increase inflation, weaken the trade sector by appreciating the real exchange rate, and reduce the labor market because households can prefer to live on migrants' transfers and not by working.

Meyer and Shera's (2017) study investigated the impact of worker remittances on the economic growth of Albania and five regional countries using annual panel data from 1999 to 2013 and multiple regression analysis. The study found that worker remittances are positively and significantly contributing to the economic growth of six countries. Also, these remittances help the economy by increasing consumption and investments.

According to Matuzeviciute and Butkus (2016), the macroeconomic influence of remittances on economic growth can be positive (increasing investment, amount of foreign currency, imports, and decreasing macroeconomic volatility) or negative (increasing currency exchange rate and price levels, decreasing labor supply, and decreasing export competitiveness). They used unbalanced panel data from a sample of 116 countries during the period 1990-2014 to study the interaction between remittances and the level of economic development. The study found evidence that remittances have promoted growth in relatively developed countries. Also, remittance-driven growth was found to be a less likely factor that promotes growth in relatively undeveloped countries. Nusrate et al.'s (2015) paper examined whether financial development catalyzes the transmission channel from workers' remittances to economic growth. The findings revealed that workers' remittances through financial development significantly accelerate economic growth.

Catrinescu et al.'s (2006) study found that estimates indicated that remittances had a weakly positive impact on long-term macroeconomic growth. The data on remittances was collected from the World Bank's World Development Indicators database during a 34-year period (1970–2003) using Dynamic Data Panel observation in 162 countries.

Prekazi (2018) studied the role of remittances received in Kosovo and their effects on the economy, especially on GDP, exports, and FDI. The conclusion was that the influence of

remittances on underdeveloped and developing countries is very high and important, as the percentage of remittances to GDP is high.

Also, there are several studies focused on remittances in Albania. Golitsis et al. (2018) investigated the relationship of foreign inflows (remittances) and FDI with GDP for the period 1996–2014 in Albania. By running a VAR, they concluded that there is a significant relationship between remittances and economic growth.

Trends of Remittances in Albania

Personal remittances consist of capital transfers in cash or in kind made or received by resident households to or from non-resident households and the net compensation of employees from persons working abroad for short periods of time (less than one year) (IMF, 2005, p. 3).

According to the Bank of Albania (2018), remittances can also come in the form of goods sent to families in the country of origin that may not be registered as imports, donations for institutions (churches, etc.), or payments (insurance premiums, education, flights tickets, etc.). So the true size of the remittance inflow based on official statistics may be underestimated, impacting the economy in general. Albanian immigrants have mainly emigrated to neighboring countries: Italy (455,468 or 40% of immigrants) and Greece (429,428 or 37%), followed by the USA with 8% (Bank of Albania, 2018). In the 1990s, emigration to Albania was a common phenomenon, undertaken in the majority of cases by men. Female emigration has increased, mostly as a result of family reunification.

Total inflows of migrants from remittances and short-term employee income transfers are valued at proximally 213.66 million euros in the first quarter of 2023, up from 241.69 million euros in the fourth quarter of 2022 (Trading Economics, 2023).

At the macro level, remittances have an influence on GDP and economic growth and also on the reduction of poverty, especially in areas with high unemployment rates where remittances represent about 13% of the annual family budget (Bank of Albania, 2018, p. 22).

During the first quarter of 2023, the employment rate for the population aged 15–64 years old was 67.1% (Instat, 2023–First 3 Quarters Report). According to Instat (2023), there are around 163,000 unemployed people in Albania. Meanwhile, the lowest unemployment rate is in the districts of Kukës with 4% and Gjirokastra with 4.7%, while the highest is in Lezha with 22.6%, Vlora with 19.5%, and Durrës with 16.1%.

Figure 1: Flows of remittances and FDI to Albania during 1991-2022

Year	Personal remittances, received (% of GDP)	FDI inflows % GDP	Personal remittances, received (current US\$)	Foreign direct investment, net inflows (current US\$)
1991	0	0	0	0
1992	23.28	3.07	151,800,000	20,000,000
1993	28.01	4.89	332,000,000	58,000,000

Figure 4: Flows of remittances and FDI to Albania as percentage of GDP during 2013-2022

Source: World Bank

Remittances have had a positive effect on the economy of Albania, taking into consideration that it is one of the poorest countries in the region. The destination of remittances has been consumption, buying new houses for their relatives, bank investments, or the opening of new small businesses. According to the data obtained from the World Bank (2023), the importance of remittances as a percentage of GDP has fallen consistently in the past five years. The latest

data for 2022 shows that remittances accounted for only 9.24% of GDP, which is the lowest value of all the periods, or were more than 1.61% higher than FDI (World Bank, 2023). The data presented above shows that remittances have higher values and are more stable than FDI, showing the importance of these money inflows in the Albanian economy. This is evident in the first post-transition years, where the highest values of the percentage of remittances to GDP were approximately 23% in 1992 and 28% in 1993. FDI has had low values during the period 1992–2007, with a low contribution to the economy of 1.28% in 1999 and 1.77% in 1998. These figures are explained by the presence of the Civil War (1997), also named the Pyramid Crisis, which happened because of the bankruptcy of the pyramid system. The opposition wanted to take advantage of the difficult situation and channel the protests into political ones, demanding the resignation of the government.

Also, remittances have a positive effect on the development of tourism. Especially in the summer, many emigrants return to their country and go on vacation. In addition to the remittances or contributions, they bring goods for relatives living in Albania, increase consumption, make investments, etc.

Remittances also have a positive effect on the banking sector because immigrants may decide to increase bank deposits or make financial investments in Albania. A significant increase in bank savings happened after the Greek financial crisis. During this period in Greece, there was a lack of liquidity, a limitation on bank withdrawals, and emigrants increased the flow of money in the country.

During the Greek crisis, remittances from this country have increased since 2009. Albanians have increased their withdrawal of money in the form of savings from Greek banks. These developments have directly affected the Albanian economy (ACIT, 2012). According to statistics from Eurostat in 2010, remittances sent from Greece to Albania increased to 514 million euros, a drastic increase compared to 2008 and 2009, when they were 390 million euros and 314 euros, respectively (Eurostat, 2010).

CONCLUSIONS and RECOMMENDATIONS

The importance of remittances for developing countries is vital, taking into consideration that they represent a high percentage of GDP. From statistics, it can be concluded that they exceed FDI and are one of the main sources of income for Albanian families. The percentage of remittances in relation to GDP is almost every year over 9 percent during the period 1992–2022, while FDI ranges from 1.28% as the minimum value to 11.17% as the maximum value.

It is impossible or hard to estimate the exact amount of remittance flows because most of them come through unofficial channels or in different forms (cash, goods, services, expenses while visiting their home country, etc.). There are formal (banking systems and transfer operators), which are the most used, and informal (friends or relatives) delivery channels.

Macroeconomic factors such as unemployment and poverty, a low GDP growth rate, and political instability have been the main factors driving migration from Albania to other developed countries during the last 30 years. In 2022, the official unemployment rate was 11.81%, whereas youth unemployment (for 15–24-year olds) stood at 27.79% (Macro Trends, 2023). The high unemployment rate can be explained by working in the informal sector (agriculture, with 63.9% of the total) (International Labor Organization, 2020), retail sales, construction, accommodation, etc., online work, family businesses, without being registered as an employee, mostly in rural areas. According to the International Labor Organization (2020), the informal sector in 2019 accounted for 56.7% of the total and formal employment only for 47.3% of the total.

The main destination countries for Albanian emigrants have remained Italy with 39.4% and Greece with 35.3% of total emigrants in 2019 (European Training Foundation, 2021, p. 13), and Albanian migrants consist of young age groups; 46.2% of the total number are between the ages of 20 and 44 (European Training Foundation, 2021, p. 16).

In the last decade, there has been a migration of professionals, especially doctors, from Albania to OECD countries. The first country that has attracted the most doctors since 2011 is Germany. According to OECD statistics, the number of Albanian doctors in Germany in 2021 was 897, while in 2000 there were only 12 (OECD, 2023).

During the first decade of migration, remittances consisted of inflows for basic expenditures. In recent years, remittances have been used for the opening of small businesses and entrepreneurial activities, which have also been supported by the banking sector by lending money to new enterprises. In order to increase the impact of remittances on the economic environment, it is necessary to implement policies that support investments in businesses by migrants.

The government must provide public services, especially in education, transport, healthcare, etc., as well as a secure environment (low level of crime) and a low level of bureaucracy. All these can serve as incentives to increase remittances, not only for consumption but also for small investments from relatives who live in our country. Remittances in this way can raise the well-being of its citizens.

Bank policies must favor savings by using several incentives (higher interest rates, faster procedures, etc.) and financial investments (providing consultations on Treasury Bonds or Obligations) or supporting financing in real estate investment.

ÖZET

Araştırmanın amacı sosyo-demografik faktörlerle çalışmaya tutkunluk arasındaki ilişkiyi muhasebeci olarak gruplandırılan katılımcılar ve diğer meslek sahipleri bağlamında analiz etmektir. İşte çalışma esnasında bireyin kendini iyi hissetmesi ve bunun süreklilik arz etmesi çalışmaya tutkunluğun tanımıdır. Dinçlik, adanmışlık ve yoğunlaşma bu ruh halinin alt boyutlarıdır. Çalışırken enerjiklik, zihinsel dayanıklılık, çaba harcama isteği, kolayca yorulmama yeteneği dinçlik boyutunun unsurlarıdır. Dinçlik, bireyin motivasyonu ve sebat göstermesi ile ilgilidir. Çalışmaya yönelik güçlü bağlılığı adanmışlık temsil eder. Önemlilik hissi, heves, esin, övünç, çaba olguları adanmışlığın unsurlarıdır. İşe tamamen odaklanma, mutlu şekilde çalışmaya dalma, zamanın nasıl geçtiğini fark edememe yoğunlaşmadır. Özerklik, performans geri-bildirimi, ödüller ve kurum içindeki sosyal destek çalışmaya tutkunluğu artıran faktörlerdendir. Çalışmaya Tutkunluk Ölçeği (Turgut, 2011) demografik-faktörlere ilişkin sorular eklenerek 91 katılımcıyla gerçekleştirilmiştir. 650 Borsa-İstanbul şirketinin e-posta adresleri, kişisel bağlantılar ve sosyal medya hesapları anketin dağıtımında kullanılmıştır. Finansçı/Bankacı, Mali-Müşavir-Muhasebeci, İşletmeci/Yönetici olan 41 katılımcı, diğer meslek mensupları ile karşılaştırılmıştır. Katılımcılarının %43,90'ı kadın, %53,66'ı evli-çocukludur. Yaklaşık ⅔'ü yetişme çağını şehirde geçirmiştir. Katılımcıların %4,88'i tek-çocuk, %21,95'i beş-kardeş, baskın grup iki-kardeş grubudur—%43,90. Katılımcıların %39,02'si ilk, %7,32'si beşinci/sonraki çocuktur. Katılımcıların %60,98'i lisans mezunudur. İş hayatı bir yıldan kısa olanların oranı %2,44, 25 yıl ve üzeri olanların %34,15'tir. Çalıştığı işteki kıdemi 1-4 yıl arası olanların oranı %29,27; 20-24 yıl arası olanların %21,95'tir. Orta-gelir grubundakilerin oranı %73,17; iki kişinin gelir getirdiği hane oranı %51,22'dir. İsteddiği alanda çalışanlar %73,17; işinde yönetici olanlar %75,61'dir. Katılımcıların %43,90'ı fazla mesai yapmazken, %21,95'i haftada 11 saatin üzerinde fazla mesai yapmaktadır. Kullanılan ölçeğin Cronbach-Alpha değeri 0,910'tir. Yönetici olup/olmama, Yoğunlaşma ve Adanmışlık Alt Boyutlarında; İstenilen Mesleği Yapıyor Olma, Adanmışlık ve Dinçlik Alt Boyutlarında anlamlı fark yaratmaktadır. Medeni Durum, Yoğunlaşma Alt Boyutunda; Eğitim Seviyesi, Adanmışlık Alt Boyutunda; Tecrübe ve Kıdem, Yoğunlaşma ve Dinçlik Alt Boyutlarında anlamlı fark yaratmaktadır.

Anahtar Kelimeler: Sosyo-Demografik Faktörler, Çalışmaya Tutkunluk, İşletmeci, Muhasebeci, Türkiye

THE RELATIONSHIP BETWEEN SOCIO-DEMOGRAPHIC FACTORS AND WORK ENGAGEMENT: A FIELD RESEARCH

ABSTRACT

The aim of the research is to analyze the relationship between socio-demographic factors and work engagement in the context of participants grouped as accountants and other professionals. At work, the individual's feeling of well-being and its continuity is the definition of work engagement. Vigor, dedication, and concentration are the sub-dimensions of this mood. Energy while working, mental endurance, willingness to exert an effort, and the ability not to tire easily are the elements of the vigor dimension. Vigor is about an individual's motivation and perseverance. The strong commitment to work is represented by dedication. Significance, enthusiasm, inspiration, pride, effort are the elements of dedication. Focusing completely on work, happily immersed in work, not noticing how time passes is concentration. Autonomy, performance feedback, rewards and social support within the organization are factors that increase work engagement. The Utrecht Work Engagement Scale (Turgut, 2011) was carried out with 91 participants by adding questions about demographic-factors to the study. The e-mail addresses of 650 Borsa Istanbul companies, personal links and social media accounts were used in the distribution of the survey. 41 participants, who are Financier/Banker, Financial Advisor-Accountant, Operator/Manager, were compared with other professionals. 43.90% of the participants are women, 53.66% are married with children. About $\frac{2}{3}$ of them spent their upbringing in the city. 4.88% of the respondents were one-child, 21.95% were five-siblings, and the dominant group was the two-sibling group—43.90%. 39.02% of the participants are the first child, and 7.32% are the fifth/next child. 60.98% of the participants are undergraduates. The rate of those, who have a business life less than one year, is 2.44%, and 34.15% of those who have 25 years or more. The ratio of those with 1-4 years of seniority in their job is 29.27%; it is 21.95% of those between 20-24 years. The proportion of those in the middle-income group was 73.17%; the ratio of households, where two people bring income, is 51.22%. Those working in the field they want are 73.17%; those who are managers in their job are 75.61%. While 43.90% of the participants do not work overtime, 21.95% of them work over 11 hours a week. The Cronbach-Alpha value of the scale used is 0.910. Being a manager makes a significant difference in the sub-dimensions Concentration and Dedication; Doing the Desired Profession makes a significant difference in the sub-dimensions Dedication and Vigor. Marital Status makes a significant difference on Concentration sub-dimension; Education Level makes a significant difference on Dedication sub-dimension; Experience and Seniority make significant differences on Concentration and Vigor sub-dimensions.

Keywords: Socio-Demographic Factors, Work Engagement, Managers, Accountants, Turkey

GİRİŞ

Belirli bir zaman içinde belirli bir amaca yönelik güç ortaya konularak gerçekleştirilen çalışma, iş niteliğine dönüşmektedir. İş ise bireyin hayatını sürdürebilmesi amacıyla gerçekleştirdiği zihinsel ve bedensel faaliyetler olarak tanımlanabilir (Silah, 2005: 31). Çalışmaya tutkunluk-*Work engagement* kavramı da birey odaklı bir kavramdır. Kavram, çalışma süresi içinde çalışanın kendini iyi durumda hissettiği ruhsal bir durum olarak açıklanmaktadır (Çankır & Yener, 2017: 61). Bireyde çalışmaya tutkunluğun yüksek olması çalışma ortamında enerjik, hevesli ve dayanıklı çalışan olduğu anlamına gelmektedir. Dolayısıyla bu çalışan tipi günümüz çalışma hayatının yoğun çalışma koşulları ortamında tercih edilen çalışan olarak görülmektedir. Çalışmaya tutkunluğun hangi faktörlere göre artış gösterdiği belirlenebildiği takdirde, bu faktörlerin iş performansına etkisinin de yüksek olacağı düşünülmektedir (Topaloğlu vd., 2019: 60). Bu çalışmada sosyo-demografik faktörlerin çalışmaya tutkunluk ile ilişkisi analiz edilmektedir.

Çalışmaya Tutkunluk

Cerit Soydan'ın deyişiyle *Work engagement* kavramının nasıl ifade edileceği konusunda fikir birliğine varılamamıştır (2018: 2290). Türkiye'de yapılan çalışmalarda kullanılan farklı tanımlar ve tanımların kullanıldığı çalışmalar aşağıdaki tabloda gösterilmektedir.

Tablo 1: Tanımlar ve Tanımları Kullanan Örnek Çalışmalar

Tanımlar	Tanımları Kullanan Örnek Çalışmalar
İşe Tutkunluk	Çağlar 2011; Turgut 2011
Çalışmaya Tutkunluk	Batuk 2011; Çankır 2016; Turgut 2010
İşe Cezbolma	Esen 2011; Kartal 2017; Özer, Saygılı & Uğurluoğlu 2015; Doğan 2002

İşe Kapılma	Öner 2008

Kaynak: Cerit Soydan & Bahçecik, 2018: 2290 ve Başoba, 2017: 73'ten uyarlanmıştır.

Türkçe yazında, bu kavramların “işe tutkunluk” kavramıyla eş anlamlı olarak kullanıldığı görülmektedir. Bu çalışmada Turgut (2011) tarafından geçerlilik ve güvenirliği yapılan Çalışmaya Tutkunluk Ölçeği kullanıldığından, “work engagement” kavramı “çalışmaya tutkunluk” olarak ifade edilmektedir. Literatürde “work engagement” kavramının ilk kez William A. Kahn tarafından kullanıldığı görülmektedir. Yazar çalışmalarında, bu kavramın oluşmasında bireyin kişisel özellikleri ile iş yerinde üstlendiği roller arasındaki uyumun önemli etkisi olduğuna vurgu yapmaktadır. Böyle bir uyumlulukla, bireylerin çalışma esnasında ruhsal anlamdaki tatminleri artmaktadır. Kahn’ın tanımına göre çalışmaya tutkunluk; çalışanların işte duygusal, bilişsel ve fiziksel anlamda tatmin olarak, iş yükümlülüklerini yerine getirmeye çalışmasıdır (Kahn, 1990’dan akt.: Kaplanseren, Örucü, 2018: 1). Çalışmaya tutkunluk göstermeyen çalışanlarsa, işle ilgili rollerin yerine getirilmesinde isteksiz ve otomatik davranışlar göstermektedirler (Keser, Yılmaz, 2015: 117).

Çalışmaya tutkunluk, “pozitif, tatmin edici, çalışmayla ilgili ruh hali” olarak tanımlanmaktadır (Schaufeli, et al., 2002: 74’ten akt.: Turgut, 2011: 156). Schaufeli ve arkadaşlarına göre çalışmaya tutkunluk üç boyuttan oluşmaktadır. Bunlar; dinçlik, adanmışlık ve bütün ilginin işe verilmesi—yoğunlaşma boyutlarıdır (Simpson, 2009: 47’den akt.: Keser, Yılmaz, 2015: 118). *Dinçlik boyutu* bireyin çalışma halindeyken yüksek enerji düzeyine sahip olmasını, zihinsel dayanıklılık göstermesini, çaba sarf etme isteğini ve kolay yorulmama yeteneğini içermektedir. Birey çalışırken büyük bir dinçlik hissetmekte ve yaptığı işle motive olmaktadır. Bunun yanında bir takım zorluklarla karşılaşsa dahi birey işini yapmaya devam etmektedir. *Adanmışlık boyutu* çalışmaya yönelik olarak kuvvetli bir bağlılığı ifade etmektedir. Adanmışlık boyutunun kapsadığı olgular; önemlilik hissi, şevk, ilham, övünç ve mücadele olgularıdır. Çalışmaya adanmış olan bireyler işlerinin mücadeleyi gerekli kıldığını ve işlerinin ilgi çekici olduğunu düşünürler. İşleri aynı zamanda bir amaca hizmet etmektedir; işleri onlara göre anlam yüklüdür ve yaptıkları işten ilham almaktadırlar. Dolayısıyla bu kişiler işlerini hevesle yapmaktadır. İşine adanmış bir birey işleriyle de gurur duymaktadır. *Yoğunlaşma boyutu*; bireyin yaptığı işe tamamen odaklanarak mutlu bir şekilde çalışmaya dalması şeklinde tanımlanmaktadır. İşinde yoğunlaşan birey, çalışırken yaptığı işe kendisini kaptırmakta; çalışırken zamanın nasıl geçtiğini anlamadığı için çalışmaya ara vermekte zorlanmaktadır (Turgut, 2011: 156).

Çalışmaya Tutkunluk ile İlişkili Faktörler

Özerklik, performans ile ilgili geribildirimler, ödüller ve kurum içindeki sosyal destek literatürde çalışmaya tutkunluğu arttırdığı gözlenen ortamsal faktörler olarak ortaya konulmuş olup Tablo 2’de özetlenmiştir.

Tablo 2: Çalışmaya Tutkunluğu Arttırdığı Gözlenen Ortamsal Faktörler

Özerklik	Llorens, Bakker, Schaufeli & Salanova, 2006; Mauno, Kinnunen & Ruokolainen, 2007
Performansla ilgili geri ileti	Llorens vd., 2006; Schaufeli & Bakker, 2004
Ödüller	Koyuncu vd., 2006; Saks, 2006
Kurum içindeki sosyal destek	Hakanen, Bakker & Schaufeli, 2006; Schaufeli & Bakker, 2004

Kaynak: Turgut, 2011: 156-157’den tablo haline getirilmiştir.

Turgut tarafından yapılan çalışmada da çalışmaya tutkunluk üzerinde olumlu ve olumsuz etkileri olabileceği tahmin edilen değişkenlerin ele alındığı görülmektedir. Değişkenler arası ilişkiler işle ilgili yeni bir stres modeli olan “İş Gereklilikleri/Kaynakları (İGK) Modeli” (Job Demands and Resources (JDR) Model, Demerouti, Bakker, Nachreiner & Schaufeli, 2001) temelinde kurgulanmıştır. Modelde iş gereklilikleri kapsamında iş yükü, iş aile çatışması ele alınırken; iş kaynakları kapsamında esnek çalışma saatleri ve yönetici desteği üzerinde durulmuştur. Araştırmada Schaufeli ve diğerleri (2002) tarafından geliştirilen Utrecht Work Engagement Scale (UWES) ölçeği kullanılmıştır. İstanbul’da hizmet sektöründe faaliyet gösteren 279 kişi üzerinde yapılan araştırma sonucuna göre (Turgut, 2011: 156–157).

Çalışmaya Tutkunluk ve Sosyo-Demografik Faktörler İlişkisi ile İlgili Çalışmalar

Literatürde çalışmaya tutkunluk ile sosyo-demografik faktörler arasındaki ilişki ile ilgili yapılan çalışmalar bulunmaktadır. Şahin’in (2019) 260 kişi üzerinde gerçekleştirilen araştırmasında örneklem olarak Sakarya İl Ambulans Servisinde çalışanlar alınmıştır. Araştırmada Türkçe uyarlaması, geçerlik ve güvenilirlik analizi Turgut tarafından yapılan Schaufeli ve arkadaşlarının (2002) geliştirdiği “Çalışmaya Tutkunluk Ölçeği” (The 28 Utrecht Work Engagement Scale-UWES) kullanılmıştır. Araştırmada elde edilen sonuçlardan birine göre Çalışmaya Tutkunluk Ölçeğinde cinsiyete göre yalnız dinçlik boyutunda anlamlı fark bulunmaktadır (Şahin, 2019: 27, 47).

Özer Topaloğlu ve diğerleri (2019) tarafından yapılan araştırma Konya ili merkez ilçelerdeki özel, kamu ve katılım bankalarında çalışan 100 bankacı üzerine gerçekleştirilmiştir. Araştırmada işe tutkunluğu ölçmek için Turgut (2011) tarafından uyarlanan ve 17 ifadeden

meydana gelen ölçek kullanılmıştır. Araştırma sonucuna göre çalışmaya tutkunluğun dinçlik ve yoğunlaşma boyutlarında anlamlı fark elde edilmiştir. Araştırmada erkeklerin yoğunlaşma ve dinçlik puanları kadınlara göre daha yüksek çıkmıştır. Elde edilen bir başka bulguya göre eğitim ve medeni durum düzeyinde çalışmaya tutkunluk boyutunda anlamlı bir farklılık bulunmamaktadır. Diğer taraftan çalışmaya tutkunluğun adanmışlık alt boyutunda yaşa göre anlamlı bir farklılık elde edilmiştir; 26–30 yaş arasında olanlar diğer yaş gruplarına göre daha az adanmışlık puan ortalamasına sahiptir (Özer Topaloğlu vd. 2019: 63, 66–67, 68, 69, 71).

Cerit Soydan ve Bahçecik (2018) tarafından gerçekleştirilen çalışma İstanbul ilinde 10 kamu hastanesinde istihdam edilen 743 hemşire üzerinde yapılmıştır. Araştırma sonuçlarına göre birçok düzeyde çalışmaya tutkunluk puanlarının yüksek olduğu sonucu elde edilmiştir. Devlet hastanesinde çalışanlar, erkekler, 42 ve üstü yaş grubundakiler, yönetici hemşireler, 11–18 yıl mesleki deneyime sahip olanlar, çalıştığı bölümü isteyerek seçenler, gündüz çalışanlar, bilimsel etkinliklere katılan hemşireler, mesleğinden memnun olanlar, serbest zamanlarda farklı ilgi alanı olanlar yüksek çalışmaya tutkunluk puanlarına sahiptir. Ayrıca hemşirelerin yaşları, mesleki deneyim ve bölümde çalışma süreleri arasında pozitif yönde anlamlı ilişki elde edilmiştir (Cerit Soydan & Bahçecik, 2018: 2289–2290). Şanlı ve diğerleri tarafından gerçekleştirilen 2017 tarihli çalışma Malatya İlinde 2014–2015 öğretim yılında görev yapmakta olan, farklı okul ve branştan tesadüfi örneklem ile seçilen 985 öğretmenin görüşlerinden faydalanılmıştır. Araştırmada Schaufeli et al. (2002) tarafından geliştirilen, Turgut (2011) tarafından Türkçeye uyarlanan çalışmaya tutkunluk ölçeği kullanılmıştır. Araştırmada çalışmaya tutkunluk boyutlarından “yoğunlaşma” puanlarının cinsiyet bakımından anlamlı bir şekilde farklılaştığı bulgusu elde edilmiştir. Buna göre kadın öğretmenlerin yoğunlaşma puanları, erkek öğretmenlerin yoğunlaşma puanlarından daha yüksektir. Diğer bir bulguya göre, çalışmaya tutkunluk boyutlarında mesleki kıdem değişkenindeki gruplar arasında anlamlı ilişki bulunmaktadır (Şanlı et al., 2017: 470). Turgut (2011) tarafından gerçekleştirilen araştırmada, Schaufeli et al. (2002) tarafından geliştirilen Utrecht Work Engagement Scale (UWES) kullanılmıştır. İstanbul’da hizmet sektöründe faaliyet gösteren 279 kişi üzerinde yapılan araştırma sonucuna göre çalışmaya tutkunluğun her üç boyutunda erkeklerin puanlarının kadınların puanlarına göre daha yüksek olduğu sonucuna varılmıştır. Araştırmada elde edilen bir diğer sonuç; kadınların ve erkeklerin çalışmaya aynı seviyede adanmış ve yoğunlaşmış olmalarıdır. Ancak erkeklerin kadınlara göre kendilerini çalışırken biraz daha dinç hissettikleri bulgusu elde edilmiştir. Demografik değişkenler—yaş, evlilik süresi, ilkokul çağındaki çocuk sayısı, çalışma süresi— ile

çalışmaya tutkunluk boyutları arasında dikkate değer bir ilişki elde edilmemiştir (Turgut, 2011: 156–157, 166).

ARAŞTIRMA YÖNTEM ve TEKNİKLERİ

Araştırma Amacı, Çalışmaya Tutkunluk Ölçeği alt boyutlarında, mesleğini Finansçı/Bankacı, Mali-Müşavir-Muhasebeci, İşletmeci/Yönetici olarak tanımlayan—kısaca muhasebeciler—tanımlayanların diğer meslek çalışanlarından farkı olup/olmadığını ortaya koymaktır. Belirli bazı araştırma konularında evrenin belirlenmesi veya araştırma sonuçlarının geniş bir evrene genellenmesi söz konusu değildir. Özellikle bir grubun veya özel bir olgunun araştırıldığı durumlarda evren, çoğu kez ulaşılan en küçük birim olabilmekte ve evrenin büyüklüğünün belirlenmesi her durumda mümkün olamamaktadır (Charmaz, 2011; Neuman & Robson, 2014'ten; akt. Baltacı, 2018: 245). Böylesi evrenler için örneklem çerçevesi oluşturmak da mümkün olmadığından, bu evrenlerden olasılığa dayalı ya da temsili bir örneklem seçilmesi de söz konusu olamaz (Marshall & Rossman, 2014'ten; akt. Baltacı, 2018: 245). Bu çalışmada da evren değil, örneklem ön plana çıkmaktadır. Çalışmada Nitel *Araştırma Yöntemi* kullanılmıştır. Çalışmada, Türkçe uyarlaması ve faktör geçerliliği Turgut (2011) tarafından yapılan, Schaufeli et al. (2002) tarafından geliştirilen Çalışmaya Tutkunluk Ölçeği (UWES) kullanılmıştır. Sosyo-Demografik-faktörlere ilişkin soruların ölçeğe eklenmesi sonrasında araştırma Google formlar üzerinden anket olarak Haziran-Ağustos 2023 tarihleri arasında gerçekleştirilmiştir. Kamu Aydınlatma Platformu (KAP) üzerinden 650 Borsa-İstanbul şirketine ait iletişim bilgilerinden örneklem oluşumuna uygun olan görev ve konumlarda bulunan yönetici ve yetkililerin e-posta adresleri belirlenmiş, yaklaşık 1800 adres toplanmıştır. Ayrıca, araştırmacıların kişisel bağlantıları ve sosyal medya hesapları da anketin dağıtımında kullanılmıştır. Mesleğini Finansçı/Bankacı, Mali-Müşavir-Muhasebeci, İşletmeci/Yönetici olarak tanımlayan 41 kişi ve diğer mesleklerden 50 kişi olmak üzere; toplamda 91 katılımcı anketi yanıtlamıştır. Tüm sorular zorunlu tutulduğundan eksik veri bulunmamaktadır. Kısaca muhasebeci olarak tanımlanan grup diğer meslek mensupları ile karşılaştırılmıştır.

Tablo 3: Çalışmada Kullanılan Sosyo-Demografik Faktörler

Çalışmaya Tutkunluk Ölçeği

Araştırma Hipotezleri çerçevesinde Sosyo-demografik faktörlerin her biri Çalışmaya Tutkunluk Ölçeğinin alt boyutları ile tek tek sınanmış ve eldeki örneklem açısından farklılık bulunup bulunmadığı belirlenmiştir.

BULGULAR

Güvenirlilik Analizi

Kullanılan ölçeğin Cronbach's Alpha değeri; 0,91 çıkmıştır. Genellikle literatürde belirtilen güvenirlik kriteri olan 0,70 değerini aştığı için, uygulanan anketin başarılı, kendi içinde tutarlı olduğu ve elde edilecek bulguların gerçekleri yansıtacağı sonucuna varılmış ve analizler gerçekleştirilmiştir.

Tablo 4: Güvenirlilik Analizi

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
,910	,916	17

Demografik faktörlerden yönetici olup olmama, meslek, istenen mesleği yapıyor olup olmama faktörler için Mann-Whitney analizi uygulanmıştır. Diğer faktörler için Kruskal-Wallis analizi uygulanmıştır. Araştırmaya katılan muhasebecilerden oluşan grubun ve bunların da dahil olduğu tüm katılımcıların çalışmaya tutkunluk ölçeğinin alt boyutlarına yönelik düzeyleri, puan ortalamaları (\bar{x}) ve aldıkları en düşük ve en yüksek puan ortalamaları tablolaştırılmıştır.

Tablo 5: En Düşük ve En Yüksek Puan Ortalamaları

Boyutlar	N	Min.	Max.	Mean
Dinçlik_Alt_Boyut	41	2,33	6	4,39
	91	2,50	6	4,28
Adanmışlık_Alt_Boyut	41	1,60	6	4,59
	91	1,60	6	4,70
Yoğunlaşma_Alt_Boyut	41	2,33	6	4,28
	91	2,17	6	4,08

Elde edilen bulgulara göre tüm katılımcıların Dinçlik puan ortalaması $\bar{x} = 4,28$; muhasebeci olarak gruplandırılan katılımcıların ortalaması $\bar{x} = 4,39$ 'dur. Bu ortalama Dinçlik Alt Boyutuna yönelik düzeylerinin yüksek olduğunu göstermektedir. Diğer taraftan tüm katılımcıların Adanmışlık Alt Boyutuna yönelik puan ortalaması $\bar{x} = 4,70$; muhasebeci olarak gruplandırılan katılımcıların ortalaması $\bar{x} = 4,59$ 'dur. Bu ortalama Adanmışlık alt boyutuna yönelik düzeylerinin yüksek olduğunu belirtmektedir. Son olarak Yoğunlaşma Alt Boyutunda genel ortalama $\bar{x} = 4,08$; muhasebeci olarak gruplandırılan katılımcılarınki $\bar{x} = 4,28$ 'dir. Yoğunlaşma alt boyutuna yönelik düzeylerin de diğer iki alt boyuta benzer şekilde yüksek olduğu anlaşılmaktadır. Dinçlik ve Yoğunlaşma Alt Boyutlarında muhasebeci olarak gruplandırılan katılımcıların puan ortalamalarının daha yüksek olduğu görülmektedir.

Mann-Whitney Test

Meslek faktörü için Mann-Whitney testi uygulanmıştır. Sonuçlar 6 ve 7 numaralı tablolarda gösterilmiştir.

Tablo 6: Meslek Faktörüne Göre Yoğunlaşma, Adanmışlık, Dinçlik Alt Boyutlarında Mann-Whitney U Testi Sonuçları

Not: MW U Mann-Whitney U Testi, KW Kruskal-Wallis Testi

Yapılan Mann-Whitney U testlerine göre hem örneklemin bütünü, hem de muhasebeci olarak gruplandırılan katılımcıların istenen alanda çalışmaları durumunda, Dinçlik ve Adanmışlık Alt Boyutlarında istediği alanda çalışmadığını beyan edenlere göre farklılaştığı görülmektedir. Kruskal-Wallis testlerinde ise muhasebeci olarak gruplandırılan katılımcıların Çalışmaya Tutkunluk Ölçeğinin Adanmışlık, Dinçlik ve Yoğunlaşma Alt Boyutlarında diğer meslekleri icra eden katılımcılarda farklılaşmadığı belirlenmiştir.

Örneklemin bütünü medeni durum açısından incelendiğinde; bekâr ve çocuklu olan katılımcıların, bekâr ve çocuksuz olanlara göre Yoğunlaşma Alt Boyutunda 0,017 düzeyinde farklılaştığı görülmektedir. Bu farklılığın nedeni muhtemelen çocuk sahibi olmanın bireyin hayata bakış açısını etkilemesi ve çalışma hayatına da yansımalarıdır.

Eğitim durumu incelendiğinde Adanmışlık Alt Boyutunda 0,05 düzeyinde, sınırda kalan bir farklılaşma görülmeyle beraber, Post hoc analizlerinde gruplar arasında herhangi bir farklılık belirlenmemiştir. Örneklemin bütünü tecrübe ve işyerindeki kıdem çerçevesinde incelendiğinde her ikisi de Yoğunlaşma Alt Boyutunda sırasıyla 0,006 ve 0,003 düzeyinde farklılaşmıştır. İlave Post hoc testleri 25 yıl ve üzerinde tecrübeli olanların, tecrübesi beş yılın altında olanlardan Yoğunlaşma Alt Boyutunda 0,024 ve Dinçlik Alt Boyutunda 0,010 düzeyinde; 15–19 yıl arası tecrübesi olanlardan Dinçlik Alt Boyutunda 0,008 düzeyinde farklılaştığını ortaya koymuştur. İşyerindeki kıdemi 25 yıl ve üzerinde olanlar Yoğunlaşma

Alt Boyutunda kıdemi bir yıldan az olanlardan 0,010; 1–4 yıl olanlardan 0,029; 5–9 yıl olanlardan 0,006 ve 15–19 yıl olanlardan 0,008 düzeyinde farklılaşmaktadır.

Yöneticilik rolü olan bireyler işlerinde daha çok yoğunlaşmakta ve daha dinç hissetmektedir. Buradan yöneticilik rolü olanların işlerine yaklaşımlarına farklılık olduğu çıkarımında bulunulabilir.

Belirlenen Sosyo-demografik faktörlerin Çalışmaya Tutkunluk Ölçeği ile birlikte kullanılması sonucunda gerçekleştirilen bu çalışma, sonraki aşamalarda aynı örneklemden toplanan farklı ve ilişkili olduğu düşünülen ölçeklerle değerlendirilecek ve çıkarımlarda bulunulacaktır.

ABSTRACT

Plants may exposure stress under conditions that affect their normal growth and development. The stress factors could be from biotic (microorganisms, animals, humans) or abiotic resources like drought, high/low temperature or, air pollution. This paper aims to research the effects of air pollution because of a private cement factory dusts on olive trees in Silifke, Mersin province. For this purpose, six olive gardens were selected at different distances to the factory. Pigment (chlorophyll a, chlorophyll b and total chlorophyll), proline, lipid peroxidation (malondialdehyde content), antioxidative enzyme (SOD), soluble sugar (glucose and fructose) and heavy metal analysis (Cd, Cr, Pb ve Ni) were done. The data was evaluated with SPSS 20 program. Pigment analysis results showed that there is no significant effect on olive trees of factory dusts. Also, SOD enzyme activity, malondialdehyde and fructose contents of the leaves were not found significant. Factory dusts decreased glucose contents of the 1. and 4., and increased proline content except 2. garden leaves. The dust had no important effect on the heavy metal contents of olive leaves. According to these results, cement factory-sourced dust pollution's effects were found hardly any on olive trees.

Keywords: Olive, Dust, Pigment, Proline, Heavy metal

INTRODUCTION

Olive (*Olea europaea* L.) is grown on 8 million hectares area and second most significant oil fruit tree after palm in the world. Its cultivation mainly takes part in Mediterranean region and Spain is the leader in the global olive oil bazaar with %38,7 of the world's production. Also, Italy, Greece, Turkey, Tunisia, Syria, Jordan, Morocco and Algeria are the main countries that grow olive (Baldoni et al.,2009). This species is important because of restricting soil erosion and protecting green landscapes from the negative effects of insufficient rainfall and rising temperatures (Zourai et al.,2016).

Plants are usually exposed to stress under conditions that affect their normal growth and development. Air pollution is a common stress factor that is caused by generally anthropogenic activities, especially by cement factories. This industry is the main reason for dust, carbon dioxide CO₂, nitrogen oxides (NO_x) and sulphur dioxide (SO₂) accumulation (Belmokhtar et al.,2019). Accumulation of these pollutants leads to decreasing photosynthesis activity, growth and stomata movements (Nanos and Ilias, 2007). Baldantoni et al (2014) declared that the cement factory dusts caused accumulation of lead, zinc and vanadium on the olive leaves around the factory. Elkhatab et al (2021) stated that olive leaves around the cement had thicker cuticula, more dust and morphologic defects like chlorosis and necrosis.

Determining the pigment, proline, soluble carbohydrate contents, lipid peroxidation and enzyme activity (SOD) are some stress parameters. In the present study, we aimed to understand the effects of the cement factory dusts on the olive trees' with these physiologic parameters in Silifke, Mersin province.

MATERIAL and METHOD

Olive (*Olea europaea*) leaf samples were obtained from gardens that had different distances to a private cement factory (Figure 1). According to this, 1. (550 m) and 4. (1375 m) gardens are the nearest gardens to the factory while 6. garden (3000 m) was the farthest garden and its samples were used as control.

Figure 1 The localities of the sampled gardens around the factory

In each garden, five trees that represent the mean were selected and leaf samples were taken from all directions of the trees. The leaf samples were brought to the laboratory in a movable icebox quickly. The samples were blended and kept in deep freeze for analysis. One part of the leaves was put in an oven at 65°C for heavy metal analysis. The laboratory analyses were done in Cukurova University Biology Department Plant Physiology Laboratory, and the heavy metal analysis was conducted at Cukurova University Central Research Laboratory. Pigment analysis was done according to Arnon (1949). For this purpose, 200 mg fresh leaf tissue was homogenized with 15 ml %80 acetone and filtered. The samples' values were measured spectrophotometrically at 470, 646 ve 663 nm and the pigment content was calculated with the formula below (Lichtenthaler and Wellburn, 1983).

$$\text{Chlorophyll a} = 12.21 * A_{663} - 2.81 * A_{646}$$

$$\text{Chlorophyll b} = 20.13 * A_{646} - 5.03 * A_{663}$$

$$\text{Karotenoid} = (1000 * A_{470} - 3.27 * \text{Chlorophyll a} - 81.4 * \text{Chlorophyll b}) / 229$$

Lipid peroxidation analysis was done with Hodges et al.(1999)' modified protocol. 1 g fresh leaf tissue was homogenized with %80 ethyl alcohol, centrifuged and conducted in two steps. The first step had % 0.01 BHT and % 20 TCA as reaction mixture and the second step had also ml %0,65 TBA in addition to these. After boiling bath and ice bath first stage samples were read at 532 and 600 nm; second stage samples at 440, 532 ve 600 nm

spectrophotometrically. The lipid peroxidation calculated with the formulas below as malondialdehyde (MDA) content.

$$1. [(ABS_{532}+TBA)-(ABS_{600}+TBA)-(ABS_{532}-TBA)-(ABS_{600}-TBA)]=A$$

$$2. [(ABS_{440}+TBA-ABS_{600}+TBA)*0.0571]=B$$

$$3. \text{nmol MDA / ml} = (A-B/157\ 000) * 10^6$$

Enzyme (superoxide dismutase, SOD) analysis was done according to Çakmak and Marshner (1992). 1 g fresh leaf tissue was extracted with 10 ml pH 7.6 K-P tampon that contains 0.1mM Titriplex (NaEDTA). After centrifugation, the supernatant was used for analysis. The reaction mix had tampon, 0.5 ml (50 mM Na₂CO₃), 0.5 ml (12 Mm L-methionine), 0.5 ml (75 µM NBT), enzyme extract and 0.5 ml (10 µM riboflavin). The samples were kept under 350 µmol/m²s light resource and read at 560 nm spectrophotometrically.

Soluble carbohydrate analysis was conducted with Halhoul et al. (1972). 100 mg dry leaf samples were homogenized with 15 ml %80 ethyl alcohol. The samples were treated with anthrone solution (150 mg anthrone 100 ml sulphuric acid). After the water bath, the samples were read at 625 nm, glucose and fructose contents were calculated with standart curve.

Proline analysis was done with Bates et al.(1973) protocol. 500 mg fresh leaf tissue was homogenized with 10 ml %3 sulfosalicylic acid and filtered. 2 ml ninhydrin solution (1,25 gram ninhydrin solved in 30 ml glacial asetic acid and 20 ml 6M orthophosphoric acid) added on 2 ml plant filtrate. Boiling water and ice bath applications were applied, respectively. At the last step 4 ml tolüene was added on the samples and read at 520 nm. The prolin contents of the samples were calculated with standart proline curve. Heavy metal analyses were conducted at Cukurova University Central Research Laboratory. 400 mg dry plant sample was burned in a microwave oven with nitric acid and hydrogen peroxide. Ni, Cr, Cd and Pb contents of the samples were read at ICP-OES. Laboratory analyses were conducted as four replications. Data was evaluated with SPSS 20 program for LSD test.

RESULTS and DISCUSSION

According to pigment results (Table 1), all chlorophyll a, chlorophyll b, total chlorophyll and carotenoid contents of all gardens around the factory were found insignificant ($p \leq 0.05$) when compared to 6. Garden (control). On the contrary, Belmokhtar et al.(2019),_declared that cement factory dusts caused decreasing in chlorophyll a, chlorophyll b and carotenoid content.

Table 1 Pigment contents of the leaves that were sampled from different gardens around the cement factory ($p \leq 0.05$, * represents significant differences)

	Pigment Content (mg/g fresh weight)							
	Chlorophyll a		Chlorophyll b		Total Chlorophyll		Carotenoid	
	Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.
6.garden	0,416 ± 0,09		0,187 ± 0,02		0,603 ± 0,11		0,205 ± 0,03	
3.garden	0,391 ± 0,07		0,175 ± 0,02		0,566 ± 0,09		0,205 ± 0,02	
2.garden	0,350 ± 0,04		0,228 ± 0,07		0,578 ± 0,11		0,217 ± 0,03	
5.garden	0,408 ± 0,11		0,258 ± 0,12		0,667 ± 0,21		0,229 ± 0,05	
4.garden	0,331 ± 0,12		0,184 ± 0,07		0,515 ± 0,19		0,203 ± 0,07	
1.garden	0,401 ± 0,09		0,238 ± 0,11		0,639 ± 0,18		0,229 ± 0,05	
LSD	0,155		0,134		0,268		0,077	

Malondialdehyde content is an indicator of lipid peroxidation and membrane damage directly. Except for 1. garden, there is no significant effect ($p \leq 0.05$) about MDA, the low value of the first garden didn't indicate a negative effect (Table 2).

SOD enzyme results (Table 2) showed that there is no significant difference ($p \leq 0.05$) between the 6. garden and other gardens around the cement factory.

Table 2 Lipid peroxidation (MDA) and Enzyme (SOD) contents of the leaves that were sampled from different gardens around the cement factory ($p \leq 0.05$, * represents significant differences)

	Lipid Peroxidation (MDA) and Enzyme (SOD) Content			
	MDA (nmol/mL)		SOD (U/g fresh weight)	
	Mean	Std. Dev.	Mean	Std. Dev.

There is no significant effect ($p \leq 0.05$) for fructose content from soluble carbohydrates (Table 3) between the gardens, while glucose content decreased in 1. and 4. gardens significantly ($p \leq 0.05$).

Proline is an amino acid type and an important parameter against plant stress factors Koç et al.,2022). The proline results of the study (Table 3) showed an increasing trend ($p \leq 0.05$;

except 2. garden) and may indicate a stress response of the olive gardens to the cement factory.

Table 3 Soluble carbohydrates (glucose and fructose) and Proline contents of the leaves that were sampled from different gardens around the cement factory ($p \leq 0.05$, * represents significant differences)

Soluble Carbohydrate (Glucose-Fructose) and Proline Content						
	Glucose (mg/mL)		Fructose (mg/mL)		Proline ($\mu\text{mol/L}$)	
	Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.

4.garden	0,036* ± 0,009		0,141 ± 0,015		34,0* ± 2,5	
1.garden	0,030* ± 0,032		0,130 ± 0,053		44,2* ± 13,9	
LSD	0,028		0,046		19,9	

Factory dusts had no significant effect on olive leaves' heavy metal content that all metal (Cr, Pb, Ni and Cd) contents were found under 0.1 ppm in each garden's samples (Table 4). Conversely, Baldantoni et al (2014), found the Cr and Ni contents of the olive samples against to cement dusts higher than 0.2 $\mu\text{g/g}$, but Pb content was found 0.1 $\mu\text{g/g}$, too.

Table 4 Heavy metal (Cd, Cr, Pb and Ni) contents of the leaves that were sampled from different gardens around the cement factory ($p \leq 0.05$, * represents significant differences)

	Heavy Metal Content (ppm)			
	Cd	Ni	Cr	Pb
6.garden	< 0,1	< 0,1	< 0,1	< 0,1
3.garden	< 0,1	< 0,1	< 0,1	< 0,1
2.garden	< 0,1	< 0,1	< 0,1	< 0,1
5.garden	< 0,1	< 0,1	< 0,1	< 0,1
4.garden	< 0,1	< 0,1	< 0,1	< 0,1
1.garden	< 0,1	< 0,1	< 0,1	< 0,1

CONCLUSIONS and RECOMMENDATIONS

Based on the field surveys and laboratory analyses there was no relation between the distance of olive gardens to the factory and physiological effects (except proline). According to these results, cement factory-sourced dust pollution's effects were found hardly any on olive trees.

ÖZET

Bu çalışmada, 2020-2023 yılları arasında Yüksek Öğretim Kurumu Ulusal Tez Merkezi (YÖKTEZ) veri tabanında kayıtlı fotovoltaik konusunda yayınlanmış tezlerin bibliyometrik analizi ele alınmıştır. Yapılan literatür araştırmalarında son yılları kapsayan fotovoltaiklerin bibliyometrik analizi ile ilgili ulusal bir çalışmaya rastlanılmamıştır. Çalışma kapsamında 274 lisansüstü tez verisi incelenmiş ve değerlendirilmiştir. Bu alanda en fazla yüksek lisans ve doktora tezi yayınlayan Ege Üniversitesinin katkı sağladığı görülmüştür. Üniversitelerin anabilim dallarının sağladığı katkılar sıralandığında Elektrik ve Elektronik Mühendisliği 87 tez ile ilk sırada yer almıştır. Anabilim dallarında en çok araştırılan konular ise Maksimum Güç Noktasının Tespiti (MPPT), soğutma sistemleri, şebekeye bağlı ve şebekeden bağımsız sistemler ile termodinamik (enerji, ekserji, eksergoekonomi) analiz olmuştur. Half-cut PV paneller, Yüzen PV sistemler ve hibrit (yakıt pili, hidrojen ve süperkapasitör) sistemler çalışmalar arasında en az çalışılan araştırma konularıdır.

Anahtar Kelimeler: Fotovoltaik, Bibliyometrik Analiz, Fen Bilimleri, Ulusal Tez Merkezi, Lisansüstü Tezler

**BIBLIOMETRIC ANALYSIS OF POSTGRADUATE THESIS IN THE FIELD OF
PHOTOVOLTAICS BETWEEN 2020-2023**

ABSTRACT

In the current study, the bibliometric analysis of the theses published on photovoltaics registered in the database of the Higher Education Institution National Thesis Center (YÖKTEZ) between the years 2020-2023 is discussed. In the literature researches, no national a study on the bibliometric analysis of photovoltaics has been found in recent years. 274 postgraduate thesis data were examined and evaluated within the scope of the study. It was seen that Ege University, which published the most master's and doctoral theses in this field, contributed. When the contributions made by the departments of the universities are listed, Electrical and Electronics Engineering ranks first with 87 theses. The most researched subjects in the departments were Determination of Maximum Power Point Tracking (MPPT), cooling systems, grid-connected and off-grid systems, and thermodynamic (energy, exergy, exergoeconomics) analysis. Half-cut PV panels, Floating PV systems and hybrid (fuel cell, hydrogen and supercapacitor) systems are the least studied research topics among studies.

Keywords: Photovoltaic, Bibliometric Analysis, Sciences, National Thesis Center, Postgraduate Theses

GİRİŞ

Dünya nüfusunun her geçen gün artması, insanoğlunun yaşam standartlarının değişmesi, sanayileşme vb. faktörler nedeniyle enerji, yaşamın birçok yönünde yaygın bir etkiye sahip olmuştur. Dünya genelinde enerji üretimlerinin fosil kaynaklı yakıtlardan elde edilmesi hava kirliliği olmak üzere birçok zararlı etkene sahiptir (Chea et al., 2023; Dhaidan et al., 2023). Enerji üretiminde yenilenebilir sistemler umut verici bir şekilde potansiyellerini arttırmaktadırlar. Yenilenebilir enerji teknolojileri arasında güneş enerjisi, güneş enerjisi içerisinde de fotovoltaik (PV) sistemler araştırma konularının ilk sıralarında yer almaktadır.

Fotovoltaik sistemlerinin ilk yatırım maliyetlerinin yüksek olması, sistem verimlerinin düşük olması ve sıcaklık artışının güç üretim performansını azaltması gibi bazı etkenlerin sistem üzerindeki olumsuz etkileri yatırımcıların bu sistemlere yönelmesini zorlaştırmaktadır. Bu alanda yapılacak düzenlemeler ve Ar-Ge faaliyetleri sonucunda teknolojik gelişmeler ve sistem kararlılıkları meydana gelecektir. Bu bağlamda fotovoltaik sistemler alanında yapılan bibliyometrik araştırmalar nerede olduğumuzu belirlemede önemli bir yere sahip olacaktır.

Bibliyometrik analizler, istenen bir alanda, dönemde ve bölgede üretilen bilimsel çalışmaların arasındaki ilişkilerin sayısal olarak analiz edilmesini sağlayan bir yöntem olması açısından oldukça önemli literatür analiz inceleme yöntemleridir. Bu yöntem ile bilimsel yayınların metrik verilerini kullanarak bilimsel araştırma alanlarını, yazarları, kurumları ve çalışmalar arasındaki ilişkileri yayın veri tabanlarından toplanan bibliyografik verileri kullanarak anlamamıza yardımcı olmaktadır. Literatürde farklı programlar kullanarak fotovoltaik sistemlerin bibliyometrik analizini inceleyen çalışmalar aşağıdaki gibi özetlenmiştir.

Azad ve ark. (Azad & Parvin, 2022) 1981-2021 yılları arasında Fotovoltaik/Termal (PV/T) sistemlerin bibliyometrik analizini incelemiştir. Çalışma konuları ile ilgili filtreleme işlemleri yapıldıktan sonra Scopus veri tabanından 1659 makale farklı başlıklar altında incelenmiştir. Sonuç olarak; yapay sinir ağları, çok fazlı akış sistemleri ve manyetik etkilerin PV/T sistemlerin üzerindeki etkileri literatürde çok fazla çalışılmadığı ifade edilmiştir. David ve ark. (David et al., 2020) 2000-2019 yılları arasında Scopus veri tabanı kullanılarak fotovoltaik güneş enerjisi yönetiminde bibliyometrik analiz yapılmıştır. Bu analiz sonunda güneş enerjisi teknolojileri ile ilgili geleceğe yönelik araştırma konu başlıklarını sıralamışlardır. Bu başlıklar arasında tahmin teknikleri, verim artırma ve atık yönetimi gelmektedir. Elomari ve ark. (Elomari et al., 2022) PV sistemlerin elektrik şebekesine olan entegrasyonun bibliyometrik analizi üzerine bir çalışma yapmışlardır. Web of Science veri

tabanı kullanılarak 7146 makale ulaşılmıştır. Bibliyometrik şekiller R-package ve VOSviewer programları kullanılarak görselleştirilmiştir. Jabar ve ark. (Abdul Jabar et al., 2023) PV/T sistemlerde kullanılan faz değiştiren malzemeler ile sistem gelişimine etkisinin bibliyometrik analizi incelenmiştir. Araştırma içerisinde en sık kullanılan anahtar kelimeler “faz değiştiren malzeme”, “güneş enerjisi” ve “nanoakışkan” olmuştur. Sistem kümelendirmesi ise; optimizasyon, enerji-ekserji ve ısıtma, havalandırma ve iklimlendirme (HVAC) sistemleri olmuştur. Raboaca ve ark. (Raboaca et al., 2021) yakıt hücresi, fotovoltaik paneller ve rüzgar türbini hibrit sistemlerinin, He ve ark.(He et al., 2023) şebekeden bağımsız hibrit yenilenebilir enerji sistemlerinin, Saikia ve ark. (Saikia et al., 2020) güneş enerjili soğutma sistemlerinin, Paliwal ve ark. (Paliwal et al., 2023) nano katkılı faz değiştiren malzemeler ile fotovoltaik panellerin soğutulmasının, Fauzi ve ark. (Ashraf Fauzi et al., 2023) çatı tipi fotovoltaik panellerin bibliyometrik analizini incelemiştir. Tambunan (Tambunan, 2022) fotovoltaik panellerin bibliyometrik analizi ele alan bir çalışma gerçekleştirmiştir. Bu çalışmanın sonunda; perovskit güneş hücresi, yarı şeffaf organik hücreler ve faz değiştiren malzemeler popüler konular arasında yer almıştır.

Güneş enerjisi içerisinde fotovoltaik ile ilgili yapılan bilimsel çalışmaların sayısı her geçen gün artmaktadır. Fotovoltaik alanında artan araştırmacı ve yayın sayısı “Hangi makale”, “Hangi dergi” veya “Hangi arama motoru” sorularını sormamızı sağlamıştır. Bibliyometrik analizler yapılarak mevcut çalışmaların ulusal veya uluslararası durumunu, gelişimini, dönüşümünü ve yönelimini belirleyerek elde edilen verilerin sınıflandırılmasını sağlamaktadır. Yapılan ulusal literatür incelemelerinde fotovoltaik sistemlerin bibliyometrik analizine rastlanmamıştır. Bu çalışmanın sonunda elde edilen çıktılarla Türk literatürünün gelişimine ve yeni araştırmacılara fikir sunması planlanmaktadır.

MATERYAL ve YÖNTEM

Bu çalışmada 2020-2023 yılları arasında Türkiye’de fotovoltaik alanında yazılan ve YÖKTEZ’de taranan yüksek lisans ve doktora tezlerinin bibliyometrik analizi incelenmiştir. YÖKTEZ veri tabanında gelişmiş taramalar butonu seçilmiş ve Aranacak Kelimeler; “fotovoltaik” veya “photovoltaic”, Aranacak Alan “Tez Adı”, Arama Tipi “Sadece yazılan şekilde”, İzin durumu “izinli” olacak şekilde listeleme yapılmıştır. YÖKTEZ’den elde edilen verilerin erişimi 30.07.2023 tarihinde olup toplam 792 adet lisansüstü tez elde edilmiştir. Elde edilen veriler Excel formatına aktarılıp yıl filtresi (2020-2023) uygulanmıştır. Filtre sonunda 274 adet lisansüstü tezin bibliyometrik analizi incelenmiştir. Ayrıca bu çalışma kapsamında aşağıdaki soruların yanıtı aranmış ve elde edilen bulgular grafiklerle sunulmuştur.

- Tezlerin yıllara göre dağılımı nasıldır?
- Yazıldıkları dile göre dağılımları nasıldır?
- Çalışma türlerine göre dağılımları nasıldır?
- Yayınlandıkları üniversitelere göre dağılımları nasıldır?
- Anabilim dallarına göre dağılımları nasıldır?
- Anabilim dallarındaki ağırlıklı çalışma konuları nelerdir?

BULGULAR ve TARTIŞMA

Ulusal Tez Merkezi veri tabanında taratılan ve 2020-2023 yılları arasında fotovoltaik sistemler veya fotovoltaik paneller konusunda yazılmış izinli tezlere ait veriler Şekil 1’de gösterilmiştir. Şekil 1 incelendiğinde 2022 yılında Türkçe ve İngilizce yazım dillerinde hem yüksek lisans hem de doktora tezlerinde bir önceki yıllara göre artış gerçekleşmiştir. 2023 yılında bu alandaki tezlerin bir önceki yıllara göre az sayıda kalmasında ki sebep yayınlanmamış ve henüz bitmemiş tezler öngörülebilir. Şekil 2’de lisansüstü tezlerin çalışma türü (yüksek lisans veya doktora) ve yazım diline (Türkçe veya İngilizce) dağılımları verilmiştir. Belirtilen yıllara arasında yüksek lisans tezlerinin 162 tanesi Türkçe olarak yazılırken 61 tanesi İngilizce olarak yazılmıştır. Doktora tezleri incelendiğinde ise 40 tanesinin Türkçe, 11 tanesi de İngilizce olarak yazılmıştır. Toplam olarak 223 tane yüksek lisans tezi ve 51 tane de doktora tezi yazılmıştır.

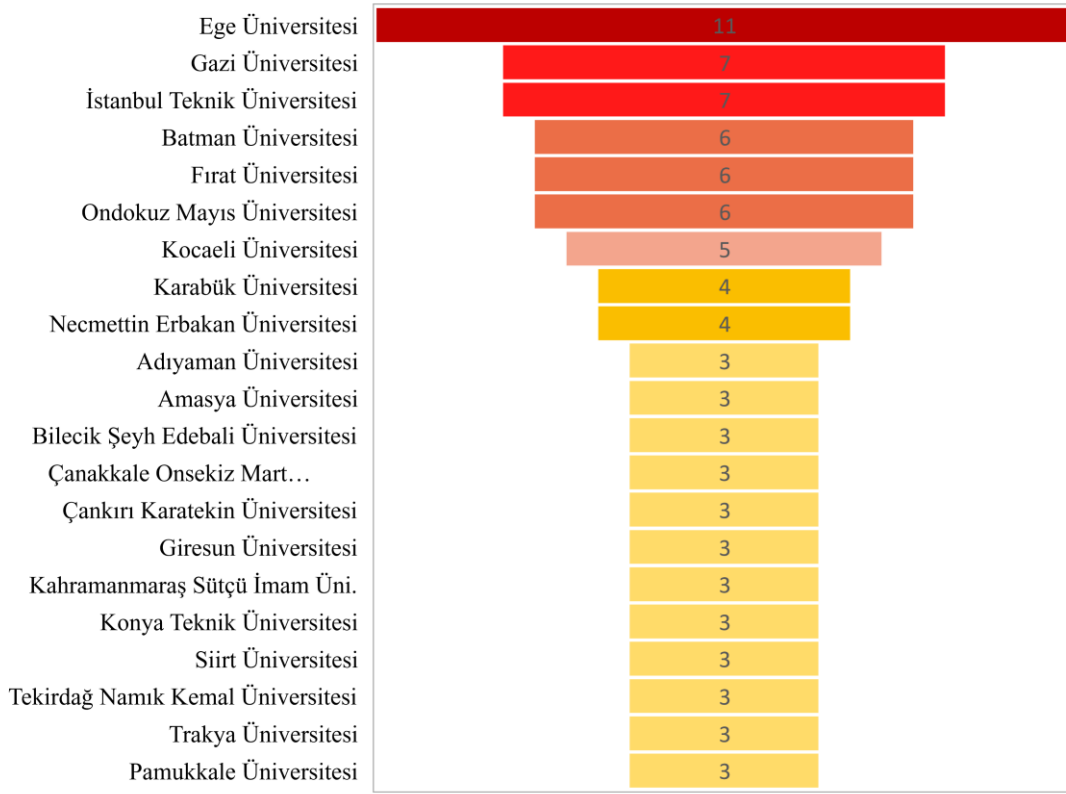

Şekil 1. Lisansüstü tezlerin yıllara göre dağılımı

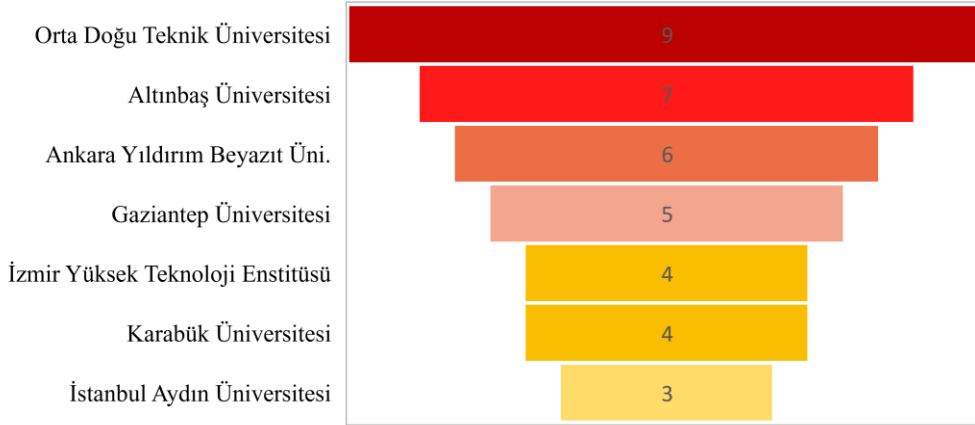

Şekil 2. Lisansüstü tezlerin çalışma türü ve yazım dillerine göre dağılımı

Şekil 3’de yazım dili Türkçe Şekil 4’de ise yazım dili İngilizce olan yüksek lisans tezlerinin üniversitelere göre dağılımı gösterilmiştir. Araştırma kapsamında yüksek lisans tezlerinin hangi üniversiteler bünyesinde araştırıldığı incelenmiştir. Yazım dilinin Türkçe olduğu tezler incelendiğinde 70 farklı üniversitede fotovoltaik alanında çalışma gerçekleştirilmiştir. Ege Üniversitesi bu alanda 11 adet tez bitirerek ilk sırada yerini alırken, Gazi Üniversitesi ve İstanbul Teknik Üniversiteleri 7 adet bitirerek ikinci sırada yer almıştır. Enerji alanında ihtisaslaşan Batman Üniversitesi, Araştırma Üniversiteleri arasında yer alan Fırat Üniversitesi ve Ondokuz Mayıs Üniversitesi bu alanda 6 adet tez bitirerek üçüncü sırada yer almışlardır. Yazım dili İngilizce olan yüksek lisans tezlerin üniversitelere göre dağılımı incelendiğinde 25 farklı üniversitede fotovoltaik alanında çalışma gerçekleştirilmiştir.

Şekil 3. Yazım dili Türkçe olan yüksek lisans tezlerin üniversitelere göre dağılımı

Şekil 4. Yazım dili İngilizce olan yüksek lisans tezlerin üniversitelere göre dağılımı

Şekil 5’de yazım dili Türkçe veya İngilizce olan doktora tezlerinin üniversitelere göre dağılımı gösterilmiştir. Türkçe yazılan doktora tez sayısı 40 adet olup 18 farklı üniversitede İngilizce yazılan tezler ise 8 farklı üniversitede bünyesinde gerçekleştirilmiştir. Türkçe yazılan doktora tezlerinde Ege Üniversitesi ilk sırada yer alırken İngilizce yazılan tezlerde ise Yıldız Teknik Üniversitesi ilk sırada yerini almıştır.

Şekil 5. Doktora tezlerin üniversitelere göre dağılımı

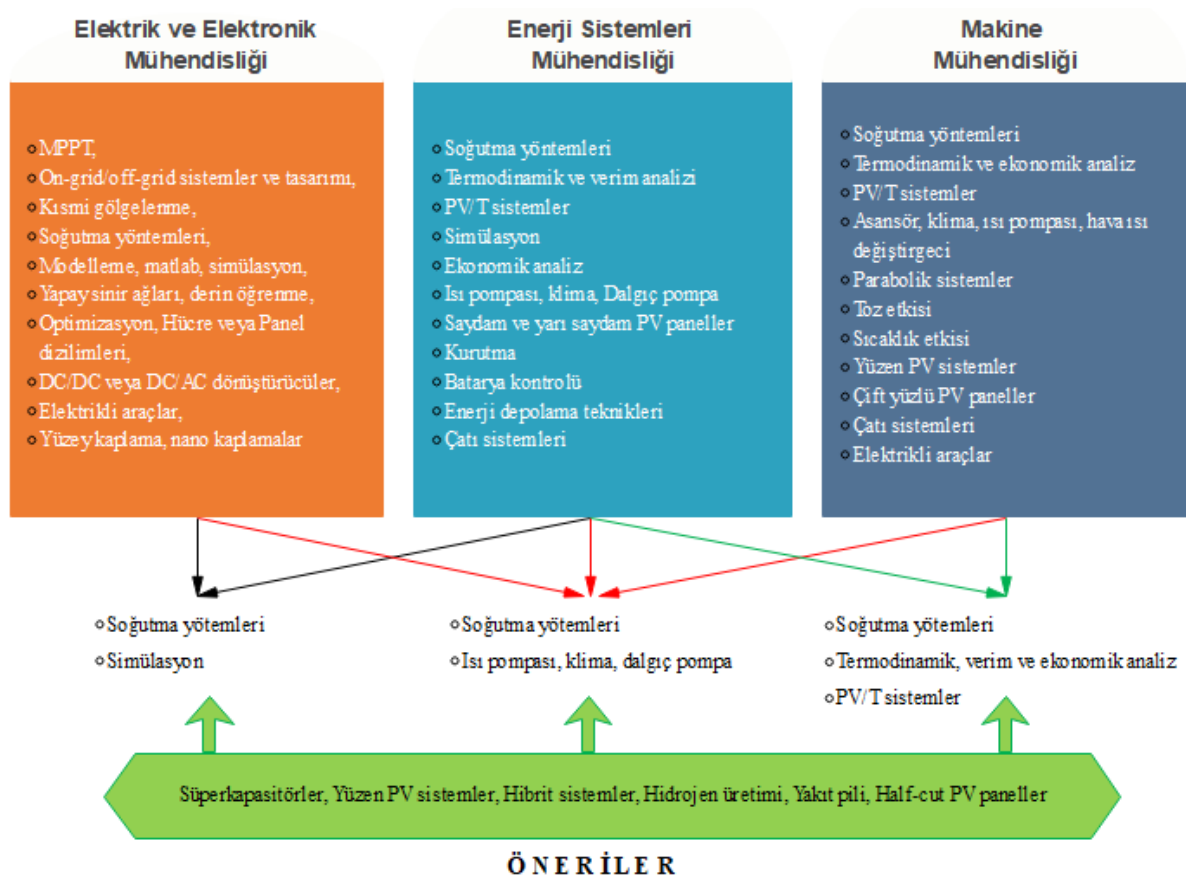

Tablo 1. Fotovoltaik alanında yazılan tezlerin anabilim dallarına göre dağılımı

Anabilim dalı	Sayı	Anabilim dalı	Sayı
Elektrik ve Elektronik Mühendisliği	87	Mekatronik mühendisliği	2
Enerji Sistemleri Mühendisliği	45	Yer sistem bilimi	2

Tablo 1’de yüksek lisans ve doktora tezlerinin anabilim dallarına göre dağılımı verilmiştir. Elektrik ve Elektronik Mühendisliği anabilim dalında yapılan 87 tezin 73’ü yüksek lisans, 14’ü doktora’dır. Enerji Sistemleri Mühendisliği anabilim dalında yapılmış 45

tezin; 37'si yüksek lisans, 8'i doktora'dır. Makine Mühendisliği anabilim dalında gerçekleştirilmiş 43 tezin; 34'ü yüksek lisans, 9'u doktora'dır.

Şekil 6'da fotovoltaik alanında en çok lisansüstü tez üreten anabilim dallarının araştırma konuları ve ortak çalışma konuları şematize edilmiştir. Elektrik ve Elektronik Mühendisliği anabilim dalında fotovoltaik sistemlerin maksimum güç noktasının takibi (MPPT) ve tasarımı, şebekeye bağlı ve şebekeden bağımsız sistemlerin tasarımı ile modelleme ve optimizasyon üzerinde yoğunlaşmıştır. Enerji Sistemleri Mühendisliği ile Makine Mühendisliği anabilim dalları ise fotovoltaik paneller üzerinde oluşan atık ısının atılmasını sağlayan farklı soğutma sistemleri ve termodinamik analizler üzerine yoğunlaşmışlardır.

Şekil 6. En çok tez yazan 3 anabilim dalına ait araştırma ana başlıkları ve öneriler

SONUÇLAR ve ÖNERİLER

Bu çalışmada, 2020-2023 yılları arasında YÖKTEZ veri tabanında fotovoltaik konusunda yayınlanmış olan lisansüstü tezlerin bibliyometrik analizi ele alınmıştır. Konu kapsamında incelen kriterler; yazım dili, çalışma türü, üniversitelere göre lisansüstü tezlerin dağılımı ve anabilim dallarına göre tezlerin dağılımıdır. Araştırma sonunda elde edilen önemli bulgular aşağıdaki gibi özetlenebilir;

- 2020-2023 yılları arasında fotovoltaik konusunda 274 lisansüstü tez yayınlanmıştır.
- 274 tezin 223'ü yüksek lisans, 51'i ise doktora türlerinde yapılmıştır.
- Yazım dili Türkçe olan yüksek lisans ve doktora tezlerinde Ege Üniversitesi diğer üniversitelere göre daha fazla çalışma üretmiştir.
- Yazım dili İngilizce olan yüksek lisans tezlerinde Orta Doğu Teknik Üniversitesi diğer üniversitelerden daha fazla çalışma yapmıştır.
- Yazım dili İngilizce olan doktora tezlerinde Yıldız Teknik Üniversitesi ilk sırada yer almıştır.
- En fazla tez üreten anabilim dalları sırasıyla; Elektrik ve Elektronik Mühendisliği, Enerji sistemleri Mühendisliği ve Makine Mühendisliği olmuştur.
- Anabilim dallarında en çok çalışılan konular ise MPPT, şebekeye bağlı ve şebekeden bağımsız fotovoltaik sistemler, soğutma yöntemleri ve termodinamik analizler olmuştur.
- Half-cut teknoloji, PV destekli hibrit sistemler (hidrojen üretimi, yakıt pili, süperkapasitör), yüzen PV sistemler anabilim dallarında çok az sayıda çalışılmıştır.

ÖZET

Bir ülkede iktidarın en önemli görevi, toplumsal huzuru ve esenliği sağlamaktır. Bu sebeple tüm siyasi iktidarlar, yönetmiş oldukları toplumlar üzerinde belirli konularda söz sahibi olmak, gayesi gütmektedirler. Halk ile iktidarın birbirini kabul edebilmesi önemlidir. Çünkü iktidarın halkın gözünde meşru bir kimlik kazanması, gerekmektedir. Halkın gözünde bir iktidarın meşruiyetini kaybetmiş olması, çok ciddi sorunların yaşanmasına sebebiyet verebilmektedir. Bir siyasi iktidar için en önemli sorunun, meşruiyet sorunu olmasının yanı sıra, iktidarın çeşitli uygulamaları da halkın belirli kesimlerini, rahatsız edebilir. Halk ile iktidar arasında yaşanan iletişimde, belli başlı üç sonucun karşımıza çıktığı, görülmektedir: Bunlar, kabullenme, kısmi muhalefet ve kökten ret şeklinde olmaktadır. Meşru bir şekilde iktidara gelen ve bu şekilde iktidarını devam ettiren bir siyasi yapının, kabullenildiğini; bazı sorunlar karşısında, kısmi bir muhalefetin yaşandığını ve iktidarın, halkın gözünde tam manası ile meşruiyetini kaybetmesi durumunda ise kökten bir ret eyleminin başladığı, görülebilmektedir. İktidar ile halk arasındaki ilişkinin, tam manası ile hangi noktada olduğunu anlamanın yolu ise sokaktan, geçmektedir. Bu sebeple sokağın nabzı, iktidar ile halk arasındaki ilişkiyi, doğru analiz edebilmemiz için ciddi doneler sunmaktadır. Bu çalışmada, uzun bir süredir Fransa'da, belirli olaylar karşısında ortaya çıkan toplumsal hareketlerin, sosyolojik ve siyasi nedenleri, anlaşılmaya çalışılmıştır. Özellikle Macron döneminde, artışa geçen toplumsal hareketlerin arka bahçesi, analiz edilmiştir. Daha sonrasında yaşanan eylemler karşısında, iktidarın verdiği tepkinin özü, ortaya konulmuştur. En nihayetinde ise yaşanan olayların, Fransa'nın siyasi tarihi üzerinde nasıl bir etki oluşturacağı konusunda, çeşitli tespitlerde bulunulmuştur.

Anahtar Kelimeler: Toplumsal Hareketler, İktidar ve Halk İlişkisi, Fransa'da Protestolar, Macron Dönemi Fransa

**SOCIAL MOVEMENTS IN FRANCE IN THE MACRON ERA WITH POLITICAL
AND SOCIOLOGICAL ASPECTS**

ABSTRACT

The most important task of the government in a country is to ensure social peace and well-being. For this reason, all political governments aim to have a say on certain issues in the societies they govern. It is important that the people and the government accept each other. Because the government must gain a legitimate identity in the eyes of the people. If a government loses its legitimacy in the eyes of the people, it can cause very serious problems. In addition to the fact that the most important problem for political power is legitimacy, various practices of the government may also disturb certain segments of the public. In the communication between the public and the government, three main outcomes are observed: Acceptance, partial opposition, and radical rejection. It can be seen that a political structure that comes to power legitimately and maintains its power in this way is accepted; in the face of some problems, partial opposition is experienced, and when the government loses its legitimacy in the eyes of the people, a radical rejection begins. The only way to understand the exact nature of the relationship between the government and the people is through the streets. For this reason, the pulse of the street provides us with serious data to analyze the relationship between the government and the people. In this study, the sociological and political reasons for the social movements that have been emerging in France in response to certain events for a long time have been tried to be understood. The backyard of social movements, which increased especially during the Macron era, is analyzed. Then, the essence of the government's reaction to the protests was revealed. Finally, various determinations are made about the impact of the events on the political history of France.

Keywords: Social Movements, Relationship between Power and People, Protests in France, France under Macron

GİRİŞ

Demokratik bir toplumda sorunları dile getirmek, bu sorunlara çözüm önerileri sunmak, tartışmak ve bu sorunları siyasal alana taşımak, sosyal hareketler yoluyla olmaktadır (Kök ve Tekerek, 2012: 60). Doğası itibari ile sosyal hareketler hem siyasi iktidarın hem de halkın dikkatini yaşanan sorunlara çekmek gayesi, taşımaktadırlar. Çağımızda yaşanan teknolojik gelişmeler nedeniyle artık bu tür olayların, internet ortamında ve televizyonlarda daha çok yer aldığını, görebilmemiz mümkündür. Lakin, teknolojik gelişmelere rağmen halen sokak hareketlerinin, çok ciddi bir etkisi olduğu, görülmektedir. Eylemci kitlelerin, sokak hareketleri ile daha çok ses getirebildiklerini düşündükleri, sezilmektedir.

Öte yandan bir toplumsal hareketin, doğması ve yayılması noktasında, hareketin üyeleri ile halk arasında kesintisiz bir iletişimin olmasının elzemliğinden, daim bahsedilmiştir (Işık, 2018: 158). Hareketin öznesi olan kesimlerin, toplumun dikkatini çekebilmesi ve bir sorunun varlığını halka kabul ettirebilmeleri için bu iletişimin, büyük bir önemi vardır. Çünkü yaşanan her toplumsal hareket karşısında, üç farklı kesimin var olduğu bilinmektedir: Bunlar, siyasi iktidar, halk ve eylemci sınıflardır. Yaşanan hareketin, başarıya ulaşip ulaşmayacağını belirleyen temel unsur ise halkın, hangi kesimin yanında duracağıdır. Bu temelde bir toplumsal hareketin, başarıya ulaşabilmesi için halkın desteğini alması, gerekmektedir.

21. yy. ile beraber teknolojideki önemli gelişmeler ve sosyal ağların, iletişim alanlarını dönüştürmesi sonucunda, toplumsal hareketler de çeşitli şekillerde, değişime uğramıştır (Çömlekçi, 2019: 3005). Fakat yaşanan tüm değişimlere rağmen, halen daha toplumsal hareketler deyince, aklımıza gelen en önemli olgu, sokakta yaşanan eylemler olmaktadır. Elektronik ortamlarda yaşanan olayların da toplumun çeşitli kesimleri üzerinde, etkisi olabilir. Lakin bir toplumsal hareketin, toplumun tüm kesimine ulaşabilmesinin yolu, bugün için de sokaklardan geçmektedir.

Güncel medya teknolojileri ile toplumun farklı kesimleri, bazı huzursuzluklarını gün yüzüne çıkarmak için bu araçları kullanmaya başlamışlardır (Karagöz, 2013: 131). Bu yönü ile yeni medya teknolojilerinin insanlara, her yönü ile çeşitli imkanlar sunduğu, anlaşılmaktadır. Özellikle iletişim teknolojilerinin yoğun olarak kullanıldığı toplumlarda sosyal medya ortamlarının, çeşitli şekillerde kullanıldığı bilinmektedir. Yeni medya teknolojileri, sadece toplum içi iletişimde değil uluslararası ilişkiler de ciddi bir iletişim alanı olarak, kullanılmaktadır.

Örneğin, milyarlarca üyesi bulunan bir sosyal medya hesabı üzerinden, iki devlet başkanı arasındaki siyasi iletişimin içeri anlaşılabilir. Ya da dünya insanlığını ilgilendiren bir konuda, herhangi bir devlet başkanının fikirleri, sosyal medya hesapları üzerinden takip edilebilir. Bu temelde yeni medya teknolojilerinin, her yönü ile dünya insanlığı için iletişim adına yeni bir dönemi başlattığını, ifade edebilmemiz mümkündür.

İletişim teknolojilerinde yaşanan değişimlere rağmen, halen daha bir ülkedeki siyasal havayı analiz edebileceğimiz en önemli yer, sokaklardır. Bu nedenle sokağın nabzı, bir ülkenin ekonomik, siyasi, kültürel ve sosyolojik gelişmeler konusunda nasıl bir bakış açısına sahip olduğunu anlamamız için en önemli doneleri sunmaktadır. Ayrıca sokaklarda yaşanan eylemler, her yönü ile bir ülkedeki siyasi havayı en güçlü şekilde etkileyen olaylar olarak, karşımıza çıkmaktadır. Sosyal medya alanlarında yaşanan eylemlere nazaran sokak eylemlerinin, çok daha büyük bir etkisinin olduğunu, söyleyebilmemiz mümkündür. Bu nedenle herhangi bir sorun karşısında rahatsızlığını dile getirmek isteyen sınıfların, yoğunlukla tercih ettiği yer, sokaklardır. İktidar ve halk arasındaki siyasal iletişimi, doğru analiz edebilmemiz için sokağın dilini, doğru okumamız gerekmektedir.

Nihayetinde bu çalışmada: Uzun bir dönemdir çeşitli sorunlar nedeni ile Fransa'da yaşanan toplumsal hareketlerin temel yapısı, anlaşılmaya çalışılmıştır. Özellikle Fransa Cumhurbaşkanı Emmanuel Macron döneminde yaşanan olayların, siyasi ve sosyolojik boyutları, gün yüzüne çıkarılmıştır. Ardından, yaşanan olayların seyrine ve önümüzdeki dönemlerde nasıl bir yapıya bürünebilecekleri üzerine, birtakım tespitlerde bulunulmuştur. Son kertede ise yaşanan olayların, demokratik bir zeminde nasıl bir çözüme kavuşabileceği üzerine, öneriler sunulmuştur.

Teorik Çerçeve

Çalışma sürecinde Macron döneminde, yaşanan toplumsal hareketler, ele alınmıştır. Konu üzerine yazılan bilimsel eserlerden toplanan doneler, analiz edilerek çalışmanın gövdesine eklenmiştir. Ayrıca, literatür taraması yapılarak, çalışma bilimsel bir temele oturtulmuştur. Daha sonrasında ise yaşanan olaylar üzerine, ciddi basın-yayın organlarında çıkan haberlerden önemli veriler toplanarak, kronolojik bir temelde çalışmanın gerek görülen bölümlerine, eklenmiştir. Yaşanan eylemlerin genel yapısı, şeffaf bir şekilde analiz edilerek, Macron döneminde Fransa'da halk ile iktidar arasındaki siyasi iletişimin genel çerçevesi, çizilmiştir. Tüm tespitler ve öneriler sonucunda çalışmamız, bir araştırma-derleme çalışması noktasına ulaşmıştır.

Toplumsal Hareketlerin Doğası

Toplumsal hareketler, yeni bir yaşam düzeni kurmaya yönelik, kolektif girişimler olarak görülebilir. Herhangi bir huzursuzluk durumunda başlarlar ve itici güçlerini ise bir yandan mevcut yaşam biçiminden duyulan memnuniyetsizlikten, diğer yandan da yeni bir yaşam planı veya sistemi için dilek ve umutlardan, alırlar (Blumer, 1995: 60). Bu yönü ile bir toplumsal hareketin özünde, öncelikle bir hoşnutsuzluk olduğunu ve ardından yığınların, bir umut dahilinde bir araya geldiğini ifade edebilmemiz, mümkündür. Toplumsal hareketlerin, klasik manada şekillendiği en önemli alan ise sokaklardır. Sokaklarda yaşanan hareketlerin, siyasi iktidarı oldukça yakından ilgilendirdiği, anlaşılmaktadır.

Her toplumsal hareketin, bir siyasi neden üzerine cereyan ettiğini ifade edebilmemiz, mümkün değildir. Bazı toplumsal hareketlerin dini hassasiyetler, çeşitli çevresel sorunlar veya hayvan hakları için olduğu, bilinmektedir. Her ne sebeple olursa olsun bir ülkede yaşanan toplumsal hareketlerin, en çok yankı uyandırdığı yer sokaklar olarak, karşımıza çıkmaktadır. Çünkü sokaklarda yaşanan hareketlerin hem toplumsal hafıza hem de siyasi iktidar için oldukça etkili bir boyutu, bulunmaktadır.

Genel manada toplumsal hareketler, el yordamıyla ve eşgüdüksüz çabalar biçiminde oluşurlar. Yavaş, duraksayan ama ısrarlı bir şekilde ilerleyen, genel bir yönleri vardır. Sistematik hareketler olarak, örgütlenmemişlerdir. Ne yerleşmiş bir liderlikleri ne de tanınmış üyelikleri, vardır. Çok az rehberlik ve kontrole sahiplerdir (Blumer, 1995: 61). Bu temelde toplumsal hareketlerin, spontane bir şekilde gelişen olaylar olduğu, ifade edilebilir. Lakin, kısa süre içerisinde büyük bir kitleye ulaşabildikleri ve hedeflerine ulaşabilmek noktasında, başarı ihtimallerinin yüksek olduğu, görülebilmektedir.

Demokratik ya da anti-demokratik bir toplumda, toplumsal hareketlerin yaşandığını görebilmemiz, mümkündür. Özellikle baskın bir yönetim anlayışının olduğu ülkelerde, bu tür olayların yaşanma ihtimalinin yüksek olduğu, anlaşılmaktadır. Demokratik ülkelerde de aynı olayların yaşanma ihtimalinin olduğu, bilinmektedir. Yapılan bir uygulamanın demokratik anlayışla bağdaşmadığını düşünen kitlelerin, toplumsal eylemlere yöneldiği, görülmektedir.

Klasik manada toplumsal hakaretlerin en çok yaşandığı yer, sokaklardır. Fakat son dönemlerde, teknolojik gelişmeler ile sosyal medya uygulamaları üzerinden de birtakım toplumsal olayların yaşandığı, görülmektedir. Bu noktada, kaşımıza şu tür sorular, çıkmaktadır: Sosyal medya, sosyal hareketlere yardımcı mı, yoksa engel mi olur? Sosyal ağ

teknolojisi, aktivistlerin hedeflerine ulaşmalarına yardımcı olabilir mi? (Kidd, and McIntosh, 2016: 785). Gibi sorular, karşımıza çıkmaktadır. İletişim teknolojilerin gelişmesi, pek tabii ki toplumsal hareketlerin doğasını, derinden etkilemiştir. Aynı zamanda yaşanan olayların, daha büyük kitlelere ulaşmasına da imkân sunmaktadır. Lakin, sosyal medyanın kimi durumlarda, art niyetli gruplar tarafından yönlendirildiği, bir algı oluşturma aracı olarak kullanıldığı, hatta sosyal medya üzerinden toplumun terörize edilmeye çalışıldığı dahi bilinmektedir. Bu nedenle sosyal medya üzerinde yaşanan gelişmelere karşı, toplumun ve siyasi iktidarın oldukça temkinli yaklaşması, gerekmektedir. Nihayetinde, her teknolojik gelişmenin olduğu gibi iletişim teknolojilerinin de olumlu ve olumsuz yönleri, bulunmaktadır.

Bilindiği üzere, teknolojik iletişim araçlarına karşı, toplumun farklı kesimlerinden oldukça farklı yorumlar, gelmektedir. Özellikle teknolojik iletişim araçlarını eleştirenlerin başında ise tekno-kötümserler, gelmektedir. Tekno-kötümserler, temelde sosyal medyayı, insanların gerçek dünyada birbirleriyle ilişki kurma biçimini, temelden değiştirmek için çok az şey yapan, etkileyici bir patinaj olarak, görürler (Kidd, and McIntosh, 2016: 788). Tekno-kötümserlerin bakış açısına göre sosyal medyanın sanal bir yönü, vardır. Bu nedenle sosyal medya üzerinde cereyan eden bir olayın, gerçek dünya ile bir ilişkisi yoktur. Doğal olarak, sosyal medyada yaşanan bir dayanışmanın, sokağa yansması ise çok da olağan değildir.

Sosyal medya araçları üzerine yapılan yorumların ve ortaya atılan tartışmaların, bir hayli fazla sayıda olduğu, anlaşılmaktadır. Sosyal medya araçlarını, öven ya da eleştiren kesimlerin ise kendince haklılık paylarının olduğu, görülmektedir. Lakin, ifade edilmesi gereken en temel olgu ise günümüzde sokaklarda yaşanan hareketlerin doğurduğu etkiyi, teknolojik iletişim araçlarının doğurabilmesi, çok da mümkün değildir.

Toplumsal hareketler, kimi kesimlerin zihnimde, geleneksel sınıf çatışması kavramına karşıt olarak, tasarlanmıştır (Touraine, 2002: 89). Klasik manada sınıf çatışmasının genel özelliklerini, toplumsal hareketlerde bulmak, olası değildir. Çünkü, sınıf çatışmalarının özünde güçlü bir tarihi geçmiş, bulunmaktadır. Bu sebeple sınıf çatışması, bir süreklilik arz etmektedir. Oysa, toplumsal hareketler ise spontane gelişen olaylar olarak, karşımıza çıkmaktadırlar.

Son yirmi yıldan daha uzun bir süredir, toplumsal hareketlerin incelenmesi, sosyoloji içindeki en üretken ve entelektüel açıdan canlı, alt alanlar arasında yer almıştır (McAdam, 2000: 253). Gerek sosyologlar gerekse de siyaset bilimciler için çok önemli doneleri içerisinde barındıran bu hareketlerin, araştırmacılara önemli doneler sunduğu, görülmektedir.

Bu hareketlerden, en önemli dersi ise siyasi iktidarların ve toplumların, çıkarması gerekmektedir.

Dünyanın farklı ülkelerinde toplumsal hareketlere yönelik, farklı bakış açılarının olduğu bilinmektedir. Özellikle demokratik ve anti-demokratik ülkelerde toplumsal hareketlerin, çok farklı bir bakış açısı içerisinde değerlendirildiği, anlaşılmaktadır. Örneğin, nedeni ne olursa olsun, fikirlere, ideolojiye veya kimliğe gerçek bir vurgu yapılmaması, Amerika Birleşik Devletleri içinde toplumsal hareketler üzerine mevcut literatürde, güçlü bir “akılcı” ve “yapısal” önyargı, oluşturmuştur (McAdam, 2000: 254). Bu durumun oluşmasının temel nedenini, siyasal kültür içerisinde aramak gerekmektedir. Her yönü ile toplumlar ve siyasi iktidarlar için ciddi süreçler olarak karşımıza çıkan bu hareketlere karşı, farklı ülkelerin ve farklı toplumların, değişik bir yaklaşım geliştirdiği, görülmektedir.

Çeşitli nedenlerle vuku bulan toplumsal hareketlerin, farklı bileşenleri olduğu anlaşılmaktadır. Belirli durumlar karşısında, kendiliğinden oluşan toplumsal hareketlerin, bir ülke içerisinde önemli değişikliklere sebebiyet verdiği de görülebilmektedir. Bir tür eleştiri şekli olarak formüle olan bu hareketlerin, nihai hedefine ulaşabilmesinin en önemli ayağı ise günün konjonktürel şartlarının, uygun durumda olması olarak, karşımıza çıkmaktadır.

Macron Döneminde Fransa’da Yaşanan Toplumsal Hareketlerin Genel Yapısı

Bilindiği üzere Emanuel Macron’un, 2017 yılında Fransa’da cumhurbaşkanı olmasından sonra çeşitli protestoların yaşandığı, görülmüştür. İlk olarak, bu hakaretlerin öne çıkması ise Sarı Yelekliler Hareketi, olmuştur. Öncelikle Sarı Yelekliler Hareketi’nin, politik ve sosyo-ekonomik temeline değinecek olursak, neoliberal siyasetin uzun yıllar süren tahribatının doğurduğu sonuçların etkisinin olduğu, anlaşılmaktadır (Gürcan, 2019: 443). Ülke içerisinde uygulanan ekonomik politikaların, toplumun kimi kesimleri üzerinde ağır tahribatlara sebebiyet vermesi nedeniyle bu hareketin oluştuğu, görülmektedir.

Önceleri, local çapta ve Fransa’nın kırsal alanlarında tarım sektöründeki girdilerin başında gelen benzin fiyatlarındaki ağırlaşan vergilere ve fiyatlardaki artışa yönelik eylemler, az bir süre sonra genel manada, hükümete karşı toptan bir ekonomik eleştiri boyutuna, varmıştır (Yıldırım ve Öztürk, 2020: 103). Yaşanan olaylar serisi, toplumun önemli bir kesiminin, ekonomik gidişattan memnun olmadığını ve ağırlaşan vergilerin, toplumun ekonomik direncini kırdığını, göstermektedir.

Bilindiği üzere, AB (Avrupa Birliği) üyesi ülkeler içerisinde, ekonomik kırılganlık boyutu ile dikkat çeken ülke, uzun bir dönemdir Fransa'dır. Almanya gibi AB'nin ekonomik dinamosu olan ülkelere kıyasla Fransa'nın, ciddi derecede ekonomik bakımdan geride kaldığı, görülmektedir. Yaşanan toplumsal hareketler de bu durumun en önemli işareti olarak, karşımızda durmaktadır.

Fransa'nın siyasi tarihine değinecek olursak, tarihsel bağlamda önemli bir işçi sınıfı mazisi olan Fransa'da, 1905 senesinde oluşan İşçi Enternasyonalı Fransız Seksiyonu (SFIO), parlamenter manada solun ilerleyişi noktasında, büyük bir rol oynamıştır (Arslantaş ve Arslantaş, 2020: 3). Bu temelde, Fransa'nın yakın ve uzak tarihinde bu tür toplumsal hareketleri görebilmemiz, mümkündür. Fransız toplumunun sahip olduğu siyasi kültürün de bu tip hareketlerin yaşanmasında, önemli bir etkisi olduğu, bilinmektedir. Lakin yakın tarihe gelindiğinde Fransa'da, yaşanan toplumsal hareketleri, tam manası ile bir sınıf çatışması üzerinden okumak ya da sol sınıfların siyasi mücadelesi üzerine temellendirmek, eksik bir yaklaşım olarak, karşımıza çıkmaktadır. Çünkü ülke içerisinde yaşanan ekonomik sorunların, toplumun tüm kesimlerini bir şekilde rahatsız ettiği, anlaşılmaktadır.

Fransa'da 17 Kasım 2018 tarihinde ortaya çıkan Sarı Yelekliler Hareketi, bir yıldan daha fazla bir süre, devam etmiştir (Eraydın, 2020: 146). Yaşanan olayların etkisi, kısa sürede büyük bir alana yayılmış, hatta başka ülkelerde de aynı olayların, baş gösterdiği görülmüştür. Her yönü ile siyasi iktidarın uyguladığı ekonomik politikalara karşı, bir protesto eylemi mahiyetinde ortaya çıkan bu hareketler, kısa sürede ciddi bir kitleye ulaşmıştır.

Daha sonrasında Fransa'da yaşanan olaylara gelecek olursak, bilindiği üzere 27 Haziran 2023 tarihinde Nanterre kentinde polisin dur ihtarına uymayan 17 yaşındaki bir genç, polis tarafından açılan ateş sonucu, hayatını kaybetmiştir (Kosif, 2003). Bu olayın ardından, büyük çaplı protesto eylemelerinin yaşandığı ve yaşanan eylemlerin, büyük bir alana yayılarak, etkisinin uzun bir dönem sürdüğü, bilinmektedir. Eylemci sınıfların, polisin orantısız güç kullanmasından ve eşitsiz davranışlardan şikâyetçi oldukları, gözlenmiştir.

Aslında, Fransa'da uzun bir dönemdir banliyölerden gelen Siyahi ve Araplara, onlarca yıldır medya, politikacılar ve polis tarafından vahşi ve kana susamış gangsterler muamelesi, yapılmıştır (Otte, 2003). Yapılan bu ötekileştirici uygulamalar sonucunda, Fransa'da etnik ve dini kimlikleri farklı olan insanların, zor şartlar altında yaşamak zorunda kaldıkları, anlaşılmaktadır. Bu nedenle yaşanan herhangi bir olay karşısında, toplumun önemli bir kesiminin, sokak eylemlerine başladığı, anlaşılmaktadır.

Paris'in dışındaki bir işçi sınıfı banliyösünde yaşayan Kuzey Afrika asıllı 17 yaşındaki Nahel Merzouk'un polis tarafından öldürülmesinden sonra, ortaya çıkan öfkenin etkisinin üstesinden gelmek, çok uzun zaman almıştır. Yaşanan olaylarda, 5.000'den fazla araç yakılmış 1.000'den fazla mülk hasar görmüş ve 250 polis karakolu saldırıya uğramıştır. Yerel makamlar tarafından, verilen karşılıklarda ise 4.000'e yakın kişi, tutuklanmıştır (Tharoor, 2023). Yaşanan olayların kapsamı ve vahameti dikkat ile incelendiğinde, Fransa'da toplumun belli bir kesiminin, siyasi iktidarın uyguladığı politikalara karşı, ciddi bir birikimi olduğu, anlaşılmaktadır. Özellikle kolluk güçlerinin, belli sınıflara karşı uyguladığı şiddet eylemlerinin, tam manası ile belli sınıflar tarafından ciddi bir tepkiyle karşılandığı, anlaşılmaktadır.

Esasında, Fransa'da göç, entegrasyon ve milli kimlikle ilgili tartışmalarda nefret söylemi; politik zeminin ilerisinde, toplumsal alana ulaşmış ve sıradan bir tartışma konusu boyutuna, evrilmiştir (Durakçay ve Gülal, 2017: 126). Siyasi iktidarın, doğrudan ve dolaylı bir şekilde sebep olduğu bu nefret söyleminin, toplumun belli kesimlerine inmesi, özü itibari ile Fransa'da yaşanan olayların temel nedeni olarak, karşımıza çıkmaktadır. Ülkedeki etnik ve dini farklılıklara karşı, gösterilen tahammülsüz davranışlar sonucunda, çeşitli olayların yaşandığı, görülmektedir. Özellikle siyahilere ve farklı dini değerlere karşı kullanılan nefret içeren söylemlerin, tam manası ile toplumsal çatışmaların temel körükleyicisi olduğu, görülmektedir.

Fransa'da siyasi iktidarın ekonomik, siyasi ve kültürel politikalarına karşı, gerçekleşen toplumsal hareketlerin sayısı, artırılabilir. Aynı zamanda, önümüzdeki dönemlerde de bu tür hareketlerin yaşanması, kuvvet ile muhtemeldir. Eğer tam manası ile siyasi iktidar, bir mantalite değişimi yaşar ve gerek toplumun büyük kesiminin gerekse de siyasilerin, nefret içeren açıklamalardan ve uygulamalardan vaz geçmesi söz konusu olursa, yaşanan eylemlerin sonlanabilmesi, mümkün gözükebilir. Bu temelde yapılması gereken, demokrasinin ve hukukun üstünlüğünün gereklerini hem resmî kurumların hem de toplumun tüm kesimlerinin, kavramasıdır.

Yaşanan Hareketlerin Siyasal ve Sosyolojik Sonuçları

2000'ler sonrasında Fransa'da, siyaset sosyolojisi ve politika çalışmaları da dahil olmak üzere, mikro düzeydeki çalışmalara odaklanılması başka yerlerde, özellikle Avrupa'da, yankı bulmuştur. Belirli alanların incelenmesinin, "Fransız dokunuşu" olarak kabul edildiği, orta sınıf bir konum da ortaya çıkmıştır (Elgie, Grossman and Mazur, 219: 390). Bilimsel alanda yaşanan gelişmelerin, Fransa'da toplum ve devlet ilişkisi adına, yeni düşünceleri ortaya

çıkardığı görülmektedir. Lakin sonraki süreçte yaşanan olaylar, bilimsel alanda yaşanan yeniliklerin, Fransa'da toplum ve iktidar ilişkisine büyük manada bir etkide bulunmadığını, göstermektedir.

Son yirmi yıldan daha uzun bir süre, Fransız siyasi yaşamında, bir uluslararasılaşma ve özellikle de Avrupalılaşma, olmuştur (Elgie, Grossman and Mazur, 219: 398). Bu durumun bir etkisi olarak, çeşitli konularda değişimlerin yaşandığı, görülebilmektedir. Lakin etnik ve dini farklılıklara karşı yaklaşımlarda, ciddi bir değişimin olmadığı, gözlenmektedir. Çünkü halen daha belirli kimliklere karşı Fransa'da, nefret içeren söylem ve eylemlerin olduğu, göze çarpmaktadır.

Fransız siyasetini veya herhangi bir ülkenin siyasi yaşamını anlamak için, ana akım kurum ve yapılarda neler olup bittiğine bakmak, yeterli değildir. Bu bağlamın dışında, toplumun kendi içinde neler olup bittiğine de bakmamız, gerekmektedir. İnsanlar, bir konu hakkında bir şeyler hissettiklerinde, dile getirecekleri bir derterleri olduğunda veya bir itirazda bulunmak istediklerinde görüşlerini, politikacılara veya partilere, bildirebilirler (Waters, 2003: 1). Bu nedenle Fransa'da yakın dönemde yaşanan toplumsal hareketlerin, toplumun belirli kesimlerinin mevcut uygulamalar konusunda oluşan düşüncelerinin, siyasi iktidara karşı geri dönüşleri üzerinden ele almamız, gerekmektedir. Çünkü yaşanan eylemlerin, bir siyasi arka bahçesi olduğu, anlaşılmaktadır. Politik söylemler ile kendini iktidara ifade edemeyen kitlelerin, toplumsal hareketler ile kendilerini ifade etmeye çalıştıkları, anlaşılmaktadır.

Bilindiği üzere, 1990'lar boyunca Fransa, farklı nedenler etrafında harekete geçen ve toplum içindeki değişen talepleri dile getiren, yeni toplumsal hareketlerin yükselişiyile karakterize edilmiştir. Bu hareketler, alternatif siyasi ifade biçimlerini öne çıkarmış ve daha önce siyasi sistem içinde söz sahibi olmayan grupları, temsil etmişlerdir (Waters, 2003: 11). Yaşanan gelişmeler, siyasi iktidar ile toplumun farklı kesimleri arasında, ciddi derecede siyasi ve sosyolojik sorunların olduğunu, göstermektedir. Bu temelde yaşanan olayların, Fransız siyasi kültürü ile yakın bir ilişkisi olduğu, anlaşılmaktadır. Ayrıca, uzun bir dönemdir Fransa'nın, uluslararası alanda bu hareketler ile anılır bir konuma gelmesinin de temelinde bu siyasi kültür, bulunmaktadır. Yaşanan eylemlerin, bugün için Fransa'da toplumsal entegrasyon sorunundan kaynaklandığı, görülmektedir.

Fransa'nın yakın tarihe tekrar dönecek olursak, seçimlere katılım düzeylerindeki düşüş, siyasi parti ve sendika üyeliklerindeki düşüş gibi faktörlerin ortaya koyduğu sonuç, Fransız toplumunda, siyasete karşı artan bir hoşnutsuzluğun olduğunu, göstermiştir (Waters, 1998:

493). Aynı olgunun, süreç içerisinde devam ettiği ve toplumun önemli bir kesiminin, siyaset mekanizmasına sırtını döndüğü, kimi dönemlerde ise talep ve tepkilerini, toplumsal hareketler ile ifade ettikleri, görülmektedir.

Bilindiği üzere 1990'lı yıllarda Fransa'da, yeni toplumsal hareket türlerinin olağanüstü bir yükselişine, tanık olunmuştur (Waters,1998: 494). Bu temelde yaşanan olayların, ciddi bir arka bahçesi olduğu, anlaşılmaktadır. Yaşanan hareketlerin, oluşmasına sebebiyet veren çeşitli spesifik nedenler, ardı sıra dizilebilir. Lakin, büyük resimden çıkan ana tema, siyasi iktidar ile toplumun belirli kesimleri arasında bir çatışmanın var olduğu, gerçeğidir.

Geleneksel siyasetin sınırlarını aşan çeşitli toplumsal hareket biçimlerinin, değerlerin, şikayetlerin ve kimliklerin incelenmesi, sosyoloji alanında derin bir öneme sahiptir (Meyer and Kretschmer, 2007: 541). Bu sebeple bu olgular üzerine, derinlemesine bir sosyolojik bakış açısı ile ilerlemek gerekmektedir. Son tahlilde ise Fransa'da ortaya çıkan toplumsal hareketlerin, siyaset sosyolojisi bağlamında ele alınması ile temel nedenlerin gün yüzüne çıkacağı, anlaşılmaktadır.

Özünde, siyasi ittifakların, potansiyel katılımın veya kamu politikasının nesnel koşulları ne olursa olsun, önemli sayıda insan hem aciliyet hem de etkililik konusunda, öznel bir duyguya sahip olmadıkça belli hareketler, ortaya çıkmaz (Meyer and Kretschmer, 2007: 544). Bu temelde Fransa'da vuku bulan toplumsal hareketleri, geniş bir zamansal bütünlük ile ele almak, gerekmektedir. Yaşanan eylemlerin, birden çok sorumlusu olduğu gibi, birden çok nedeninin olduğu da anlaşılmaktadır. Mevcut arka plan dahilinde sorunun çözümü için tüm aktörlerin, demokratik müeyyideler etrafında birleşmesi, gerekmektedir.

SONUÇ

İnsan yaşamında vuku bulan tüm olayların, bir taktiksel şeması olduğu gibi toplumsal hareketlerin de bir taktiksel şeması, bulunmaktadır. Bu nedenle kitleler, bir toplumsal hareketi gerçekleştirirken bu taktikler arasında bir seçim yapmak, durumundadırlar. Taktiksel seçimler ve bunların uygulanması, toplumsal hareketlerde, kolektif kimliklerin inşasıyla yakından ilgilidir. Kolektif kimliği incelemek, araştırmacılara insanların neden kolektif eyleme katıldığını anlamalarında, yardımcı olmuştur. Ancak, eylemi şekillendiren taktikler dizisi tam olarak, araştırılmamıştır (Smithey, 2009: 658). Bu konu üzerine yapılacak derinlemesine bir araştırmanın, farklı bilgileri gün yüzüne çıkaracağı, dönüştürülebilir. Lakin, bugün için en etkili toplumsal hareketlerin, sokak eylemleri şeklinde karşımıza çıktığı, görülmektedir.

Bunun yanısıra teknolojik imkanlar kullanılarak, birtakım toplumsal hareketlerin, son dönemlerde yoğunluk kazandığı görülse de sokak eylemlerinin, toplumların ve iktidarların hafızasında çok derin bir yeri olduğu, anlaşılmaktadır. Belirlenen hedefe ulaşabilmek için en doğru aracın kullanılması, tam manası ile toplumsal hareketlerin başarı oranını, etkilemektedir.

Toplumsal hareketler üzerine yapılan çalışmalarda, ortaya çıkan bir diğer önemli olgu ise kolektif kimlik, konusudur. Çünkü, tüm toplumsal hareketlerin temelinde, yığınları bir araya getiren ortak veya benzer kolektif kimliklerin olduğu, karşımıza çıkmaktadır. Fransa örneğinde yaşanan toplumsal hareketler analiz edilince bu hareketlerin, öznesi olan yığınların, kolektif kimlik bilinçlerinin oldukça yüksek olduğu, görülmektedir.

Bu noktada akıllara şöyle bir soru gelmektedir: Fransa'da yaşanan toplumsal hareketlere katılan yığınların, genel manada kolektif kimlikleri hangi özellikleri içermektedir? Bu sorunun cevabı aranırken, Fransa'nın siyasi tarihi, derinlemesine gözden geçirilmelidir. Son tahlilde, karşımıza çıkan yegâne olgu ise Fransa'da yaşanan toplumsal hareketlerde, hareketlere katılan yığınların, genel manada etnik ve dini olarak, farklı kimliksel özelliklere sahip olduklarıdır.

Tam manası ile demokratik yollar ile kendisini, iktidara ifade edemeyeceğini düşünen yığınların, bir politik tercih olarak gördükleri toplumsal hareketler, Fransa'nın siyasi tarihinde yoğun bir şekilde, karşımıza çıkmaktadır. Ekonomik şartların ağırlaşması, polisin orantısız güç kullanması, nefret söylemleri içeren durumların ortaya çıkması veya çifte standart içeren yaklaşımlar sonucunda, Fransa'da toplumsal hareketlerin yaşandığı, görülmektedir.

Yaşanan bu tür sorunların, demokratik teamüller ve hukukun üstünlüğü ile çözüme kavuşabilmesi, mümkündür. Lakin, bu noktada siyasi iktidara önemli görevler, düşmektedir. Siyasi iktidarın, toplumun tüm kesimlerini kucakladığını, toplumun tüm kesimlerine içten bir şekilde ifade etmesi, gerekmektedir. Ayrıca, hangi konuda olursa olsun siyasi iktidarın, ürettiği bir politikanın kesinlikle toplumun tüm kesimlerine hitap ettiği, söylem ve eylemlerle ifade edilmelidir. Aksi bir durumda, toplumda bir entegrasyon sorununun olduğu, düşünülebilir. Bu durumda, yeni toplumsal hareketlerin ortaya çıkması, kuvvet ile muhtemeldir.

Demokratik bir ülkede insanların, sorunlarını hukuki ve siyasi makamlara iletmek yerine, toplumsal hareketlere yönelerek, eylemlerden ve sokaklardan medet umması,

demokratik bir ÷lke için önemli bir sorundur. Bu nedenle Fransa'da siyasi iktidarın, yaşanan sorunların çözümü noktasında resmî kurumların, yeterli özelliklere sahip olduğunu, toplumun tüm kesinlerine ifade edebilmesi ve onları ikna edebilmesi, gerekmektedir.

ABSTRACT

The soil fauna contributes to decomposition processes both directly through the breakdown of litter material and indirectly by consuming microbial biomass and providing nutrient-rich feces in to the soil. As a result, their feeding behaviour helps to maintain soil structure. Further, the movement of animals through soil influences the dispersal of microbial propagules carried on their body surfaces and guts. In this study we investigate the daily fluctuation of two soil mite groups (Mesostigmata and Oribatida) in the upper layers of soil. Between 25-27 July four soil samples (at sunrise, mid-day, sunset and evening) each day, totally 12 soil sample were taken from upper layer (5 cm). Samplers were carried to Acarology laboratory in Sakarya University and placed to the Berlese funnels for a week. The mites of Mesostigmata and Oribatida were counted in each sample and daily average numbers were compared.

Keywords: Daily fluctuation, Population densities, Soil fauna

INTRODUCTION

The soil fauna contributes to decomposition processes both directly through the breakdown of litter material and indirectly by consuming microbial biomass and providing nutrient-rich feces into soil. As a result, their feeding helps to maintain soil structure (Cole et al., 2006). Further, the movement of animals through soil influences the dispersal of microbial propagules carried on their body surfaces and guts.

The soil fauna divided into three groups according to their size as macrofauna, mesofauna and microfauna. Soil mesofauna are between 1 mm to 2 mm in length and includes mostly springtails, mites and small hexapods, oligochaete worms. Mites are one of the most abundant and diverse groups in soil and they have important ecological roles in soil because they have a range of feeding types as herbivores, microbial grazers, decomposers and predators (Nielsen, 2019). In the upper layers of soil their densities may reach up to 250,000 mites per square meter. Oribatida species are dominant in undisturbed soils with high organic content. Mite species other than Oribatida also are found in the soil in less densities (Hoy, 2008).

In this study we investigate the daily fluctuation of two soil mite groups (Mesostigmata and Oribatida). Between 25-27 July four soil samples (at sunrise, mid-day, sunset and evening) each day, totally 12 soil samples were taken. The mites of Mesostigmata and Oribatida were counted in each sample and daily average numbers were compared.

MATERIALS and METHODS

In this study, Oribatid and Mesostigmatous mite samples were collected, sorted and examined using appropriate methods. Samples were taken from Sakarya Maltepe Korupark between 25-27 July four soil samples (at sunrise, mid-day, sunset and evening) each day, totally 12 soil samples were taken. Samples were taken at 5:30 in the morning, at 12:00 in the afternoon, at 17:30 in the afternoon and at 20:30 in the evening. The samples taken were brought to the Acarology laboratory of Sakarya University, Department of Biology and placed in sorting devices consisting of Berlese funnels.

The mites of Mesostigmata and Oribatida were counted in each sample under a stereo microscope and daily average numbers detected.

Figure 1. a- research area, b- berlese funnels, c- stereo microscope, d- mite samples

FINDINGS and DISCUSSION

According to our results in sunrise the number of individuals were the highest. While the individuals number is still high in oribatids, it was the lowest in Mesostigmata. Number of oribatid mites is the lowest in afternoon.

Table 1. Daily specimen number (average, n=3)

	Oribatida	Mesostigmata
sun rise	470	22
midday	286	9
afternoon	92	20
evening	195	11

Oribatid abundance ratio: sun rise > midday > evening > afternoon,

Mesostigmata abundance ratio: sun rise > afternoon > evening > midday.

Figure 2. Daily fluctuation of soil mites

Figure 3. Daily ratios of oribatida and mesostigmata

CONCLUSION and RECOMMENDATIONS

Oribatid abundance ratios sun rise > midday > evening > afternoon, This can be explained by the presence highly sclerotized cuticle and absence of eyes in oribatids. Despite the weather temperature is highest in midday, in soil the temperature get hotter later. We can conclude oribatids are more sensitive to temperature than light. They can continue to feeding in the mid day with the help of absence of eyes. Mesostigmata abundance ratios sun rise > afternoon > evening > midday. Mites including in the Mesostigmata have weakly sclerotized cuticle, and eyes so they are sensitive to sun light and they may go to deep in midday.

ABSTRACT

The family Labidostommatidae is placed in superorder Acariformes, order Trombidiformes, and supercohort Labidostommatides. The family Labidostommatidae comprises 5 genera and 75 species. In Türkiye this family previously only recorded from Denizli province. In this study we investigate the distinct sexually dimorphism of male and female specimens collected from a oak forest in Sakarya province of Türkiye. For investigation Vega Tescan II Scannnig Electron Microscopy is used.

Keywords: Sexual dimorphism, Labidostommatidae, Türkiye, SEM

INTRODUCTION

Prostigmatid mites live on land and in water with a wide variety of diets such as predators, phytophages and parasites. Some parasitic mites are around 100 micrometers, while others are more than 10,000 micrometers in length. In the suborder Prostigmata four supercohorts have been recognized, namely Labidostomatides, Eupodides, Anystides and Eleutherengonides (Walter et. al., 2009).

The family Labidostommatidae comprises mostly yellow or orange coloured, heavily sclerotized and medium to large sized raptorial mites. Members of the family are often found in moist forest leaf litter, tree barks, mosses, lichens, and caves. All species of the family Labidostommatidae are predators on micro arthropods. The members of family Labidostommatidae have typical appearance with highly sculptured integument, chelate dentate chelicerae, first leg with capturing and sensing ability and the other three pairs of legs for walking (Pflieger & Bertrand, 2011).

Figure 2. Labidostommatid mite

The biology of Labidostommatid mites is poorly known; they have one non-feeding inactive larval stage and three active nymphal stages. Between the members of this family fertilization takes place through spermatophores (Walter et. al., 2009).

MATERIALS and METHODS

In this study, Labidostommatid mites were collected, sorted and examined using appropriate methods. Samples were taken from Sakarya, on February 2014. The samples taken were brought to the Acarology laboratory of Sakarya University, Department of Biology and placed in sorting devices consisting of Berlese funnels. For SEM investigation Vega Tescan II Scannnig Electron Microscopy is used.

FINDINGS and DISCUSSION

Sexual dimorphism is highly developed in Labidostommatid mites. The anal and genital plates are joined in females, whereas these are apart, yet close to each other in males.

Figure 2. A- female, B- male

Figure 3. female genitoanal region

Figure 4. female genital plate

Figure 5. female anal plate

Figure 6. male genitoanal region

Figure 7. male genital plate

CONCLUSION and RECOMMENDATIONS

According to Błoszyk et al. (2022) the place of origin of species can be predict according to distribution of bisexual and thelytokous parthenogenetic populations. According to Oliver (1971) thelytokous parthenogenetic reproduction is present in all suborders other than Tetrastigmata and Notostigmata.

Parthenogenesis is common in some soil mites and the evolving genotypes enable them to exist under a wide range of ecological conditions (Heethoff et al., 2007).

In some cases, geographical parthenogenesis can be observed. Sexual dimorphism in labidostommatid mites can be observed well, so the male-to-female ratios of the samples can be easily detected. The phenomenon of male decline in soil mite populations is known, and distribution pathways of the species can be analyzed using sexual and bisexual population distribution data. Populations in which specimens of both sexes are found should be considered as the place of origin of the species (Błoszyk et al. 2022).

Thanks and Information Note

We wish to thank Prof. Dr. Fatih USTEL from SAU-TESLAB (Thermal Spray Coating Laboratory) for the SEM investigations.

ABSTRACT

Polymers, which are becoming widespread day by day and find use in almost every sector, has many advantageous properties. On the other hand, their use in areas where thermal conductivity is needed is limited due to their low thermal conductivity. In order to overcome this problem, the demand for composite materials with high thermal conductivity is increasing and studies on this subject are becoming widespread. In this context, it is known that the thermal conductivity values of the polymer composite structure can be increased by adding additives to the polymer structures. In this study, to improve the thermal conductivity of polypropylene (PP), a hybrid composite of PP filled with silicon carbide (SiC) and magnetite (Fe₃O₄) was prepared. Furthermore, the impact of the filler content on the final properties of hybrid composites was also investigated in order to determine the optimum amount of additives. Afterwards, thermal conductivity and scanning electron microscope analyzes were carried out for the characterization of all hybrid PP composites. When the results of the work were examined, it was seen that the PP/SiC/Fe₃O₄ composite structure containing the highest filler ratio with 20 wt.% filler content allowed to increase the thermal conductivity value from 0.28 to 0.35 corresponding to an improvement by 26% of the thermal conductivity compared to the pure PP polymer. In addition, it could be mentioned that all these results were in accordance with the microstructure results.

Keywords: Polypropylene Composites, Thermal Conductivity, Silicon Carbide, Magnetite

INTRODUCTION

Polymeric materials, whose use is increasing day by day in many areas such as automotive, textile, packaging, packaging and construction, have features such as low density, advanced mechanical properties and high chemical resistance. One of these features, being thermally and electrically insulated, gives them an advantage in some sectors, but limits their use in applications such as heat sinks. Heat sinks are used in electronic devices to dissipate heat and prevent overheating and are employed as power transistors and optoelectronics such as lasers and light-emitting diodes (LEDs) (Moore & Shi, 2014).

In recent years, considering the usage needs of polymers in heat sink applications, it has become important to work on improving the thermal and electrical conductivity of PP, which is one of the most used polymers in the sector. PP, which is the second most used thermoplastic in the world, has advantageous and unique properties such as reasonable price and low density, high mechanical performance, excellent temperature and chemical resistance, easy processability and recyclability (Zhao et al., 2019). With these properties, PP is widely used in many areas such as packaging, automotive, textile, construction and furniture industry (Eagan, 2017). Considering its broad market prospects and excellent performance, PP is also the most promising candidate in conductivity applications. One of the methods that can be preferred for polymers such as PP in order to improve their conductivity properties is the use of appropriate fillers and additives that will increase conductivity. It is known that it is possible to increase the conductivity values of hybrid composites produced in this way.

When studies on the conductivity of polymers in the literature are examined, it is seen that it is possible to obtain an increase in conductivity values when additives with high conductivity values are added to the polymer (Zaitsev et al., 1999, Weidenfeller et al., 2014, Zhang & Zheng, 2011). In this study, it is aimed to use additive materials with high conductivity values such as silicon carbide and magnetite. Silicon carbide (SiC) is a well-known, non-oxide ceramic material and shows unique physical properties such as high thermal conductivity, low density, high strength, high hardness and excellent thermal shock resistance (Davis, 2017). On the other hand, magnetite (Fe₃O₄), an iron ore, is the mineral with the most magnetic properties among the substances found in nature. Magnetite is also known to have high thermal conductivity and radiation absorption power (Bäck, 1999).

In this study, in order to increase the thermal conductivity of PP, SiC and Fe₃O₄ added PP hybrid composites were prepared. PP/SiC/Fe₃O₄ composites with different additive contents

were prepared by extrusion method and then shaped by compression molding method in order to determine the optimum additive amount. All prepared composites were characterized by thermal conductivity analyzer and scanning electron microscope. All produced hybrid composites were characterized by thermal conductivity analyzer to investigate the thermal conductivity properties and scanning electron microscope to observe the microstructure properties.

MATERIALS and METHODS

Materials

Neat PP obtained from PETKIM and silicon carbide and magnetite nanoparticles provided from Molchem were used in this study for sample preparation. Hybrid composite structures with different additive ratios were prepared by using the specified polymer and nanoparticle additives added to the polymer at a ratio of 1:1. The blend ratios of different compositions were presented in Table 1.

Table 1: Blend ratios of PP/SiC/Fe₃O₄ hybrid composites.

Samples	PP (wt.%)	SiC (wt.%)	Fe₃O₄ (wt.%)
PP	100	0	0
PP/SiC/Fe ₃ O ₄ _5	95	2.5	2.5
PP/SiC/Fe ₃ O ₄ _10	90	5	5
PP/SiC/Fe ₃ O ₄ _20	80	10	10

Methods

Composite structures in granular form were obtained by using a twin-screw extruder (Polmak Plastik, 18 mm) in order to prepare PP based hybrid composite structures with SiC and Fe₃O₄ additives at different rates (5 wt.%, 10 wt.% and 20 wt.%). Afterwards, hybrid composite samples were shaped using a compression molding machine (CARVER/12-12) to perform characterization tests and determine optimum additive ratio.

C-Therm Technologies Comp./TH89-05-00400 brand/model device was used to measure and evaluate the thermal conductivity values of PP based hybrid composites with SiC and Fe₃O₄ nanoparticles. Analyzes were performed at room temperature according to the ASTM C518 standard. Microstructure analyzes of PP/SiC/Fe₃O₄ hybrid composite structures were performed using a Carl Zeiss/Gemini 300 brand/model scanning electron microscope (SEM).

After all samples were coated with gold/palladium alloy and made conductive, images were taken at 5 kV and a magnification of $\times 1000$.

FINDINGS and DISCUSSION

Thermal Conductivity Analysis Results of PP/SiC/Fe₃O₄ Hybrid Composites

The thermal conductivity results of PP/SiC/Fe₃O₄ composites were gathered in Table 2. In the thermal conductivity analyzes performed according to ASTM C518 standard, 4 mm thick plate was used to determine thermal conductivity values of the hybrid composites at a total filler content of 5, 10 and 20 wt.% ratios. It was observed that the PP/SiC/Fe₃O₄ composite structure containing the highest filler ratio with 20 wt.% filler content allowed to increase the thermal conductivity value from 0.28 to 0.35 corresponding to an improvement by 26% of the thermal conductivity compared to the pure PP polymer.

Table 2: Thermal conductivity values of PP/SiC/Fe₃O₄ hybrid composites.

Samples	k (W/m.K)	Standard Deviation
PP	0.28	0.00055
PP/SiC/Fe ₃ O ₄ _5	0.28	0.0022
PP/SiC/Fe ₃ O ₄ _10	0.27	0.00084
PP/SiC/Fe ₃ O ₄ _20	0.35	0.0020

Microstructure Analysis Results of PP/SiC/Fe₃O₄ Hybrid Composites

SEM images of hybrid composite structures prepared with SiC and Fe₃O₄ additives added to PP polymer matrix at 5, 10 and 20 wt.% under $\times 1000$ magnification were given in Figure 1. When SEM images were examined, it can be said that a homogeneous distribution were obtained as the additive rate increases. As a matter of fact, it can be stated that the reason why the effect of SiC and Fe₃O₄ additives appears more clearly in the composite formulation containing 20 wt.% additives can be related to this homogeneous distribution in the polymer matrix.

Figure 1. SEM images of a) 5 wt.%, b) 10 wt.% and c) 20 wt.% added PP/SiC/Fe₃O₄ hybrid polymeric composites.

CONCLUSION and RECOMMENDATIONS

In this study, PP-based hybrid composite structures were obtained by using 5, 10 and 20 wt.% SiC and Fe₃O₄ additives. Thermal conductivity properties and microstructures of the samples produced with a twin-screw extruder and shaped by compression molding method were examined. When the results are examined, it can be stated that there is a significant increase in the thermal conductivity values, especially in the hybrid composites with the highest amount of SiC and Fe₃O₄ and this is related to the homogeneous distribution of the particles in the structure, as can be seen from the SEM images.

**A STUDY OF THE IDENTIFICATION OF RATIO DECIDENDI
WITHIN THE DOCTRINE OF STARE DECISIS IN DECISION-MAKING IN INDIA**

Teaching Assistant Ph.D. Suparna BANDYOPADHYAY
Department of Law, University of North Bengal, West Bengal (INDIA)
Email: suparna_190@nbu.ac.in.

ABSTRACT

The best interest of every judge is to deliver justice to the case at hand. In order to deliver a sound, fair and reasonable judgment, a judge often refers either to precedents or to overruling. If the precedent is applied, it becomes *stare decise* in an authoritative sense, and if the precedent is overruled it merely remains persuasive and loses its value. While referring to or overruling a judgment *ratio decidendi*, present in the ruling plays a very significant role. *Ratio decidendi* ordinarily means the reason or reasons behind a decision. Hence, it is pertinent to identify the ratio of the cases from the discussions of the court with due regard to the case present at hand. Because ratio challenges the validity of a judgment in which context it was decided. Problems do arise in determining *ratios*, as a case may have multiple reasons for reaching a decision. In such a situation, the correct identification of a ratio becomes complicated. The researcher has discussed four tests for determining the *ratio decidendi* of a case which includes- Wambaugh's Inversion Test, Goodhart's Material Test, Julius Stone Test and Halsbury Test. The focus of the paper is to study the correct application and validity of precedents as well as the reasoning behind the overruling of cases in the Indian context so that the nature of law in terms of stability and dynamism can be assessed.

Keywords: Stare Decisis, Precedent, Overruling, Judge, Ratio Decidendi, Wambaugh's Inversion Test, Goodhart's Material Test, Julius Stone Test and Halsbury Test

I. INTRODUCTION

The intention of every judge is to impart justice to the case at hand. In terms of imparting justice, judges refer the previously decided cases and apply those principles to the case at hand because it is a belief that the principles so laid were tested and accepted principles of law. However, if such previously laid principles of law remain rigid and unalterable, then there is likely to be a situation where society will lose its dynamism of growth and development as nobody will dare to introduce changes. On the other hand, if this doctrine of *stare decisis* is disregarded and frequent overruling is resorted to, it will create an unjust situation where the justice delivery system will forego its stability, and people will have no faith in law and justice. Hence, for an effective justice delivery system, it is important to balance both *stare decisis* and overruling doctrine so that justice may be rendered effectively.

Therefore, the focus of the present chapter is on understanding the role of the doctrine of *stare decisis* in justice delivery system and its stability as well as its dynamism. The objective of writing this paper is to assess the opinion of the jurists regarding the doctrine of *stare decisis* and its utility for stability of the justice delivery system and evolution of new principles of law and how the ratio decidendi stabilizes the concept of precedent and overruling.

II. Evolution and The Concept Of The Doctrine Of *Stare Decisis*

The ancient Greek Philosopher Aristotle during 322 BC in Nicomachean Ethics, offered the ubiquitous maxim that- “like cases should be treated alike”.¹

The doctrine of *Stare Decisis* is based on a Latin maxim- *Stare decisi et non quieta movere* it means “to stand by decisions and not to disturb the undisturbed.”² For providing judges with a useful decision rule, the *stare decisis* doctrine reflects the legal process's fundamental values and the primordial tension within the common law system, between change and stability.

Stare decisis has its origins in ancient Greece, Rome, and Egypt, where judges referred to past decisions for guidance on how to interpret present and future cases. However, consulting past cases was not an obligation.

²Plato, (1999), Apology Part I, (The Death of Socrates), www.gutenberg.org The Project Gutenberg EBook of Apology (e-book).

During 1200, for the first time something like *stare decisis* was introduced in the medieval English period of common law. By 1256, Justice **Henry de Bracton** from England wrote a treatise that supported the idea of legal precedent. De Bracton did not believe that following precedent should be an obligation; his treatise helped and introduced the principle of precedent to other legal professionals. De Bracton's treatise, have compilation of legal cases which further popularized the idea of precedent in a persuasive sense.

By 1500, for the first time, the idea of following precedents started and simultaneously became obligatory. In the English case of *Virley v. Gunstone*,³ the appellate court decided not to overturn a decision based on the idea that it should conform to past decisions. Chief Justice of King's Bench, Sir Edward Coke (1613-19), elaborated the idea of precedent further and stated, "Our bookcases are the best proof of what the law is," referring to past decisions. Justice Edward Coke of Britain in 1606 gave a maxim, "*Neminem oportet esse sapientiores legibus i.e.*, no man out of his own private reason ought to be wiser than the law, which is the perfection of reasons."⁴ Sir Coke believed traditions should be followed and common law was an ancient custom dating back to time immemorial.⁵ And the best way to learn customs was by studying the decisions of earlier cases.⁶ He attempted to further popularize his legal philosophy by writing a thirteen-volume treatise called *The Reports*, a vast collection of case laws.⁷ Through these reports, he wanted to explain the case laws and his objective was to improve the quality of law reports which may undermine the usefulness of precedent.

Coke's ideas about the importance of legal precedent continued to influence the development of case laws over the next few centuries. However, there were still fluctuations relating to adopting precedents or overruling them. However, if one considers Jeremy Bentham and John Austin of the United Kingdom during 1800, they also followed strict positivism stating law is a command of political superior on political inferior, where case laws are subservient to statutes made by legislature.

Sir Edward Coke describes and justifies the existing legal rules rather than working out how the law provides rules for making rules. He was not a prophet of change. He feels

⁷ *Ibid.*

that what exists has lasted, and therefore, it is to be trusted.⁸ Coke so trusted the wisdom of judges that he ranked it above the wisdom of the legislature. Coke is the architect of the doctrine of judicial review. The modern doctrine of judicial review traces its origin to the opinion of Coke rendered in *Bonham's Case* (1610).⁹ From this history emerged *Marbury v. Madison*¹⁰ and two central principles of constitutional law. The first of these is that the judges are the ultimate arbiters of what is constitutional. The second, perhaps a necessary corollary of the first, is that judges are independent of other branches of the government. Coke treats the judicial decision as a process by which law is made. According to him, a case is to be trusted not because it could be easily understood or because it framed the issues. It is to be trusted because the crystallization of the facts and elucidation of the principles had been established through the process. Hence, Coke contributed substantially to the development of the doctrine of the *stare decisis*.¹¹

Stare decisis has a long history in the United States as well. In India, the rule began with the advent of the British raj and later with the acknowledgement of the Constitution in 1950 under Article 141 of the Constitution of India.¹² The Framers of the Constitution of the U.S.A. believed in the importance of the doctrine, Alexander Hamilton, a founding father of the United States in 1775, believed that it should be obligatory to follow precedent. James Madison, the 4th U.S. President, however, disagreed with the principle that following legal precedent should be compulsory. During Chief Justice John Marshall's tenure (1801-1835), the Supreme Court voted for a strong preference for adhering to precedent, while still allowing some room to overturn cases.

But simultaneously *Stare decisis* became less strict by 1938, when a longstanding precedent set by *Swift v. Tyson*¹³ was overruled in *Erie Railroad Company v. Tompkins*.¹⁴ It was a landmark decision by the U.S. court in which the Court held that [federal courts](#) do not have the judicial power to create general federal common law when hearing state law claims under [diversity jurisdiction](#). The U.S. courts have continued to uphold precedents for the most

part, but courts are not bound by them unless the precedents come from higher courts. But in 1973 through the judgment of *Roe v. Wade*,¹⁵ the U.S. Supreme Court ruled that the Constitution of the United States protects a pregnant woman's liberty to choose to have an abortion without excessive government restriction.

III. Rule of Precedent

The doctrine of precedent, *i.e.*, that the decision of a court of competent jurisdiction on a point of law necessarily involved in the judgment, is not only binding upon the parties, but until overruled becomes evidence of law which courts are bound to follow when applicable, is firmly established in both England and the United States, though not, at least to that extent, in Continental countries. Judge Dillon says in his *Laws and Jurisprudence*: “Evidently the doctrine of precedent and its direct fruits – namely, the colossal and ever –growing mass of reported cases, are to-day even more than in Bentham’s time, subjects of vast and living moment, whose depths none of us has fully sounded.”¹⁶ It is obvious that this embarrassment is not temporary, but owing to continuing causes which must increase the bulk of our case law in the future in ever greater volume. An exhaustive practice by precedent in this country has, therefore, become impossible. This vast accumulation of case law has a profound effect, if not upon the quality, certainly upon the length of judicial opinion. An opinion is not deemed exhaustive unless it quotes at length not only from the prior opinions of the same court but from the opinions of the courts of other states, and sometimes from courts of England, and attempts to reconcile their conflicting analogies. It may be suggested that this latter evil may be remedied by greater condensation and brevity of opinions. We must not overlook, too, the crowded dockets of our courts, the lack of time for condensation; nor may we ignore the prevailing use of stenography by our judges, as it is a matter of familiar knowledge that dictation without ample time for revision does not tend to conciseness of statement. The conclusion is inevitable that the doctrine of judicial precedent will be profoundly affected by the growing impossibility of the effective use of precedent due to this enormous and increasing volume of case law.

In this connection, it must be observed that the doctrine of judicial precedent as understood in this country is not similar to the practice followed in the continent of Europe. Although superior tribunals are required to put their judgments in writing, with the reasons and grounds therefore, such decisions do not have the element of authority they have

¹⁵ 410 U.S. 113 (1973), (UNITED STATES).

¹⁶ “Law and Jurisprudence of England and America.

henceforth, had in our judicial system.¹⁷ Chief Justice Baldwin of Connecticut said in a recent address: “we have given; I cannot but think undue prominence to judicial precedence as the natural source or enunciation of the law. The multiplications of distinct sovereignties in the same land are fully officered and publishing in official form the opinion.¹⁸ The guiding principles of our law are few and plain. Their application to the matter we have in hand is the business of our profession to make, and if we spend more time in doing it ourselves, unless in endeavoring to find out how other men have done it, in other cases, we should, I think, be better prepared to inform the court and serve our clients.”¹⁹

The doctrine of *stare decisis* is a composite doctrine in which rule of precedent forms a part of it. Literal meaning of *stare decisis* is- let the decision stand at its rightful place or do not disturb which has been settled once. Whereas, precedent means pre + incidence, it signifies previous incidence or previous principles that can be applied in the present ruling or in future cases. The principle of *stare decisis* keeps the legal system moving in the same direction but in precedent it is always possible that it may get overturned, however, it requires lot of effort, analysis, logic, and analogy. It is like stopping a car that is moving at 60 miles per hour.²⁰

The rule of precedent can be understood better with an illustration, suppose Mr. X drove his car through a footpath and knocked down a beggar accidentally. Court ruled that driving in a footpath is illegal and punishable. Hence, while determining subsequent cases with similar facts and issues court will follow the case of Mr. X. this is called precedent. However, the court will be bound to distinguish a case from previous case and overrule the decision placed in Mr. X, in a similar situation when the car is not an ordinary car but an ambulance or an army vehicle which is going for an emergency or a war. Hence, the decision of the case revolves around the purpose and function the vehicles were to discharge. The edifice of the principle of precedent stands on three important pillars *i.e.*, the decision itself which is derived after analyzing the *ratio decidendi* which is the reason behind the judgment or the principle upon which the decision is made to stand and *obiter dicta* that are comments passed by the court in the context but not in relation to the case at hand.

IV. Identification Of Ratio Decidendi

Ratio decidendi ordinarily means the reason or reasons behind a decision. It is important to identify the ratio of the case from the discussions of the court with regard to the case at hand. Problems do arise in determining *ratios*; as a case may have multiple reasons for reaching a decision. In such a situation identification of a ratio becomes complicated. There are four tests for determining the *ratio decidendi* of a case.

1. Wambaugh's Inversion Test
2. Goodhart's Material Test
3. Julius Stone Test
4. Halsbury Test
- 5.

Wambaugh's Inversion Test

In order to understand whether the statement in a given decision is *ratio decidendi*, Eugene Wambaugh,²¹ an American legal scholar, propounded a test known as Wambaugh's Inversion Test in 1892. This test is applied to determine whether a judicial statement in a common law case is a *ratio* or an *obiter*, which is respectively called as a crucial part of the judgment and non-crucial part of the judgment. According to Wambaugh for understanding the element of a case one should invert the statement of a judgment; that is to say, ask whether the decision would have been different, if the said statement was omitted. If the answer is 'yes', then the statement is crucial and is the *ratio* of the case as well. If the answer is 'no,' then the statement is not crucial, hence, not a *ratio*.²²

Wambaugh gave the following instructions for determining the ratio:

- (a) Write gingerly the exact proposition of law

Eg- Manufacturer's **liability** to end consumers in case of contaminated food

- (b) Now, insert within the proposition a word reversing the meaning

Eg- Manufacturer's **no-liability** to end consumers in case of contaminated food

- (c) Inquire as to whether, if the court had conceived this new proposition to be correct and had it in mind, the decision could be the similar

Eg- No

(d) If the answer is positive, however correct the original proposition may be, the case is not a precedent for the said proposition.

²¹American Legal Scholar, (February 29, 1856– August 6, 1940).

²² *Supra* 21.

(e) But if the answer is negative, the case is a precedent for the original proposition and possibly for another proposition also.

A proposition of law which is not *ratio decidendi* under the above test must, according to Wambaugh, constitute a mere dictum. The Inversion Test (or reversal test) as propounded by Wambaugh is based on the assumption that the *ratio decidendi* is a general rule without which a case must have been decided otherwise. The merit of Wambaugh's test is that it gives an idea as to which part of the decision cannot be a *ratio decidendi*, rather than pointing out which part of a decision is *ratio decidendi*. On the same point the inversion test has been criticized by Sir Rupert Cross. He states,

“The encouragement to carefully shape the presumed proposition of law and the restriction of the test to cases shows only one point which rob the most of its value as a means of determining what was the *ratio decidendi* of a case, and also ascertain what not a ratio is”.²³

The fundamental principle is that the *ratio* will be that which confirms the ultimate jurisdiction. So, the proposition given by Wambaugh is that if the *ratio* is removed from the judgment will there be a reversal of judgment or will it remain as it is, if it changes then it is *ratio* and if it does not then it is *obiter dictum* or no *ratio*.

Supreme Court of India through its judgment in 2018 has introduced the “inversion test”, in *State of Gujarat and others v. Utility Users Welfare Association and others*,²⁴ a two-judge bench consisting of Justice **Jasti Chelameswar** and Justice **Sanjay Kishan Kaul**, they considered the judgment of a coordinate bench of two judges consisting of Justice **Surinder Singh Nijjar** and Justice **A.K. Sikri** of Supreme Court in *TANGEDCO Ltd. v. PPN Power Generation Co. (P) Ltd*²⁵ that was said to be binding to some extent even if it was only persuasive in nature. One of the points on which the Supreme Court in TANGEDCO's case had pronounced its judgment was on the point as to who should head Electricity Regulatory Commissions constituted under the Electricity Act, 2003. The Supreme Court contented that the appointment to the post of a chairman should be occupied by a retired judge of a High Court. This *ratio* would have been binding on the coordinate bench of two judges in the subsequent case *i.e.*, the *Utility Users Welfare Association* case, in which the question is directly involved, as to whether the Electricity Commission constituted under the Electricity

²³ Rupert and Cross, J W. Harris, 1991, Precedent in English Law, p. 52, Clarendon Law Series.

²⁴ CIVIL APPEAL No.14697 of 2015 (INDIA)

²⁵ CIVIL APPEAL NO. 4126 OF 2013 (INDIA).

Act 2003 should be headed by a High Court judge?²⁶ **Justice Kaul**, while writing the judgment in the *Utility Users Welfare Association*, posed another question that,

“Thus, the issue arises, whether the observations made, albeit to be constituted as advisory or suggestive qua the appointment of a Chairman and a Member are to be treated as ratio decidendi or obiter dicta.”

The Supreme Court then applied the inversion test in the following terms:

“In order to test whether a particular proposition of law is to be treated as the ratio decidendi of the case, the proposition is to be inverted, i.e. to remove from the text of the judgment as if it did not exist. If the conclusion of the case would still have been the same even without examining the proposition then it cannot be regarded as the ratio decidendi of the case.”

Applying the test, the Supreme Court, held that the presence of judicial member to a commission was indisputable in so far as the Chairman of the commission was concerned, and further held as follows,

“Now applying the test to the aforesaid judgment the proposition is reversed, i.e., “the Chairman need not be a judicial member,” the fact remains that it would have no impact on the decision in that case, which was related to inter alia the interpretation of Section 86 of the said Act. This in fact testifies what we have held aforesaid qua of the appointment a chairman from the pool of Judges.”

In effect, the Supreme Court while agreeing with that part of the judgment in TANGEDGO case held the commission must have a legally trained member. The court did not feel bound by the other observation that it should be headed by a retired High Court judge since it did not pass the inversion test.

Thus, through the judgment in *Utility Users Welfare Association*, the “inversion test” has come to stay in Indian jurisprudence.

Goodhart’s Material Test

By 1929, Goodhart argued that there is no necessary connection between ratio and reasons of a decision rather the *ratio* of a case must be found in the reasons for the decision. The reasons given by the judge in his opinion guide us for determining which facts are considered material and which are immaterial. Hence, there could be numerous reasons for a decision but the *ratios* among those reasons are few which are binding as precedent in future

²⁶ NL Rajah, (July 30, 2020), *The creeping presence of the Inversion Test*, <https://www.barandbench.com/columns/the-creeping-presence-of-the-inversion-test>.

cases.²⁷ For example, in *Donoghue v Stevenson*²⁸, the House of Lords held that the manufacturer of a bottle of ginger beer could be liable to the consumer if, the bottle was sealed and the ginger beer was contaminated by the remains of a snail which made consumer ill after drinking it. So, if we look into the reasons of such judgment it involves-

- A. The person who drank the beer was a consumer,
- B. The impurity in the beer was a major concern
- C. Presence of snail in the beer amounts to negligence,
- D. The bottle was sealed and opaque in condition
- E. And the negligence has been caused by the manufacturer.

These above facts are the reasons behind the judgment. But among these reasons the *ratio* is based on the material fact which includes the – the harm caused to an extent to make somebody ill due to the decomposed body of snail which is poisonous and the harm must have been caused negligently. The negligence was on the part of the manufacturer of the beer. The rest of the facts like consumer was a woman, where she is from, the year when this negligence happened and who did this, whether he had prior motive to commit wrong or not to commit the wrong is entirely immaterial. The *ratio decidendi* of a case can be defined as decisions based upon the material facts of the case. According to Goodhart material facts are those facts without which a case becomes impossible to decide. Therefore, Goodhart's theory is also known as Material fact theory.²⁹ Goodhart test of the ratio is ratio decidendi = material facts + decision. Goodhart states that "It is by his choice of material facts that the judge creates law."³⁰

Thus, *ratio decidendi* as per Goodhart is facts determined to be the material facts of the case, plus the judge's decision based on those facts. It is by his choice of the material facts that the judge creates law.

For Goodhart, the first task is to ascertain which facts the judge took into consideration, then to determine which of them "material" to the decision. The *ratio decidendi* of a case is the conclusion that the judge reaches on the basis of the facts deemed material and those excluded as immaterial. The reasons placed by a court in reaching a decision might be considered inadequate, incorrect or correct, or all of the above but the decision of the court,

²⁷ Rupert and Cross, J W. Harris, (1991), Precedent in English Law, p. 66, Clarendon Law Series.

²⁸ *Donoghue v Stevenson*, [1932] UKHL 100. (UNITED KINGDOM).

²⁹ Rupert and Cross, J W. Harris, 1991, Precedent in English Law, p. 68, Clarendon Law Series.

³⁰ *Ibid.*

with respect to material fact would be binding on subsequent cases. The principle that evolved in this case was manufacturer's liability to the consumer.

In yet another example Lord Goodhart in *Rylands v. Fletcher*³¹ analysed the following facts:

Fact I. D had a reservoir built on his land.

Fact II. D did not know about the presence of old coal shafts under the land filled loosely with soil and debris which joined Fletcher's adjoining mine.

Fact III. The contractor who built it was negligent in treating coal shaft.

Fact IV. Water escaped and injured P.

Conclusion- D is liable to P.

Material Facts, as considered by the Court are all the above four facts. Based on these facts, the court held D liable to P and evolved the principle that one should not undertake any activity on one's own land that has the potential of causing harm to others. Altogether, the *ratio* was established, and the doctrine of "strict liability" was pronounced.

This judgment is considered to have been based on the decision of *Dhonogue v. Stevenson*. A further development of this principle case can be seen in the case of *M.C Mehta v. Union of India*.³² In this case the Supreme Court broadly used the analogy of *Ryland v. Fletcher* Case but refrained from giving the same judgment, though all the above facts of M.C Mehta's case were similar to Ryland's case with one exception that the company was "aware" of the toxic or dangerous nature of the gas. In *Ryland v. Fletcher* the respondent was not "aware" of the shaft and water was *per se* not dangerous. The facts of the case of *M.C Mehta v. Union of India* (oleum gas leak) are:

Fact I. Oleum gas leaked from a fertilizer plant.

Fact II. Company under all circumstances knew about the toxic nature of the gas

Fact III. The escaped gas took many lives and caused damage.

Conclusion- the company is liable to pay compensation

As an extension of the principle of strict liability, the principle of absolute liability evolved. The principles laid down in *Dhonogue v. Stevenson*, *Ryland v. Fletcher* remain intact, and yet they are a chain leading to the present principle of strict liability.³³

³¹(1868) UKHL 1, (UNITED KINGDOM).

³² 1987 Oleum gas leak Case (INDIA).

³³ Rupert and Cross, J W. Harris, (1991), Precedent in English Law, p. 68, Clarandon Law Series.

Hence, Goodhart's principle states, that the facts of the case must be considered to be as the judge saw them or treated them and not necessarily as the judge actually saw them material, which can lead to some strange consequences.

The only drawback of the Goodhart test is that Goodhart could not lay down a test for identification of material facts that is to be taken into consideration. The test is also not in actual use by the judges because in practice the courts pay more attention to the judge's own sense of rationality, logic and formulation of the law than that permitted under the test.

Difficulty arises when the court deals with the law without first finding the facts. The researcher believes Goodhart relied upon the facts of the case and segregated the same as material and immaterial but in reality *ratio* lies in reasons not in facts.

Hence, no two judgments can be exactly similar to each other, there has to be certain variations as to the facts and circumstances. And there is no thumb rule to determine material and immaterial facts because all the facts are relevant to the case, the judge uses his reason to identify the relevant fact.

JULIUS STONE'S TEST

The test propounded by Julius stone for determining *ratio* of the case is divided into two types- one is descriptive ratio and another is prescriptive ratio. Descriptive *ratio* is the *ratio* from the actual case while the prescriptive ratio denotes how the ratio may be applied to a future case.

Descriptive *ratio Decidendi*

The reason of a case as per Stone is neither the facts of the case nor the issues present or the law applied or the order given rather it is a 'necessary step' that a judge needs to apply while resolving the case.³⁴ Ryland was the owner of the land. He would continue to be the owner of the land even if the land had been leased or mortgaged. The escape of water from the tank amounted to unusual activity on the land. Escape of water from the underground was not natural.

The descriptive ratio means the reason behind a judgment, which needs to be established by describing the point in a case with the help of one necessary or an additional step. As in *M. C Mehta v. Union of India*, the judge in order to establish absolute liability had to describe the ratio that the gas which leaked was not an ordinary gas rather the oleum gas which is highly toxic in nature.

³⁴ Julius Stone, (Nov. 6, 1959), The Ratio of the Ratio Decidendi, Mod. Law Rev., Vol. 22, <https://www.jstor.org/stable/1091547>.

Therefore, the *ratio decidendi* of a decision is the interpretation of the word which may have dubious meaning. The reason being as it was the only part of the judgment that needed an extra step *i.e.*, as per Professor Stone a necessary step of clarification and reconsideration. The other parts of the judgment were simply the facts, the existing law, and the application of the law to the facts. And the rest of the statement in a judgment could be *obiter dicta* which have no binding force in future cases.

Prescriptive Ratio Decidendi

After understanding *descriptive* ratio, one needs to examine the *prescriptive* ratio so that the decided or precedent *ratio* can be prescribed or applied to future cases satisfactorily.³⁵ The reason behind such a prescription is that, the previous case and the future case will never be identical to each other. There will always be distinctions between the two.

Professor Stone defined the transference of a single judgment to the future judgment as the level of generality because the transference can only occur when the previous case with due precedent is useful in a similar case in which exact facts occur. Such a situation normally does not arise. Taking the example of *Donoghue v. Stevenson*³⁶ again, the House of Lords held that the manufacturer of a ginger beer could be made liable to the consumer if, before the actual consumption the bottle was sealed and the ginger beer was contaminated by the remains of a snail which made the consumer ill as a result of drinking it. *Prima facie*, the decision would be binding on later courts in cases with the same facts. But when the facts slightly change like in this case, it would be binding if Coca-Cola was sold in a sealed bottle, but would not be applicable if Coca-Cola was sold loose. It would not be applicable if the drink was a transparent liquid in a transparent bottle. In the case of Coca-Cola, the precedent would be applicable as the liquid is dark in colour, and the snail would be invisible. The logic suggests that the principle should apply, to all food and drink which is ‘packaged’ to prevent inspection.

As per Julius Stone the precedential reasoning does not work by way of deductive logic. The descriptive ratio may be similar or dissimilar to the future case. The greater the similarity of the descriptive ratio to the future case, the greater the ratio will be binding on that future case. And lesser the descriptive ratio is similar to the future case, the lesser it will be binding. In that case Inductive reasoning is seen in the Julius Stone’s test as it employs a

³⁵ *Ibid.*

³⁶ [1932] AC 562, (UNITED KINGDOM).

scientific method, of probabilities of situation where from one factual situation one can get number of probable situations which may likely to arise.

According to Professor Gangotri Chakraborty, it is practically impossible that two situations are indistinctively similar. However, facts that occurred years back may have same application in present or in future only in terms of the principle laid down and in that case judges should not only resort to deductive, inductive reasoning or analogous reasoning of case but also be guided by the principles of natural law of equity, justice and fairplay.

For example, in *Bridges v Hawkesworth*,³⁷ the court ruled, a customer is entitled to keep money which he found on the floor of a shop because shop is a public place of private ownership. But in *South Staffordshire Water Company v Sharwood*,³⁸ the finder of two gold rings in the mud at the bottom of a pool owned by plaintiff was held to be not entitled to retain them, because the site of the finding had not been open to the public as it was a private property. Hence, the Hon'ble court with a correct analogy distinguished between two identical cases and based its judgment upon logical reasoning.

Halsbury's Test

Lord Halsbury also acknowledged law of precedent. He explained the word “*ratio decidendi*” as a general rule where only the part of a decision alone given by the Court of Law is binding upon the Courts of coordinate jurisdiction and inferior Courts. *Ratio decidendi* is consisting of a reason, an important principle upon which the court determines the question of law as to the fact. This underlying principle or to be said a general rule which forms the only authoritative element of a case is termed as *ratio decidendi*.”³⁹

According to Lord Halsbury a case lays down only one ratio. In the famous case of *Quinn v. Leathem*,⁴⁰ Lord Halsbury said:

Every judgment must be treated as applicable to the proved particular facts, or which were assumed to be proved, as the generality of the expressions found in previous cases are not intended to be the interpretation of the whole law, but governed and qualified by the particular facts of the case in which such expressions are to be found. In this case court held the conspiracy of Quinn to wrongfully and maliciously induce Leathem's own employees and

⁴⁰ [1901] UKHL 2, (UNITED KINGDOM).

customers to stop working for Leathem and stop buying from Leathem's shop was actionable upon proof of damage.

Similarly in the precedent of *Allen v. Flood*,⁴¹ Flood and Walter was a shipwright employed on a ship, on a casual basis. The fellow workers objected to their employment as they had worked for a rival employer earlier. Allen was a trade union representative for the other employees on the ship and approached the employers, for removal of Flood and Walter. The employers consequently discharged them and refused to employ them again. Flood and Walter brought action for maliciously inducing a breach of contract. Thus, according to Lord Halsbury, it is by the choice of material facts that the Court creates law. Hence, good judges' makes good law and bad judges make bad law.

Hence, the case before the Court should be decided in accordance with laws and the doctrines. The mind of the Court should be clearly reflecting on the material facts which are in issue with regard to the facts of the case itself. The reason and spirit of case makes the law not the written words of a particular precedent make it. It is always dangerous to take one or two observations out of a long judgment and treat them as if they gave the *ratio decidendi* of the case.

V. Rules of The Ratio Decidendi

The pre dominant rules of *ratio decidendi* are as follows:

1. The ratio must be directly related to the issue of the case;
2. The ratio must be derived from disputes of law, not from the disputes of fact;
3. To constitute as the ratio, it must be argued in court at the first instance;
4. The facts of the precedent case shape how narrow or wide the ratio should be applied to future cases. For example, from the finder' keeper principle we can derive that a finder can keep the thing if he/she has found in public land not in private land. As it is for the future courts to decide how narrow or wide the precedent ratio is.
5. *In case a precedent has multiple reasons, all the reasons are said to be binding.*

To constitute as the ratio, the majority of judges must agree where there are multiple judges.⁴² *In Cheater v Cater*⁴³, the Hon'ble court said

“If a judge states two grounds for his judgment and bases his decision upon both, neither of those grounds is a dictum”.

⁴¹ [1898] AC 1, (UNITED KINGDOM).

⁴² H.K. Lücke, (1989), 'Ratio Decidendi: Adjudicative Rationale and Source of Law, 1 *Bond Law Review* 49.

⁴³ (1918) 1 KB 247, (UNITED KINGDOM).

In *London Jewellers Ltd v Attenborough*,⁴⁴ Greer LJ said:

“In that case two reasons were given by all the members of the Court of Appeal for their decision and we are not entitled to pick out the first reason as the ratio decidendi and neglect the second, or to pick out the second reason as the ratio decidendi and neglect the first; we must take both as forming the ground of the judgment”.

6. The ratio can come in multiple forms like: A common law rule; or an Interpretation of statute, or of a common law rule etc.⁴⁵
7. When judges have different reasons for their decision, the essential areas of agreement is the ratio. In such situation determining the *ratio decidendi* of a judicial decision becomes a complex task. Hence, the *ratio* must be drawn from the essential areas of agreement found within the reasons of the judges in the majority. If judge A decides in favour of plaintiff for reasons x, y, and z, and judge B decides for the plaintiff for reasons p, q, and x, and if judge C decides for the defendant, then the *ratio decidendi* is x, i.e., the only reason shared by a majority of judges.⁴⁶

VI. Obiter Dicta

The term dictum derives from the Latin ‘dicere’, which means- to say, and refers in legal usage to anything in a judicial opinion that is "merely" said and not, strictly speaking, meant. That which is "*obiter dictum*" is stated only "by the way" to the holding of a case and does not constitute an essential or integral part of the legal reasoning behind a decision. The concept of dictum has thus been used to distinguish that which is significant, authoritative, binding-in short, meant-in a judicial opinion from that which is not.

In *Mohandas Issardas v. A.N. Sattanathan*⁴⁷ the Bombay High Court expressed that the judgment which does not have any importance in the decision is called obiter dicta. This is not an important element to arrive at a decision rather used to describe the circumstances. They are generally the incidental remarks made by the court while dealing with the actual conflict between parties. But in the case of *Sarwan Singh Lamba v. Union of India*⁴⁸, the Supreme Court observed, that in general circumstances, even the *obiter dictum* mentioned in a decision of the court is expected to be followed. Moreover, the Supreme Court’s *obiter dictum*

⁴⁴ [1934] 2 KB 206, (UNITED KINGDOM).

⁴⁵ Christopher Enright, 2002, *Legal Technique*, p. 247, The Federation Press.

⁴⁶ Frederick Schauer, (2009), *Thinking Like a Lawyer: A New Introduction to Legal Reasoning*, Harvard University Press.

⁴⁷ AIR 1955 Bom. 113, (INDIA).

⁴⁸ 1995 SCC (4) 546, (INDIA).

carries a considerable weightage. But such weightage depends upon the kind of *dictum* given by the court. If the *dictum* is a casual remark by the court, it does not have any effect on the parties or the subsequent cases. In another scenario, certain *obiter dicta* have recommendatory or persuasive value but do not bind anyone. Hence, the *ratio decidendi* is an important element of judgment rather than *obiter dicta*. One can say that the *Obiter dicta* is not binding on inferior courts, it generally has a persuasive element.

VII. Merits And Demerits Of Stare Decisis

The doctrine of *Stare decisis* includes merits as well as demerits which can be seen in the legal systems where it is practiced which includes mostly in common law legal system and mixed law system. Merits of *stare decisis* include:

- I. **Consistency and fairness:** the doctrine of *Stare decisis* ensures consistent legal principles it is meant to ensure that similar cases will reach similar decisions that are consistent with each other. The idea of consistency is to help the courts to implement laws in a better way, because the law treats everyone fairly irrespective of citizen or non-citizen.
- II. **Flexibility:** there is a presumption that the law changes with time because we live in a dynamic society which keeps a room of overturning precedent open.
- III. **Saves time and resources:** the doctrine encourages judges to consult past decisions for reference instead of making their decisions in a vacuum. This may help courts decide difficult cases more efficiently and quickly because they have set of guidelines in a form of law reports.

The doctrine of *stare decisis* also has some demerits as well which includes:

- I. **Rigidity:** because of the sense of respect for past judge and their judgments even if it was bad or wrong it becomes a tough task for a judge at present to overrule a past decision.
- II. **Undemocratic decision-making:** Unlike laws passed by governments, high-court decisions are often made by judges who are appointed by the executive who is politically coloured rather than elected by the common people. This may make their decisions less accountable to the general public.
- III. **Too much emphasis on the past:** Following precedents that are decades or even centuries old can sometimes lead to absurd or outdated results. Change is the law of nature if anything does not change it is considered dead.

VIII. Doctrine of *Stare Decisis* in Indian Context

The doctrine of *stare decisis* is an age old and most respectful doctrine which states- once a decision has been made by the court of law it shall not be allowed to be opposed or reversed by anyone. As per the researcher, this principle is based on the law of ‘bow and arrow’ as once an arrow is out of the bow and hits a bird the same cannot be reversed at any cost and reversing the same will be against the law of nature. The doctrine of *stare decisis* has an express mention under Article 141 of the Constitution of India. It states- **the law declared by the Supreme Court shall be binding on all Courts within the territory of India. The article *prima facie* includes the Supreme Court of India itself. But by the year 1955 in *Bengal Immunity Co. v. State of Bihar*,⁴⁹ the Supreme Court overruled its own decision in *State of Bombay v. The United Motors Ltd.*,⁵⁰ observing that the Supreme Court can depart from its previous decisions if it is found on erroneous principle and has baneful effect on the general interest of the public. Therefore, the overruling of a decision is permissible, “if the rule of construction accepted by the Supreme Court is inconsistent with the legal philosophy of the Constitution.”⁵¹**

Hence, one can say that till 1955 judiciary followed the idealistic approach in decision making by not overruling its previous decisions. Simultaneously, the judiciary also had the positivist approach which was seen in *A. K Gopalan* case⁵² during 1951. And later on after 1978 the judiciary ingrained the naturalist approach in its decision via *Maneka Gandhi* case⁵³. Thereafter, by 1978 judiciary applied pragmatic approach in its decision making along with naturalistic approach which can be seen in *kesavananda Bharti Case*,⁵⁴ *Sunil Batra case*,⁵⁵ *Shayara Bano case*,⁵⁶ *Joseph Shine case*⁵⁷ and many more till now.

Indian constitution and the apex Court applied the new version of *stare decisis* which is based on the progressive approach of decision making *i.e.*, even if an arrow is out of the bow and hits a bird, the action needs to be scrutinized and reconsidered because hitting a bird is *per se* wrong and continuing this wrong will be a heinous crime above all. Therefore, even if a law has been promulgated through cases, the same law while regarding as a precedent

should be re-examined that whether it is fulfilling the test of rationality or not. And if the answer is in affirmative sense then only the law shall be applied. Such super precedents are called *stare decisis*. In 1976, **Richard Posner** and **William Landes** coined the term "super-precedent." In an article⁵⁸ they described on testing theories of precedent by counting citations. Posner and Landes used this term to describe the influential effect of a cited decision. The term "super-precedent" later became associated with the difficulty of overturning a decision. The landmark judgment like *Maneka Gandhi v. Union of India*⁵⁹ has been cited 215 times by the apex court while delivering other judgments. Similarly, the decision of *State of Haryana v. Bhajan Lal*⁶⁰ is also pronounced 165 times.⁶¹ The longest judgment ever delivered by the Supreme Court is *Kesavananda Bharati v. State of Kerala*,⁶² which is the third-most cited case with 155 citations in the history of the apex court.⁶³ The judgment established the Supreme Court's authority over the Constitution and prevented Parliament from altering its 'basic structure.' Even the series of M.C Mehta cases including *M.C. Mehta v. Union of India*⁶⁴ is also cited in most of the environmental law issues for establishing 'absolute liability principle.' In *Shayara Bano v. Union of India*,⁶⁵ Supreme Court gave a much awaited ruling for uplifting the situation of Muslim women by declaring *talaq-ul-bidat* to be illegal which is yet another achieved milestone of constitutionalism.

In *Joseph Shine v. Union of India*⁶⁶ **Justice D. Y Chandrachud** struck down 158 year old pre-colonial law of criminalization of adultery under Section 497 of IPC as unconstitutional by overruling *Sowmithri Vishnu v. Union of India*⁶⁷ which upheld adultery. Again, in the year of 2018, the apex court delivered its unanimous verdict in *Navtej Singh Johar v. Union of India*,⁶⁸ by decriminalizing portions of section 377 of IPC, relating to consensual sex among same sex adults in private. This decision overturns the 2013 ruling of *Suresh Kumar Koushal v. Naz Foundation*⁶⁹ in which the court upheld the law. In order to interpret the law in a broader way the Supreme Court in *National Legal Services Authority v.*

⁵⁸ Mark S. Kende, 2012, Is Bakke now a super precedent does it matter? The U.S Supreme Court's updated Constitutional Approach to affirmative action in Fisher", 15 U. Pa. J. Const. L. Height. Scrutiny 1.

⁶³ *Ibid.*

⁶⁴ AIR 1987 SCR (1) 819, (INDIA).

⁶⁵ writ petition (civil) no. 118 of 2016

⁶⁶ WRIT PETITION (CRIMINAL) NO. 194 of 2017, (INDIA).

⁶⁷ AIR 1985 SC 1618, (INDIA).

⁶⁸ W. P. (Cr.) No. 76 of 2016, (INDIA).

⁶⁹ CIVIL APPEAL 10972 OF 2013, (INDIA).

Union of India,⁷⁰ declared transgender people to be a 'third gender', with equal right of reservation under the socially and economically backward class section for education and jobs. The Court affirmed that the fundamental rights granted under the Constitution of India equally applies to the transgender people, by giving them the right to self-identification. This judgment is a major step towards gender equality in India.

Unlike *Vishakha* case,⁷¹ in a significant judgment on gender equality,⁷² the Supreme Court directed that Permanent Commission should be granted to women in army regardless of their service, in all the ten streams where the Union Government have already taken a decision to grant Short Service Commission to women. The Court also held that absolute exclusion of women from command assignments is against Article 14 of the Constitution of India.

In 2020 through the case of *Anuradha Bhasin v. Union of India*⁷³ Supreme Court declared that the freedom of speech and expression and also freedom of trade and commerce through the medium of the internet are constitutionally protected rights under Articles 19(1)(a) and Articles 19(1)(g), respectively. The Court observed that indefinite suspension of internet is not permissible and that repeated orders under Section 144 Cr.P.C will amount to abuse of power.

In another recent case of *Vineeta Sharma v. Rakesh Sharma*⁷⁴ A three-judge bench headed by **Justice A.K. Sikri** held that the daughters are entitled to equal property rights even if they were not born at the time of 2005 amendment to the Hindu succession act, 1956, and even if the father died prior to the enforcement of the amendment act, 2005. **Justice Mishra** stated: Daughter remains a loving daughter throughout life and they shall remain a coparcener throughout life, irrespective of whether her father is alive or not. The Supreme Court ruled that the 2005 amendment would have retrospective effect in conferring rights on daughters, who were alive at the amendment, even if they were born prior to it.

IX. CONCLUSION

If judgments are the source of law, then judges are said to be the source of power and authority. The rule of precedent is the instrument through which that power is exercised in common law countries. But the rule of precedent loses its importance when it gets overruled

⁷⁰ WP (Civil) NO. 604 OF 2013, (INDIA).

⁷¹ *Vishakha v. State of Rajasthan* ((1997) 6 SCC 241), (INDIA).

⁷² *The Secretary, Ministry of Defence v. Babita Puniya and others*. Civil Appeal No. 1210 of 2020, (INDIA).

⁷³ WRIT PETITION (CIVIL) NO. 1031 OF 2019, (INDIA).

⁷⁴ Civil Appeal 32601/2018, (INDIA).

in subsequent judgment. But on the other way one may say a precedent gets stronger and ripe into *stare decisis* when gets overruled if its base is erroneously made. The revived decision becomes unquestionable as its decision becomes sound and consistent with the Constitutional laws. Hence, one can call a precedent has a broader perspective while *stare decisis* has a narrower perspective with *ratio* a major role to play. In terms of value *stare decisis* holds much more value in law-making then precedent itself.

KANSER HÜCRELERİNDE METABOLİT TAYİNİ

ÖZET

Kanser, büyüme ve gelişimi sağlayan mekanizmalarda meydana gelen mutasyonlar sonucunda hücrelerin kontrolsüz çoğalmalarına neden olan, çok adımdan oluşan bir süreçtir. Aşırı ve zamansız çoğalan kanser hücrelerinde apoptoz, sınırlı bölünme, metabolizma gibi önemli mekanizmalar bozulur veya yeniden programlanır. Normal hücrelerden farklı olarak sürekli bölünen kanser hücrelerinin daha fazla enerji üretmesi ve makro molekülleri sentezlemesi gerekmektedir. Bu nedenle kanser hücrelerinde metabolizmada bulunan metabolik yollar yeniden düzenlenir. Ara madde olarak bilinen metabolitler, metabolik yollar tarafından üretilen ve hücrenin büyüme, gelişme ve üreme süreçlerinde rol oynayan küçük moleküllerdir. Metabolitler, gen düzenlenmesi gibi önemli yollarda rol alan çeşitli enzimleri aktifleştirdiği veya inhibe ettikleri için hücre içi veya hücre dışı seviyeleri oldukça önemlidir. Onkometabolit kanserin başlamasında veya ilerlemesinde önemli rol oynayan metabolitlerdir ve kanser hücrelerinde oldukça yüksek seviyede üretilirler. Sağlıklı hücrelerde onkometabolit düzeyi düşükken, yüksek miktarlarda sentezlenmesi ve birikmesi, sinyal yollarını aktive ederek hücreyi metastaza yönlendirir. Bu özellikler göz önüne alındığında metabolit düzeylerinin incelenmesi kanserin erken teşhisinde oldukça önemlidir. Son zamanlarda bilim insanları, kanser öncesi lezyonları ve/veya metastatik kanseri tespit etmek için biyobelirteç olup olamayacaklarını belirlemek amacıyla plazma, serum, idrar veya tümör dokusundaki metabolitlerin profilini çıkarmaya ve sınıflandırmaya odaklanmıştır. Metabolit seviyesinin belirlenmesinde nükleer manyetik rezonans (NMR), spektroskopi, gaz ve sıvı kromatografi gibi çeşitli yöntemler kullanılmaktadır. Bu derleme çalışmasında kanser hücrelerinde özellikle TCA döngüsü ve Glikolizde üretilen metabolitlerin hücre içi ve hücre dışı seviyesinin belirlenmesinin öneminden ve şimdiye kadar gerçekleştirilmiş olan çalışmalardan bahsedilmesi amaçlanmıştır.

METABOLITE DETERMINATION IN CANCER CELLS

ABSTRACT

Cancer is a multi-step process that causes uncontrolled proliferation of cells as a result of mutations in the mechanisms that provide growth and development. In cancer cells that proliferate excessively and untimely, important mechanisms such as apoptosis, limited division, and metabolism are disrupted or reprogrammed. Unlike normal cells, continuously dividing cancer cells need to produce more energy, synthesize more macromolecules, and maintain cellular redox balance. For this reason, metabolic pathways in metabolism in cancer cells are rearranged. Metabolites, known as intermediates, are small molecules produced by metabolic pathways and play a role in the growth, development, and reproduction processes of the cell. Intracellular or extracellular levels are very important as metabolites activate or inhibit various enzymes involved in important pathways such as gene regulation. Oncometabolites are metabolites that play an important role in the initiation and progression of cancer and are produced at very high levels in cancer cells. While the oncometabolite level is low in healthy cells, its synthesis and accumulation in high amounts activates the signaling pathways and directs the cell to metastasis. Considering these features, examination of metabolite levels gains great importance in the early diagnosis of cancer. Recently, scientists have focused on profiling and classifying metabolites in plasma, serum, urine, or tumor tissue to determine whether they can be biomarkers for detecting precancerous lesions and/or metastatic cancer. Various methods such as nuclear magnetic resonance (NMR), spectroscopy, gas and liquid chromatography are used to determine the metabolite level. This review study aims to mentioned the importance of determining the intracellular and extracellular levels of metabolites produced in cancer cells, especially in the TCA cycle and glycolysis, and the studies carried out so far.

GİRİŞ

Kanser, büyüme ve gelişimi sağlayan mekanizmalarda meydana gelen mutasyonlar sonucunda hücrelerin kontrolsüz çoğalmalarına neden olan, çok adımdan oluşan bir süreçtir. Kanser hücreleri aşırı ve zamansız çoğalır ve bu hücrelerde apoptoz, sınırlı bölünme, metabolizma gibi önemli mekanizmalar bozulur veya yeniden programlanır. Kanser hücreleri sürekli bölündüğü için normal hücrelere kıyasla daha fazla enerji üretilmesi, makro molekül sentezlemesi ve hücrel redoks dengesini koruması gerekmektedir. Kanser hücrelerinin çoğalması ve hayatta kalabilmesi için metabolik yollar yeniden düzenlenir (Hanahan & Weinberg, 2000).

Hücrelerin enerji üretimi için kullandıkları çeşitli metabolik yollar bulunmaktadır. Glikoliz ve TCA döngü aracılığıyla enerji üretmek için substrat seviyesinde fosforilasyon gerçekleştirilir. Enerji üretiminin ilk aşaması olan glikolizde, karbonhidrat substratı (esas olarak glikoz) aerobik ve anaerobik ortamlarda piruvata dönüştürülür. Normal şartlar altında, oksijen varlığında glikoz piruvata metabolize edilir ve daha sonra oluşan piruvatın önemli bir kısmı mitokondride oksidatif fosforilasyon yoluyla CO₂'ye oksitlenir. Ancak hücreler anaerobik koşullar altında glikolitik piruvatı mitokondriyal oksidasyona yönlendirmez ve onu önemli ölçüde laktata indirgerler (Lunt & Heiden, 2011). Atipik metabolik özelliklere sahip kanser hücreleri, yalnızca iki ATP molekülü üretilmesine rağmen, aerobik ortamda glikoz alımını artırır ve bunu laktata dönüştürür. Böylece kanser hücreleri anaerobik koşulları simüle ederler. Yalnızca kanser hücrelerinde gözlenen bu olaya "Warburg Etkisi" adı verilmektedir (Warburg vd., 1927). Bir molekül glikozdan elde edilen enerji çok düşük olduğundan, kanser hücrelerinin glikoz alım hızı artar. Bu sayede hücre içine büyük miktarlarda alınan glikoz, hem amino asitlerin ve nükleotidlerin sentezine katkıda bulunur hem de enerji üretimi için hızlı bir yol oluşturur. Bu durum hızla çoğalan kanser hücrelerinin geçici veya kalıcı hipoksik koşullara uyum sağlayarak hayatta kalması için bir avantaj sağlar (Lunt & Heiden, 2011).

Aerobik koşullar altında sitoplazmada sentezlenen piruvat molekülü mitokondriye taşınır ve bir sonraki aşama olan TCA döngüsünü başlatır. Bu döngü, Asetil-CoA'dan oksaloasetata iki karbonun eklenmesi sonucunda sitratın oluşmasıyla başlar ve çeşitli reaksiyonlarla devam eder. Son basamakta malat tekrar oksaloasetat oluşturacak şekilde oksitlenir ve böylece döngü tamamlanır (Lehninger vd., 2005). Enerji üretimine ek olarak, Glikoliz ve TCA döngüsü ara ürünleri, hücrenin temel yapıtaşlarından olan nükleik asit, yağ asidi ve proteinlerin biyosentezi için merkezi konumda bulunmaktadır (Şekil 1) (Martínez-Reyes ve Chandel, 2020).

Şekil 1: Glikoliz ve TCA döngüsü ara ürünlerinin, nükleik asit, yağ asidi ve proteinlerin biyosentezinde kullanılması

Metabolizma hücre ve doku büyümesine en az iki farklı yoldan katkıda bulunur. Bunların ilkinde, biyosentetik yapı taşları ve enerji sağlayarak hücre biyokütle oluşumunu destekler. Ayrıca, metabolitler, büyümeyle ilgili sinyal yollarının aktivitesini kontrol ederek hücre büyümesini düzenler (Figlia vd., 2020). Ara madde olarak bilinen metabolitler, metabolik yollar tarafından üretilen ve hücrenin büyüme, gelişme ve üreme süreçlerinde rol oynayan

küçük moleküllerdir. Metabolitler, hücre sinyalini ve gen ekspresyonunu farklı mekanizmalar aracılığıyla düzenleyebilir. Birincisi, metabolitler sinyal yollarında yer alan α -KG'ye bağımlı histon demetilazlar gibi enzimler için kofaktör görevi görür (Tsukada vd., 2006). İkincisi, metabolitler allosterik düzenleme yoluyla sinyalleşmeyi etkileyebilir (Hardie ve diğerleri, 2012). Üçüncüsü, metabolitler proteinler üzerinde kovalent translasyon sonrası modifikasyonlar (PTM'ler) oluşturarak sinyalleşmeyi düzenleyebilir (Hardie vd., 2012; Tsukada vd., 2006). Özet olarak, bu ara maddeler, hücrel hemostazın düzenlenmesinde ve metabolizmanın epigenetik değişikliklere bağlanmasında rol oynayarak mitokondri ile nükleus arasında bağlantı sağlarlar (Pavlova & Thompson, 2016).

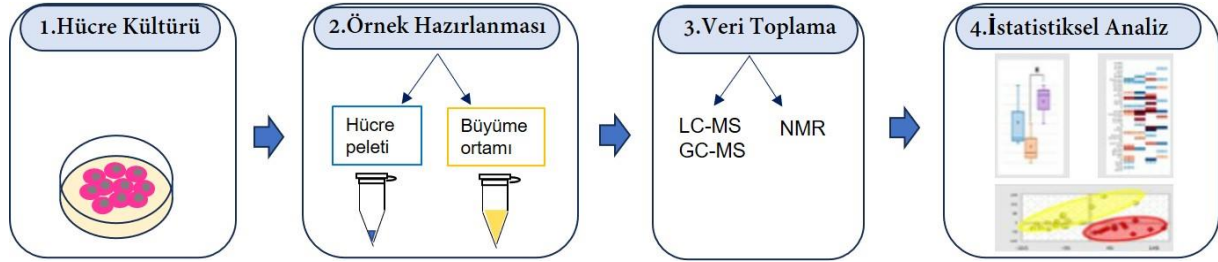

Metabolitler, gen düzenlenmesi gibi önemli yollarda rol alan çeşitli enzimleri aktifleştirdiği veya inhibe ettikleri için kanserin başlamasını, ilerlemesini ve tedavi yanıtını destekleyebilir ve/veya yönlendirebilir (Pavlova & Thompson, 2016). Bu sebeple bir metabolitin hücre içi veya hücre dışı seviyesi kanser teşhisinde oldukça önemlidir. Onkometabolit kanserin başlamasında veya ilerlemesinde önemli rol oynayan metabolitlerdir ve kanser hücrelerinde oldukça yüksek seviyede üretilirler. Sağlıklı hücrelerde onkometabolit düzeyi düşükken, yüksek miktarlarda sentezlenmesi ve birikmesi, sinyal yollarını aktive ederek hücreyi metastaza yönlendirir. Bu özellikler göz önüne alındığında metabolit düzeylerinin incelenmesi kanserin erken teşhisinde oldukça önemlidir (Nadhan vd., 2023). Son zamanlarda bilim insanları, kanser öncesi lezyonları ve/veya metastatik kanseri tespit etmek için biyobelirteç olup olamayacaklarını belirlemek amacıyla plazma, serum, idrar, tümör dokusu veya hücre hatlarındaki metabolitlerin profilini çıkarmaya ve sınıflandırmaya odaklanmıştır (Liesenfeld vd., 2015; Qiu, Y., vd., 2014; Atalay & Kayalı, 2022).

Metabolit seviyesinin belirlenmesinde nükleer manyetik rezonans (NMR), spektroskopi, gaz ve sıvı kromatografi gibi çeşitli yöntemler kullanılmaktadır. Metabolomiks çalışmalar hedeflenmiş ve hedeflenmemiş olmak üzere ikiye ayrılmaktadır. Hedeflenmemiş metabolomik, bilinmeyenler de dahil olmak üzere bir numunedeki tüm ölçülebilir analitlerin miktarının tespit edilmesini amaçlayan kapsamlı bir analizdir. Hedeflenmiş metabolomik, belirli metabolik yollarda üretilen metabolitlerin miktarlarını belirlemektedir (Schrimpe-Rutledge vd., 2016).

MATERYAL ve YÖNTEM

Hücre kültürü çalışmalarında uygulanan genel bir metabolomik iş akışı Şekil 2'de gösterilmiştir. Hücre kültürü çalışmalarında hücre peleti veya hücrenin büyüme ortamı kullanılarak sırasıyla intraselüler ve ekstrasellüler metabolit seviyesi belirlenmektedir. Bunun

için hücrenin parçalanması ve sonrasında santrifüj gibi çeşitli aşamaların gerçekleştirilmesi gerekmektedir. Örneklerin hazırlanmasından sonra metabolit seviyeleri NMR veya sıvı (LC-MS) veya gaz (GC-MS) kromatografisi ile belirlenmektedir. Son aşamada ise elde edilen veriler çeşitli istatistiksel analiz programları kullanılarak değerlendirilmektedir (Bispo vd., 2021).

Şekil 2: Hücre kültürü çalışmalarında uygulanan genel bir metabolomik iş akışı.

BULGULAR ve TARTIŞMA

Bu derleme çalışmasında, TCA döngüsü ve Glikolizde üretilen metabolitlerin seviyelerinin belirlendiği çalışmalar incelenmiştir. Literatüre bakıldığında, Atalay & Kayalı (2022), TCA döngüsü ve Glikolizde üretilen bazı metabolitlerin ve D-2-hidroksiglutarat (D-2-HG) onkometabolitinin seviyesini primer ve metastatik kolon adenokarsinom hücre hatlarında belirlemişlerdir. Ayrıca bu metabolitlerin seviyeleri ksenograft modellerinden elde edilen beyin, kolon, karaciğer ve tümör dokularında HPLC analizi, DNS yöntemi ve piruvat analizi yöntemi ile belirlenmiştir. D-2-HG seviyesi kolon epitel hücre hattında (CCD-18Co) tespit edilemeyecek kadar düşük seviyede iken primer (Caco-2) metastatik (SW620) kolon adenokarsinom hücrelerinde $\mu\text{mol/mg}$ seviyesinde tespit edilmiş. Caco-2 ve SW620 tümör dokularında D-2-HG seviyesinin sağlıklı dokuya göre sırasıyla 7,4 ve 19,9 kat arttığı görülmüştür. Sonuç olarak, endojen D-2-HG'nin artan seviyesinin kolon kanseri metabolizmasında karakteristik bir değişiklik olduğu görülmüştür.

Başka bir çalışmada ise, akciğer kanserli farelere izotop etiketli glikoz veya glutamin uygulandıktan sonra bu besinlerin tümör ve normal dokudaki metabolize olduğu yollar incelenmiştir. Sonuç olarak, tümör dokusunda glikozun yüksek miktarda laktata dönüştüğü bulunmuştur. Bununla birlikte hem tümör hem de sağlıklı dokuda glutamin kullanımı minimal düzeyde iken tümör dokusunda sağlıklı dokuya kıyasla TCA döngüsü metabolitlerinin seviyesinin yüksek olduğu bulunmuştur (Davidson vd., 2016).

Lu ve diğeri (2010), sağlıklı fare meme epitel hücrelerinin metastatik potansiyellere sahip olması sürecinde 157 metabolit seviyesindeki değişiklikleri incelemiştir. Sonuçlar, tümör ilerlemesine eşlik eden metabolit değişikliklerin, Glikoliz, TCA döngüsü, pentoz fosfat yolu, yağ asidi ve nükleotid biyosentezi dahil olmak üzere çeşitli yollarda olduğu bulunmuştur. Elde edilen bulgular, meme kanseri ilerlemesinin olası biyolojik belirteçlerinin yanı sıra, metabolik yolların hedeflenmesi yoluyla tümör ilerlemesinin durdurulması veya yavaşlatılması fırsatlarını da ortaya koymaktadır (Lu vd., 2010).

SONUÇ ve ÖNERİLER

Metabolik yollar tarafından üretilen metabolitler, gen düzenlenmesi gibi önemli yollarda rol alan çeşitli enzimlerin ifade edilmesini düzenledikleri için hücre içi veya hücre dışı seviyeleri oldukça önemlidir. Son zamanlarda, kanser hücrelerinde ve tümör dokusunda TCA döngüsü ve Glikolizde üretilen metabolitlerin seviyelerinin belirlenmesi çalışmaları önem kazanmış olup bu çalışmalardan elde edilen sonuçlar ileride kanser teşhisinde veya tedavisi için yeni bir yol sunacaktır.

ÖZET

NaBH₄ hidrolizi, yüksek hidrojen içeriği ve stabil depolama özelliği nedeniyle anlık hidrojen üretimi için umut vaat eden bir yöntemdir. Ancak, hidroliz reaksiyonu yavaş ilerlediğinden, reaksiyon hızını artırmak için katalizörler kullanılır. Üçlü katalizör sistemleri genellikle üç farklı katalizör türünün birleştirilmesi içerir: metal katalizörler (platin, paladyum, rutenyum gibi), alkali bileşikler (sodyum hidroksit, potasyum hidroksit gibi) ve metal hidrürler (titanyum hidrür gibi). Bu alandaki çalışmalar, katalizör kombinasyonlarının ve bileşimleri optimize edilmesine, daha yüksek hidrojen üretim hızlarına, artırılmış stabiliteye ve düşürülmüş maliyetlere yönelik çabalara odaklanmıştır. Kinetik çalışmalar, reaksiyon mekamlarının anlaşılmasına ve performansın geliştirilmesine yönelik yapılmıştır. Bu çalışmada, Co–Mo–B katalizöründe birkaç farklı Co/Mo atom oranını inceledik. Katalitik reaksiyonda en iyi verimliliği elde etmek için en uygun koşulları belirlemeye çalıştık.

Anahtar Kelimeler: Katalizör, hidroliz, üçlü metal, NABH₄

THE EFFICIENCY AND POTENTIAL OF TERNARY CATALYSTS IN NABH₄ HYDROLYSIS

ABSTRACT

NaBH₄ hydrolysis is a promising method for instantaneous hydrogen production due to its high hydrogen content and stable storage property. However, since the hydrolysis reaction progresses slowly, catalysts are used to enhance the reaction rate. Triple catalyst systems typically involve the combination of three different types of catalysts: metal catalysts (such as platinum, palladium, ruthenium), alkali compounds (like sodium hydroxide, potassium hydroxide), and metal hydrides (like titanium hydride). Studies in this field have focused on optimizing catalyst combinations and compositions, aiming for higher hydrogen production rates, increased stability, and reduced costs. Kinetic studies have been conducted to understand reaction mechanisms and improve performance. In this study, we examined several Co/Mo atomic ratios in the Co-Mo-B catalyst. We attempted to determine the optimal conditions for achieving the highest efficiency in the catalytic reaction.

Keywords: Catalyst, hydrolysis, tri-metal, NABH₄

GİRİŞ

Katalitik hidroliz, kimya alanında önemli bir reaksiyon tipidir ve birçok endüstriyel uygulama, orgaMok sentez ve biyolojik süreçte kullanılan etkili bir yöntemdir. Sodyum borohidür (NaBH_4), katalitik hidroliz reaksiyonlarında yaygın olarak kullanılan bir indirgeyici ajandır. Bu reaksiyonlar, orgaMok bileşiklerin karboMol gruplarını ($\text{C}=\text{O}$ bağları) indirgeyerek aldehit ve ketonları ilgili alkollerine dönüştürme işlemidir. Co-B katalizörü ise, sodyum borohidür'ün hidroliz reaksiyonunda hızlandırıcı bir rol oynayan değerli bir koordinasyon bileşiğidir [1, 2].

NaBH_4 , kimyasal formülü NaBH_4 olan inorgaMok bir bileşiktir ve sodyum borhidrit olarak da adlandırılır. Bu bileşik, metanol veya su gibi protik çözücülerde, aldehit ve ketonların karboMol grubunu indirgemek için sıkça kullanılır. Sodyum borohidür, hidrojen gazı oluşumuyla hidrolize uğrar. Bu reaksiyon şu şekilde temsil edilebilir [3]:

Burada, sodyum borohidür ve su, sodyum borat (NaBO_2) ve hidrojen gazı (H_2) oluşturmak için reaksiyona girer.

NaBH_4 'ün hidroliz reaksiyonları, aldehit ve ketonların indirgenmesi işleminde oldukça yaygın olarak kullanılır. OrgaMok sentezde, farmasötik sektörde ve diğer endüstriyel uygulamalarda önemli bir yere sahiptir. NaBH_4 'ün hidrolizi, seçici ve etkili bir indirgeyici ajan olarak çalışmasını sağlar ve tepkime koşullarına bağlı olarak farklı ürünlerin elde edilmesiMo mümkün kılar [4].

Co-B katalizörü, sodyum borohidür'ün hidroliz reaksiyonlarında katalitik aktiviteyi artırmak için kullanılan bir koordinasyon bileşiğidir. Genellikle kobalt tuzları ve borhidrit tuzları kombinasyonu ile elde edilir. Bu katalizör, hidroliz reaksiyonunun hızını artırarak tepkime süresiMo azaltır ve ürün verimiMo artırır. Ayrıca, bu katalizör kullanıldığında daha düşük sıcaklık ve basınç koşullarında tepkime gerçekleştirilebilir, bu da enerji maliyetleriMo düşürür ve proses verimliliğiMo artırır [5, 6].

Deneysel Çalışma

Co-Mo-B katalizörleri, oda sıcaklığında kobalt klorür (CoCl_2) ve molibden klorür (MoCl_5) sulu karışım çözeltisine, indirgeyici ajan olarak NaBH_4 eklenerek hazırlanmıştır. Tamamen Co ve Mo katyonlarını metale indirgemek için fazla miktarda borohidrit kullanılmıştır. Tepkime sırasında çözeltiden ayrılan sonuçta elde edilen siyah toz, sürekli azot akışı altında 323 K civarında kurutulmuştur. Tepkime sırasında çözeltiden ayrılan sonuçta elde edilen siyah toz, sürekli azot akışı altında 323 K civarında kurutulmuştur. Daha sonra, Cl^- ve Na^+

iyonlarını uzaklaştırmak için saf su ve etanol (99.9%) ile kapsamlı bir şekilde yıkanmış ve süzülmüştür.

BULGULAR ve TARTIŞMA

Şekil 1, 298K'de Co-B, Mo-B ve Co-Mo-B katalizör tozları kullanılarak alkalın NaBH₄ (0.025M) çözeltisi Mo hidrolizi ile elde edilen zaman fonksiyonlu hidrojen üretim verimi Mo göstermektedir. Kullanılan katalizör tipinden bağımsız olarak, beklenen toplam hidrojen miktarı ölçülmüştür. Hidrojen üretim hızı başlangıçta maksimum bir değere ulaşarak zamanla azalır, çünkü NaBH₄ konsantrasyonu çözeltide azalır: bu, tepkime kinetiği Mo sıfır olmayan bir derecesi Mo göstermektedir. Co-Mo-B katalizörü, aynı miktarda Co-B ve Mo-B'ye göre çok daha iyi katalitik aktivite göstermektedir.

Şekil 1. Co-B, Mo-B ve Co-Mo-B katalizörler varlığına NABH₄'ün hidrolizi

Şekil 2, Co-B, Co-Mo-B ve Mo-B tozlarının SEM görüntüleri Mo göstermektedir. Hem Co-B hem de Mo-B, ortalama boyutları sırasıyla yaklaşık 30 ve 18 nm olan iyi dağılmış küresel parçacıklar şeklinde mevcuttur. Co-Mo-B katalizörün durumunda, parçacık boyutları diğer tozlarla karşılaştırıldığında daha küçük görünmektedir ve nanometre boyutunda pamuk benzeri filamentöz matrise gömülü olduklarından ölçümü zor olmaktadır. Bu tür morfoloji Mo, Co-Mo-B katalizörün aktif yüzey alanını artırmaya yardımcı olabileceği düşünülmektedir.

Şekil 2. Co-B, Mo-B ve Co-Mo-B katalizörlerine ait SEM görüntüleri

SONUÇLAR

Azot protoksit hidrolizi yoluyla hidrojen üretimi için Co-Mo-B tozundaki atomik kompozisyonun rolünü araştırdık. Co-B veya Mo-B tozlarına kıyasla, karışık Co-Mo ve B atomlarının varlığının geliştirilmiş bir katalitik etkiye neden olduğu kanıtlandı.

ÖZET

Çinko kalay oksit (Zn_2SnO_4), fotokatalitik özelliklere sahip bir seramik malzemedir. Güneş veya yapay ışık altında kimyasal reaksiyonları hızlandırabilme yeteneğiyle dikkat çeker. Çinko kalay oksit, güneş enerjisi dönüşümü, çevre temizliği ve enerji dönüşümü gibi alanlarda kullanılabilecek yüksek fotokatalitik aktiviteye sahip bir malzemedir. Güneş ışığını absorbe ederek elektron ve boşluk oluşumunu tetikler, bu da malzeme yüzeyinde kimyasal reaksiyonları hızlandırır. Bu özellikleri sayesinde güneş panelleri, su ayrıştırma sistemleri, hava temizleyicileri gibi birçok uygulamada potansiyel olarak değerlendirilebilir. Bu çalışmada, Zn_2SnO_4 nanoparçacıklarının fotokatalitik aktivitesi üzerinde farklı parametrelerin (boya miktarı, katalizör miktarı ve sıcaklık) etkisi incelendi. Elde edilen sonuçlar, Zn_2SnO_4 nanoparçacıklarının atık boya parçalanması için umut verici fotokatalizörler olarak kullanılabileceğini ortaya koydu. Ayrıca, boya fotokatalitik parçalanma kinetiği tüm sıcaklıklarda birinci derece kinetik modeline daha iyi uyum sağladı.

NANOSCALE TRIPLE METAL OXIDE FOR EFFECTIVE DYE DEGRADATION

ABSTRACT

Zinc stannate (Zn_2SnO_4) is a ceramic material with photocatalytic properties. It is known for its ability to accelerate chemical reactions under sunlight or artificial light. Zinc stannate exhibits high photocatalytic activity, making it suitable for various applications such as solar energy conversion, environmental cleanup, and energy transformation. By absorbing sunlight, it triggers the formation of electrons and holes, which in turn accelerates chemical reactions on the material's surface. Due to these characteristics, it has the potential to be utilized in applications like solar panels, water splitting systems, and air purifiers. In this study, the effect of different parameters (dye concentration, catalyst amount, and temperature) on the photocatalytic activity of Zn_2SnO_4 nanoparticles was investigated. The results obtained demonstrated the promising use of Zn_2SnO_4 nanoparticles as photocatalysts for the degradation of waste dyes. Additionally, the photocatalytic degradation kinetics of the dye exhibited better conformity to a first-order kinetic model at all temperatures.

Keywords: Photocatalytic, Nanoparticles, Dyes

GİRİŞ

Çinko kalay oksit (Zn_2SnO_4), çinko, kalay ve oksijen elementlerinin birleşimiyle oluşan bir seramik malzemedir. Bu bileşik, fotokatalitik özellikleri nedeniyle büyük ilgi görmektedir [1]. Fotokatalitik malzemeler, güneş ışığı veya yapay ışık altında kimyasal reaksiyonları hızlandırabilen malzemelerdir. Çinko kalay oksit, yüksek fotokatalitik aktivite gösteren bir malzeme olarak dikkat çekmektedir. Bu özelliği, güneş enerjisi kullanımı, çevre temizliği ve enerji dönüşümü gibi birçok uygulama alanında değerli kılar [2].

Çinko kalay oksitin fotokatalitik özellikleri, güneş ışığını absorbe ederek elektronların ve boşlukların oluşmasını sağlamasıyla ilgilidir. Oluşan elektronlar ve boşluklar, malzeme yüzeyinde meydana gelen kimyasal reaksiyonları katalizler. Örneğin, suyun fotokatalitik olarak ayrışmasıyla hidrojen üretimi veya organik kirleticilerin parçalanması gibi reaksiyonlar gerçekleştirilebilir [3].

Bu fotokatalitik özellikler, çinko kalay oksiti güneş enerjisi dönüşümü alanında umut vadeden bir malzeme haline getirir. Güneş panelleri, su ayrıştırma sistemleri, hava temizleyicileri ve organik atık arıtma sistemleri gibi uygulamalarda kullanılabilir. Ayrıca, antibakteriyel yüzey kaplamaları, kendiliğinden temizlenen camlar ve kirlilik azaltma teknolojileri gibi alanlarda da potansiyel uygulamaları bulunmaktadır [4].

Ancak, çinko kalay oksitin fotokatalitik performansını artırmak için hala bazı zorluklar vardır. Malzemenin kristal yapıları, yüzey alanı ve ışığa duyarlılık gibi faktörlerin iyileştirilmesi üzerine araştırmalar devam etmektedir. Bu çalışmalar, daha etkili fotokatalitik malzemelerin geliştirilmesine ve yenilikçi uygulamaların ortaya çıkmasına katkı sağlamaktadır [5].

Sonuç olarak, çinko kalay oksit, fotokatalitik özellikleri sayesinde güneş enerjisi dönüşümü ve çevresel uygulamalar için büyük bir potansiyele sahip olan bir malzemedir. Gelecekteki araştırma ve geliştirme çalışmaları, malzemenin performansını ve kullanım alanlarını daha da genişletebilir.

DeneySEL Çalışma

Çinko klorür ($ZnCl_2$) ve kalay tetraklorür ($SnCl_4 \cdot 5H_2O$), Zn_2SnO_4 hidrotermal sentezi için sırasıyla çinko ve kalay kaynakları olarak kullanıldı. İki kaynak, distile su içinde çözülerek iki şeffaf çözelti oluşturuldu. Ardından, kalay tetraklorür çözeltisi yavaşça çinko klorür çözeltisine eklenildi. Bu çalışma süresince, Zn:Sn mol oranı 2:1 olarak korundu. Mineralizatör olarak, sodyum karbonat (Na_2CO_3) çözeltisi manyetik karıştırma altında karışıma damla damla eklendi. 2:1:2, 2:1:4 ve 2:1:6 Zn:Sn: Na_2CO_3 oranlarına sahip çeşitli Na_2CO_3 konsantrasyonları tepkimeye girdi. 15 dakika boyunca manyetik karıştırma

yapıldıktan sonra, karışım Teflon kaplı paslanmaz çelik bir otoklav (120 ml kapasiteli) içine transfer edildi ve toplam hacminin %80'ine kadar dolduruldu. Karışım, 120-230 °C sıcaklık aralığında hidrotermal koşullara 30 saate kadar tabi tutuldu. Reaksiyondan sonra, otoklav oda sıcaklığına doğal olarak soğutuldu. Elde edilen çökeltiler, 3000 rpm'de santrifüjlenerek, DI su ve etanol ile sırasıyla iyice yıkandı ve daha sonra karakterizasyon için 8 saat boyunca 60 °C'lik bir fırında kurutuldu.

Zn₂SnO₄ nanoparçacıklarının RhB boyasının fotokatalitik aktivitesi, sulu bir çözeltide değerlendirildi. Fotodegradasyon reaksiyonu, xenon ark lambası (420 nm den küçük) kullanılarak görünür ışık aydınlatması altında 1 cm'lik bir spektrometrik kuvars küvetinde gerçekleştirildi. RhB boyasının etkili bir şekilde parçalanması için sentezlenen 0.5 mg Zn₂SnO₄ fotokatalizörü, sürekli karıştırma altında 2 cm³ RhB'li sulu çözeltiliye (5×10^{-6} mol L⁻¹) eklenildi. Görünür ışıkla uyarlamadan önce, süspansiyon karanlık koşullar altında yaklaşık 1 saat boyunca sürekli karıştırılarak RhB boyası ve fotokatalizör arasında bir adsorpsiyon-desorpsiyon denge noktasına ulaşıldı. Daha sonra, kararlı sulu boyalı çözelti, kesikli bir filtre kullanılarak oda sıcaklığında havada görünür ışıkla aydınlatıldı. Üm kuvars küveti, farklı aydınlatma süreleri aralıklarında bir UV-vis spektrofotometreye doğrudan aktarıldı. RhB konsantrasyonu, 554 nm'deki absorpsiyon maksimumundaki değişiklikler izlenerek belirlendi.

BULGULAR ve TARTIŞMA

Sentetik Zn₂SnO₄ nanoparçacıkları tarafından organik kirletici modeli olan rodamine B'nin (RhB) fotodegradasyonu, görünür ışıkla aydınlatma altında değerlendirildi. Fotodegradasyon, Zn₂SnO₄ nanoparçacıklarının 0.25 g/L varlığında 5×10^{-6} mol L⁻¹ başlangıç konsantrasyonuna sahip 2 cm³ RhB'li sulu çözeltiliye eklenerek oda sıcaklığında gerçekleştirildi. RhB'nin sulu çözeltisi 554 nm'de güçlü ve karakteristik bir absorpsiyon bandı sergilemektedir. Fotokatalitik bozunma, ışığa süresine bağlı olarak RhB'nin absorpsiyonunun azalmasıyla izlendi. Katalizör olmadan, RhB, görünür ışık altında oldukça stabil bir şekilde kaldığı gözlemlendi. Şekil 1, Zn₂SnO₄ nanoparçacıkları varlığında 0.25 g/L konsantrasyonda görünür ışıkla aydınlatma öncesi ve sonrası RhB'nin absorpsiyon spektrumunu göstermektedir.

Şekil 1. Görünür ışık ile katalizör altında Zn₂SnO₄ nanoparçacıkları varlığında RhB'nin ışınlama öncesi ve sonrasındaki UV-vis emilim spektrumu

Bu durum, 554 nm'deki absorpsiyon bandının azaldığını ve aynı zamanda birlikte giderek artan bir hipoakromik kayma olduğunu gösterir. Görünür ışık altında absorpsiyon bandının maviye kayması, RhB'nin aşamalı olarak deetilasyonunu (tetraetillenmiş RhB'nin etil gruplarının sırasıyla deetile edilmesi; N,N,N'-triethylated rodamine'e karşılık gelen pik 539 nm'de, N,N'-diethylated rodamine'de 522 nm'de ve N-ethylated rodamine'de 510 nm'de) ifade eder. Tamamen deetilasyonla oluşan molekül (RhB'nin tamamen N-deetilasyon ürünü), 498 nm'de karakteristik bir absorpsiyon bandı sergiler [6]. Bozunma derecesi, 120 dakikalık ışınma sonrasında yaklaşık olarak %83'tür.

SONUÇLAR

Zn₂SnO₄ katalizörü, görünür ışıkla aydınlatma altında RhB boyasının fotodegradasyonu için başarıyla kullanılmıştır. ZTO nanopartiküller/su arayüzündeki -OH radikallerinin reaktif oksidatif türler olarak fotokatalitik süreçteki rolü vurgulanmıştır. Bu çalışmada sunulan sonuçlar, Zn₂SnO₄ tabanlı substratların çeşitli fotokatalitik uygulamaları açısından oldukça umut vericidir.

ABSTRACT

According to the World Health Organization, Traditional and Complementary Medicine (TCM) is “the sum total of the knowledge, skill, and practices based on the theories, beliefs, and experiences indigenous to different cultures, whether explicable or not, used in the maintenance of health as well as in the prevention, diagnosis, improvement or treatment of physical and mental illness.” In our country Turkey, the most comprehensive regulation on TCM was published as “Traditional and Complementary Medicine Practices Regulation” in 2014. In this regulation, 15 applications were accepted and their usage areas and usage competencies were determined. Physiotherapists who are an integral part of the health sector, are often preferred for TCM practices in our society. Nonetheless in the regulation published in 2014, the practice competencies of physiotherapists were limited and there was uncertainty throughout the society. In this study, the place of the physiotherapist within the situs of the regulation was examined. TCM practices are carried out by certified physicians, dentists, pharmacists and some special professional groups on the condition that they are limited to their own fields. In addition, healthcare professionals with basic training in the field of practice can also assist certified physicians. In this context, physiotherapists have the competence to practice in the section of certified health workers, provided that they are under the supervision of a physician. The branches that are allowed according to the regulation are leech therapy, chiropractic, cupping therapy, osteopathy, reflexology, music therapy. In order for the physiotherapist to perform these applications, there is a condition of being under the supervision of a physician and being certified. As a result, physiotherapists can apply leech therapy, chiropractic, cupping therapy, osteopathy, reflexology and music therapy in our country if suitable conditions are provided.

Keywords: Complementary and alternative medicine, Complementary medicine, Alternative medicine, Traditional medicine, physiotherapy, physiotherapist.

INTRODUCTION

According to the World Health Organization, Traditional and Complementary Medicine (TCM) is defined as "all the knowledge, skills and practices that have emerged through theories, religious beliefs and past experiences specific to various civilizations for the diagnosis and treatment of diseases or the protection of health" (World Health Organization, 2002). The first legal regulation regarding TCM in our country was made in 1991 (Akupunktur Tedavi Yönetmeliği, 1991). The last legal regulation in TCM was made with the "Regulation on Traditional and Complementary Medical Practices" published in October 2014 (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014). With this regulation published in 2014; 15 different TCM practices have been identified, including acupuncture, apitherapy, phytotherapy, hypnotherapy, leech therapy, homeopathy, chiropractic, cupping therapy, larval application, mesotherapy, prolotherapy, osteopathy, ozone therapy, reflexology and music therapy.

Physiotherapists, an integral part of the health sector, are often preferred for TCM in our country. However, with the regulation published in 2014, the practice competencies of physiotherapists were limited. With this limitation, uncertainty has occurred throughout society. In this study, the place of physiotherapists in the "Regulation on Traditional and Complementary Medical Practices" was examined.

MATERIALS and METHODS

Within the scope of the study, the "Regulation on Traditional and Complementary Medicine Practices" published in 2014 was examined. TCM practices that physiotherapists are competent to practice were determined and the "Health Field Certified Training Standards" of the relevant practices were examined.

FINDINGS and DISCUSSION

The practices included in the Regulation on Traditional and Complementary Medicine Practices published in 2014 are given in Table 1 (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014). Among the applications given in Table 1, the applications that physiotherapists are competent to apply under certain conditions are marked with an asterisk.

Leech therapy

Leech therapy is also known as hirudotherapy. The use of leech therapy dates back to 1500 BC in Egypt, and the first written record dates back to 200 BC. It is also the most important traditional treatment approach recommended by Ibn Sina (Porshinsky et al., 2011; Wells et al., 1993). Leeches belong to the annelid worm group and there are more than 15,000 species. Of these leech species, only the Annelida phylum, Clitellata and Hirudinea classes are used for therapeutic purposes (Ayhan & Mollahaliloğlu, 2018). Leech therapy is performed by sterile leeches both sucking blood from the target area of the body and injecting secretions containing bioactive substances and enzymes into the target area (Singh, 2010).

In our country, within the scope of the current regulation, certified healthcare professionals are also authorized to apply leech therapy, provided that they are under the supervision of a doctor (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014; Sağlık Alanı Sertifikalı Eğitim Standartları-Sülük Uygulaması, 2015). Within the scope of this article, it is seen that physiotherapists can also apply leech therapy under the supervision of a doctor.

Chiropractic

It is a manual approach that aims to eliminate diseases occurring in the nervous system, musculoskeletal system and spine, and includes both diagnosis and treatment of these disorders (WHO, 2005). In this approach, manual treatment methods, stretching, continuous pressure applications, soft and sudden movements applied by hand, and joint manipulation applications are used. These applications are often used in the spinal line, but can also be applied to other joints if necessary (NCCIH).

In our country, certified healthcare professionals are also authorized to practice chiropractic, provided that they are under the supervision of a doctor, within the scope of the current regulation (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014). Within the scope of this article, it is seen that physiotherapists can also practice chiropractic under the supervision of a doctor.

Cupping therapy

Cupping therapy is one of the oldest in TCM and it was mentioned in Egypt in 1500 BC as a method of removing foreign objects from the body (Bamfarahnak et al., 2014; Müyesser, 2016). Cupping therapy is divided into two: wet cupping therapy and dry cupping therapy, depending on the presence of an incision during application. In both applications, cupping materials are placed on the skin to create negative pressure. In wet cupping application, an incision is made in the target tissue by making an incision on the skin with a scalpel, negative pressure is created by placing cupping material in the incision area, and through this pressure, blood is allowed to flow out of the tissue through the skin. It is known to accelerate blood circulation and help systemically clean heavy metals (Benli & Ersoy, 2020; Kılınç, 2018). Unlike wet cupping therapy, there is no incision in dry cupping therapy. The cup material to be used in dry cupping application is attached to the application area by creating negative pressure (Çiftçi, 2019; Al-Rubaye, 2012).

In our country, within the scope of the current regulation, certified healthcare professionals are also authorized to apply cupping therapy, provided that they are under the supervision of a doctor (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014; Sağlık Alanı Sertifikalı Eğitim Standartları-Kupa Uygulaması, 2015). Within the scope of this article, it is seen that physiotherapists can also apply cupping therapy under the supervision of a doctor.

Osteopathy

The basic philosophy of osteopathy is based on the body's ability to heal itself. It is an approach that centers on a holistic approach, contributes to the healing of somatic

dysfunctions, and is applied using only hands. It is an approach frequently preferred and widely used by physiotherapists (Aydın, 2015; Öztürk et al., 2020; Yılmaz, 2020).

In our country, certified healthcare professionals are also authorized to practice osteopathy, provided that they are under the supervision of a doctor, within the scope of the current regulation (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014; Sağlık Alanı Sertifikalı Eğitim Standartları-Osteopati, 2016). Within the scope of this article, it is seen that physiotherapists can also practice osteopathy under the supervision of a doctor.

Reflexology

Reflexology is an approach that is applied manually to the points on the hands, feet and ears, related to all glands and organs, and helps normalize body functions (Vennels, 2004). Pressure is applied to the reflex points in these areas of the body with squeezing and rubbing movements. It is thought that electrochemical stimulation occurs in the application area with the pressure and these stimulations affect the target organ (Tabur & Basaran, 2009).

In our country, within the scope of the current regulation, certified healthcare professionals are also authorized to practice reflexology, provided that they are under the supervision of a doctor (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014; Sağlık Alanı Sertifikalı Eğitim Standartları-Refleksoloji, 2015). Within the scope of this article, it is seen that physiotherapists can also apply reflexology under the supervision of a doctor.

Music therapy

Music is a universal and common language among people. It has an important role in understanding and feeling human emotions. The origin of music therapy dates back to ancient times; it has been used for therapeutic purposes in many societies since the 2000s BC. Turkish society has pioneered the music therapy method in reaching today. Especially in the hospitals built for the treatment of mental illnesses during the Seljuk and Ottoman periods, hours and days were allocated for music therapy and it was preferred in the treatment of psychological diseases (Uyar & Akın Korhan, 2011; Öztürk et al., 2020; Akgün & Akgün, 2017). Music therapy is still used worldwide today.

In our country, certified healthcare professionals are also authorized to practice music therapy, provided that they are under the supervision of a doctor, within the scope of the current regulation (Geleneksel ve Tamamlayıcı Tıp Uygulamaları Yönetmeliği, 2014; Sağlık Alanı Sertifikalı Eğitim Standartları-Müzikterapi, 2016). Within the scope of this article, it is seen that physiotherapists can also apply music therapy under the supervision of a doctor.

CONCLUSION and RECOMMENDATIONS

Although the level of evidence is controversial today, TCM practices are widely used in our country. As the popularity of TCM practices increases, demands from society also increase, its use becomes widespread and its preference by many health professionals increases. TCM practices should be applied in a controlled and correct manner by competent people in all fields of medicine, in accordance with the regulation. However, in this way, the popularity of people who are not competent in our country will also decrease (Öztürk et al., 2020).

TCM practices should be known by physicians and dentists who are authorized to practice and should be used in addition to patients' existing medical treatments when necessary. It is clear that the leech therapy, chiropractic, cupping therapy, osteopathy, reflexology and music therapy approaches included in the regulation can be applied by physiotherapists certified by the Ministry of Health, provided that they are under the supervision of a doctor. By raising awareness of physiotherapists in terms of these approaches, the foundation for creating a standardized work area will be laid.

ABSTRACT

Family medicine is a service area that forms the basis of the health system. Satisfaction with family medicine increases the quality and motivation of both healthcare professionals and healthcare recipients. In this context, the aim of the research is to determine individuals' opinions about the family medicine system and their satisfaction level with the family medicine system. Descriptive scanning model was used in the research conducted with quantitative method. An online survey was used as the data collection method in the research. The survey form consists of two parts. Demographic data was used in the first part, and "Patient Satisfaction Scale in Family Medicine Practice" was used in the second part. The sample of the research consists of 400 people who live in Turkey and voluntarily agreed to participate in the online survey. In the study, scale reliability ($C\alpha$) was determined as 0.945. Confirmatory factor analysis was performed for the validity of the scale and the validity of the scale was confirmed. The majority of individuals participating in the research stated that they knew their family physician. Approximately half of them stated that they frequently benefit from family medicine services. According to the research results, individuals' satisfaction levels with the family medicine system are high. It has been observed that the satisfaction levels of individuals who visit family medicine frequently are higher. Individuals who are satisfied with family medicine access health services more regularly and conveniently. This contributes to improving health conditions and reducing healthcare expenses. In this context, identifying and eliminating the deficiencies in the family medicine system is very important for the effectiveness of the health system. For the success of this process, it is recommended that more comprehensive studies be conducted on the family medicine system.

Keywords: Family Medicine, Satisfaction, Health System, Management

INTRODUCTION

Family medicine is a branch of medicine that provides services from a comprehensive, continuous and holistic perspective to protect and improve the health of individuals and families and to prevent or treat diseases. Family physicians are the first people to approach health issues throughout their patients' life cycle. Therefore, they know their patients and know their health history, family history, lifestyle and psychosocial situations (Taylor, 1998: 4). In this way; family medicine; It combines the knowledge and skills of biomedical, behavioral and social sciences to meet the physical, mental and social needs of patients. Family medicine forms the basis of the health system and contributes to increasing the health level of the society. Family medicine is based on a patient-centered, scientific, ethical and quality healthcare approach (David et al., 2013: 13). Satisfaction with family medicine increases the quality and motivation of both healthcare professionals and healthcare recipients. The importance of satisfaction with family medicine can be summarized in the following points (McWhinney & Freeman, 2009):

- Individuals who are satisfied with family medicine access health services more regularly and conveniently. This contributes to the improvement of health conditions and the reduction of health expenditures.
- Families who are satisfied with family medicine establish a trust-based relationship with their family doctor. This makes it easier for them to comply with their physicians' recommendations and acquire healthy lifestyle habits.
- The health system that is satisfied with family medicine operates more efficiently and effectively. This supports the implementation of health policies and the achievement of health goals.

In this context; The importance of satisfaction with family medicine provides benefits at both individual and social levels. To increase satisfaction with family medicine, strategies such as strengthening communication with family physicians, improving family medicine services and improving family medicine education can be implemented. Considering all this; The research was conducted to determine individuals' opinions about the family medicine system and their satisfaction levels with the family medicine system. The problem statements and hypotheses developed for this purpose are as follows:

P₁: What are the satisfaction levels of individuals with family medicine?

H₁: Individuals' satisfaction levels with family medicine vary according to gender.

H₂: Individuals' satisfaction levels with family medicine vary according to marital status.

H₃: Individuals' satisfaction levels with family medicine vary according to age.

H₄: Individuals' satisfaction levels with family medicine vary according to their education level.

H₅: Individuals' satisfaction levels with family medicine vary depending on the number of applications.

MATERIALS and METHODS

Descriptive scanning model was used in the research. In the study, "Patient Satisfaction Scale in Family Medicine Practice", for which explanatory factor analysis was performed by Pınar (2019), was used to evaluate individuals' opinions and satisfaction levels about the practice of family medicine. The scale contains a total of 13 judgment statements; It consists of two factors: family physician (6 items) and family medicine practice (7 items). A minimum and maximum score of 65 can be obtained from the scale. Scale items are answered in a five-point Likert structure as "1=strongly disagree", "2=disagree", "3=undecided", "4=agree", "5=strongly agree". In the study, scale reliability ($C\alpha$) was determined as 0.945. The sample of the research consists of 400 people who live in Turkey, who voluntarily agreed to participate in the online survey, who are over the age of 18 and who have received family medicine services. For the validity of the scale, confirmatory factor analysis (CFA) was performed and the validity of the scale was confirmed.

FINDINGS and DISCUSSION

Araştırma sonucunda elde edilen bulgular sırası ile sunulmuştur.

Table 1. Data of Participants

Gender	n	%	Marital status	n	%
Woman	206	51,5	Married	259	64,8
Male	194	48,5	Single	141	35,3
Age	n	%	Education	n	%
18-25	101	25,3	Primary-Secondary School	82	20,5
25-34	95	23,8	High school	91	22,8
35-44	79	19,8	Associate Degree	125	31,3
45-54	90	22,5	Licence	71	17,8
55 years and older	35	8,8	Graduate	31	7,8
Annual Number of Applications	n	%			
1-2	131	32,8			
3-4	165	41,3			
5-6	78	19,5			
7 +	26	6,5	Total	400	100,00

The data of the participants are presented in Table 1. It seems that the genders of the participants are proportional. Most of them are married and are between the ages of 18-34. The educational level of the participants is at an intermediate level. When the number of applications to family medicine is evaluated, it is seen that applications are generally not frequent.

Table 2. Confirmatory Factor Analysis Results for the Scale-I

Measurement Model	p	χ^2/sd	GFI	AGFI	NFI	IFI	TLI	CFI	RMSEA
Reference Values		≤ 5	$\geq 0,850$	$\geq 0,850$	$\geq 0,900$	$\geq 0,900$	$\geq 0,900$	$\geq 0,950$	$\geq 0,080$
Scale Values	0,000	4,902	0,904	0,851	0,933	0,946	0,928	0,946	0,099

As a result of the CFA conducted for the patient satisfaction scale in family medicine practice, it is seen that the scale values are within the reference values range.

Table 3. Confirmatory Factor Analysis Results for the Scale-II

			Estimate	S.E.	C.R.	P
AH1	<---	Family Doctor	1,000			
AH2	<---	Family Doctor	,772	,035	22,327	***
AH3	<---	Family Doctor	,875	,045	19,277	***
AH4	<---	Family Doctor	1,080	,045	24,031	***
AH5	<---	Family Doctor	1,093	,046	23,952	***
AH6	<---	Family Doctor	1,004	,050	19,940	***
AHS1	<---	Family Physician System	1,000			
AHS2	<---	Family Physician System	1,301	,078	16,693	***
AHS3	<---	Family Physician System	1,436	,120	12,003	***
AHS4	<---	Family Physician System	1,426	,120	11,867	***
AHS5	<---	Family Physician System	1,509	,116	13,047	***
AHS6	<---	Family Physician System	1,274	,115	11,069	***
AHS7	<---	Family Physician System	1,270	,111	11,407	***

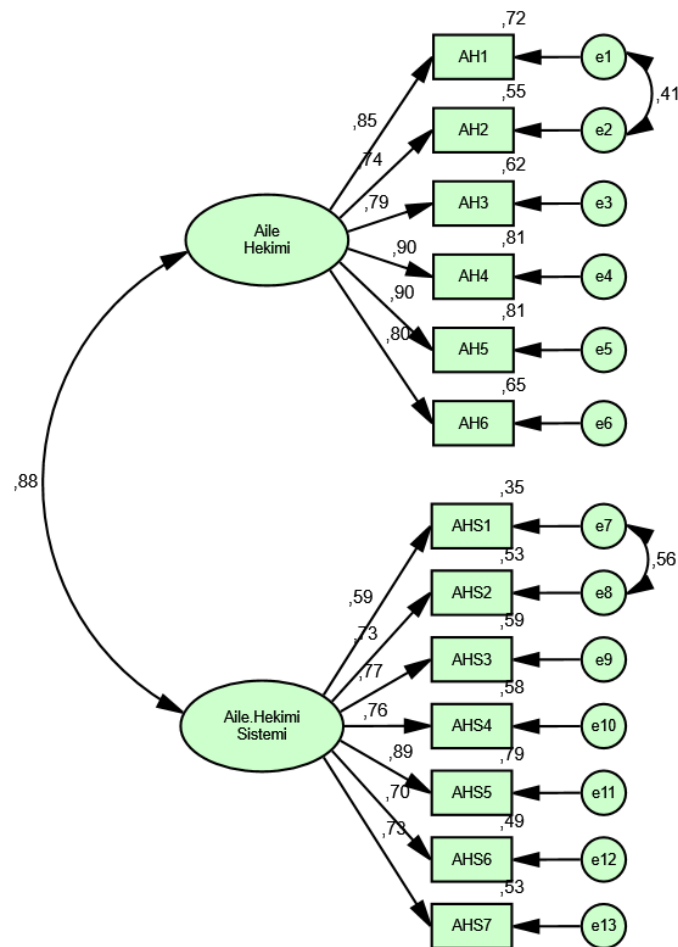

Figure 1. CFA Diagram for the Scale

When Figure 1 and Table 3 are examined, the scale is confirmed as all paths are meaningful and above 0.40, and at the same time the measurement values are within the reference values (Table 2). Analyzes were continued in the same way, using thirteen items and two factors.

Table 4. Statistical Values Related to the Scale

	C α	Min.	Max.	X \pm Ss	Skewness	Kurtosis
Scale Total	,948	13,00	65,00	42,97 \pm 9,72	-,809	,122
Family doctor	,930	6,00	30,00	20,61 \pm 4,77	-,947	,122
Family Medicine System	,902	7,00	35,00	22,36 \pm 5,44	-,546	,122
n	400					

When the statistical values of the scale are examined; It is seen that the reliability of the scale is high (α : 0.948) and the kurtosis-skewness values are within ± 1.5 . According to these results, it was assumed that the scale came from a normal distribution and the analyzes were continued with parametric tests. At the same time, when the scale and factor averages are examined, it is seen that the participants' satisfaction levels with their family physicians and the system are high.

Table 5. T-Test Results Measuring the Relationship between Gender and Family Medicine Satisfaction

	Gender	n	X \pm Ss	t	p
Scale Total	Woman	206	42,74 \pm 9,28	-,482	,630
	Male	194	43,21 \pm 10,18		
Family doctor	Woman	206	20,46 \pm 4,59	-,664	,507
	Male	194	20,77 \pm 4,96		
Family Medicine System	Woman	206	22,28 \pm 5,22	-,278	,781
	Male	194	22,43 \pm 5,67		

When the t-test results measuring the relationship between gender and family medicine satisfaction are examined; satisfaction levels of men are higher than women; but it is seen that this difference is not statistically significant ($p > 0.05$). In this context; H_1 : "Individuals' satisfaction levels with family medicine differ according to gender." His hypothesis was rejected.

Table 6. T-Test Results Measuring the Relationship between Marital Status and Family Medicine Satisfaction

	Marital status	n	X \pm Ss	t	p
Scale Total	Married	259	43,66 \pm 9,79	1,938	,053
	Single	141	41,70 \pm 9,50		
Family doctor	Married	259	21,08 \pm 4,83	2,690	,007*
	Single	141	19,75 \pm 4,54		
Family Medicine System	Married	259	22,58 \pm 5,51	,218	,262
	Single	141	21,95 \pm 5,30		

When the t-test results measuring the relationship between marital status and family medicine satisfaction are examined; The satisfaction levels of married people are higher than single people; However, it appears that this difference is statistically significant only in the family physician factor

($p < 0.05$). In this context; H₂: “Individuals' satisfaction levels with family medicine vary according to marital status.” His hypothesis was partially accepted.

Table 7. Anova Results Measuring the Relationship between Age and Family Medicine Satisfaction

	Age	n	X ± Ss	F	P
Scale Total	18-24 ⁽¹⁾	101	40,80 ± 9,72	8,76	,000*
	25-34 ⁽²⁾	95	46,85 ± 6,96		
	35-44 ⁽³⁾	79	39,37 ± 11,56		
	45-54 ⁽⁴⁾	90	43,98 ± 8,79		
	55 and over ⁽⁵⁾	35	44,22 ± 9,90		
Family doctor	18-24 ⁽¹⁾	101	19,43 ± 4,73	7,72	,000*
	25-34 ⁽²⁾	95	22,13 ± 3,41		
	35-44 ⁽³⁾	79	18,98 ± 5,90		
	45-54 ⁽⁴⁾	90	21,55 ± 4,28		
	55 and over ⁽⁵⁾	35	21,14 ± 4,64		
Family Medicine System	18-24 ⁽¹⁾	101	21,36 ± 5,29	8,65	,000*
	25-34 ⁽²⁾	95	24,71 ± 4,05		
	35-44 ⁽³⁾	79	20,39 ± 6,08		
	45-54 ⁽⁴⁾	90	22,43 ± 5,38		
	55 and over ⁽⁵⁾	35	23,08 ± 5,54		

When ANOVA results measuring the relationship between age and family medicine satisfaction are examined; The satisfaction levels of the 25-34 age group are higher than others; It is seen that the satisfaction levels of the 35-44 age group are lower than the others and this difference is statistically significant ($p < 0.05$). In this context; H₃: “Individuals' satisfaction levels with family medicine vary according to age.” His hypothesis was accepted. It is thought that this situation may be related to individuals' expectations.

Table 8. Anova Results Measuring the Relationship between Educational Status and Family Medicine Satisfaction

	Education	n	X ± Ss	F	P
Scale Total	Primary-Secondary School ⁽¹⁾	82	42,79 ± 9,06	8,83	,000*
	High School ⁽²⁾	91	44,94 ± 8,08		
	Associate Degree ⁽³⁾	125	39,76 ± 11,25		
	Licence ⁽⁴⁾	71	43,32 ± 9,19		
	Graduate ⁽⁵⁾	31	49,80 ± 3,89		
Family doctor	Primary-Secondary School ⁽¹⁾	82	20,53 ± 4,05	5,91	,000*
	High School ⁽²⁾	91	21,73 ± 4,26		
	Associate Degree ⁽³⁾	125	19,40 ± 5,65		
	Licence ⁽⁴⁾	71	20,28 ± 4,64		
	Graduate ⁽⁵⁾	31	23,19 ± 2,10		
Family Medicine System	Primary-Secondary School ⁽¹⁾	82	22,256 ± 5,45	10,71	,000*
	High School ⁽²⁾	91	23,20 ± 4,38		
	Associate Degree ⁽³⁾	125	20,36 ± 6,11		
	Licence ⁽⁴⁾	71	23,04 ± 4,90		
	Graduate ⁽⁵⁾	31	26,61 ± 2,61		

When ANOVA results measuring the relationship between educational status and family medicine satisfaction are examined; The satisfaction levels of master's degree graduates are higher than others; It is seen that the satisfaction levels of associate degree graduates are lower than others and this difference is statistically significant ($p < 0.05$). In this context; H_4 : "Individuals' satisfaction levels with family medicine vary according to their education level." His hypothesis was accepted. It is thought that this may be related to the number of samples and physician-patient communication.

Table 9. Anova Results Measuring the Relationship between the Number of Applications to Family Medicine and Satisfaction with Family Medicine

	Number of Applications	n	X ± Ss	F	P
Scale Total	1-2 ⁽¹⁾	131	34,72 ± 8,97	78,529	,000*
	3-4 ⁽²⁾	165	46,45 ± 6,03		
	5-6 ⁽³⁾	78	46,35 ± 9,13		
	7 and over ⁽⁴⁾	26	52,30 ± 5,56		
Family doctor	1-2 ⁽¹⁾	131	16,35 ± 4,57	88,750	,000*
	3-4 ⁽²⁾	165	22,75 ± 2,50

	7 and over ⁽⁴⁾	26	27,84 ± 3,25		

When ANOVA results measuring the relationship between the number of applications to family medicine and satisfaction with family medicine are examined; In general, as the number of

applications increases, the level of satisfaction increases; It is seen that the satisfaction levels of those who have made seven or more applications are higher than the others and this difference is statistically significant ($p < 0.05$). In this context; H_5 : "Individuals' satisfaction levels with family medicine vary depending on the number of applications." His hypothesis was accepted.

CONCLUSION and RECOMMENDATIONS

As a result of the research conducted to determine the satisfaction levels of individuals who received family medicine services, it was determined that 400 people who participated in the research were satisfied with family medicine and the system. Similarly; Sparkes et al. (2019) also determined that individuals were satisfied with the family medicine system as a result of their research across Turkey using panel analysis. Üstün (2019) found a medium level of satisfaction as a result of his research.

According to the results of the relationship between education level and family medicine satisfaction, the satisfaction levels of master's graduates are higher than others; It is seen that the satisfaction levels of associate degree graduates are lower than others. It is thought that this may be related to the number of samples and physician-patient communication. In this context; It would be useful to examine the level of satisfaction with variables such as communication and expectations. As a matter of fact, in the research of Şakiroğlu and Çayır (2022); They determined that shortening waiting times by accepting patients by appointment, providing physicians with training that will increase their empathy level, and ensuring continuity will increase satisfaction with the family medicine system.

As a result of the research; It has been observed that the satisfaction levels of individuals who visit family medicine frequently are higher. The reason for this situation is that individuals' frequent visits to family physicians help them become better known by their physicians; This is thought to contribute to increased communication, effective treatment and efficiency. Thus; In the literature, it was observed that those who applied to the family health center once a month were more satisfied than those who applied once a year (Şakiroğlu, Çayır 2022).

Yaprakçı et al., as a result of their research in 2019; They determined that individuals receive service from family physicians in limited areas, that they are not very aware of the services offered, and that there is a perception that family physicians deal with simpler health problems than specialist physicians serving in other fields. Again; As a result of Yıldız and Şahin (2022) research;

They found that the majority of the participants evaluated the family physicians' approach to them positively, but the frequency of going to family medicine was generally low and they preferred different health institutions.

In this context; It seems that directing individuals to family medicine is important in terms of both effective health care and reducing health care costs. On the other hand, it seems that family medicine is not used actively. In this sense, in order to raise awareness, it is recommended that state policies focus on preventive medicine and raise public awareness through public service announcements.

ÖZET

Bu çalışmada, yaz spor okullarında basketbol kursuna katılan bireylerin saldırganlık durumlarının incelenmesi amaçlanmıştır. Araştırmada betimsel yöntemlerden biri olan genel tarama modeli kullanılmıştır. Araştırmada örneklem grubunu, 2023 yılı Gaziantep gençlik ve spor il müdürlüğü tarafından gerçekleştirilen yaz spor okullarında basketbol kursuna katılan 112 erkek, 70 kadın toplam 182 kişi oluşturmaktadır. Araştırma verilerinin elde edilmesinde araştırmacı tarafından hazırlanan “Kişisel Bilgi Formu” ve “Sporda Saldırganlık ve Öfke Ölçeği (SSÖÖ)” kullanılmıştır. Maxwell ve Moores (2007) tarafından geliştirilen, Türkçe’ye uyarlaması Gürbüz, Kural ve Özbek (2019) tarafından yapılan ölçekte toplam 12 madde bulunmaktadır. Bu 12 madde, “Öfke” ve “Saldırganlık” adı verilen iki farklı alt boyut çevresinde toplanmaktadır. Ölçek 5’li likert tipindedir. Uyarlama araştırmasında Cronbach Alpha değerleri “Öfke” alt boyutu için 0,72 ve “Saldırganlık” alt boyutu için 0,71 olarak hesaplanmıştır. Ölçeğin geneline ilişkin Cronbach alfa değeri 0,82 bulunmuştur. Elde edilen verilerin çözümlenmesinde SPSS 25 paket programı kullanılmıştır. Çalışma verileri değerlendirilirken tanımlayıcı istatistiksel metotlardan (Frekans, Ortalama, Standart Sapma, Yüzde) kullanılmış, ikili gruplar için T-Testi ve çoklu gruplar için One Way Anova ve post hoc olarak Scheffe testi kullanılmıştır. Çalışma verilerine bakıldığında cinsiyete göre herhangi bir anlamlı farklılık bulunmamıştır. Gelir durumuna göre saldırganlık alt boyutunda anlamlı bir farklılık bulunmuştur. Yaş değişkenine göre öfke alt boyutunda ve genel ölçek puanında yaşı daha büyük olan bireylerin lehine anlamlı farklılık bulunmuştur.

INVESTIGATION OF AGGRESSION SITUATIONS OF INDIVIDUALS ATTENDING SUMMER SPORTS SCHOOLS

ABSTRACT

In this study, it was aimed to examine the aggression status of individuals participating in basketball course at summer sports schools. The general survey model, which is one of the descriptive methods, was used in the research. The sample group in the research consists of 182 people, 112 men and 70 women, who participated in the basketball course in the summer sports schools organized by the Gaziantep Youth and Sports Provincial Directorate in 2023. "Personal Information Form" and "Aggression and Anger Scale in Sports (SSÖS)" prepared by the researcher were used to obtain the research data. The scale, which was developed by Maxwell and Moores (2007) and adapted into Turkish by Gürbüz, Kural and Özbek (2019), has a total of 12 items. These 12 items are gathered around two different sub-dimensions called "Anger" and "Aggression". The scale is 5-point Likert type. In the adaptation study, Cronbach Alpha values were calculated as 0.72 for the "Anger" sub-dimension and 0.71 for the "Aggression" sub-dimension. The Cronbach's alpha value for the overall scale was found to be 0.82. SPSS 25 package program was used to analyze the obtained data. While evaluating the study data, descriptive statistical methods (Frequency, Mean, Standard Deviation, Percentage) were used, T-Test for paired groups, One Way Anova for multiple groups and Scheffe test as post hoc were used. Considering the study data, no significant difference was found according to gender. A significant difference was found in the aggression sub-dimension according to income status. According to the age variable, a significant difference was found in favor of the older individuals in the anger sub-dimension and the general scale score.

Keywords: Sports, Aggression, Sports School

GİRİŞ

Saldırganlık kişilerde farklı türlerde görülen bir davranış biçimidir. Bu davranış şeklini ortaya çıkaran nedenlerle, onu bazı davranma biçimlerinden ayırt etmek çok zordur. Çünkü saldırganlık yıpratmak, zarar vermek, ortadan kaldırmak kin kızgınlık nefret gibi davranışların yanı sıra, çeşitli sözel tutumlar halindeki davranış biçimleri olarak ortaya çıkabilir. Diğer türlü saldırganlık, değişik tutumlar içerisindeki davranış şekillerini de tanımlamak için kullanılan bir sözcüktür. (Köksal, 1991).

Saldırganlığı ön plana iten sebeplerden birisi de arzu edilen durumların gerçekleşmemesi ya da önüne engel çıkmasıdır. Saldırgan davranış, bu durumlara karşılık olarak çıkan etkiye tepki şeklinde de açıklanabilir. Saldırgan tutumlardan bazısı engellenme olgusunu meydana getiren durumun yok olması içine ortaya çıkarken, kimi zaman da ters tepki gösterilerek daha da kötü olmasına sebep olur (Cüceloğlu, 2005).

Spor oyunu ve yarışma olgusunu bir araya getiren, bedensel meziyetleri daha çok olduğundan dolayı kazananları ödüllendiren, üst düzey oyun, mücadele ve ağır kas egzersizleri yapmak gerektiği için devamlı olarak çaba gerektiren bir durumdur. Sporda gaye; hoşnut olmak, serbest zamanda aktivite yapmak olduğu kadar, bugünlerde geçim kaynağı ve maaş kazanmak amacı için de yapılmaktadır. İnsanoğlu kazanma hırsına ve isteğine sahip bir canlıdır. Etrafına, yaşadığı çevreye var olduğu ortamı yönetmek insanın içerisinde yer alan bir davranış biçimidir. Eğer bu davranış biçimi doğru şekilde yönetilmezse ortaya saldırganlık ve şiddet çıkar. (Pulur, 2001).

Spor içerisinde en hızlıya, en yukarıya, en güçlüye erişmek için verilen bir uğraş olsa da bununla beraber küresel kuralları olan içerisinde küresel ilkleri barındıran bir oyun bir yarışma aracıdır. Spor içerisinde rekabet, müsabakanın yanı sıra barışı, karındaşlığı ve karşılık sevgiyi içerisinde barındırır. Sporun içerisinde yer alan unsurlar olan; sporcuların, antrenörlerin, seyircilerin, kişisel veya sosyal sebeplerle bu gayeleri göz ardı etmeleri, farklı amaçlara yönlentmeleri, kötü maksatlarına alet etmeleri sporu saldırgan ve şiddet davranışları barındıran eylemlerine alet ederek amacı dışına çıkararak savaş meydanı haline getirirler (Yetim, 2005)

Sporun yer alan bütün paydaşlar müsabakalarda veya sportif organizasyonların içerisinde bir yada bir çoğunun sosyolojik, psikolojik ve ya fiziksel nedenlerin etkisi altında kalarak sporu içerisinde barından ilke ve kuralları terk ederek rakibine zarar verici davranışta bulunmak veya bir noktaya

varmak için ortaya çıkardığı sözlü yada fiziki davranışlar sporda saldırganlık olarak söylenebilir. (Derwent, 2007).

Bu araştırmadaki temel amaç yaz spor okullarına katılan bireylerin saldırganlık durumlarının yaş değişkeni, aile gelir durumu değişkeni ve cinsiyet değişkeni açısından incelenmesi amaçlanmaktadır.

MATERYAL ve YÖNTEM

Bu çalışmada nicel araştırma yöntemlerinden birisi olan genel tarama modeliyle gerçekleştirilmiştir.

Evren ve Örneklem

Araştırmanın evrenini Gaziantep gençlik ve spor il müdürlüğü tarafından yapılan yaz spor okullarında basketbol kursuna katılan öğrenciler oluşturmaktadır. Araştırmada evrenin tamamına ulaşılmaya çalışılmıştır. Araştırma 2023 yılı Gaziantep gençlik ve spor il müdürlüğü tarafından gerçekleştirilen yaz spor okullarında basketbol kursuna katılan 112 erkek, 70 kadın toplam 182 kişi oluşturmaktadır.

Veri Toplama Aracı

Araştırma verilerinin elde edilmesinde araştırmacı tarafından hazırlanan “Kişisel Bilgi Formu” ve “Sporda Saldırganlık ve Öfke Ölçeği (SSÖÖ)” kullanılmıştır. Maxwell ve Moores (2007) tarafından geliştirilen, Türkçe’ye uyarlaması Gürbüz, Kural ve Özbek (2019) tarafından yapılan ölçekte toplam 12 madde bulunmaktadır. Bu 12 madde, “Öfke” ve “Saldırganlık” adı verilen iki farklı alt boyut çevresinde toplanmaktadır. Ölçek 5’li likert tipindedir. Uyarlama araştırmasında Cronbach Alpha değerleri “Öfke” alt boyutu için 0,72 ve “Saldırganlık” alt boyutu için 0,71 olarak hesaplanmıştır. Ölçeğin geneline ilişkin Cronbach alfa değeri 0,82 bulunmuştur.

Verilerin Analizi

Çalışmamızda veriler değerlendirilirken, istatistiksel analizin de SPSS Statistics 25 programından faydalanılmıştır. Çalışma verileri analiz edilirken tanımlayıcı istatistiksel yöntemlere (Frekans, Ortalama, Standart Sapma, Yüzde) bakılmıştır. Hipotez testleri değerlendirilirken ilk olarak verilerin normallik durumunu belirlemek için Skewness ve Kurtosis değerleri incelenmiştir. Elde edilen veriler +1.5 ve -1.5 arasında yer aldığı için verilerin normal dağılım oluşturduğu kabul edilmiştir (Tabachnick ve Fidell, 2013). Bundan dolayı Independent Samples T-Test ve One Way Anova Testi kullanılmıştır. Çoklu grupları karşılaştırırken Levene Testi uygulanmış ve Post-hoc

testlerinden Scheffe testi yapılmıştır.. Sonuçlar % 95 güven aralığında, anlamlılık düzeyi $p<0.05$ olarak kabul edilmiştir.

BULGULAR

Tablo 1. Öğrencilerin Demografik Bilgilerine İlişkin Frekans ve Yüzdeler Dağılımları

Değişken	Alt değişken	N	%
Cinsiyet	Erkek	112	61,5
	Kadın	70	38,5
Yaş	12-14	66	36,3
	15-17	62	34,1
	18-20	54	29,7
Aile Gelir Durumu	Kötü	36	19,8
	Orta	113	62,1
	İyi	33	18,1

Tablo 1 ilişkin bilgilerim incelediğimizde araştırma grubunun %61,5 Erkek katılımcılardan oluşurken %38,5 ise Kadın katılımcılardan oluştuğu gözlenmektedir. Araştırma grubunun yaşa ilişkin verilerine bakıldığında en çok %36,3 ile 12-14 yaş arası bireyler, yaş grupların bakıldığında en az ise %29,7 ile 18-20 yaş arası bireyler oluşturmaktadır. Gelir durumu açısından bakıldığında %19,8'i Kötü olarak nitelendirilirken, %62,1'i Orta olduğu belirtmiş ve %18,1'ise gelir durumu İyi olduğu görülmektedir.

Tablo 2. Öğrencilerin Cinsiyet Değişkeni Açısından T Testi Sonuçları

Değişken	Gruplar	N	\bar{x}	ss	t	p
Sporda Saldırganlık ve	Erkek	112	4,5670	,44769	,371	,711
	Kadın	70	4,5405	,50035		
Öfke Alt Boyutu	Erkek	112	4,6414	,41264	,347	,729
	Kadın	70	4,6167	,54311		
Saldırganlık Alt Boyutu	Erkek	112	4,4926	,54128	,333	,740
	Kadın	70	4,4643	,58214		

p<0,05*

Tablo 2 incelendiğinde genel ölçek ve alt boyutlarda istatistiksel olarak herhangi bir anlamlılığa rastlanmamıştır. Ortalama puanlara baktığımızda ölçeğin geneline ve alt boyutlarına ilişkin ortalama puanlarda erkek bireylerin bayanlara göre daha yüksek ortalamalara sahip olduğu görülmektedir.

Tablo 3. Öğrencilerin Yaş Değişkeni Açısından Tek Yönlü Varyans Analizi (ANOVA) Sonuçları

Değişken	Gruplar	N	\bar{x}	ss	F	p	Gruplar Arası
Sporda Saldırganlık ve Öfke Ölçeği	a.12-14	66	4,5568	,45647	4,772	,010	b-c
	b.15-17	62	4,4341	,57183			
	c.18-20	54	4,6975	,27676			
Öfke Alt Boyutu	a.12-14	66	4,6364	,42758	5,385	,005	b-c
	b.15-17	62	4,5000	,60282			
	c.18-20	54	4,7778	,23792			
Saldırganlık Alt Boyutu	a.12-14	66	4,4773	,57801	2,961	,054	-
	b.15-17	62	4,3683	,64241			
	c.18-20	54	4,6173	,37004			

p<0,05*

Öğrencilerin yaş değişkenine bakıldığında Sporda Saldırganlık ve Öfke Ölçeği ve alt boyutları açısından one way anova testi sonuçlarına bakıldığında, Sporda Saldırganlık ve Öfke Ölçeğinde istatistiki olarak anlamlılığın b-c grupları arasında olduğu görülmektedir. Öfke alt boyutunda istatistik olarak anlamlılığa rastlanmıştır. Bu anlamlılık b-c grupları arasında bulunmaktadır. ($p<0,05$).

Tablo 4. Öğrencilerin Aile Gelir Durumu Değişkeni Açısından Tek Yönlü Varyans Analizi (ANOVA) Sonuçları

Değişken	Gruplar	N	\bar{x}	ss	F	p	Gruplar Arası
Sporda Saldırganlık ve Öfke Ölçeği	a.Kötü	36	4,5208	,46563	3,168	,044	-
	b.Orta	113	4,6165	,43906			
	c.İyi	33	4,3914	,53094			
Öfke Alt Boyutu	a.Kötü	36	4,6528	,38499	1,272	,283	-
	b.Orta	113	4,6593	,47318			
	c.İyi	33	4,5152	,51432			
Saldırganlık Alt Boyutu	a.Kötü	36	4,3889	,63120	4,679	,010	b-c
	b.Orta	113	4,5737	,50047			
	c.İyi	33	4,2677	,59064			

$p<0,05^*$

Tablo 4 incelendiğinde bireylerin aile gelir durumuna ilişkin verilerle tek yönlü varyans analizi sonuçlarına bakıldığında istatistiksel olarak anlamlılığın ($p=0,10$) $p<0,05$ olduğu için Saldırganlık alt boyutunda olduğu görülmektedir.

TARTIŞMA

Yaptığımız araştırmada yaz spor okullarına katılan bireylerin cinsiyet, yaş ve aile gelir durumu değişkeni açısından saldırganlık durumları incelenmiştir.

Araştırma grubunun cinsiyet değişkeni açısından incelediğimizde istatistik açıdan herhangi bir anlamlılık bulunamamıştır. Bununla birlikte ortalama puanlar incelendiğinde erkek katılımcıların kadın katılımcılara oranla saldırganlık puanlarının daha yüksek olduğu bulunmuştur. Literatürde yapılan çalışmaları incelendiğinde çalışmamızla benzer olarak Araştırma neticesinde sözel saldırganlıkta cinsiyetler arasında herhangi bir anlamlı ilişki görülmezken, fiziki saldırganlık türünü erkek bireylerin daha çok tercih ettiği sonucuna ulaşılmıştır. Başka araştırma da ise fark bulamazken, fiziksel saldırganlığa daha çok erkeklerin başvurduğu sonucunu bulmuştur. Giles ve Heyman (2005) yapmış olduğu çalışmalarında, ergenlik dönemindeki bireylerin cinsiyet ve saldırganlık durumlarını karşılaştırmıştır. Bulduğu sonuç neticesinde erkeklerin kadınlara göre saldırganlık eğilimlerinin daha çok olduğunu bulmuştur. Tiryaki (1996) yılında ortaya koyduğu çalışmasında saldırganlığın alt boyutu olan yıkıcı saldırganlıkta erkek katılımcıların kadınlara göre daha fazla yıkıcı saldırganlığa sahip olduğu bulmuştur. Bu sonuçlar araştırmamızın sonuçlarının destekler niteliktedir.

Araştırmanın yaş değişkeni açısından bulgular incelendiğinde 18-20 yaş aralığındaki yaz spor okullarına katılan bireylerin diğer yaş gruplarına göre saldırganlık ortalama puanlarının daha yüksek olduğu, diğer yaş gruplarına oranla saldırganlık düzeylerinin daha fazla olduğu bulunmuştur. Literatürde yapılan çalışmalar incelendiğinde Kula (2008)'nin meslek lisesi öğrencileri üzerin yapmış olduğu çalışmasında cinsiyet değişkeni ve saldırganlık arasında herhangi bir istatistiksel anlamlılık bulunamamıştır. Ece (2014)'nin yaptığı çalışmada 18-21 yaş aralığındaki bireylerin 14-17 yaş aralığındaki bireylere göre saldırganlık oranlarının daha yüksek olduğu ve aralarındaki farkı dikkate değer olarak belirtmiştir. Sonuçlarına bakıldığında çalışmamızla benzerlik göstermektedir.

Araştırmamızda aile gelir durumu değişkeni açısından bulgulara bakıldığında genel ölçek ortalamalarında ve öfke alt boyutunda istatistikse bakımdan anlamlık bulunmazken saldırganlık alt boyutunda anlamlılık bulunmuştur. Gelir durumu orta seviyede olanların diğer gelir gruplarına göre ortalama puanlarının daha yüksek olduğu görülmektedir. Literatürdeki çalışmalara bakıldığında Dizman ve Gürsoy (2004) ve Aral vd. (2004) yapmış oldukları çalışmalarda gelir seviyesi az olan

ailede yetişen çocukların gelir seviyeleri daha iyi olan çocuklara göre daha saldırganlık seviyelerinin daha fazla olduğunu bulmuşlardır. Bu sonuçlar çalışmamızla ile benzerlik gösterirken bunların aksine Yıldız (2009) 'ın tarafından yapılan çalışmada gelir seviyesi ve yıkıcı saldırganlığı incelemiş ortaya çıkan sonuçta istatistiki olarak herhangi bir farklılık bulamamıştır. Ece (2014)'nin tarafından yapılan çalışmada aile gelir durumu orta derece olan bireylerin saldırganlık puanları aile gelir durumu daha iyi durumda olan çocuklarda daha düşük ve aralarından ortalama puanların anlamlı olduğunu bulmuştur. Bu sonuçlar çalışmamızla farklılık göstermektedir.

SONUÇ ve ÖNERİLER

Yaz spor okullarına katılan bireylerin erkeklerin saldırganlık seviyelerinin kadınlara göre daha yüksek olduğu sonucu bulunmuştur. Yaşları 18-20 yaş aralığında olan bireylerin yaşları daha küçük olan 12-14 ve 15-17 yaş aralığında olan bireylere göre saldırganlık seviyeleri daha yüksek sonucuna ulaşılmıştır. Gelir durumu bakımından ölçeğin geneline ilişkin ve öfke alt boyutunda anlamlı bir sonuca ulaşılamazken saldırganlık alt boyutunda gelir seviyesi orta derecede olanların lehine saldırganlık ortalama puanlarında anlamlı bir sonuca ulaşılmıştır.

Bundan sonra yapılacak olan çalışmaların dönemlerdeki spor okulları üzerine yapılması önerilebilir. Antrenörlere özellikle sporda saldırganlık konusunda bilgilendirilme yapılabilir.

ABSTRACT

Monsters are quite remarkable elements in mythological and artistic works as secondary figures that have had a very important role supporting the 'chaos theory' in creating order against chaos in the sociological, cultural, psychological and religious order of every society throughout the ages. The fact that the monsters, which create chaos with their appearance depictions and behaviors and disrupt the order in society and are frightening as a common feature in all cultures, ironically take place in the universe system as order-makers makes these non-human and non-animal creatures quite special. The concept of producing order from chaos and the systematization of chaos as a theory and the reflections of the concept of 'deterministic chaos' in today's scientific language are found in many stories describing the perception of ancient society. Embodying the battle between order and chaos through gods and monsters, each society has its own monsters with unique characters in accordance with its sociological structure. A hero who is responsible for killing the monsters, who represent the 'other within us' and who is also connected to divine powers, and who creates order from chaos, and stories of heroism exist in every culture, although they differ. Chaos theory, which states that chaos can only be managed by chaos, is included in many mythological references that show the phenomenon of the monster in Mesopotamia in the context of cosmogony, the chaos it creates in society, and the destruction of the monster at the end of this chaos and the establishment of order. The Anzu bird, one of the most remarkable hybrid monsters of ancient Mesopotamia, is also a very important figure that plays the role of protector for a period, but at the same time plays an antagonist role in the restoration of order by causing chaos. The aim of this study is to explain the place of the Akkadian Anzu bird in the social order, which creates an environment of struggle for the restoration of order by creating chaos for itself in the characterization of the important chaos monster of ancient Mesopotamia.

Keywords: Ancient Mesopotamia, Chaos Theory, Monster, Anzu

GİRİŞ

Canavarlar, çok farklı kültürlerin, ülkelerin ve çağların mitolojik hikâyelerinde ve pek çok sanat eserinde yer alan genellikle büyük, korkutucu ve hain olmaları ile ortak özellik kazanmış varlıklar olarak betimlenmişlerdir. Görünüşleri ve davranışlarıyla kafa karıştıran ve dehşete düşüren canavarların bir toplumun psikolojik, kültürel ve dini ihtiyaçlarından doğduğu kabul edilmektedir. Canavarlar ve kültür arasındaki ilişki kültürün temelinde "Biz" ve "Onlar" kavramında, benliğin bir parçası olan ile öteki olan arasındaki ayrım yatar. "Biz"in içinde bilinen ve aşına olunan, bireyin ya da grubun özdeşleştiği şeyler bulunur. Bir toplumun fiziksel, siyasi, sosyal ve dini yönlerini kapsar ve bir gruba kimlik ve uyum duygusu verir. Kültür aynı zamanda bir topluluk içindeki etkileşimleri düzenleyen bir çerçeve olan davranış kurallarını da sağlar. Bu kurallar grup üyelerine güvenlik sağlar ve hayata bir dereceye kadar öngörülebirlilik katar. Bu haliyle kültür, karşıtı vahşilik olan bir düzenleyicidir. İşte "Onlar" terimi de bunu temsil eder: "Onlar", bir topluluğun çeperinin ötesinde ve düzenlemelerinin ve geleneklerinin erişiminin ötesinde var olanlardır. "Onlar" meşru alternatifler olarak görülmez. Öznel birey için kendi kültürel paradigmasının meşru bir alternatifi yoktur: Düzen, kültür ve medeniyet birbirlerinden ayrılmaz hale gelir ve benlikle ve doğrulukla ilişkilendirilir. Şehrin duvarlarının ötesinde kalan şey vahşi, kaotik ve her şeyden öte düşmancadır (Posthumus, 2011, s. 23). Bu açıdan bakıldığında bir kültürde yaratılan canavar o kültürün kimliğini yansıtan oldukça önemli bir olgu haline gelir.

Canavar doğumlarının kehanet olarak ya da dini bir öneme sahip olarak yorumlanması, mitolojik canavar figürlerinin ilahi olanla doğuştan gelen bağıyla uyumludur: canavarlar geleneksel olarak ilahi bir soya sahiptir ya da kendilerini bir ilahın hizmetinde bulurlar, bu da onları ilahi eylem için bir tür araç haline getirir. Monstra'nın uğursuzluk alameti ve ilahi gazabın ifadesi ya da habercisi olarak okunması gibi, mitolojik canavar figürü de genellikle ilahi olana hizmet eden bir araçtır (Posthumus, 2011, s. 10). Bahsedilen bu ilahi bağlantıları sonucunda canavarların kaos ve düzenle ilişkili toplumsal ilkelerin merkezinde yer almaları oldukça akla yatkındır.

Canavar Olgusu

Antik çağlardan modern dünyaya kadar pek çok edebi ve sanat eserinde karşılaşılan canavar olgusu, farklı toplumsal özellikler geliştirse de genel kapsamda belirli ortak özellikleri barındıran ve sistemsal boyutta pek çok ortak özelliğe sahip figürlerdir. J.J. Cohen, esas olarak modern çağ canavarlığıyla ilgili yakın tarihli bir deneme koleksiyonuna yaptığı katkıda, canavar yaratıkların

yedi özelliğini tanımlamış ve bunu yaparken canavarlar tarafından paylaşılan - sınırlı da olsa - ortak zemini vurgulamayı başarmıştır. Cohen'in görüşleri modern zamanların Hollywood yaratıkları için geçerlidir, ancak antik zamanların canavarları için de aynı özellikler sıralanabilir ve bu bağlamda, modern çağ canavar olgusunun kökeni belirlenebilmiştir. Bu özellikler: (1) Canavarlar kültürel öğelerdir, (2) genellikle öldürülürler ancak tamamen yok edilmezler ve (3) alışkanlık olarak kategorizasyona meydan okurlar; (4) canavarlar farklı, dışsallaştırılmış ve sürgün edilmiş olanı temsil ederler; (5) canavarlar izin verilen sınırlarında devriye gezerler; (6) aynı anda hem korkulur hem de saygı duyulurlar; (7) canavarlar dışsal bir kaynaktan değil, insanın içinde üretilirler (Cohen, 1996, ss. 3-21).

Canavarlar, doğaları gereği iyi ya da kötü gibi görünmezler, ancak bağlamın gerektirdiği şekilde bu rolleri yerine getirmişlerdir. Doğaları da gelişme ve değişme eğilimindedir, böylece bir tanrıyla yakın bir ilişki içinde ya da insanın koruyucusu olarak başlayan bir varlık, farklı bir çağda ya da yerde o tanrıya karşıt ya da insanı tehdit eden bir varlık olarak görülebilir. Mezopotamya sanatında hem insan/hayvan melezlerinden hem de hayvan/hayvan melezi figürlerine sıklıkla rastlanmaktadır. İki ayak üzerinde dik yürüyen insan/hayvan melezleri "Demonlar" olarak adlandırılırken, dört ayak üzerinde yürüyen ve daha çok hayvana benzeyenler "Canavarlar" olarak adlandırılır - terminolojide bu bölgeye özgü bir ayrımdır (Porada, 1987, s. 1).

Canavarlar yalnızca insan ve hayvan kategorilerini aşmakla kalmaz, aynı zamanda tanrısallıktan ayırım çizgilerini de bulanıklaştırır. Eski Yakın Doğu'da canavar ve tanrı arasındaki ilişki, değişken de olsa, yakın bir ilişkiydi. Bazı melez canavarlar, antropomorfik versiyonlarından önce, tanrıların ilk temsilieriydi. Tanrılar insan şekline büründüğünde, canavar tipleri ayrı varlıklar olmak üzere ayrıldılar. Tanrının yardımcısı olarak hizmet etmişler ya da zaman zaman onun düşmanı olmuşlardır. Bu canavarlar ya da demonlar ölümsüzlük ve doğal fenomenler üzerinde hem olumlu hem de olumsuz kontrol gibi bazı ilahi özellikleri koruyabilirler (Goodnick, 2004, s. 14). Mitolojik olarak bu ilişki tanrılar tarafından amaçlı bir yaratım ya da canavarların doğurulması olarak sunulur.

Melez canavarların işlevleri de doğaları ve görünüşleri kadar değişkendir. Yine, eski Yakın Doğu figürleri netlik için büyük ölçüde bağlama dayanır ve bu da sadece tasvir parçaları hayatta kaldığında yorumlamayı zorlaştırır. Ancak elimizde mevcut olanlardan, canavarların rolünün açıkça ya da yalnızca fiziksel özellikleriyle tanımlanmadığı açıktır. Sivri dişleri ve pençeleri olan

canavarlar korkutucu ve tehlikeli saldırganlar olabildiği gibi aynı derecede etkili koruyucular da olabilmektedir (Porada, 1987, s. 2). Mezopotamya'da M.Ö. üçüncü binyılda bir Sümer tapınağı, aralarında boğa adamların da bulunduğu melez canavarlar tarafından kötü ruhlardan korunurdu ve Asur ve Babil'de tapınakların ve evlerin giriş yollarında melezlerin yazılı resimleri veya oyulmuş figürleri bulunurdu. Melez yaratıkların bu apotropik yani kötülüklerden koruyucu işlevinin mitolojik işlevlerinden önce geldiği, ancak her iki bağlamda da iyi ve kötünün çevresinde devriye gezdikleri ve evrenin düzeninin korunmasına yardımcı oldukları ileri sürülmektedir. Evrenin ilk yaratılışından itibaren kozmogonide rol alan canavarlar, neredeyse her kültürde kaosla mücadele esnasında düzenin kurulması için mücadele edilmesi gereken bir güç olarak dikkat çekmektedirler.

Kaos, Düzen ve Canavar Bağlantısı

Kaostan düzen üretmek kavramı ve kaosun bir teori olarak sistematikleştirilmesi ve günümüz bilim dilinde 'deterministik kaos' anlamını kazanması 20. yüzyıla denk gelse de aslında yukarıda belirtildiği gibi antik çağda bu kavramı niteleyen varoluşsal hikâyeler mevcuttur. Kaosun, bir kavram olarak, Antikçağdan bu yana her dönemde düşünce tarihinde kendine bir yer bulduğu bilinmektedir. (Kaçmaz, 2005, s. 2.). Kaos kelimesinin kendisinden sonra var olanları bir şekilde oluşturacak olan düzensiz, şekilsiz, karmaşık bir boşluğu ifade etmek için kullanılan Yunanca bir kelimedir. Antikçağ medeniyetlerinde pek çok yaratılış miti, dipsiz, yönsüz, esneyen ve hiçbir cismin düşmesinin durdurulamayacağı farklılaşmamış bir boşluk olan Kaos ile başlar (Kaçmaz, 2005, s. 9).

Çeşitli ve farklı toplulukların yaratılış mitlerine göre evrenin ilk hali bir hiçlik ve kaos içerisinde sıkışmış haldedir. Dünyanın bu ilk hali çoğu mitolojik hikâyede kişiselleştirilir ve bu kaos ortamına genellikle bir isim verilmiştir: Mısır'da bu isim Nun, Yunanlılar Kaos, Asur-Babil mitolojisinde ise bu ilkel düzensizlik Tiamat olarak adlandırılmıştır. Yaratılış, bu kaos durumu bastırıldığında, onun antitezi olan düzeni tesis eden bir güç tarafından aşıldığında gerçekleşmiştir. Antik Mezopotamya toplumlarından özellikle Babilliler, Yeni Yıl Festivalini, Düzenin Kaosa karşı kazandığı zafer olarak benimser ve bunu ritüel olarak kutlama haline getirmiştir. Bu kutlamalar sırasında kral, yaratıcı tanrı Marduk'un genellikle bir canavar olarak temsil edilen Tiamat ile mücadelesini canlandırmak için bir ejderha ile savaşırdı. (Penglase, 1994, s. 103). Böylece Babil baş tanrısı Marduk kaosu simgeleyen Tiamat zaferiyle kozmik, mevsimsel ve sosyal düzeni sağladı (Vernant, 1982, s. 111).

Eski Yakın Doğu'nun bilişsel ortamında tanrılar, bireysel ya da kurumsal düzeyde kendi aralarında, tehdidi temsil eden varlıklar ya da yokluklarla ya da insanlarla çeşitli koşullar altında ve çeşitli düzeylerde çatışmaya dâhil olurlar. Bu çatışma ortamı, düşmanın doğası ve varoluş çabası günümüz algısında, *chaoskampf*, *kozmogoni* ve *teomaksi* gibi birbirleriyle bağlantılı belirli terimlerle açıklanmaya çalışılmıştır¹ (Walton, 2008, s. 49).

Düzen ve kaos arasındaki savaşı ya da iyi ve kötü arasındaki savaşı, tanrılar ve canavarlar aracılığıyla somutlaştıran toplumların her birinin de kendine özgü canavarları bulunmaktadır. İçimizdeki ötekini temsil eden canavarların öldürülmesinden sorumlu olan bir kahraman ve kahramanlık öyküleri ise her kültürde vardır. Mitolojide yaygın olarak karşılaşılan bir öykü çeşidi olan canavar öldürme ritüelinin “içten ve dıştan gelen tehditleri yok edebilmek” anlamına geldiğini söylenebilir (Leeming, 2017, s. 229-335). Canavarı öldüren kahraman, içeriden ya da dışarıdan gelen tehlikeleri önlemekte; yani kaos çıkmasına engel olmakta ve de toplumun düzenli yapısının oluşturulmasına katkı sunmuş olmaktadır. Bu açıdan bakıldığında canavar öldürme öyküsünün bir yönüyle zorunlu olduğu da görülmektedir; çünkü toplumsal yaşamın olmazsa olmaz koşulu kamu düzeninin sağlanmasıdır. (Şahin & Doğan, 2017, s. 152). Enuma Eliş² olarak bilinen Babil Yaratılış Destanı'nda Marduk'un Tiamat'a karşı savaşında temsil edilen kaosa karşı mücadele motifi, antik bilişsel ortamda hüküm süren yaratılış modeli olarak durmuştur (Walton, 2008, s. 48). Bilişsel ortamda düzensizliğin çok sayıda cephede tehdit oluşturması, tanrıların ve insanların ortak görevinin, düzensizliğe yönelik eğilimi ya da düzensizliğin düzenli dünyaya sızmasını kontrol altına almak ve bununla mücadele etmektir. Düzen ilk olarak geçmişte bir noktada kurulmuştu, ancak bu savaşın bittiği anlamına hiçbir zaman gelmemiştir. Tekrarlayan tehditler hem ara sıra gerçekleşen saldırılar şeklinde hem de mevsimsel ve günlük döngülerde ortaya çıkmıştır. Kaos teriminin bu durumlara uygulanmasının meşruiyeti haklı olarak tartışılrsa da, kişileştirilmiş olsun ya da olmasın makrokozmos düzensizliği temsil eden unsurlarla ilgili olduğu gibi önemli bir

¹ Chaoskampf: Chaoskampf (Almanca "kaosa karşı mücadele") mit ve efsanelerde her yerde bulunur ve bir kültür kahramanı tanrının, genellikle yılan veya ejderha şeklindeki bir kaos canavarıyla savaşını tasvir eder. Makrokozmos düzensizliği kontrol altına alma girişimlerine odaklanan çatışmalar; düzene karşı düzensizlik. Kozmogoni: Evrenin kökeninin araştırması veya evrenin kökeni, 'evren doğumu'. Teomaksi terimi biraz daha kapsamlı olup chaoskampf ve kozmogoni kavramlarını da içermektedir: 1. Tanrısal proletarya arasında rollere ilişkin memnuniyetsiz sınıf isyanı. 2. Makrokozmosda düzene karşı düzensizlik (Chaoskampf) a. Düzenin ilk kuruluşu (kozmogoni) b. Kaos canavarının tek seferlik tehdidi c. Mevsimsel ya da günlük olarak yenilenme. 3. Tanrılar arasında birbiriyle rekabet eden bireysel hak sahipleri arasında egemenlik mücadelesi. 4. Tanrılar arasında egemenliği ele geçiren kuşak darbesi" (Walton, 2008, s. 49).

² Enuma Eliş destanının tamamı için bkz: Alexander Heidel, 2000 Enuma Eliş Babil Yaratılış Destanı Çev: İsmet Birkan Din ve Mitoloji Yayınları Ankara.

nitelemeyle bu teomaksi kategorisinin tanımı için benimsenebilir. Ortak özelliği düşmanın makrokozmetik düzensizliği temsil etmesidir. İlk Kaoskampf alt kategorisi, makrokozmetik düzenin başlangıçta kurulduğu (kozmogoni) metinlerden oluşur. Bu kavramları yansıtan klasik edebiyat parçası yukarıda da bahsedilen Enuma Eliş'tir ve burada kişileştirilmiş Deniz olan Tiamat düşmandır ve kozmogoni ortaya çıkar (Walton, 2008, s. 50).

Kaos yaratma eğilimli melez canavarların bileşimi genellikle coğrafi bölgedeki tehlikeli faunadan ödünç alınan özelliklerin bir araya getirilmesiyle oluşturulmuştur. Ciddi zararlar verebilecek hayvanlar korku ve saygı gerektirmiştir. Bu hayvanlardan birkaçının en yıkıcı, en korkutucu özelliklerinin tek bir varlığa yüklenmesi, ona doğal olmayan ve olağanüstü bir güç kazandırmıştır: İlk olarak, zarar verme kabiliyeti doğal hayvanların kabiliyetinin ötesine geçmiştir. İkinci olarak, sınıflandırılabilir, doğal hayvan alanının dışına çıkararak, bileşik varlık ilahi alanlara geçen bir yaratık olarak özel bir statü kazanmıştır. Mezopotamya'da aslanın başı ve pençeleri, zehirli yılanın unsurları gibi bileşik yaratıklarda sıklıkla kullanılmıştır. Yırtıcı kuşların fiziksel özellikleri sadece gizlilikleri ve güçlü pençe ve gagaları nedeniyle değil, aynı zamanda uçuşları Yakın Doğu coğrafyasını kasıp kavuran yıkıcı fırtınalarla ilişkilendirildiği için de kullanılmıştır (Goodnick, 2004, s.13).

Kaos Canavarı Anzu Kuşu

Kaosun ancak kaos ile yönetilebileceğini ifade eden kaos teorisi, pek çok antik kültürde olduğu gibi kozmogoni bağlamında Mezopotamya'da canavar olgusunu, toplum içerisinde yarattığı karmaşayı ve bu karmaşanın sonunda canavarın yok edilerek düzenin oluştuğunu gösteren pek çok mitolojik referansta yer almaktadır (Kaçmaz, 2005, s.58). Birçok eski Yakın Doğu mitolojik motifi, kaos güçlerine karşı verilen ilksel savaş olan Chaoskampf ile bağlantılıdır. Antik Mezopotamya'nın en dikkat çekici melez canavarlarından biri olan Anzu kuşu da yukarıda bahsedilen canavar özelliklerini taşıyarak hem bir dönem koruyuculuk görevi üstlenen ancak aynı zamanda da kaosa sebep olarak tekrar düzenin kurulmasında kötü başkarakter olarak rol oynayan oldukça önemli bir figürdür.

Mezopotamya mitleri Akadca Anzu, Sümerce IM.DUGUD'u, dağlarda yaşayan bir yırtıcı kuş olarak tasvir eder. Melez bir yaratık olan bu kuş, yırtıcı bir hayvan sesine benzetilen gök gürlemesinin ancak bir aslanın ağzından çıkması sebebiyle edebiyatta ve ikonografide aslan yüzlü bir kartal olarak tasvir edilir. Oldukça görkemli ve güçlü bir yaratık olan Anzu kuşu metinlerde,

bir tanrı veya bir kahramanla yer alırken, hikâyelerin her birinde farklı karakterlerde betimlenmektedir. (Ay Arçın, 2019, s. 492). Anzu'nun en belirgin özelliği devasa boyutudur. Sümerlerin 'Lugalbanda Destanı'nda Anzu'nun, kökleri güneş tanrısı Utu'nun yedi başlı nehrini delip geçen geniş boyutlardaki bir ağacın içinde yuva yaptığı anlatılır. Anzu, doğu sıradağlarında yabancı öküzleri avlar ve yavrularını beslemek için onları pençeleriyle ve boynuna dolayarak yuvasına taşıyan bir yaratık olarak tasvir edilir. Anzu, geniş kanatlarını çırdığında rüzgâr fırtınalarına ve kum fırtınalarına neden olabilen tuhaf çehresi ve kükreyen sesi ile dikkat çekmektedir. Ayrıca metinlerde Anzu'nun şafak vakti kanatlarını açarak ve dağlarda yükselen güneşe doğru korkutucu bir sesle kükreyerek toprağın titremesine neden olacak kadar korkutucu bir yaratık olduğu anlatılmaktadır (Wazana, 2009, s. 113).

Mezopotamya sanatı ve edebiyatındaki diğer yaratıklara benzer şekilde, Anzu başlangıçta kaotik güçlerle ilişkili değildir. 'Anzu Miti' adıyla bilinen Akad destanında tehditkâr bir güç haline gelmiştir.³ Bu hikâyeye göre bu canavar kuş, Mezopotamya baş tanrısı Enlil'den 'Kader Tableti'ni çalar, böylece kozmik güçler elde ederek dünya ve tanrılar üzerinde kontrol sahibi olur ve mevcut düzeni bozar. Taş kesilen tanrılar, Anzu'yla yüzleşecek, tableti meşru sahibine iade edecek ve dünyaya düzeni yeniden getirecek bir kahraman ararlar. Görünüşte yenilmez olan Anzu'yla yüzleşmek ve ebedi zaferi kazanmak Enlil'in oğlu Ninurta'ya kalmıştır. Anzu Miti mücadele mitleri türüne aittir. Hikâyenin orijinal Akadca başlığı, kahramanı Ninurta'ya atıfta bulunarak "Bin sar dadme"-yerleşim yerlerinin kralının oğlu" şeklindedir.

Anzu, Mezopotamyalıların dünya görüşünde yerleşim, medeniyet ve düzenin dışında kalan dağlarda yaşadığı için kozmik düzene yönelik tehdidi kişileştirmeye uygun bir kaos canavarı olarak tanımlanmaya oldukça uygun bir yaratıktır. Anzu dağlarda doğmuş ve göksel Tablet'i çaldıktan sonra oraya çekilmiştir. Kader tableti⁴, Antik Mezopotamya toplumlarında evrenin düzeninin

³ Anzu Miti tamamı için bkz: Bottero Jean & Samuel Noah Kramer 2017 Mezopotamya Mitolojisi, çeviren: Alp Tümerterkin, Türkiye İş Bankası Kültür Yayınları, İstanbul 439-472.

⁴ "Kader Tableti, yüce gücün bağı, gök ve yeraltı tanrıları üzerindeki hâkimiyet ve İgigi ve Anunnaki'nin krallığı, göklerin ve yeraltı dünyasının sırrı, (5) Anu ve Gansir'in Kubbesinin bağı, [çoklukların(?),] Tanrıların kralı Assur'un eline aldığı ve [göğsünde] tuttuğu, formunun bir temsili, uygun görünümünün kopyası, [(tasvir edilmiştir)] üzerinde: büyük göklerin tasmalarını, [İgigi] ve Anunnaki'nin bağını [elinde] tutuyor. (10) [Efendis] Assur'un temsilinin önünde, tüm dünyanın kralı, [Asur'un] kralı, Bit Kitmuri tapınağının Assur, Anu, Sin, Samas, Adad, Belet-ill ve İhtar suretlerini yapan, alçakgönüllü bir şekilde hürmet eden çoban, efendis Assur'un temsilcisi Sen-nacherib'in bir temsili duruyordu. (15) [Ey Assur, cennetin babası(?)], tanrıların kralı, kaderlerin belirleyicisi, tanrıların Kader Tableti sadece senin elinde: Asur kralı Sanherib'in saltanatına bak ve benim kaderim olarak iyi bir kader, iyi bir sağlık(?) (ve) krallık kaderi belirle! Saltanat sürenlerin arasında benim başımı yücelt ve (20) tahtımın tabanı uzun günler boyunca bir dağ gibi güvenli olsun! Benim için, senin rızkın için, doğudan batıya [tüm yabancı toprakları(?)] boyunduruğum altına al! İnsan ırkı [sana yalvarsın ki] oğullarım, torunlarım, hanedanım (25) [ve soyum(?)] insanlık arasında [sonsuz dek] sürsün!" (George, 1986, s. 134).

simgesi olan değiştirilmez bir yasa metni ya da imzalanmış bir antlaşma olarak düşünülmüştür. Tanrı, onu elinde tutan ya da onu göğsüne bastırmış olarak betimlenmiştir (Black & Green, 2017, s. 166). Kader tableti kaos karşıtı düzeni sembolize eden bir nesne olarak onun bu yaratık tarafından çalınması, dönemde kaos yaratarak öldürülerek tekrar düzene sokulma motifi açısından oldukça önemli bir noktaya değinmektedir.

Kahraman Ninurta ile asi Anzu arasındaki son karşılaşma dağlarda gerçekleşmiştir. Sonraki ve daha ünlü ilahi savaş miti Enuma Eliş gibi, Anzu'nun konusu da ilkel zamanlarda geçer. Enuma Eliş dünyanın yaratılışını ilahi savaşın bir yan ürünü olarak açıklarken, Anzu destanında olay örgüsü kısa bir süre sonra gerçekleşir. Dünya kurulmuştur ama tamamlanmamıştır. Tanrılar vardır, ancak insanlardan eser yoktur; Fırat ve Dicle nehir yatakları kurulmuştur, ancak suları henüz serbest bırakılmamıştır. Anzu'nun doğumu rüzgârlar ve toz fırtınaları eşliğinde istenen suyu serbest bırakmıştır ve Ninurta'nın Anzu'yu öldürmesine daha fazla su seli eşlik eder. Anzu böylece kaynağı gerçekten de dağlarda olan sulu unsurla sıkı bir şekilde ilişkilendirilir. Kaotik unsur önce yaratılmalı, sonra fethedilmelidir. Dünya nihai şeklini almadan önce dengesizlik ve ardından yenilenmiş, gelişmiş bir istikrar sağlanmalıdır.

Asi kuş Anzu, Mezopotamya'da ünlü bir mito-şiirsel figür olarak adlandırılabilir. Çeşitli ilahi savaş mitleri arasında Anzu görünüşe göre bilinen en eskilerden biridir, ilk olarak Eski Babil döneminde tasdik edilmiş ve bir Standart Babil versiyonundan da tanınmıştır. Daha sonraki versiyon hem içerik hem de metnin tabletlere bölünmesi bakımından M.Ö. 1200 civarında bütünleştirilmiştir. Anzu destanının Mezopotamya kültürel geleneğindeki yeri, Enuma Eliş ile olan bağlantısı ile desteklenmektedir. Lambert'in belirttiği gibi, bu ünlü kompozisyonda Marduk kasıtlı olarak 'Ninurta Redivus' olarak tasvir edilmiş ve bu da Anzu Destanı'ndan "doğrudan ve bilinçli bir ödünç alma" olduğunu kanıtlamıştır (Lambert, 1986, s. 56). Her iki destanda da hikâye ilkel günlerde geçmektedir ve tanrılar tarafından temsil edilen uygarlığın dışındaki bir güç, sahibine kozmik kontrol sağlayan Kaderler Tableti'ni çalarak dünya düzenini tehdit etmektedir. Enuma Eliş 'te deniz canavarı Tiamat, yardımcısı Qingu ve on bir canavar kaotik tehdidi oluştururken, Anzu destanında göksel tableti çalarak Anu, Enlil, Ea ve diğer tanrılar tehdit eden şeytani dağ kuşudur. Her iki öyküde de tanrılar savaşmaları için küçük bir tanrıyı görevlendirir ve onu ödüllendirirler.

Yeni Asur döneminde, bir tarihselleştirme süreciyle, efsanevi semboller kralı kahramanca bir ışık altında tasvir etmek için kullanılmış, sıradan zaferleri Anzu ve Tiamat gibi kozmik kaotik

düşmanların öldürülmesini anımsatan terimlerle anlatılmıştır. Bu zamana kadar Anzu Mezopotamya kültüründe uzun süredir var olan bir semboldü. M.Ö. yedinci yüzyılda İsrail'de Ninurta ve Anzu'nun savaşını tasvir eden bir silindir mühür bulunmuştur. Bu nadir olan grafik tanıklık Anzu Destanı'nın bilindiğine dair bir kanıt sayılamasa da, savaş efsanesinin sembollerinin Asur ordusuyla birlikte geldiğini ve genel bir kültürel etkinin parçası olduğunu göstermektedir (Keel & Uehlinger, 1992, s. 293). Dahası, araştırmalar Kutsal Kitap'ın Asurlu konuşmacılardan "alıntı yaparken" kraliyet Yeni Asur yazıtlarını yansıtan edebi motifler ve dilsel ifadeler kullandığını göstermiş, bazı Kutsal Kitap yazarlarının sadece "Asur deneyiminden" değil, aynı zamanda resmi kraliyet edebi geleneklerinden de haberdar olması gerektiği sonucuna varmıştır (Cohen, 1979, s. 36). Anzu Destanı'nın Yeni Asur kraliyet yazıtlarının dilinde bir rol oynadığı ve emperyalist propagandadaki bazı figürlerin suçlu olarak nitelendirilmesinin altında yattığı düşünüldüğünde, İncil yazarlarının Babil sürgününden önce destanın kendisini bilmeseler bile bu yaratığa ve geleneklerine aşina olmaları kuvvetle muhtemeldir (Wazana, 2009, s. 116).

SONUÇ

Canavarlar, çağlar boyunca her toplumun sosyolojik, kültürel, psikolojik ve dini düzeninde oldukça önemli rolleri olan, kaosa karşı düzeni oluşturmakta 'kaos teorisini' destekleyen yardımcı figürler olarak mitolojik ve sanat eserlerinde oldukça dikkat çekici unsurlardır. Görünüş tasvirleriyle ve davranışlarıyla karmaşa yaratan ve tüm kültürlerde ortak özellik olarak korkutucu ve toplumdaki düzeni bozarak kaos yaratan canavarların ironik bir biçimde düzen kurucu olarak evren sisteminde yer almaları bu insan ve hayvan dışı yaratıkları oldukça özel kılmaktadır. Kaostan düzen üretmek kavramı ve kaosun bir teori olarak sistematikleştirilmesi ve günümüz bilim dilinde 'deterministik kaos' kavramının yansımalarına, antik çağ toplum algısını anlatan birçok hikayede rastlanmaktadır. Düzen ve kaos arasındaki savaşı, tanrılar ve canavarlar aracılığıyla somutlaştıran toplumların her birinin de sosyolojik yapısına uygun olarak kendine özgü karakterleri olan canavarları bulunmaktadır. 'İçimizdeki ötekini' temsil eden aynı zamanda ilahi güçlerle de bağlantısı olan canavarların öldürülmesinden sorumlu olan ve kaostan düzen yaratan bir kahraman ve kahramanlık öyküleri ise her kültürde farklılık göstermesine rağmen mevcuttur. Kaosun ancak kaos ile yönetilebileceğini ifade eden kaos teorisi, pek çok antik kültürde olduğu gibi kozmogoni bağlamında Mezopotamya'da canavar olgusunu, toplum içerisinde yarattığı karmaşayı ve bu karmaşanın sonunda canavarın yok edilerek düzenin oluştuğunu gösteren pek çok mitolojik

referansta yer almaktadır. Antik Mezopotamya'nın en dikkat çekici melez canavarlarından biri olan Anzu kuşu da canavarlık özelliklerinin belirleyici unsurlarından olan hem bir dönem koruyuculuk görevi üstlenen ancak aynı zamanda da kaosa sebep olarak tekrar düzenin kurulmasında antagonist olarak rol oynayan oldukça önemli bir figürdür. Baş tanrı Enlil'den evrenin düzeninin simgesi olan değiştirilmez bir yasa metni olan kader tabletini çalarak toplumsal düzende kaos yaratır ve tekrar düzenin kurulması için kaos teorisi bağlamında mücadelenin başlamasına sebep olur.

ÖZET

Plastik sanat alanlarında 1960 sonrasında malzeme, konu ve kavram gibi birçok alanda değişimler söz konusu olmuştur. Bu durum sanatçıların kendilerini ifade etmesi açısından yeni teknikleri ve olanakları denemeleri bakımından da oldukça önemlidir. Günümüz koşulları değerlendirildiğinde teknolojinin sağladığı olanakların bireysel ve toplumsal alanlarda da farklı dinamikleri beraberinde getirmesi söz konusudur. Teknoloji dahilinde yer alan tüm olanakların hayatın her alanında kendine yer edinmesi elbette sanat alanında da mümkün olmaktadır. Sanatın özgün ve dinamik yapısı özellikle günümüzde teknoloji ile gelişen ve oluşan dilin ortaya konmasında etkili olmuştur. Teknoloji ve sanatın işbirliği sanatçının odağında yer almaktadır ve onun yaratıcı sürecinin büyük bir parçası olarak kendisini göstermektedir. Bu noktada teknolojik gelişmelerin bir yansıması olarak dijital sanatın mekân bağlamında izleyiciye sunulması enstalasyon kavramını da içinde barındırmaktadır. Mekân, malzeme, izleyici ve sergileme pratikleri gibi birçok unsur artık çağdaş sanatın dinamikleri arasındadır ve sanatçılar tarafından özgün biçimlerde yorumlanmaktadır. Bu çalışma; mekân ve izleyici etkileşimleri bağlamında Peter Kogler'in enstalasyonları üzerine odaklanmaktadır. Sanatçının mekânın izleyici üzerinde oluşturduğu etkiye odaklandığı çalışmaları dikkat çekicidir. Mekânın tekrar kurgulandığı bu üretimlerde ses ve ışık aracılığı ile izleyicinin algısı sürekli olarak dinamik tutulmaktadır. Peter Kogler'in enstalasyonlarında yer alan dijital unsurlar teknolojinin kullanımı aracılığı ile mekânsal kurgulamaları da oluşturmaktadır. Bu bağlamda çalışmada Peter Kogler özelinde teknolojinin enstalasyonlardaki yansımalarını ve mekana özgü yeni açılımları ortaya koymak amaçlanmaktadır.

Anahtar Kelimeler: Çağdaş Sanat, Mekân, İzleyici, Enstalasyon, Peter Kogler

**READINGS ON PETER KOGLER'S ESTALATIONS IN CONTEXT OF SPACE AND
AUDIENCE INTERACTIONS**

ABSTRACT

After 1960, there were changes in many fields such as materials, subjects and concepts in the fields of plastic art. This situation is also very important in terms of trying new techniques and possibilities for artists to express themselves. When today's conditions are evaluated, it is possible that the opportunities provided by technology bring different dynamics in individual and social areas. Of course, it is also possible in the field of art that all the possibilities within the technology have a place in every aspect of life. The original and dynamic structure of art has been especially effective in presenting the language that has developed and formed with technology today. The collaboration of technology and art is at the focus of the artist and shows itself as a big part of her/his creative process. At this point, the presentation of digital art to the audience in the context of space, as a reflection of technological developments, also includes the concept of installation. Many elements such as space, material, audience and exhibition practices are now among the dynamics of contemporary art and are interpreted by artists in original ways. This work; focuses on Peter Kogler's installations in the context of space and audience interactions. The works of the artist, in which he focuses on the effect of the space on the audience, are remarkable. In these productions where the space is reconstructed, the perception of the audience is kept dynamic through sound and light. The digital elements in Peter Kogler's installations also create spatial constructions through the use of technology. In this context, it is aimed to reveal the reflections of technology in installations and new space-specific expansions in Peter Kogler.

Keywords: Contemporary Art, Space, Audience, Installation, Peter Kogler

1. GİRİŞ

1.1. Çağdaş Sanatta Enstalasyon Kavramı Üzerine

Sanat, yalnızca biçimsel olarak bir çıktı niteliğinde düşünülmemelidir. Sanatın başlangıç, gerçekleşme, sonuçlanma ve izlenme süreçlerinde ayrı ayrı düşünsel, duygusal sorgulamalar, tartışmalar, keşifler söz konusudur. Bu anlamda sanatçıların ortaya koydukları yapıtları onların ele aldıkları ve özgün bir tavırla yansıttıkları sonsuz konu çeşitliğini gözler önüne sermektedir (Çevik ve Kayahan, 2021: 1104). Çağdaş sanatta, üzerinde düşünülen tüm malzeme seçimleri ya da teknikler gibi konuların başında dikkat çeken tavır, özgünlük kavramının ön planda tutulmasıdır. Sanatçının temel motivasyonu tam da bu noktada özgünlük teması çerçevesinde gezinen zamandan, mekandan, malzeme, konu, kavram ve daha bir çok sınırlılıktan uzaklaşarak sınır tanımayan eylemler olarak varlığını göstermektedir. Özgünlük ve beraberinde gelen özgürlük anlayışı, sanatçının disiplinlerarası sahalarda yer alabilmesine imkan tanımakta ve deneyimsel süreçlerin başat olduğu uygulama alanları yaratmaktadır (Kayahan ve Çevik, 2022: 42-43).

Kavramsal sanat ile sanat dünyasında hiçbir kalıbın olmadığını anlaşılmış ve alışılmışın dışında bir çizgide sanat eserleri kabul görmüştür. Sanatın anlamı genişleyerek, yeni tanımlar ortaya çıkmıştır. Atölyelerde gerçekleşen üretim şekilleri değişmiş, kaide üzerinde yer alan heykel kamusal alanda izleyicinin de dahil olabildiği yeni biçimlere dönüşmüş, tuval resmi tuvalin dışına çıkmış, kısacası plastik sanat alanı yeni ve bilinmeyene doğru yol almaya başlamıştır (Artun ve Öрге, 2017: 27-28). 20. yüzyıl teknolojinin hızla geliştiği bir dönemdir. Hayatın her alanına yansımaları gösteren teknolojinin sanatta da varlığını göstermesi doğal bir akış olarak nitelendirilebilir. Teknolojinin dahil olduğu üretimlerde yazılım, mühendislik, mimarlık ve daha bir çok alan sanat yapıtının gerçekleşme ve sonuçlanma sürecine katılmaktadır. Bu mantık doğrultusunda oluşan eserler ile yeni bir izleme ve değerlendirme biçimi gelişmiştir. Geleneksel sanatlardan tuval resmi, kaide üzeri heykel yerini hareketli videolara ve farklı duylulara hitap eden üç boyutlu yeni sanat biçimlerine bırakmaktadır. Bu noktada enstalasyon sanatı önem taşır. Özellikle video enstalasyonları ile sanatçılar, video sanatını etkin bir biçimde kullanabildikleri gibi aynı zamanda mekanı da sanat yapıtına dahil ederek üç boyutlu ve algısal olarak farklılıklar sunan özgün anlatımlara ulaşmışlardır. Bu bağlamda sanat yapıtının ortaya çıkma sürecinde soyut düşünceler etkili olabildiği gibi kimi zaman somut bir nesne ya da olay da sanatçının üretim şekline ilham olabilmektedir (Albayrak ve Kurak Açıcı, 2022: 165).

Enstalasyon, sanatta düşüncenin, nesnenin ve mekanın dahil olduğu yeni bir alandır. Enstalasyon sanatında sanatçı tüm mekanı yapıtının bir parçası olarak algılayabilir. Bu bütünleşik yapının içerisine katılan izleyici ile birlikte yapıt genişleyerek yeni bir sanat biçimine dönüşebilmektedir. Disiplinlerarası çözümlenmeleri ile enstalasyon sanatı çok boyutlu bir yapıya sahiptir (Aldınç, 2022:38).

2. MATERYAL ve YÖNTEM

Çalışma, betimsel yöntem ve tarama modeli ile gerçekleştirilmiştir. İlgili ulusal ve uluslararası literatür taranarak, gerekli bilgiler olduğu gibi ele alınarak sunulmuş ve yorumlanmıştır.

3. BULGULAR ve TARTIŞMA

3.1. Mekân-İzleyici Etkileşimleri ve Peter Kogler'in Çalışmaları Üzerine

1960 sonrası sanatta birbiri ardına çoğalarak devam eden yeni akım ve hareketler özellikle kavramsal sanat ile birlikte mekan kavramının ön plana çıktığı bir anlayış doğurmuştur. Mekan kavramı kamusal alanda yer alan sanat yapıtlarından, heykel alanına ya da disiplinlerarası çalışmalara kadar sanatçıların ele aldıkları bir uğraş olmuştur. Mekân kavramı, Sanatta Kavram ve Terimler Sözlüğü'nde, uzayın sınırlanmış bir parçası ve aynı zamanda mimari bir ürünün vazgeçilmez bir niteliği ve bu ürünü var eden en temel koşul olarak tanımlanmaktadır. Mekân aynı zamanda boşluk olarak da tanımlanmaktadır (Kilimci, 2012: 107). Bu anlamda, günümüz sanatçısı mekânı, deneyim alanına dönüştürmesi ve özel ya da toplumsal geçmişi/anıları yeniden canlandırıp izleyiciye düşünsel bir platform sunmak için bir araç olarak görmektedir. Resimden yerleştirmeye, heykelden videoya uzanan pek çok sanatsal pratiğinin mekânın sınırlarını ve algısını genişlettiğine rastlanmaktadır (Şenel, 2016: 9).

Sanat alanında yaşanan tüm değişimler ve dönüşümler hem sanatçıları hem de izleyiciler benzer açılardan etkiler. Sanatın üreticisi konumunda olan sanatçı ve sanatın alımlayıcısı konumunda olan izleyiciyi birbirinden farklı değerlendirmek söz konusu değildir. Sanatın her alanında bu iki taraf, sanatçı ve izleyici karşılıklı iletişim ve etkileşim halindedir (Kayahan ve Çevik, 2023 b: 816). Sanatçıların yapıtlarındaki çeşitli özellikler mekanın nasıl algılandığı konusunda izleyicileri yönlendirmektedir. Mekanla özdeşleşen sanat eserleri ile mekan tek başına bir varlık olarak belirmiş ve zamanla mekan sadece kendi öz varlığıyla bir sanat yapıtı olarak değerlendirilmeye de

başlamıştır (Sağlam, 2020: 54). 1940 yılı sonrası ve özellikle 1960 sonrası hızla çoğalarak gelişen yeni sanat biçimlerinde öne çıkan kavram ve bu kavramı ya da fikri en iyi ifade edecek malzeme çeşitliliği olmaktadır. Sanatta geleneksel tabular yıkılmış yerini sorgulayan, tartışan, analiz eden, öneren, sıra dışı yaklaşımlar almıştır. “1960’lı yıllardan itibaren sanat alanında ortaya çıkan pek çok yeni ifade biçimi kavramsal sanat başlığı altında incelenebilir. Geleneksel anlamda estetikten ziyade kavramı yani düşünce önemsendir ve sanatta alternatif arayışlar önem kazanır” (Uz ve Uz, 2018: 657).

Postmodern dönemde sanat ile mekan arasında bütünleşik bir ilişki başlamış, hazır nesnelerin bir arada sunulduğu asamblaj ve enstalasyonlar ile birlikte bu bütünleşik yapı genişleyerek yeni anlamlar kazanmıştır. Bu dönemin sanat anlayışında mekan başlı başına önem kazanmıştır. Sanatçı sadece mekanı bir sanat yapıtına dönüştürebilirken, mekandaki enstalasyona izleyiciyi de dahil ederek alımlayıcının farklı duyularına hitap eden yeni açılımlar da sunabilmektedir (Kocakaya, 2015: 121). Sanat yapıtı olarak mekan hem nesneye bağlı hem de özneye bağlı olarak değişkenlik gösterebilir. Nesneye yönelik bakış açısında hareketli ya da durağan nesnelere karşılaştırıldığında hareketli unsurların daha fazla dikkat çektiği görülürken, özneye yönelik düşünüldüğünde ise hareketli ya da sabit öznenin mekanı algılamasında farklılıklar belirecektir. Bununla birlikte mekanı deneyimleyen bireyin hareketlerinin hızına bağlı olarak da algılamada farklılıklar ortaya çıkacaktır (Ozar, 2018: 54).

Süreçsel bağlamda değerlendirildiğinde, özellikle 1960 sonrası sanatta oluşan yeni açılımlar/kırılmalar sayesinde ve sonucunda plastik sanatlarda resim, heykel ve fotoğrafın kullanım olanaklarının ötesinde mimari, enstalasyon, video art ve performans aracılığıyla da farklı düzenlemeler gözlenmiştir. Mekân/nesne ilişkisini tekrar tekrar sorgulayan sanatçılar neredeyse her çalışmanın mekânsal kurgusunda izleyiciye yeni deneyimler yaşatır (Kayahan ve Çevik, 2023 b: 816).

Gelişen teknoloji olanakları ve özellikle 20. Yüzyılda başlayarak günümüze değin ulaşan geleneklerin kırılması ile görsel sanatlar sınırlarını zorlamaktadır. Sanat sınır tanımamakta, farklı sanat alanları birbirlerinin içinde eriyerek sanat alanı olmak dışında yeni söylemlere ulaşmaktadır. Bu anlamda sanatlar arası etkileşim, sanatların kendi sınırlarını aşan yapısıyla önemini yitirmektedir (İpşiroğlu, 2010: 11). Teknoloji geleneksel değer yargılarını yıkan önemli bir güçtür. Sanat, teknolojinin bu güçlü yapısı altında değişime uğramakta ve 20. Yüzyılın son yarısında

güncel sanata değin ortaya çıkan sanat akım ve hareketleri ile bu düşünce doğruluğunu göstermektedir. Bunlar All Over, Art Brut, Funk Öncesi, Kobra, Fluxus, Soyut Dışavurumculuk, Kinetik Sanat, Happening, Pop Art vb. (Binzet, 2006: 12). Akımlarda karşımıza çıkan bu farklı adlandırmalar sanatçıları, izleyicileri ve sanatın algılanmasına yönelik olan yerleşik kalıpların da dönüşmesine sebep olmuştur. Sanatçı aynı anda hem tüketen, hem kullanan, hem de üreten konumuna gelmiştir. Bu gerçeklik kapsamında izleyiciye yönelik anlamlarında değiştiği görülmektedir. İzleyici hem sanatı izlerken başka bir yerde var olmakta hem de sanat yapıtlarına dahil olarak yeri yine değişikliğe uğramaktadır. Geleneksel sanat anlayışlarında mekan yalnızca eserin sergilendiği bir alan iken, izleyici için mekan artık yapıtın bir parçası ve bazen yapıtın ta kendisi olabilmektedir (Şenova, 2005: 14-15).

Plastik sanatların her alanında öncü olan sanatçılar için kavramsal sürecin öneminin yanı sıra üretimlerinde kullandıkları malzemeler de artık “yaratıcı söylemin” konusunu oluşturmaktadır. Özellikle günümüzde teknoloji ile oluşturulan dilin hayatın her alanına yansımalarının bir sonucu olarak sanat alanında da bu değişim ve dönüşümden söz etmek mümkündür. Teknoloji ve sanat işbirliği kapsamında sanatçının odağında yer alan yaratıcı sürecin izleyiciye sunulması durumu içinde birçok değişkeni barındırır. Bu değişkenler arasında kavramsal süreç, mekân, malzeme, izleyici, sergileme pratikleri gibi birçok unsur söz konusudur. Çağdaş sanat dinamikleri açısından değerlendirildiğinde özellikle teknolojik gelişmelerle birlikte sanat, tasarım ve uygulama alanlarında zenginleşen disiplinlerarası uygulamaların hem izleyicinin hem de sanatçının ifade olanaklarını değiştirdiğini söylemek mümkündür. Teknolojik olanakların ilerlemesiyle birlikte ortaya çıkan üretimler özellikle 1960 sonrası hız kazanmış ve sanatta kavramsal ifadenin yansımaları olarak sanatçıya sınırsız bir yaratıcılık aracılığı ile bireysel üretim süreci sunmuştur. Bu durum kendi içinde sanatçının öncü ve özgün olabilmesinin önemini artırmıştır (Kayahan ve Çevik, 2023 a: 825).

El ustalığına bağlı geleneksel sanat üretimleri dijital teknolojilerin hayata dahil olması ile değişmiş, sanat eseri ve izleyici kavramları da yeniden biçimlenmiştir. Dijitalleşen dünyada sanat yapıtı, izleyici farklılaşırken sanatın izlendiği ya da sergilendiği mekanda değişiklik göstermektedir. Kitle iletişim araçları ile izleyiciye ulaşan sanat yapıtlarında izleyici de bu sanat biçiminin bir parçası haline dönüşebilmektedir (Tanyel Başar, 2021: 57-58). Sanat teknoloji ile birlikte sürekli değişkenlik gösterirken, teknoloji ile dijitalleşen sanat eserleri zaman içerisinde farklı isimlerle

anılmıştır. 1970’lerde ‘bilgisayar sanatları’, ardından ‘multimedya sanatları’ gibi farklı isimler alan dijital sanat, artık, özellikle film, video sanatı, ses sanatı ve daha farklı hibrit biçimler ile birlikte “yeni medya sanatı” altında değerlendirilmektedir (Akten, 2008: 18).

Dijital sanat dünyasında izleyici tarafından yaşanan deneyim, eserin zihinde canlandırılmasından ziyade sayısal izdüşümün sanat eserine dönüştüğü esrarengiz ortamda gerçekleşerek, izleyici-yapıt arasındaki etkileşim bir nevi cisimleşmektedir. Dijital sanat eserleri, fiziki gerçek kuralların çok ötesinde izleyiciyi yazılımların içerisinde dolaştırmakta, gerçeküstü bir yaşam alanı sunmaktadır. Dijital sanat ile bütünleşen mekan, tüm alışılmış mekan kurallarını ya da algıları bozan, değiştiren, bedene dair tüm sınırların ortadan kalkabildiği, içsel bakışın aktif konumda yer aldığı, izleyicinin sınırlarını da zorlayan ve birçok duyuyu aynı anda harekete geçirerek izleyicinin yapıtı değiştirdiği ve etkileşimli bir uzam olarak karşımıza çıkmaktadır (Şahin, 2010: 129). Sayısal dünyanın sanata dahil olması ile beraber sanatta geri dönülmez bir noktaya varılmıştır. Dijital teknolojiler her geçen gün gelişmekte ve çeşitlenmektedir. Bu anlamda sanatın oluşum sürecinde sonsuz olanakları barındıran yeni bir alan oluşturmaktadır. Dijital oluşumlar, hem sanatçının hem de izleyicinin algısını değiştirerek, ikisi içinde mekanla kurulan deneyim farklılaşmıştır. Sürekli gelişen dijital teknolojinin sanatçıyı, sanat yapıtını ve izleyiciyi de değiştireceğini söylemek yanlış olmayacaktır. Sanatın mekanları farklılaşarak dönüşmeye devam edecektir (Selçuk, 2022: 602).

Görsel 1: Peter Kogler, MUDAM Luxembourg, 2010 (Url 1).

Çağın koşulları içerisinde her alanda olduğu gibi plastik sanatlarda da değişiklik gözlenmektedir. Plastik sanatların farklı alanlarda gerçekleştirilen sanat yapıtları gelenekselden uzak yeni düşünce ve anlayışlar ile oluşturulduğundan içerik çözümlemesinin de özgün analizler ile değerlendirilmesini gerekli kılmaktadır (Akdeniz, 1995: 9-10). Dijital teknolojilerin gelişim süreçleri, sanat, tasarım, kavrama yönelik yenilikleri de beraberinde getirmektedir. Bu gelişimlerin sonuçları olarak Dijital Sanat, Yeni Medya Sanatı, Dijital Animasyon Sanatı, Yazılım Sanatı gibi çok çeşitli alanların ortaya çıkmasına sebep olmuştur (Özdemir, 2010: 4).

Mekan, sanat yapıtı bir nesne olarak ele alındığında bu nesnenin kurgusu için önemli bir alanı temsil etmektedir. Bu anlamda düşünülmüş bir mekan sanat yapıtının oluşum sürecinde önem taşımaktadır. Mekana dair sanat alanında bilinenler gelişen teknoloji ile birlikte hatırı sayılır değişikliklere uğramıştır. Sanat eserini konumlandırırken ya da sanat yapıtını oluştururken kullanılan mekan, günümüzde tek başına kendine ait alanı ile bir sanat yapıtına dönüşebilmektedir. Mekani, sanatçı bir kavram olarak ele alıp değerlendirebilir. Peter Kogler, mekana dair sorgulamalara yer veren sanatçılardan biri olarak, mekan içinde yeni mekanlar oluşturmakta ve mekanın özgün bir biçimde deneyimlenmesine olanak tanımaktadır. Mekanın tüm yüzeyinde hareket eden bir üç boyut algısı içinde yer alan izleyici mekan içinde kendini konumlandırmaya çalışmaktadır. Bu muazzam derinlik algısında izleyici hem kendi gerçekliğinin hem de mekana dair bilinenlerin değişimine tanık olmaktadır (Sağlam, 2020: 52 ve 63). Peter Kogler, mekanda oluşturduğu çizgisel animasyonlar ile optik bir yanılsama elde ederek mekandaki derinlik algısını ve mekanın tümünü yapı bozuma uğratmaktadır (Aldinç, 2022: 50).

Enstalasyon sanatında eser, izleyicinin deneyimleyebileceği bir alan olarak belirlemektedir. Sanat yapıtı, üç boyutludur ve bir mekan içerisinde yerleştirilen eser gerçek yaşamın bir parçası haline gelir. Sanat eserine dokunabilen, onu duyabilen ya da eserin kokusunu alan izleyici karşısında yapıt etkileşimli bir hal almaktadır. Enstalasyonda yapıt ve mekan bir aradadır. Mekan çoğu zaman yapıtın bir parçasıdır. Zengin malzeme olanağı ile sanatçı kavramı için en uygun malzemeyi seçerek mekanla birlikte yeni bir anlam sunmaktadır. Mekan üzerine değerlendirildiğinde enstalasyon ve video art'ın bir arada kullanıldığı sonsuz olasılık mevcuttur. Kapalı, açık, kamusal alan ya da doğada gerçekleştirilebilen video enstalasyonların çoğunda izleyicinin sanat eserine dahil olduğu bir süreç izlenmektedir (Demirkıran: 10-14).

Peter Kogler, Gallery, Istanbul, 2011 (Url 1).

Mekan, Peter Kogler'in dijital dünyası ile yeniden biçimlendirilerek, izleyicinin dahil olduğu çalışmalara dönüşmektedir. Mekanı ve mekan içinde bulunan insanın konumunu sorgulatan Kogler, teknoloji olanakları ile mekanı kurgular, kurgulanan mekanlar yeniden dijital olanaklarla dönüşür ve hareketli görüntülerle mekan tekrar tekrar biçimlenir. Sürekli hareket eden animasyon mekan içinde boş-dolu ve gerçeklik kavramlarını sorgulamaktadır. Kogler, bir sanat yapıtı olarak mekanı izleyiciye sunmakta, ses efektleri ile birleşen hareketli görüntüler galeri mekanını sanat eserine dönüştürmektedir. İzleyici için iki boyutlu olan galerinin düz duvarları, Kogler'in dijital animasyonları ile üç boyutlu bir gerçeklik algısı yaratmaktadır (Selçuk, 2022: 595).

Görsel 3: Peter Kogler, ING Sanat Merkezi, Brüksel, 2016 (Url 1).

Avusturyalı sanatçı Peter Kogler otuz yıllık sanatsal kariyerinde, mekân algısını anlatmak için grafik, mimari ve yeni medya gibi farklı alanlarda çalışmalarda bulunmaktadır. Kogler'in birçok eserinde ele alınan hareket teması parçanın bütününe hayat veren ana unsur olarak değerlendirilebilir. Bu durum özellikle Kogler'in teknoloji ve onun sanatsal alandaki uygulamalarıyla çalışmaya başladığında ortaya çıkmıştır. Sanatçı, enstalasyon odalarında bazı soyut veya geometrik figürler yerleştirerek bunları duvarlara yansıtarak belirli ve çarpık bir atmosfer yaratmıştır. Bu üretimlerinde sanatçı, basit grafik öğelerin, mimari öğeleri değiştirmeden mekân algısını tamamen değiştirebileceğini ortaya koyabilmektedir. Kogler'in çizgileri, maksimum kontrast ve etki için genellikle beyaz üzerine siyaha indirgenmektedir. Bu durum Peter Kogler'in enstalasyonlarında yer alan düzenlemelerin sergi mekânının tüm yüzeyini anomorfik biçimde kaplıyor oluşu ziyaretçinin algısında bir netlik oluşturamaması durumuna da işaret etmektedir. Sanatçının mekânsal bu üretimlerinde artık izleyicinin algılayabileceği üst, alt, sağ veya sol yönleri yoktur ve genellikle tüm deneyim, izleyiciyi daha da fazla etkileyen bir arka fon müziği ile ilişkilendirilir (Luglio, 2020, Url 1).

Görsel 4: Peter Kogler, Zagreb Çağdaş Sanat Müzesi, 2014 (Url 1).

Dijital sanat pratiklerinde izleyici sadece bakan ve sanat yapıtının ne olduğu üzerine değerlendirmeler yapan kişi olmaktan çıkıp, yapıta dahil olan ve bütünleşen bir performansta yeni bir deneyim yaşamaktadır. Sanatçı sunumlarında bilgi transferi sağlamakta, fiziki gerçekliği kimi zaman yok saymakta, disiplinlerarası buluşmalarla özgün üretimlere ulaşmaktadır. Görüntüleme sistemleri mekanın algılanmasını farklılaştırmakta, dijital mekanlar yaratmaktadır. Dijital sanat pratiklerinde ekran, projeksiyon, arttırılmış gerçeklik sistemleri gibi görüntüleme araçları ile izleyici ve izleyicinin deneyimlerini arttıran dijital yapıtlar arasında özel bir bağlantı kurulduğunu gözler önüne sermektedir. Görüntüleme sistemleri, yapıtların plastik çözümlemeleri aşamasında dijital mekanın algısını değiştirmesi bağlamında önem taşımaktadır (Aldinç, 2022: 75).

Eduardo Kac, “Genesis” çalışması da bir video enstalasyon olarak karşımıza çıkmaktadır. Çalışma (1998/99) biyoloji, inanç sistemleri, bilgi teknolojisi, diyalojik etkileşim, etik ve internet arasındaki karmaşık ilişkiyi araştıran bir sanat çalışmasıdır. Sanatçının sentetik genini kullanarak UV ışınları ile birlikte renk ayrımlarının olduğu bir düzenekte gelişmektedir. Galeri ekranı, yerel katılımcıların yanı sıra uzak (Web) katılımcıların da çalışmanın gelişimini izlemesine olanak tanır. Web üzerindeki uzak katılımcılar UV ışığını açarak sürece müdahale etmektedir. UV ışığının bakteri üzerindeki enerji etkisi, DNA dizilimini bozarak mutasyon oranını hızlandıracak şekildedir. Sol ve sağ duvarlarda doğrudan duvara uygulanan büyük ölçekli metinler yer alır. Seçilen bakterilerin kamusal alanda kullanımı güvenlidir ve galeride UV kaynağı ile birlikte koruyucu

şeffaf bir muhafaza içinde sergilenmektedir. Aynı zamanda ses olarak müzik galeride web üzerinden yayınlanmaktadır. Çok kanallı kompozisyonun parametreleri bakteriyel çoğalma ve mutasyon algoritmalarından türetilmiştir (Kac, 1999). Sayısallaştırılmış verilerin inşası ile dijital mekanların yaratım sürecinde yeni bir kurgusal gerçeklik oluşmaktadır. Bir tür simülasyona dönüşen ortamda mekanda zamansallık ve geçicilik söz konusudur (Aldinç, 2022: 76). Peter Kogler'in, iç mekânda yaptığı enstalasyonlar insanın derinlik algısı ile oynamaktadır (Ozar, 2018: 49).

4. SONUÇ ve ÖNERİLER

Günümüz sanatı kapsamında değerlendirildiğinde teknolojik olanakların sanat alanında sağladığı olanaklar ve ortaya koyduğu uygulamalar hem sanatçı hem de izleyici açısından oldukça önemlidir. Bu durum teknolojik olanakların kullanımı özellikle sanat ve teknoloji bağlamında özgün uygulamaların ortaya çıkması bakımından dikkat çekicidir. Bu makale kapsamında mekân ve izleyici dinamikleri bakımından Peter Kogler'in iç mekânda yaptığı enstalasyonları değerlendirilmiştir. Yapay zekâ ve dijital uygulamalar bakımından bilim ve teknoloji dünyasının en güncel konuları Kogler'in özgün çalışmalarında yer almaktadır. Özellikle izleyicide önceden bilindik olan mekân algısının yeniden sorgulanması ve oluşturulmasına odaklanan sanatçı, mekân, malzeme, boyut, izleyici ve sergileme pratikleri gibi birçok unsur açısından plastik sanatlara yeni bir bakış açısı sunmuştur. Kogler'in özgün çalışmalarında optik bir yanılsama söz konusudur. Geleneksel sanatın çok ötesinde malzeme ve teknik sınırlarını ortadan kaldıran, tamamen teknoloji odaklı yeni çözümlerlerdir. Peter Kogler, mekandaki video enstalasyonları izleyici ile bütünleşen, izleyiciyi yapıta dahil ederek hareket etmesini ve her açıdan görüntülerin düşüncelerin sürekli değişkenlik göstermesini içeren bir sanat pratiği sunmaktadır. Gerçekliği yeniden sorgulatmaktadır. Sanat, sanat yapıtı, izleyici bağlamında sanat eserinin oluşum ve sonuçlandırılma süreçlerini düşündürmekte ve durağanlıktan öte hareketli bir yaşamsallıkta varlık göstermektedir. Video enstalasyonları, dijital dünyayı izleyici ile birleştirirken, günceli alımlayıcının deneyimlemesine olanak tanımaktadır.

ÖZET

Geçmiş, şimdi ve gelecek birbirleri ile örüntülü zaman dilimleri olup, her bir dönemde gerçekleşen ya da gerçekleşecek sanat yapıtlarının birbirleri ile ilişkisinin olduğu bir sanat yapısından söz edilebilir. Sanat, doğal olarak içinde bulunduğu sosyal yapı, kişisel algılar, bilimsel ve teknolojik gelişmeler ile bütünsel bir zeminde gelişmekte ve değişime uğramaktadır. Sanatın bu değişim ve dönüşüm süreci çağdaş sanatlar bağlamında malzeme, konu ve kavram gibi birçok alanda çeşitliliğe ulaşmaktadır. Sanatçıların kendilerini ifade etmeleri açısından değerlendirildiğinde malzeme, konu ve kavram çeşitliliğini merkezine alan üretimleri özellikle çağdaş sanat alanında ve disiplinlerarası süreç bağlamında dikkat çekmektedir. Sanatçıların bu ifade olanakları özgün yorumları beraberinde getirmektedir. Çağdaş sanat üretimleri bakımından konuların çeşitliliğinin yanı sıra sanatçının üretiminde ortaya çıkan bağımsızlığın bir yansıması olarak ulaşılan özgünlük oldukça önem taşımaktadır. Ed Fairburn'un deneysel portreleri özgünlüğü bakımından çalışmanın ana dinamiğini oluşturmaktadır. Ed Fairburn, sanat alanında yaygın bir biçimde kullanılan portre kavramını kendine has bir bakış ve üretim açısıyla yeniden değerlendirmektedir. Çalışmanın amacı, özgün bir desen diline ulaşan Ed Fairburn'un deneysel portrelerini analiz ederek yorumlamaktır. Bu çalışma; Ed Fairburn'un haritalar üzerine çizdiği portreleri üzerine odaklanmaktadır. Sanatçı farklı haritaları bir hazır zemin olarak değerlendirerek figüratif unsurları bu haritaların üzerine çizmektedir. Fairburn'un haritalar üzerinde çizdiği portrelerinde dağlar, göller, ovalar, karayolları gibi birçok somut kavram, sanatçının portrelerinde yeniden hayat bulmaktadır. Sanatçının bu kartografik portreleri hem birbirinin içinde erimekte hem de birbirinin içinden yeniden oluşmaktadır. Bu durum sanatçının portrelerinin deneysel oluşum sürecine de işaret etmektedir. Ayrıca sanatçının zaman ve mekândan bağımsız olarak değerlendirilebilecek olan bu portre çalışmaları aynı zamanda izleyici içinde her biri birbirinden farklı düşsel bir gerçeklik de sunmaktadır. Araştırma betimsel yöntem ve tarama modeli ile gerçekleştirilmektedir. Ed Fairburn'un portrelerine ilişkin ulusal ve uluslararası kaynaklardan elde edilen bilgiler üzerinden yorumlar sunulmaktadır.

Anahtar Kelimeler: Çağdaş Sanat, Harita, Portre, Ed Fairburn

**ED FAIRBURN'S AS AN EXPRESSION IN CONTEMPORARY ART
EXPERIMENTAL PORTRAITS**

ABSTRACT

Past, present and future are time periods that are patterned with each other, and it can be mentioned of an art structure in which the works of art realized or to be realized in each period are related to each other. Art develops and undergoes changes on a holistic basis with the social structure, personal perceptions, scientific and technological developments in which it naturally occurs. This change and transformation process of art reaches diversity in many areas such as materials, subjects and concepts in the context of contemporary arts. When evaluated in terms of the artist's self-expression, their productions, which center on the diversity of materials, subjects and concepts, draw attention especially in the field of contemporary art and in the context of interdisciplinary process. These expression possibilities of the artists bring along original interpretations. In terms of contemporary art productions, in addition to the diversity of the subjects, the originality achieved as a reflection of the independence that emerges in the artist's production is very important. Ed Fairburn's experimental portraits constitute the main dynamic of the work in terms of originality. Ed Fairburn reevaluates the concept of portrait, which is widely used in the field of art, with a unique perspective and production point of view. The aim of the study is to analyze and interpret the experimental portraits of Ed Fairburn, who reached a unique design language. This work; it focuses on Ed Fairburn's portraits on maps. The artist draws figurative elements on these maps, using different maps as a ready-made background. In Fairburn's portraits drawn on maps, many concrete concepts such as mountains, lakes, plains and highways come to life in the artist's portraits. These cartographic portraits of the artist both melt into each other and are reconstituted from each other. This situation also points to the experimental formation process of the artist's portraits. In addition, these portrait works of the artist, which can be evaluated independently of time and space, also present an imaginary reality, each different from the other, for the viewer. The research is carried out with descriptive method and scanning model. Comments on Ed Fairburn's portraits are presented based on information obtained from national and international sources.

Keywords: Contemporary Art, Map, Portrait, Ed Fairburn.

1. GİRİŞ

1.1. Çağdaş Sanat ve İfade Biçimleri Üzerine

Geçmişten günümüze kadar ekonomik, sosyolojik, teknolojik ve kültürel değişimler sanatın her alanına yansımıştır. Bu yansıma beraberinde yeni üslup ve malzeme arayışlarını içinde barındırmasının yanı sıra deneyselliğe açık özgün sanat üretimlerini de ortaya çıkarmıştır. Modern sanat anlayışı ve sonrasında yaşanan seri üretimin ekonomiye katkısını tanımlayan Sanayi Devrimi aracılığı ile sanatın her alanı konu, kavram, malzeme ve sergileme olanakları bakımından geleneksel kalıpların dışına çıkmaya başlar. Bu değişim ve dönüşüm zamanları bir resmin çoğaltılabilir olma düşüncesi bakımından da oldukça önemlidir. Ayrıca teknolojik gelişimin bir dönüm noktası olarak fotoğrafın keşfi ile birlikte sanatçıların fotoğrafı bir malzeme olarak kullanmaları da söz konusudur. Özellikle 1960'lı yılların ardından sanatçılar, sanatın anlamını sorgulamışlar ve alternatif sanatsal malzemeler kullanmaya başlamışlardır. Sanat alanının dışında yer alan her türlü malzeme sanata dahil olabilmeye ve atık malzemeler, buluntu nesnelere, fotoğraf, video gibi çeşitli malzeme ve teknikler kullanılarak yeni anlatımlar denenmiştir (Pazarlıoğlu Bingöl, 2022: 328).

19. yüzyıl sonrası sanat bilinç/bilinçdışı süreçlerine yeni bakış açıları sunarak nesnelere bilindik biçimlerinin bozulduğu denemelerin gerçekleştiği bir deneyimi yaşamıştır. 21. yüzyılda ise sanat küresel boyutta dinamik bir yaşam biçimine dönüşmüştür. Sanat, bu yeni biçimiyle yaşamın içine daha çok dahil olmuştur. Küreselleşme, kültür ve sanat anlamında disiplinlerarası süreçleri hemen hemen her alana dahil olmasına sebep olmuştur. Çağımızda sanatta fikir ve malzemenin birlikteliğinde sürekli gelişen teknoloji olanaklarının da dahil olduğu özgün üretimler gerçekleştirilmektedir. Bu süreç açısından değerlendirildiğinde sanatın ve ifade olanaklarının değişimi ile resim ve edebiyat alanında daha çok temsil edilme olanağı bulan portre sanatı malzeme, teknik, ifade ve biçim yönünden çağdaş sanatta yeni biçimlerde disiplinlerarası alanlarda ifade edilmektedir. Bu yeni, özgün ve özgür süreç sanatın her alanında olduğu gibi portre uygulamalarında da sanatçı ve izleyici arasında deneyim aracılığı ile kendine yeni ifade olanakları bulmaktadır/bulacaktır (Çevik, 2022: 17). 1960'lı yıllardan itibaren günümüz sanatını da etkisi altına alacak çağdaş sanat olarak isimlendirilen yeni bir sanat anlayışı başlamıştır. Çağdaş sanat dinamiklerinde teknoloji ön plandadır. İzleyici ile bütünleşen, şaşırtan, alışılmadık özgün

uygulamalar çağdaş sanat pratiklerinde dikkat çekmektedir. Sanat yapıtlarının çoğu düşündürücü niteliktedir (Bulut, 2014: 119).

1.2. Portre Kavramı Üzerine Değerlendirmeler

Türk Dil Kurumu sözlüğüne göre “Portre; bir kimsenin yağlıboya, suluboya, karakalem vb. ile yapılmış resmi” olarak açıklanmıştır (TDK, 2020). Portre, temsil anlamında oldukça güçlü, evrensel değer ve içerik taşımaktadır. Anlatımın bu denli etkili bir dil ile ifade edilebildiği portre çalışmalarında otoportrele ile sanatçı kendi özünü yansıtan çalışmalar ortaya koyabilmektedir (Ağluç, 2016: 35). Başka bir deyişle portreler, ressamın görüntüleri yüzeyde sabitleme dürtüsünün başlıca kahramanları arasında yer almaktadır.

Zamansal ve toplumsal nitelikleriyle, üretildikleri dönemlerin birer aynası niteliğini her zaman koruyan portreler, o dönemin değerlerini, insana bakışını, sanat anlayışını, kültürünü ve keşfedilecek daha birçok bilgiyi, bireysel ve toplumsal nitelikleri birlikte barındırabilen eşsiz kaynaklar olarak kabul edilebilir. İnsana ve insan bedenine bakış açısının temsili olan bu tür, zamanın, kültürün ve düşünce tarihinin niteliklerini taşıyan ve aktaran biricik belgelerdir. Antik dönemlerden, ortaçağa, Rönesans’tan nihayet günümüz tüketim toplumlarına kadar gelişen ve değişen kimlik, bireysellik ve beden algısı da portreler de yön belirleyici olmuştur (Serbest, 2019:92). Portre, insanın kendisine bakışını ve kendisinden yola çıkarak onu çevreleyen hayata karşı duruşunu etkileyen modern dünyanın olumlu ve olumsuz yönleri ise sanatsal duruşunu belirlemeye çalışan sanatçılar için bir kaynak oluşturmaktadır (Usta, 2015: 229).

Her bir bireyin ayırt edici fiziksel özellikleri bulunmaktadır. Saç rengi, yapısı, göz rengi, ağız, burun, kaşların biçimsel farklılıkları tamamen insandan insana farklılaşan öznel ayrıcalıklardır. Portre, insanların yüzlerinin tüm farklılıkları ile kişiye özgü çalışılmış özgün yorumlarıdır. Portre çalışmalarında fiziksel ayırt edici özelliklere yer verildiği gibi, kişilerin ruh durumlarını, karakteristik yapılarını ya da mimiklerini ortaya koyabilen oldukça özel insan açılımları olarak sanatta varlığını göstermektedir. Bu yönden ele alınan portreler yazınsal ve görsel insan çözümlemeleridir. Tüm bunların yanı sıra portrelerde bireylerin statü göstergeleri de yer alabilmektedir. Portreler kimlikleri ortaya koyarlarken, öznel ifadeyi nesnel bir anlatımla aktaran özel ifade olanaklarıdır. Geçmişte yapılmış olan portre çalışmaları modele benzerliği açısından başarılı olarak değerlendirilirken fotoğraf makinelerinin kullanımıyla birlikte önemini kaybetmiş

olan portreler, sürecin ilerlemesiyle sanatçının yaratıcılığını öne çıkararak önem kazanmaya başlamıştır (Çevik, 2022:17-18).

Portre çalışmalarında sanatçı, portresini gerçekleştirdiği model ile bütünsel bir iletişim kurmaktadır. Bu bütünsel anlayışta dışsal tüm veriler sanatçı tarafından değerlendirilirken, içsel duygu durumları da sanatçının bakış açısıyla yorumlanıp öznel bir anlatım olarak yansiyabilir. Yüzün mimik olarak edindiği biçimsel hareketleri ve dışsal görünümünün yanı sıra portre çalışmaları farklı anlamlarda içerebilmektedir. Portreler, sanatçıların bireysel öge seçimlerine göre farklılık göstermekte ve sonucunda ise izleyici için geniş bir anlam perspektifi sunabilmektedir. Sanatçıların seçimleri olan bu ögeler, zaman ve mekan dahil olmak üzere insanlığın tarihsel izlerini taşıyan, psikolojik verileri içeren, dünyaya dair bilgileri içeren sembol ve kavramlardır (Akın, 2010: 5). Bu ögeler ışığında ele alındığında portre, insan bedeninin toplumsal dışavurumları olarak hem insan yüzü hem de toplumların yüzlerini açığa çıkarmaktadır. Kimliklerin farklı şekillerde okunabilmesidir portreler. Bir anlama ve anlamlandırma çabasıdır (Sönmez, 2018: 44). Sanatçı portresini çalıştığı kişinin tüm yönlerini tek bir yüz ifadesi ile aktarmaya çalışırken, kişilik özelliklerinin yansıtılması açısından aslında oldukça zor bir görev üstlenmektedir (Dönmez, 2009: 3). Yüz ifadesi portrenin en belirgin yönünü ortaya çıkarmaktadır. Sanatçı öncelikle iyi bir gözlem yaparak analiz etmeye çalışır, ardından incelenen yüz ifadesi başarı ile aktarılmaktadır. Portre çalışmalarının yüz ifadesini en başarılı şekilde sunabilmesinde disiplinlerarasılık önemli veriler sunmaktadır. Özellikle psikoloji bilimi, insanların ifadelerindeki anlamların ortaya çıkması konusunda önemli derecede yardımcıdır. İlk kez Leonardo Da Vinci resimlerinde insan yüzündeki endişe, kaygı, heyecan gibi çeşitli duygu durumlarını yakalayabilmiştir. Ressam, gözlemleri sonucunda karşısında gördüğü figürü anlamakta ve böylelikle daha sağlam temellere dayalı bir analiz gerçekleştirebilmektedir. Yüz ifadeleri doğal olarak süreklilik göstermez. Kişinin duygu durumu sonucunda değişiklik göstermektedir. Bu noktada, sanatçı betimlemek istediği ifadeyi hafızasında sabitleyerek aktarmaya çalışmaktadır. Dolayısıyla sanatçının algısı, farkındalığı önem taşımaktadır (Akın, 2010: 12).

2. Materyal ve Yöntem

Çalışma, betimsel yöntem ve tarama modeli ile gerçekleştirilmiştir. İlgili ulusal ve uluslararası literatür taranarak, gerekli bilgiler olduğu gibi ele alınarak sunulmuş ve yorumlanmıştır.

3. BULGULAR ve TARTIŞMA

3.1. Ed Fairburn’un Deneysel Portreleri Üzerine Okumalar

1989 İngiltere doğumlu Ed Fairburn, 2012 yılında Cardiff Metropolitan Üniversitesi Sanat ve Tasarım Fakültesinden mezun olur. Portre çalışmalarına odaklanan sanatçı, kağıt haritaları genellikle portre olmak üzere çeşitli desenler oluşturmak için de manipüle etmektedir. Sanatçı bu sürece “topopointillism” adını vermektedir. Topografi ve pointilism’in doğrudan bir birleşimini sunar. Sanatçı, mürekkep, boya ya da kurşun kalem gibi geleneksel sanat malzemelerini kullanarak haritacılıkta bulunan konturlarda, yollarda ve diğer desenlerde kademeli değişiklikler yapmaktadır. Yapmış olduğu bu değişiklikler insan formunu ortaya çıkarırken figür ile manzaranın bir arada var olmasını sağlamaktadır. Haritanın işlevselliğini koruyarak kompozisyonunu oluşturmaktadır. Herhangi bir fiziksel işleme başlamadan önce genellikle araziye inceleyerek çalışmaya başlar. Haritalardaki her bir detay uzaktan bakıldığında portre gibi davranmaktadır. Portre de yakından incelendiğinde detaylarını kaybederek paradoksal bir durumu nitelemektedir (Url 1).

Çağdaş sanat pratiklerinde disiplinlerarası buluşmalar oldukça önem taşımaktadır. Bu iç içe geçmelerde biçimsellikten daha çok içeriğin önem taşıdığı görülmektedir. Çeşitli malzemelerin bir arada kullanıldığı kavramı öne çıkaran bir anlayış çerçevesinde sanat yapıtları ortaya çıkmaktadır (Kılıç, 2005: 66). Çağdaş sanat, özellikle günümüzde her türlü yeni malzeme ve özgün tekniğin kullanıldığı düşünceyi en iyi şekilde anlatan materyal ne ise onun kullanıldığı bir alan olarak dikkat çekmektedir (Bilirdönmez ve Çevik, 2020: 76-95).

Sanatçı Ed Fairburn, üniversiteden beri alışılmadık çizim araçlarını kullanarak deneysel üretimlerde bulunmaktadır. Sanatçı geleneksel düz kâğıtla çalışmak yerine, zaten tasarım ve dokuya sahip olan yüzeyleri kullanmaktadır. Bu açıdan değerlendirildiğinde sanatçı figüratif çizime olan ilgisini geleneksel haritalarla birleştirmektedir. Sanatçının ortaya koyduğu bu portreler, haritalar ve kalemle yapılan çizimin deneysel bir yansımasıdır.

Görsel 1: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi (Url 2)

Görsel 2: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi (Url 2)

Birleşik Krallık merkezli sanatçı Ed Fairburn, alışılmadık illüstrasyonlarında insanlar ve yerler arasındaki bağı sorgulamaktadır. Kendine ait olan koleksiyonundan özenle seçmiş olduğu haritaları kullanan sanatçı, şehirlerin ve manzaraların topoğrafyasına elle çizilmiş portrelerini ekleyerek, insan figürlerini çevre ile birleştirmektedir. Fairburn, insanların yüzlerindeki hassas düzlemleri haritanın kartografik öğeleriyle ustaca harmanlayarak nehirlerin, dağların ve sokakların hatlarını insanların çenesi, gözleri ve diğer yüz hatları ile birleştirerek özgün kompozisyonlar oluşturmaktadır (Cole, 2022).

Kara parçalarının engebeleri ve çeşitli özelliklerini gösteren çizgilerin çeşitli alanlarını çizgisel etütleri ile doldurarak özgün kompozisyonlar elde etmektedir. Haritacılıkla ilgili unsurları bireye ait yüz ifadeleri ile birleştirerek, aidiyet, kimlik gibi kavramları da sorgulanmasına sebebiyet vermektedir. İnsanların buldukları coğrafyaların onların kimliklerindeki izleri adeta gözler önüne sermektedir. Coğrafya da kalan, giden, gitmeyi başaramayan ya da istemeyen, insana dair varlık mücadelelerini ya da göç kavramını akıllara getirmektedir. Bu noktada izleyici, coğrafya, kader, insan, yaşam, göç, kimlik arasında değişken bağlantılar kurabilir.

Görsel 3 ve 4'e yer alan temel harita, Michigan'daki Marquette demir yatakları bölgesinin 1896 tarihli orijinal jeolojik atlasından bir sayfadır. Sayfanın altındaki iki çubuk, haritada iki farklı çizgiyle temsil edilen enine kesitlerdir. Haritanın kendisi iki boyutlu bir alanı, her bir kesit ise derinliği göstermektedir. Tüm renkler farklı jeolojik oluşumları temsil etmektedir (Url 3).

Görsel 3: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi. Marquette, Michigan; Sheet XXIX. 16.75”X21”. 2022 (Url 2).

Görsel 4: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi Detayı. Marquette, Michigan; Sheet XXIX. 16.75”X21”. 2022 (Url 2).

İster bir şehirden, ister küçük bir sahil kasabasından olun, evinizin konumunun hayatınız üzerinde büyük etkisi vardır. Sanatçı Ed Fairburn, eski haritalar üzerinde yaptığı devam eden çizimlerle insanlar ve yerler arasındaki ilişkiyi vurgular. İnsan portrelerini mevcut kasaba ve şehir düzeniyle birleştirmek için ustaca becerilerini kullanır ve çevremizin bizi nasıl şekillendirdiğini kusursuz bir şekilde ifade eder. Bu benzersiz resimlerin her biri, Fairburn'ün kendi koleksiyonundaki haritalara ve bazen de özellikle bir proje için bulduğu haritalara elle çizilmiştir. Ardından Fairburn, portreyi doğal bir şekilde birleştirmek için önceden var olan işaretlerde gezinerek kartografi parçasına yavaşça bir yüz çizmek için bir kalem kullanır. Taramalar ve çapraz tarama yoluyla, sanki her zaman orada olmaları gerekiyormuş gibi görünen yüzler yaratmaktadır (Cole, 2023)

Sanatçı My Modern Met'e verdiği demeçte, “Çalışmalarım özünde bir arada varoluşla ilgili” der. “Bu, bir bireyin belirli bir yerle olan bağlarını anmak anlamına gelebilir, ancak aynı zamanda çok daha geniş bir şeyi temsil edebilir, kendimizle evimiz dediğimiz bu yer arasındaki benzerliklere ışık tutabilir-manzaranın bir ürünü olma şeklimizi anlatabilir ve manzaranın nasıl giderek bizim, eylemlerimizin ve hepimizin yaptığı seçimlerin bir ürünü haline geldiğini gösterebilir” (Fairburn. Cole, 2022).

Görsel 5: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi (Url 4).

Görsel 6: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi (Url 4).

Fairburn, sanatında bir dizi farklı harita kullanır. Birçoğu Avrupa'daki tanınmış kasaba ve şehirleri tasvir eder. Bununla birlikte, serisini siber haritaları, topografik haritalar ve hatta uzayın kartografisini de içerecek şekilde genişletmiştir. Bu örneklerin her birinde, birey, ilgili biçim ve ayrıntı düzeyi de dahil olmak üzere orijinal haritaya doğal bir şekilde ifade edilir (Cole, 2023).

Beyaz bir sayfayla başlamak, herhangi bir sanatçı için bunaltıcı olabilir, bu yüzden Ed Fairburn alışılmadık bir tuvali benimsemiştir. Eski haritaları yeniden değerlendirerek onları güzeli son derece ayrıntılı portrelere dönüştürüyor. Manzara ve insanlığı birleştiren Fairburn, bize çevremizin bir ürünü olduğumuzu hatırlatıyor - ve bunun tersinin de geçerli olduğunu hatırlatıyor. Fairburn, sanatsal sürecine başlamadan önce genellikle haritanın arazisini incelemek için saatler harcıyor. Daha sonra mürekkep, boya veya kurşun kalem gibi geleneksel malzemeler kullanarak haritada kademeli değişiklikler yaparak yollardan, nehirlerden ve dağlık hatlardan yüz hatlarını yavaşça çıkarıyor. Yetenekli sanatçı sürecine "topopointillism" adını veriyor ve bunu "topografya ve pointillism'in doğrudan bir karışımı" olarak tanımlıyor. Tıpkı bir noktasal resim gibi, Fairburn'ün portreleri de yakından soyut görünüyor; ancak uzaktan bakıldığında, izleyici insan öznenin topografik desenlerden ortaya çıktığını görebiliyor. Nasıl dağlar ve tepeler bir harita üzerinde kontur çizgileriyle çiziliyorsa, Fairburn de yanak kemikleri ve burun gibi yüksek yüz hatlarını aynı şekilde işliyor. Siyah ve grinin çeşitli tonlarında elle çizilmiş yüzlerce kavisli çizgi, her portrenin

üç boyutlu gibi görünmesini sağlıyor - sanki insan formu manzaranın içinde gerçekten varmış gibi (Taggart, 2020).

Görsel 7: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi (Url 5).

Görsel 8: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi (Url 5).

Fairburn, Guatemala isimli çalışması 2020 yılına tarihlenmektedir. Görsel 9'da yer alan Raul Minondo'nun Guatemala Şehri'nin topografik haritası üzerine ailesi tarafından yaptırılan portresidir. Minondo, kariyeri boyunca Guatemala'nın para birimi olan quetzal banknotunda yer alan Guatemala Ulusal Bankası da dahil olmak üzere birçok etkili projede çalışan başarılı bir mimardı (Url 6).

Ed Fairburn'un Görsel 10'da yer alan ve 2019 yılına tarihlenen bu çalışmasında New York şehri sokak haritasının arşivsel bir reproduksiyonu üzerine mürekkeple yapılmış özel bir sipariştir (Url 7).

Ed Fairburn'un çalışmaları hakkında Emma Taggart tarafından 30 Haziran 2020'de yapılan röportaja göre sanatçının üretimleri hakkında değerlendirmeleri şu şekildedir; Taggart, Emma. (2020).

“Haritalar üzerinde çizim yapmakla ilgili en çok neyi seviyorsunuz?” ; Haritaların geçici doğasını, kâğıt türlerinin çeşitliliğini, ağırlıklarını, dokularını ve hatta kokusunu seviyorum. Hiçbir yüzey birbirinin aynısı değil. Bazen bu çok kötü, çünkü bazen gerçekten sevdiğim bir kâğıt türü buluyorum, ancak onu bir daha asla başka bir haritada bulamıyorum. Eski haritalar, bembeyaz bir tuvalin aksine çok bağışlayıcı bir ortam. Bir şekilde misafirperverdir” (Fairburn, akt: Taggart, 2020).

Haritalarınızı nereden buluyorsunuz?”; Doğal olarak, bir harita koleksiyoncusu oldum, bu yüzden bugünlerde stüdyomda aradığımı sık sık bulabiliyorum. Yıllar boyunca çeşitli yerlerden haritalar topladım; hayır kurumları, eski kitapçılar ve birçok çevrimiçi yerden. Estetik olarak, neyi sevdiğimi ve neyin işe yaradığını biliyorum. Bu süreçte tecrübenin de büyük rol oynadığını düşünüyorum” (Fairburn, akt: Taggart, 2020).

Görsel 11: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi. Cambridge. 2012. Cambridge'in eski bir sokak haritası üzerine mürekkep (Url 8).

Görsel 12: Ed Fairburn, Harita Zemin Üzeri Kadın Portresi. Memphis. 2020. Memphis, Tennessee atlas haritası üzerine mürekkep. Collier's ABD Şehirleri Serisinin Bir Parçası (Url 9).

“Sürecinizi tarif edebilir misiniz? Genellikle yüzün nereye uyacağını hemen görüyor musunuz?”; Kısacası, evet. Her geleneksel ressam gibi ben de güçlü bir kompozisyon için çabalıyorum. Coğrafya çerçevesine göre portrenin ağırlığının nereye oturması gerektiğini görüyorum. Sonuçta, benim sürecim, iki yapıyı tek bir fiziksel alanda uyumlu hale getirmekle ilgilidir” (Fairburn, akt: Taggart, 2020).

“Ortalama bir parçanın yapılması ne kadar sürüyor?”; Bu süreç, boyuta ve karmaşıklığa bağlı olarak değişebilir, ancak baştan sona, genellikle birkaç günden birkaç aya kadar devam etmektedir. Stüdyomda birkaç yıldır üzerinde çalıştığım bazı haritalar var, ancak daha odaklı bir çalışma ile genellikle birkaç oturuşta çalışmalarını tamamlamaktayım” (Fairburn, akt: Taggart, 2020).

4. SONUÇ ve ÖNERİLER

Çağdaş sanat alanında yapılan üretimler genel olarak değerlendirildiğinde daha çok bireysel çözümlere odaklanan sanatsal çalışmalardan söz edebilmek mümkündür. Bu durum disiplinlerarası sürecin bir yansıması ve sonucu olarak da değerlendirilebilir. Sanatçıların farklı

malzeme ve tekniklerle özgün fikirlerini birleştirmiş olmaları sanata dair sınırların genişlemesine yol açmaktadır.

Genel bir değerlendirme ile sanatın her alanında portrelerin ayrıcalıklı ve önemli bir konumda yer aldığını söylemek mümkündür. Bu durum İngiltere’li sanatçı Ed Fairburn haritaları kullanarak oluşturduğu portre temelli eserleri içinde söz konusudur. Sanatçının çalışmalarının çoğu kadın, erkek ve çocuk portrelerinin olmasının yanı sıra hayvan ve nesne çizimleri de bulunmaktadır. Ed Fairburn’un sanatsal üretimlerinin neredeyse tamamı haritalar üzerinde yer almaktadır. Sanatçı üretimlerinde mürekkep, boya ve kurşun kalem gibi geleneksel malzemeleri kullanmasının yanı sıra haritalarda bulunan konturlarda, yollarda ve diğer desenlerde değişiklikler yaparak nihai üretimlerini ortaya koymaktadır. Sanatçı için portre ve harita birlikteliği birbiri içine geçen ve bütünleşen yeni bir alan oluşturmaktadır. Haritada yer alan unsurların sanatsal deneyimi ile okumasının sonucunda hazır nesne gibi kullandığı bu haritalarla işbirliği içine girebilmektedir. Bu süreç bağlamında sanatçı haritalarla mücadele etmek yerine onun portrelerde ortaya çıkardığı özgünlüğe saygı göstererek bir uyum yakalamaktadır. Ed Fairburn, kâğıt haritalar üzerine ayrıntılı çalışmalar yaparak, onları bir anlamda tuval olarak kullanmaktadır.

ABSTRACT

This paper reviews the agricultural and ecological (or environmental) implications of the forest ecosystem. The review specifically, focuses on the significance of forest tree canopy cover and its ecosystem (or environmental) implications, while also briefly highlighting agricultural benefits of the forest ecosystem. The forest has been a vital component of the ecosystem with a wide range of environmental, agricultural and economic benefits. Yet, there is comparatively less emphasis on the elementary contributions of the various forest resources toward improving the ecosystem and solving environmental problems such as climate change, global warming and soil infertility. In particular, agriculture, and indeed, farming benefits both directly and indirectly from the natural contributions of the forest; which help to promote soil fertility, ameliorate climate change effects on crops and provide shades or wind breaks for crops in farms located near the forest. The aim of the review therefore, is to spur a wider global and local debate and awareness campaigns on the importance of the forest, thus promoting the need for forest conservation and sustainable exploitation of forest resources.

Keywords: Agriculture, ecological significance, forest, forest ecosystem, canopy cover, micro climate, vegetation.

INTRODUCTION

The forest is an area of land covered by trees, or “land spanning more than 0.5 hectares with trees higher than 5 meters and a canopy cover of more than 10 percent, or trees able to reach these thresholds in this situation” (FAO, 2023). The forest is a significant component of the ecosystem, which helps to provide a wide range of ecosystem services (Balloffet *et al.*, 2012). The forest is an important component of the ecosystem, and its existence influences the functional aspects of the ecosystem as well as social and economic factors. With its large population of trees, the forest provides an exclusively distinct habitat for biodiversity (Brockerhoff *et al.*, 2017). The services provided by the forest include provision of wild food, fiber and fuel, clean air, filter water supplies, control floods and erosion, sustain biodiversity and genetic resources, and provide opportunities for recreation, education, and cultural enrichment (Balloffet *et al.*, 2012).

In addition, the forest, which is characterised mainly by a variety of trees, contributes to ecosystem stability following its richness in habitat and species diversity (Fournier & Hall, 2017). Specifically, trees or shrubs with specialised leaf covers impose direct influence on the wellbeing and survival of underground vegetation and other species; such influence includes impact on biochemical and physical processes within the forest micro-climate by influencing humidity and the amount of sunlight that penetrates through canopy gaps to the ground vegetation and other species (Brockerhoff *et al.*, 2017). These relationships will be further discussed in subsequent sections.

Besides the broader consideration of the ecological implication of the forest, the type of trees or tree cover directly influence the micro-climate within and around the forest environment (Luguza *et al.*, 2020). The micro-climate is characterised by a variety of factors including temperature, humidity and species diversity. With spectacular tree cover or canopy, the forest supports species biodiversity and the micro-climate with a significant influence on plant community (Bongers, 2001). Thus, an understanding of plant community ecology and the dynamics of these interactions will enhance a better understanding of the significance and implications of the effect of canopy covers within the forest ecosystem.

Plant community ecology describes the concept of vegetation type with emphasis on the ecological association of plants species (Vander, 2006). The understanding of plant community ecology encompasses the understanding of the dynamics of the interaction between plants species and other

micro-climate factors. Nevertheless, most frameworks on plant ecology tend to neglect soil micro organisms, and the implications on wellbeing of species in the soil (Bever *et al.*, 2010). It is obvious that like other natural, or anthropogenic factors, overhead canopy covers influence the micro-climate which directly influences the ecosystem services and ecological influence of the soil and soil organisms (Montgomery, 2007). Thus, to fully understand the microbial effects, the interactive relationship with important soil microbes has been incorporated into the dynamics of plant community by exploring the concepts of the niche modification and plant-soil community feedbacks. To further explore the concepts of plant community ecology, theories are made to focus on the influence of larger or dominating plant species or tree overhead covers on underground vegetation as well as implications of microbial perspective (Bever *et al.*, 2010).

Beyond the issues of canopy-effects on ground vegetation and micro-climate within the forest ecosystem, most forests are affected by insensitive woodland management. Also, the impact of heavy machinery used to establish farms and plantations can damage natural habitats for plant species even beyond the farms/plantations. Also, grazing and browsing by wild animals also pose a constraint or contribute to changes in the micro-climate that could pose a threat to the survival of ground species in the forest natural habitat (Fournier & Hall, 2017). Other factors include ground vegetation management involving trees fell and dragging through the site which damages ground vegetation, as well as genetic diversification; as some plants are clonal in nature (having the potential to reproduce asexually by means of vegetative offspring that remain attached to the parent) and most time only a single clone exist and isolated from other population (Plant Life International, 2011).

In sum, the forest has a significant agricultural and economic value. In particular, agriculture (or farming) benefits both directly and indirectly from the natural or ecological contributions of the forest ecosystem; as forest helps to promote soil fertility, ameliorates climate change effects, and provides shades and acts as wind breaks for crops in farms located near the forest (Vedandu, 2023). In view of this background, this review is important to complement existing literature on the subject matter, while also promoting a wider awareness and debates on the need for forest conservation and sustainable exploitation of its resources.

ENVIRONMENTAL IMPLICATIONS OF FOREST ECOSYSTEM

Effect of Overhead Canopy Cover on Micro-Climate and Ground Vegetation

Trees are important in helping to solve environmental issues including air pollution and for regulating the effect of environmental changes on the micro-climate within which the trees are located (Vailshery *et al.*, 2013). These effects are highly significant in the forest environment where a large number of trees with varying types and sizes of overhead canopy are located. The forest environment provides two distinct environmental variations influenced by canopy architecture; on one side, the inner-crown (or canopy) which is humid and dark; consisting mainly shade-loving plant species, and the outer-crown which is normally dry and bright (Cardelus & Chazdon, 2005). Thus, differences in forest-flow climate would strongly affect species diversity and recruitment; hence, functional understanding of canopy dynamics enhances the understanding of the micro-environmental variations within tree crowns (tree covers or canopies), underground species encounter and distinct micro-climates among tree crowns.

The micro-climate and tree species also determine species functional forms, for instance, within a single tree and depending on the species type and canopy (crown cover), there may be different species of bryophytes or epiphyte community composition, which may grow on branches along trunks, or on underside branches, or soils under tree canopy. Studies have shown that tree cover influences under-crown micro-climate, by promoting the survival and abundance of epiphytes and bryophytes, and accumulation of canopy soil organic matter which also strongly influence the survival of underground species (Cardelus & Chazdon, 2005; Brockerhoff *et al.*, 2017). By theory, organic matter (mainly from fallen leaves/canopy) would in also influence temperature and humidity of the crown micro-environment. Overhead canopy thus, has a direct influence on the under crown micro-climate relative to light transmission, vapour pressure and temperature differences (Cardelus & Chazdon, 2005). Tree canopy is thus, a unique forest sub-component that influences significant forest processes (Bongers, 2001). Specifically, studies have also shown that in the lower parts of the tree cover, light environment vary significantly within and between different tree species, creating heterogeneous micro-climate within the canopy environment (Cardelus & Chazdon, 2005).

In addition, overhead canopy can be described in terms of texture and structure which both influence the natural conditions of individual plant and plant community (Bongers, 2001). While

the canopy texture describes the quality of canopy thickness in relation to allowing or impeding light flow to the ground species, canopy structure for instance, describes the horizontal structural features of the plant community in terms of canopy surface height and leaf area index (LAI). In general, canopy architecture determines the natural activities of the micro-climate and ground vegetation. Depending on the plant species, overhead canopy can present a very complex structure or architecture under which the micro-climate and ground vegetation depend with a great influence on normal functional activities (Bongers, 2001).

Each over head canopy influences the elements of the lower levels of the structure; such influence involves the restriction or regulation of the amount of light or availability for species in the lower level (under the canopy). Recalling that plant species highly depend on sunlight for most of its biochemical and physical processes including photosynthesis, the influence of overhead canopy thus become critical as a natural regulator of light available for ground vegetation and soil organisms (Bonger, 2001; Iason & Hester, 1993).

Canopy can influence flowering, fruiting and photosynthesis. As noted by Iason & Hester (1993), overhead canopy creates a shade against which certain plant species can be influenced; for instance, shades can results in etiolation of shoots, lower shoot weights and lower flowering potential in some species. This explains the significance of canopy openness and Leaf area index (LAI) in the forest ecosystem; in the sense that the way leaf area is distributed influences the micro-climate condition and species productivity as well as influencing the light capturing capacity of the canopy. Different forest types have different natural canopy displays; this has been illustrated in Plate 1 and 2, below.

Plates 1 & 2. Photographs of a typical mangrove forest ecosystem showing tree canopy openness (or canopy cover).

Sources: Kofastudy (2022) & Environnews Nigeria (2018).

Effect of Canopy Openness and Leaf Area Index on Forest Ecosystem

As already explained, canopy cover is very important to the survival of ground vegetation. On the other hand, canopy openness (or canopy gap) has a great influence on ecological component of forest landscapes (Seidel *et al.*, 2015). Canopy gaps are critical in helping to determine the conditions of the micro-climate and ground vegetation, thus are among the major factors of natural disturbances in the forest ecosystem (Winter *et al.*, 2015). Canopy gap describes the ground area in a canopy opening extending to the bases of trees surrounding the opening or the vertical projection of the canopy opening. These gaps vary in shapes and dimensions, and create disturbance issues with varying degree of severity which is determined by the fall of a group of canopies of trees or large tree fall (Kucbel *et al.*, 2010).

Thus, canopy gaps size influences the response by ground vegetation in terms of the amount and composition of plant species within the gaps; these vegetative responses are determined by availability of light in the canopy gap (Fahey & Puetzman, 2008).

As noted by Seidel *et al.* (2015), light availability for ground vegetation is influenced by different gap size or openness, which also influences the growth and regeneration of the vegetation. Raymond *et al.* (2006) added that shape and size of canopy gap influence the growth and regeneration of ground vegetation. Canopy cover determined by the shape or gaps within canopies; also influence other physical factors including nutrient availability in soils within the canopy (Schliemann & Bockheim, 2011). As explained by Bongers (2001), abundance of undercover gaps is beneficial to the micro-climate within which most light-dependent species survive, with regards to biochemical and physical processes.

On the other hand, leaf area index (LAI) also plays a critical role in the forest ecosystem, and studies have examined the relationship between LAI and tree growth, climate and soil characteristics. For instance, a study by Cooker (2006), reported a positive and significant relationship between LAI and micro-climate within the forest ecosystem in relation to vapour pressure, soil nutrients and elements, as well as solar radiation, temperature and soil bulk density. Climate has a fundamental influence on forest ecosystem. Tree species and canopies in turn influence the micro-climate within which other species and organisms survive (Cooke, 2006). In other words, tree canopy cover (or crown) provides a distinct habitat for varying species influenced by the prevailing micro-climate within the forest area.

The LAI is a measure of canopy density, which describes the projected leaf area per unit of ground areas ($m^2 m^{-2}$) (Cooke (2006). The leaf area is sensitive to changes in climate and soil characteristics, and is important in the study of forest ecology following the relationship between LAI and physiological response of plants to changing micro-climate, and soil condition (Dewar, 2001; Cooker, 2006).

In addition, LAI plays a key role in remote sensing models involving land surface energy balance and carbon exchange. This is due to the importance of vegetation in modulating fluxes in the ecosystem (Anderson & Morgan, 2005).

In general, canopy openness can promote a favourable habitat condition and increase in the number of ground plant species by allowing comparatively higher light availability and creating more exposure to air within the micro environment for species growth. As noted by Liguza *et al.* (2020), overhead canopy could create natural disturbances by shielding ground vegetation, especially light-demanding species from sufficient light and rainfall; which affect their biochemical and other natural processes. Light availability is one of the major factors that affect the existence of vegetation and other ground species (Marmor *et al.*, 2012). Studies have shown that low light availability could limit the growth of species such as lichen, while excesses light can result in photo-inhibition and could cause quicker dehydration in other species (Green *et al.*, 2008). As reported by Marmor *et a.*, 2012), canopy openness significantly increases the number of species on a tree trunk, with relation to light availability, thus confirming the fact that higher light availability would favour higher species growth within forest micro-climate (Frit & Brunet, 2009).

Agricultural Implications of Forest Ecosystem

The forest directly influences agriculture and has implications on crops and supportive dimensions such as soil fertility, ground water and micro-climate within which the crops survive. A summary of the vital implications of the forest on agriculture are highlighted below:

- Improved nutrient recycling
- Stabilising soil features
- Increased soil fertility
- Providing shade for crops
- Regulating local climate (or agro-climatic conditions)
- Increasing ground water recharge
- Serving as wind breaks for crops and farms within the forest area, as illustrated in Plates 3&4 below.

• Plates 3&4: Forest serving as Windbreaks to nearby farms
Sources: <https://mdc.mo.gov/your-property/agriculture/windbreaks>
<https://erudef.org/importance-of-windbreaks/>

CONCLUSION

The forest is a significant component of the ecosystem and plays an important role in helping to contribute to ecosystem services. Besides the natural ecosystem services, the forest has immeasurable economic benefits especially to rural population who largely depend on the forest and its resources for their livelihood. More so, the worrisome effects of climate change in recent years have further trigger debates and consciousness of the ecological importance of the forest ecosystem. On the other hand, with regards to the significance to agriculture, the forest ecosystem

plays an important role in providing food and economic benefits to most rural population; some of whom are almost exclusively dependent on the forest for their food and economic survival. This review thus, recommends a broader awareness campaign, and debates to help promote forest conservation globally, and policies that would enhance sustainable exploitation of forest resources especially in countries where there is currently very loose natural resource conservation laws.

ÖZET

Beslenme insan yaşamında vazgeçilmesi mümkün olmayan ve başlangıcı ilk insanın varoluşuna dayanmaktadır. Ülkemiz buğdayın anavatanı olduğu için tarih boyunca bu topraklarda yaşayan insanların beslenmelerinde buğday ve buğday ürünleri önemli bir yere sahip olmuştur. Günümüzde pirinç, mısır, çavdar, yulaf ve arpa gibi diğer tahıllar da gıda olarak tüketilse de, ülkemizde buğdaya dayalı beslenme tipi hâkim olup, kişi başına tüketilen enerjinin büyük çoğunluğu buğday ürünlerinden karşılanmaktadır. Buğday geçmişten günümüze özellikle bulgur, tarhana, erişte, ekmek gibi çeşitli gıdaların üretiminde kullanılmakta ve sevilerek tüketilmektedir. Yörelere göre değişiklik gösteren ürünler, halkımızın kültürel çeşitliliğinin göstergesidir. Bu çalışmada buğday bazlı geleneksel ürünlerimizden bulgur, firik, erişte, tarhana, yassı ekmekler ve boza incelenmiştir.

Anahtar Kelimeler: Bulgur, Firik, Erişte, Tarhana, Ekmek, Boza

TRADITIONAL TURKISH WHEAT-BASED BEVERAGE AND FOODS

ABSTRACT

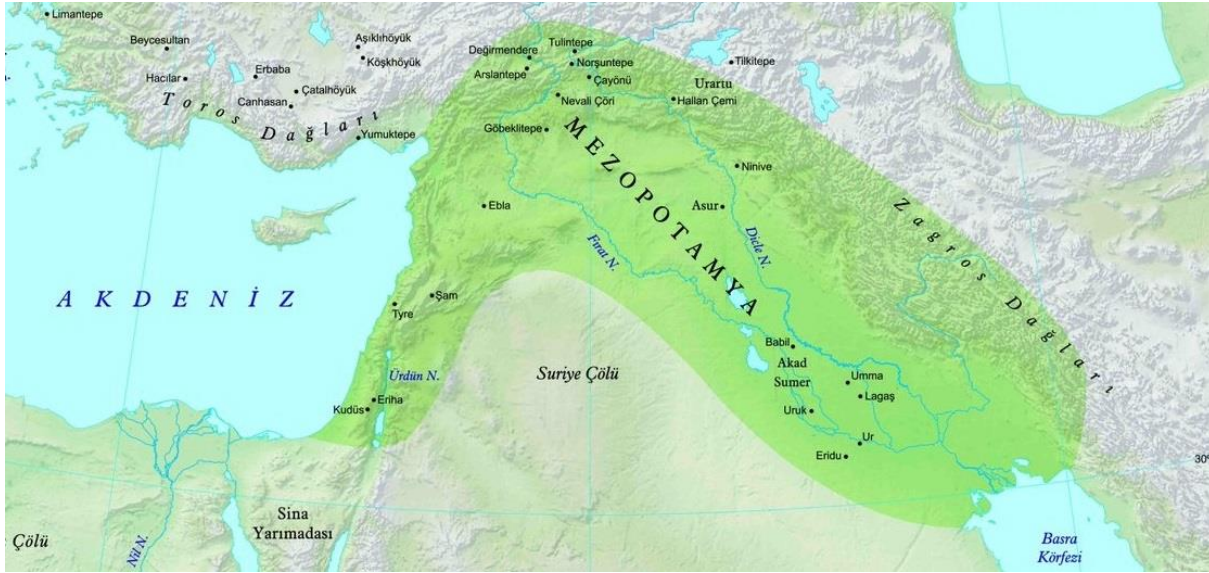

Nutrition is an indispensable part in human life and its beginning dates back to the existence of the first human being. Since our country was one of the domestication center of wheat, it and its products have had an important place in the nutrition of people living in these lands throughout history. Although other grains such as rice, corn, rye, oats and barley are consumed as food today, wheat-based diet is dominant in our country and the majority of the energy consumed per capita is met from wheat products. Wheat has been used in the production of various foods such as bulgur, tarhana, erişte (noodle) and bread from past to present and is consumed with pleasure. The products, which vary according to the regions, are an indicator of the cultural diversity of our people. In this study, bulgur, firik, erişte, tarhana, flat breads, and boza, which are our traditional wheat-based products, were examined.

Keywords: Bulgur, Firik, Noodle, Tarhana, Bread, Boza

1. GİRİŞ

Türkiye, bitki genetik kaynakları ve çeşitliliği açısından dünyanın en zengin ülkelerinden biridir. Genel olarak, çeşitliliğin ve kökenin iki ana merkezi olan Yakın Doğu ve Akdeniz'in Türkiye'de örtüştüğü kabul edilmektedir. Bu bitki türlerinden en önemlisi ise buğdaydır (Kan vd., 2017).

Yapılan son arkeolojik çalışmalar, buğdayın anavatanının Türkiye'nin güneydoğusunda yer alan Göbekli Tepe olduğunu göstermektedir (Schmidt, 2007). Türkiye'nin Güneydoğu Anadolu Bölgesi, İran, Irak ve Suriye'nin bir bölümünü kapsayan Bereketli Hilal'de (Şekil 1) kültüre alınan buğday, yüzyıllardır ülkemizde ve çevre ülkelerde insanların yaşamında önemli bir rol oynamıştır.

Şekil 1. Bereketli Hilal (Özberk vd., 2016)

Buğday, daha sonra günümüz Rusya'sının güneyindeki topraklara (Afganistan, Türkmenistan, Özbekistan, Kazakistan ve Azerbaycan), Etiyopya'nın bazı bölgelerine, Kuzey Afrika'nın doğusuna (Mısır ve Sudan) ve Akdeniz'in kuzey kıyılarını çevreleyen bölgelere yayılmıştır. Günümüzde modern buğdayın ataları hala Türkiye, İran, Kuzey Irak ve Suriye'de yol kenarlarında bile yabancı olarak yetişmektedir (Köksel ve Çetiner, 2015).

Ülkemizde buğday ekonomik anlamının yanı sıra toplumsal, kültürel, tarihi ve hatta arkeolojik bir öneme sahiptir (Kan vd., 2017). Buğdayın beslenmemizdeki yeri göz önüne alındığında, bölgenin tarihi boyunca çok çeşitli buğday bazlı ürünler geliştirilmiş ve bu ürünler bugün hala sevilerek tüketilmektedir. Başlıca geleneksel Türk buğday bazlı yiyecek ve içecekleri arasında bulgur, firik,

tarhana, erişte ve boza yer almaktadır. Ayrıca, özellikle kırsal bölgelerde çeşitli geleneksel yassı ve mayalı ekmeğin türleri de bulunmaktadır (Köksel vd., 2009).

2. ÜRÜNLER

2.1. Bulgur

Dünyada ilk işlenen gıda maddelerinden biri olan bulgur, Türkiye ve Orta Doğu'da buğdayın kültüre alındığı dönemden beri üretilmekte olan ve günümüzde de sevilerek tüketilen önemli bir gıda maddesidir (Williams vd., 1984). Çatalhöyük arkeolojik alanında bulgur tanelerinin bulunması, Anadolu'da 7000 - 8000 yıl önce bulgurun tüketildiğini göstermektedir (Halıcı, 1979). Bulgur tarih boyunca, burgul, burghoul, balgour, burghul, bulgor, boughour, boulgour, cerealis, arisah, dagan, bulgur wheat ve ala gibi çeşitli isimlerle anılmıştır (Özboy, 1998; Bayram ve Öner, 2002).

Ülkemizde bulgur üretimi, önceleri köylerde sadece ailelerin ihtiyaçları doğrultusunda küçük ölçeklerde ve geleneksel yöntemlerle gerçekleşirken, köy yaşamından kentleşmeye geçiş ile birlikte bulgur üretimi zamanla gelişmiş ve günümüzde bir sanayi dalı haline gelmiştir. Ticari olarak bulgur üretimi Karaman'da I. Dünya Savaşı'nda Ordu ihtiyacını karşılamak amacıyla Rıza Küçükkoğlu tarafından ilkel şartlarda yapılmıştır. Karaman'da İsviçre'nin Bühler-Miag firması tarafından kurulan ve 1975 yılında üretime geçen Bumas Bulgur Fabrikası ise, modern anlamda üretim yapan ilk bulgur fabrikasıdır (Parlayıcı, 1993).

Türk Gıda Kodeksi Bulgur Tebliği ve Türk Standartları Enstitüsü TS 2284 Bulgur Standardına göre bulgur; buğdayların (*Triticum durum*, *T. aestivum*, *T. monococcum*, *T. dicoccon*) tekniğine uygun olarak temizlenmesi, pişirilmesi/haşlanması, kurutulması ve istendiğinde kabuğunun ayrılarak kırılması ile elde edilen mamul olarak tanımlanmıştır (Anonim 2009a, b; Şekil 2).

Şekil 2. Makarnalık buğday (*T. durum*, sol) ve siyez (*T. monococcum*, sağ) bulgurları

Sarı renk, Türkiye'de tüketici tercihini etkileyen önemli bir bulgur kalite parametresidir (Bayram, 2007). Bu nedenle bulgur üretiminde genellikle ekmeklik buğdaya (*T. aestivum*) kıyasla daha yüksek sarı pigment içeriğine sahip olan makarnalık buğday (*T. durum*) tercih edilmektedir (Abdel-Aal vd., 2007). Fakat yöresel olarak ekmeklik veya Kunduru, Zerun gibi yerel buğdaylardan da bulgur üretilmektedir. Siyez/Iza (*T. monococcum*) bulguru Kastamonu ve Bolu civarında, gernik/kavılca (*T. dicoccum*) bulguru ise Kars ve Kayseri civarında üretilen ve sevilerek tüketilen bulgur çeşitleridir. Bulgur diğer birçok tahıl ürününe kıyasla önemli bir besinsel lif (~%18) kaynağı olup, yüksek miktarda B vitamini ve mineral madde içeriğine sahiptir (Baysal ve Över, 1994; Köksel vd., 1999).

Günümüzde Anadolu'da bulgurdan hazırlanan yaklaşık 125 çeşit yiyecek bulunmakla birlikte, bulgurun sofralarımızda en çok tüketilen şekli "pilav"dır (Işık, 2008). Günümüz itibariyle ülkemizde kişi başına tüketilen bulgur miktarı ortalama 12 kg'ı bulmuştur (Bayram, 2000; Bayram ve Öner, 2002). Bu miktar kişi başına makarna tüketiminin 2,5 katıdır ve pirincin de çok önemli bir alternatifi durumundadır (Öner, 2002). Bulgurun giderek modern işletmelerde üretilen bir sanayi ürünü haline gelmesi ile tüketimin daha da artacağı kuşkusuzdur.

2.2. Firik

Bulgura benzer eski ve geleneksel bir tahıl ürünü olan firik (frikeh veya frekeh), ülkemizde Anadolu'da ve Orta Doğu ve Kuzey Afrika ülkelerinde sevilerek tüketilir (AlMahasneh ve Rababah, 2007; Özkaya vd., 2018; Şekil 3). Firik genellikle evlerde ev içi tüketim için yapılır ya da küçük ölçekli üreticiler tarafından ticari olarak üretilir (Özkaya vd., 1999). Orta Doğu'da yıllık üretim miktarı yaklaşık 200-300 bin ton olarak bildirilmektedir. Firik, pilavda pirinç ve bulgur yerine kullanıldığı gibi, firik tüketimi bulgura oldukça benzemektedir (Özkaya vd., 2018).

Şekil 3. Firik (<https://antepyoyselurunler.com/urun/firik/>)

Buğday türü/çeşidi, hasat zamanı ve üretim yöntemi, firiğin besinsel kalitesini ve lezzet özelliklerini oldukça etkilemektedir (Özkaya vd., 2018). Firik yapımında tane sertliği önemli olup, makarnalık buğdaylar (*T. durum*), sert ekmeklik buğdaylara (*T. aestivum*) kıyasla daha fazla tercih edilmektedir (Özkaya vd., 1999). Firik üretmek için buğdaylar (geç süt olum dönemi ve orta hamur olum dönemi arasındaki) başağın altından 40 cm sap olacak şekilde hasat edilir, demetlenir,

kılıçklar ve yapraklar açık ateşte kavrulur. Kavru lan başaklar güneşte kurutulur, harmanlanır ve taneler kırılır (Özkaya vd., 2018).

2.3. Erişte

Erişte dünyada birçok çeşitte üretilmektedir. Ülkemizde ise genellikle buğday unu, tuz ve su kullanılarak üretilmektedir. Bazı yörelerde ise bu karışıma yumurta, süt ve/veya irmik eklenmektedir (Şekil 4). Erişte üretimi temel olarak hamur yoğurma, açma, kesme ve kurutma aşamalarından oluşmaktadır (Koyuncu vd., 2011; Göksel Saraç, 2021). TS-12950 Erişte Standardında, erişte “buğday ununa tuz, tipine göre alkali tuzlar (potasyum karbonat, sodyum karbonat ve sodyum fosfat gibi) ve yumurta ilave edilip içilebilir nitelikteki su ile yoğrulmuş elde edilen hamurun tekniğine uygun bir şekilde işlenmesiyle kurutulmuş, kaynatılarak pişirilmiş, buharda pişirilmiş veya doğrudan tüketime hazır olan bir ürün” olarak tanımlanmaktadır (Aydın vd., 2021; Keskin ve Kaplan Evlice, 2022).

Şekil 4. Erişte

Anadolu'da buğday unu ve farklı bileşenlerin karıştırılması ile hazırlanan erişte, günlük olarak üretilip tüketilebileceği gibi, eski çağlardan beri kurutulmak suretiyle kışlık olarak da doğrudan tüketilmekte olup, Türkiye'de özellikle kırsal kesimde yaygındır (Aydın vd., 2021).

Ülkemizde erişte yapımında bazı bölgelerde ekmeklik buğday unu, bazı bölgelerde ise makarnalık buğday unu kullanılmaktadır. Erişte yapımında hem kullanılan buğday türü/çeşidi hem de kullanılan diğer bileşenler, hamur ve erişte kalitesi üzerine etkilidir (Uzunoglu, 2002).

2.4. Tarhana

Tarhana, Türklerin Orta Asya'da yaşadıkları dönemden bu yana bilinen ve sevilerek tüketilen geleneksel bir tahıl ürünüdür. Tarhana kendi adıyla anılan çorbası yapılmak üzere kuru ya da yaş formda muhafaza altına alınan çorbalık fermente bir gıdadır (Temiz, 2021).

Tarhana genel anlamda bir un veya göce (buğday kırması, dövme, yarma, aşurelik buğday, aşlık, vb.) gibi buğday ürününün, yoğurt veya ayran gibi bir süt ürünü ile karıştırılarak isteğe bağlı bazı sebzeler, otlar ve baharatlar eklenerek fermentasyona bırakılması, kurutulması ve öğütülmesi işlemleri ile üretilir. Buğday dışında istenildiği takdirde baklagiller ve diğer tahıl unları da tarhana üretiminde kullanılabilir (Erkan vd., 2006, Özdemir vd., 2007; Temiz, 2021; Şekil 5).

Şekil 5. Bazı tarhana çeşitleri

Tarhanalar, Türk Standartları Enstitüsü Tarhana Standardında (TS 2282) üretimde kullanılan buğday türüne göre; un tarhanası, göce tarhanası, irmik tarhanası ve karışık tarhana olmak üzere dört ana grup altında toplanmıştır (TSE, 2004). Üretim sonrasında kurutma ve saklama koşullarına göre yaş ve kuru tarhanalar olmak üzere ikiye ayrılan tarhanalar, üretildiği yöreler, şehirler veya ilçelere göre de isimlendirilmektedir (Temiz, 2021).

2.5. Yassı Ekmekler

Yassı ekmekler, yassılaştırılmış hamurdan yapılan basit bir ekmek türü olup, bir dizi ekmeği içermektedir (Şekil 6). Yassı ekmek, düz ekmek veya açık ekmek olarak da isimlendirilmekte birlikte İngilizce’de “flat bread” terimi kullanılmaktadır. Farklı tahıl unları ile su, tuz ve bazen katı veya sıvı yağlar ilave edilerek üretilmektedir (Köksel ve Çetiner, 2015; Temiz, 2021).

Şekil 6. Bazı yassı ekmek çeşitleri

Yassı ekmekler, antik çağlardan günümüze kadar gelen ve birçok kültürde hala önemli bir yeri olan ekmek türüdür. Günümüzde bazı yassı ekmek çeşitleri özellikle Asya ve Orta Doğu ülkeleri başta olmak üzere birçok ülkede temel besin maddesi olarak tüketilmektedir (Temiz, 2021).

Ülkemizde ise özellikle Doğu Anadolu, Güneydoğu Anadolu ve İç Anadolu bölgelerinde çok önemli bir temel gıda maddesidir. Türkiye’de yassı ekmeklerin çoğu evde yapılır ve kırsal bölgelerde yaygın olarak tüketilir, ancak şehirlerde de giderek daha popüler hale gelmektedir (Coşkuner ve Karababa, 2005). Mayalı ya da mayasız olabilen yassı ekmekler, tek ve çift katlı olmak üzere iki gruba ayrılır (Köksel ve Çetiner, 2015; Temiz, 2021). Tek katlı grup kendi içinde iki alt gruba ayrılır; maya fermentasyonu ile mayalanmış (örneğin lavaş, tandır, pide) ve mayalanmamış (örneğin yufka). Çift katmanlı yassı ekmekler ise (örneğin gobit) fırıncı mayası ya da ekşi maya ile mayalanır ve çok yüksek fırın sıcaklığında pişirilir, bu da buharı ekmeğin içine hapseder ve pişirme sırasında kabarmasına neden olur (Qarooni, 1996). Bazlama, lavaş, pide ve yufka Türk yassı ekmeklerinin yaygın örnekleridir.

2.5.1. Bazlama

Bazlama, yassı, tek katmanlı, mayalı, kremi sarı renkte ve yuvarlak bir ekmektir. Genellikle 3 cm kalınlığında ve 10-20 cm çapındadır (Levent ve Bilgiçli, 2012). Buğday ununa, tuz, şeker, maya ve su ilave edilerek yoğrulur. 1-2 saatlik fermantasyondan sonra, hamur 150-250 gr'lık parçalara bölünür, yuvarlanır ve istenen kalınlıkta açılır. Açılan hamurların önceden ısıtılmış sac üzerinde iki tarafı da pişirilir (Taşdemir, 2005; Basman ve Köksel, 1999). Bazlamanın kalınlığı ve çapı uniform olmalı, dış kabuğunda hafif kahverengimsi benekler olmalı, içi iyi pişmiş olmalı ve iç rengi ise sarımsı olmalıdır. Bazlamanın dış kabuğunda kabarma ve çatlak olabilir. İçi ise düzgün gözenekli yapıda ve çiğnene bilirlilik özellikleri iyi olmalıdır (Basman ve Köksel, 1999).

2.5.2. Lavaş

Lavaş tek katmanlı, yassı, oval şekilli ve mayalı bir ekmektir (Coşkuner ve Karababa, 2005; Jooyandeh, 2009). Buğday unu, tuz, su ve maya karıştırılarak hamur haline getirilir ve 1-3 saat mayalanır. Mayalanan hamur 100-250 gr'lık parçalara ayrılır, yuvarlanır ve en az 15 dakika daha mayalandıktan sonra 40-60 cm uzunluğunda, 20-30 cm genişliğinde ve 3-5 mm kalınlığında bir tabaka haline getirilir. Açılan hamur özel bir tandır fırınının sıcak duvarlarına yerleştirilir ve 20-40 saniye boyunca fırın duvarında veya fırın ocağında pişirilir (Talay, 1997). Bu yumuşak, esnek yassı ekmek, dürüm yapmak için mükemmeldir. Lavaşın raf ömrü kısadır, çabuk kurur ve sertleşip kırılganlaşır (Köksel ve Çetiner, 2015).

2.5.3. Pide

Pide mayalı hamurdan yapılan yumuşak bir yassı ekmektir. Yuvarlak veya oval şekilli olabilir. Genellikle 1,5-2 cm kalınlığında ve yuvarlak pide 20-30 cm çapındadır. Pide yapımında buğday unu, tuz, su ve maya ile 15-20 dakika yoğrulur. Yoğrulan hamur 40-50 dakika mayalanır ve daha sonra parçalara ayrılır, yuvarlanır ve 30-40 dakika daha mayalanır. Elle yassılaştırılır ve üzerine parmaklar yardımı ile şekil verilir, istenildiği takdirde üzerine yumurta sarısı sürülür, susam/çörek otu ile süslenir ve 180-220 °C'de 15-20 dakika pişirilir (Talay, 1997; Anıl, 2012).

2.5.4. Yufka

Yufka, 50-80 cm çapında ince, yuvarlak, mayasız bir yassı ekmektir (Basman ve Köksel, 2001). Yufka yapımında un, su ve tuz ile yoğrulur. Hamur 60-100 gr'lık parçalara ayrılır, yuvarlanır, en az 15 dakika dinlendirilir ve oklava ile dairesel bir yufka haline getirilir. Yufka hamurları önceden ısıtılmış metal bir saç üzerinde kısa bir süre (40-60 saniye) pişirilir. Pişirme sırasında ekme ters çevrilerek her iki tarafında kahverengi lekeler bulunan kremi bir renk elde edilir (Tekeli, 1970). Yufkanın nem içeriği %5'in altına düşürülerek 6 aya kadar raf ömrü olan kuru yufka elde edilebilir. Tüketilmeden önce kuru yufka ıslatılır ve esneklik kazanması ve rulo haline getirilebilmesi için birkaç dakika dinlendirilir (Köksel ve Çetiner, 2015).

2.6. Boza

Boza, çeşitli tahıl unları, maya ve laktik asit bakterileri ile yapılan geleneksel fermente bir Türk içeceğidir. Boza; öğütülmüş tahıla (buğday, darı, pirinç, mısır, yulaf, çavdar vb.) su ilavesi ile pişirilen karışıma maya ve laktik asit fermantasyonu sağlamak amacıyla şeker eklenmesi ile üretilmektedir. Bozanın kıvamı koyu olup, kremden açık sarıya kadar değişen bir renge, tatlı-ekşimsi tada ve asidik-alkollü bir kokuya sahiptir (Kabak ve Dobson, 2011; Karacıl ve Acar, 2013). Bozanın kalitesini, kullanılan tahıl türü ve miktarı, fermantasyon süresi ve sıcaklık gibi faktörler etkilemektedir (Levent ve Çavuldak, 2017). Boza, karakteristik lezzetini sağlayan fermantasyon nedeniyle çok az alkol ve CO₂ içerir (Göçmen vd., 2000). Hoş lezzeti ve yüksek besin içeriği bozayı Türkiye'de çok popüler bir içecek haline getirmiştir. Boza, probiyotik laktik asit bakterileri açısından zengin bir kaynaktır ve fonksiyonel bir gıda ürünü olarak pazarlanabilir (Köksel ve Çetiner, 2015).

3. SONUÇ

Türkiye'de pirinç, mısır, çavdar, yulaf ve arpa gibi tahıllar gıda olarak tüketilse de buğday en yaygın tüketilen tahıldır. Bu nedenle ülkemizde buğdaya dayalı beslenme tipi hâkim olup, kişi başına tüketilen enerjinin büyük çoğunluğu buğday ürünlerinden karşılanmaktadır. Ülkemiz insanının beslenmesinde vazgeçilmezler arasında bulunan özellikle bulgur, tarhana, ekme, erişte gibi geleneksel ürünlerimizin çeşitliliği halkımızın kültürel çeşitliliğinin göstergesidir.

ABSTRACT

With increasing awareness of the role of entrepreneurship as a key in a comprehensive economic development framework, researchers in recent years have focused attention on it with a view to discovering the factors that promote its development. Previous studies have discovered that the first major step in the promotion of entrepreneurship is the formation of the intention to be an entrepreneur. It has also been shown that entrepreneurial intention is influenced by environmental factors. Since most of the attention in previous studies had been given to environmental factors such as economic, political and psychological factors with little attention given to social environment, this study, therefore, examines the effects of social environment on entrepreneurial intention in Nigeria. The study is guided by three objectives which centered around the major components of social environment- education, family background and social network, and the effects that these components have on entrepreneurial intention. Adopting a critical review of literature methodology, the study hypothesized that, education, family background and social network of an individual, all play significant roles in the formation of entrepreneurial intention and should therefore be given adequate attentions in order to promote the formation of entrepreneurial behaviour needed for the economic growth in Nigeria. It is however, recommended that an empirical study be conducted to confirm the hypotheses stated in this study.

Keywords: Social Environment, Entrepreneurial Intention, Education, Family Background, Social Network

INTRODUCTION

Entrepreneurship plays a significant role in the economic development of any nation. This view has been supported by scholarly works of researchers and theory (Richmell, Emmanuel & Augustine, 2018; Bagobiri & Yaroson, 2016; Eduardo & Manoj, 2017). It is considered as a vital source of innovation, employment and economic growth (Thortnton, Domingo & David, 2011). Entrepreneurship has become a major avenue for gainful employment with the capacity of improving the economic status of people (Mbiti, et al., 2015; Amakiri, et al., 2017). It is for this reason that entrepreneurship has attracted much attention from the government in most developing countries of the world, particularly, Nigeria.

Despite the emphasis and efforts by all nations to encourage the development of entrepreneurship, entrepreneurial intention has never been the same for all countries. Great differences exist among nations and even among sub-societies in nations, in terms of entrepreneurial development. Consequently, entrepreneurial intension has been related to environmental factors (Akp-or-Baro, 2012). The Nigerian society and environment have been widely and greatly discussed with regards to entrepreneurship. The common view is that entrepreneurship situation in Nigeria is greatly affected by the environment. Specifically, it is argued that the Nigerian environment has great influence and impact on the emergence of entrepreneurs and entrepreneurial behaviour. The concept of environment has been narrowed in most cases to infrastructures of physical and economic/financial nature which are based on political and national economic decisions by government. This accounts for the reason that government is often blamed for low entrepreneurial motivation and entrepreneurial development in Nigeria.

However, it has been posited by various scholars and researchers that social characteristics such as education, religion, and family background have great influences on entrepreneurial intention. This is the reason why we find unevenness in the distribution of entrepreneurship throughout the world. Scholars have pointed out the importance of social factors in the formation of an intention to create new businesses, arguing that entrepreneurship is a social phenomenon. (Carlos, et al., 2018; Casrud & Brannback, 2011). Therefore, while economic conditions may explain some of the variation, any convincing explanation must take account of the social aspect of entrepreneurial activity (Kalkan

& Kaygusuz, 2012). Although, there have been considerable studies on psychological and economic approaches to the development of entrepreneurial intention (Akhter & Sumi, 2014; Thornton, et al, 2011), the influence of social factors have not attracted the much needed attention from researchers. This paper, therefore, attempts to critically review the effects of social environment on entrepreneurial intention with focus on Nigeria.

Statement of the Problem

In spite of the improved attention given by the government to the development of entrepreneurship in Nigeria, which manifest in the areas of establishing entrepreneurial centers in higher institutions, development of skill acquisition centers, establishment of micro credit financial institutions and provisions of micro credit, the level of entrepreneurial intention in Nigeria is still low when compared to most countries of the world (Bagobiri & Yaroson, 2016; Akpor-Robaro, 2012). Likewise, the increasing rate of unemployment in Nigeria (Trading Economics, 2017) is very worrisome.

Since most research efforts have focused on the psychological and economic approaches to the development of entrepreneurial intention (Akhter & Sumi, 2014; Akpor-Robaro, 2012), it becomes imperative, therefore, to explore the effect of social factors on entrepreneurial intention as a way of proffering solution to the problem of low entrepreneurial intention among Nigerians. This, therefore, is the crux of this current study.

Aim and Objectives Study

The aim of the study is to assess the effect of social environment on entrepreneurial intention, adopting critical review of literature. This aim has been broken down into the following specific objectiveness:

- i. To examine the influence of education on entrepreneurial intention in Nigeria.
- ii. To assess the effect of family background on entrepreneurial intention in Nigeria.
- iii. To evaluate the effect of social network on entrepreneurial intention in Nigeria.

Literature Review

This section presents review of relevant concepts and theories. Empirical review was also done and conceptual framework of the study was equally proposed.

Entrepreneurial Intention

The process of entrepreneurship begins with the development of entrepreneurial intentions (Amakiri, et al, 2017; Ali, et al., 2010). Individuals do not become entrepreneurs as a reflex. Rather they respond to the conditions around them, they think about the opportunity and process cues from the environment which help them to construct the perceived opportunity into a viable business proposition (Thuo, Tagesse & Senbetie 2016; Remeikiene & Startiene, 2013). Entrepreneurship intention refers to a conscious state of mind that direct a person's attention to fulfilling the goal of venture creation. It refers to the anticipation of a person to start and grow a new business venture.

According to Aliyu, Sirajo & Selim (2015), entrepreneurial intention is one of the major contributing factors to the formation, growth, and development of entrepreneurship. It is the way to create new firms within available resources which is based largely on environmental factors in which individual live (Aghazamani & Roozikhah 2010). However, entrepreneurial intention is very critical in ensuring the intended entrepreneurial behaviour among the citizen of a society or country.

Social Environment

The idea that individuals and organizations affect and are affected by their social context is not new as scholars continue to argue that the entrepreneurial variations are better comprehended by reckoning with the social environment in which the firm is created, because, in addition to economic activity, entrepreneurship is a social phenomenon (Berger, 1991; Steyaert, 2007). Ramana and Sorenson (2008) contend that the social context plays an important role in shaping career aspirations and in legitimating different career choices. Thus, entrepreneurship could be seen as the outcome of a social influence process (Ijaz, Yasin & Zafar, 2012). However, the main components of social environment that are often talked about in literature: education, family background and Social network (Castano, et al., 2015).

Extant literature on venture creation has described education as a vehicle on which individuals are conveyed to entrepreneurship or self-employment (Suartha & Suprapti, 2016; Mulyadi, et al., 2016). Linan, et al., (2008) view education as instrument that can stimulate the development of entrepreneurial behaviour in different ways. According to them, the whole set of education would include the development of knowledge, capacity, attitudes, and personal qualities identified with entrepreneurship. Thus, education is a key element that could be used to improve entrepreneurial mindsets which in turn contributes to economic growth, employment, and personal fulfillment (European Commission, 2006).

Family plays an essential role in economic activity involving the creation of firms and their growth. Family represents the important part of culture and has the significant impact on the performance of its members. Moreover, family provides opportunities to its members to develop networking. Traditional families play important roles in business and society because of the stronger ties and relationships for the enhancement of business, for maintaining their position in society and to maintain their power as well (Ijaz, et al., 2012). Family business has greater influence on entrepreneurial intention because family has a greater role in career choice. Family business has stronger awareness of its impacts on new generation who want to become entrepreneur (Thompson, 2009). Czuchry and Yasin (2008) also found that the entrepreneurial engagements of both parents are strongly correlated with the children's business interests.

Social networks are such relationships that provide opportunities to access and/or use financial and human capital - such relationships in which ownership is not ultimately the property of any individual, but is organized jointly by members of a network (Thornton, et al 2011). It is believed that social networks influence entrepreneurial intention. Individuals in strong social networks exchange business information and material resources. This could give them special edge and positive effects in their entrepreneurial intentions and resultant outcomes.

Theoretical Foundation

There have been a number of theories put forward to explain the relationship between entrepreneurial emergence and social environment. The central focus of these various theories was to explain the social factors which cause people to develop entrepreneurial intention and be positively disposed to venturing into entrepreneurship. First among the theories that sought to explain the influence of social environment on entrepreneurship is the social network theory, which was propounded by a sociologist, Ronald Burt (1991). A network represents all the relationships and connections that one has with others, no matter their nature or characteristics. According to Burt, the concept of network is central to the term of social capital and proposed that there are two possible interpretations of it.

Firstly, he proposed that a network is important because it can lead to significant resources and opportunities. Secondly, he proposed that a network can be considered important for the fact that it is a resource in itself. Which is able to offer better access, timing or chances. Entrepreneurial opportunities are found in a person's network if it is structured in a certain way (Brass, 1992). An entrepreneur can only act if is in a position of mediating between distinct members of its network. Burt called entrepreneurial opportunity as a structural hole which will occur between two non-redundant contacts. A network rich in entrepreneurial opportunities provide a player with the motivation to be entrepreneurial.

Furthermore, other theories, like human capital theory, have emphasized education and family background as relevant social factors which affect entrepreneurial intention. Proponents of this perspective hold strongly the role of the family in developing the entrepreneurial character. It is believed that the home atmosphere of a family can provide a great deal of nurturing and supports for development of entrepreneurial personality or character (Kuratko, 1989). The family background of an individual is a strong influence on his values and character, thereby serving as a strong source of influence whether he would be an entrepreneur or not.

Conceptual Framework

Based on critical review of relevant literature conducted, the study proposed the model as showed in figure 1. The model shows the relationship between social environment and entrepreneurial intention.

Figure 1: Proposed conceptual framework of the study

MATERIALS and METHODS

The methodology adopted in this study was a critical review of previous relevant literature on the effect of social business environment on entrepreneurial intention. Literature were carefully studied, summarized, evaluated and synthesized into a comprehensive whole. Included literatures for the study were carefully selected on the basis of relevance and publishers' pedigree. Consequently, recent works published by notable publishers like Springer, Sage, Emerald, and Science direct, were mainly used. Variables included in the study were sourced from relevant theories and previous studies. However, the review formed the bases for the proposed conceptual framework of the study.

DISCUSSION OF REVIEW OUTCOMES

A great number of research studies have been conducted regarding the impact of education on entrepreneurship. Despite the existence of the studies, the concepts of education and entrepreneurial intention require further investigation (Peterman & Kennedy, 2003). Some Researches indicate that higher level of education leads to lower curiosity and risk taking (Naughton, 1987). Even some research studies refer to the type of the education, and the system through which it is proposed. For instance, it has been shown that traditional education leads to

lower creativity, curiosity, and risk taking, which later leads to lower tendency to become an entrepreneur (Ronstadt, 1984). Peterman and Kennedy (2003) claimed that formal education reduces the chances of becoming entrepreneurs, as these types of education are usually designed to prepare students to work in corporations.

Many scholars have established a positive relationship between the level of education and entrepreneurial intention (Asamani & Mensah, 2013; Garba, Mansor & Djafar, 2013 Zulfikar & Siti, 2014). Therefore, societies where there are a large number of people who have acquired various degrees of education are expected to have more entrepreneurs than societies where the number of people who have access to quality education is low (Akpor-Robaro, 2012). According to Samuel, Jacob & Ernest (2013), education is an important contributor for entrepreneurial intentions. They argue that education enhances creativity, innovativeness, risk-taking and ability to interpret successful entrepreneurial effect models and identification of business opportunities in a dynamic business environment. More so Linan et al. (2008) stated that the information regarding entrepreneurs and new venture creation is obtained through entrepreneurship programme. Apparently Friedrich and Visser (2005) pointed out that education about entrepreneurship increases students' interest in becoming entrepreneurs at some stage after graduation. Findings from this study have shown that education stimulates the entrepreneurship process and impacts entrepreneurial intention (Agbim, 2013).

Naturally, family has an instrumental influence on the career choice of people. Career choice of individuals more often than not reflects the interest of the family they come from (Wu & Wu, 2008). This is strongly related to the orientation with which the individual is raised in the family. More so, individuals raised by families with entrepreneurs are more likely to embrace entrepreneurship as a career in life (Akpor-Robaro, 2012). Findings from the reviewed literature (Akpor-Robaro, 2012; Peng, Lu & Hui, 2012; Krotan & Ratan, 2018; Ijaz, et al.) show that Family background have an influence on entrepreneurial intention. Analysis of the impact of parental background on business owners' entrepreneurial motivation shows very low indication that entrepreneurs are motivated by the fact that their parents own businesses. This findings corroborate the findings of (Ramos-Rodriguez, Medina-Garrido, Lorenzo-Gomez & Ruiz-Navarro, 2010;

Geissler & Zanger, 2013; Wang, Wong & Lu, 2011) who conclude that individuals close to successful entrepreneurs are very much likely to develop interest in entrepreneurship and most likely try to emulate. The nature of the relationship between social networks and entrepreneurial intention has been at the centre of discourse and research efforts for some time. Various scholars (Kro & Ratan, 2018; Thornton, et al, 2011; Mbiti et al 2015; Xiaohong, 2012) have established that social networking has an influence on entrepreneurial intentions. These findings are in line with the network theory propounded by Burt (1991). According to Burt, the concept of network is central to entrepreneurship because it is the way which can lead to significant resources and opportunities and for the very fact that it is in itself a resource, able to offer better access, timing or chances. The findings also agree with the position of Ghirmai (2011) that Social networking Social networking covers all the cultural as well as social aspects which help in the business plays an imperative role in developing entrepreneurial intentions among entrepreneurs and is the main cause for successful business.

CONCLUSION and RECOMMENDATIONS

Having conducted a critical review of relevant literature with a careful study of their findings, the researcher, in line with the objectives of the study, posits that social environment could exert notable influence on the formation of entrepreneurial intention. The various dimensions of social business environment that have been carefully studied are worthy of attention in order to promote the formation of entrepreneurial intention. This may invariably lead to greater entrepreneurial behaviour, and by extension, result in the much sought-after economic growth and development of Nigeria, with all its attendant social and economic benefits.

However, in view of the relevance of the social environment to the formation of entrepreneurial intention and the resultant behaviour, this study has proposed a workable model which other researchers can subject to empirical study in order to ascertain its efficacy in the formation of entrepreneurial intentions and/or behaviour so as to make workable recommendation and possible generalization of findings.

ABSTRACT

This article offers an overview of the topic of environmental colonialism in the Indian literary canon. Environmental colonialism is a critical concept that refers to the exploitation and degradation of natural resources and ecosystems by colonial powers. Such attitudes result in ecological and cultural destruction. This paper explores how Indian literature has engaged with the complex issues of environmental colonialism. It aims to analyse *The Hungry Tide*, and *The God of Small Things*. Through an examination of select Indian literary works, this research article analyses how authors have portrayed and critiqued the environmental impact of colonialism. It examines themes such as the loss of biodiversity, the displacement of indigenous communities, and the transformation of landscapes. It also addresses the role of literature in raising awareness about the ongoing ecological challenges in postcolonial Indian society by stressing the importance of these narratives in shaping environmental consciousness and nurturing environmental justice. This paper discusses the relevance of this research in the context of contemporary environmental issues and the urgent need for sustainable practices and policies in India and beyond.

Keywords: Ecological Narratives, Environmental Colonialism, Environmental Justice, Indian literature, Postcolonial Studies

INTRODUCTION

Postcolonial Ecocriticism is a scholarly and interdisciplinary framework that explores the interconnections of colonial history, indigenous cultures, and the natural environment within the realms of literature and culture. The current environmental catastrophe is linked to the historical phenomenon of colonial exploitation (Mason, 2012). Asia has made substantial contributions to the literary and theoretical arena due to its intricate colonial histories and wide range of cultures and ecosystems (Ukiyoto, 2020). The concept of environmental colonialism, sometimes known as ecological imperialism, relates to the manner in which colonial powers exploited and transformed the natural systems of the territories they colonised. The aforementioned exploitation frequently led to the occurrence of deforestation, soil degradation, the introduction of exotic species, and the eradication of local agricultural, forestry, and fishing practises. Indian literature in the English language has extensively explored these subjects, demonstrating the enduring presence of colonial influences in the current environmental predicaments faced by the nation (Ciocca & Srivastava, 2017).

Environmental Narratives: Western vs. Third World Perspectives

Many believe that environmental awareness in the Western middle-class stems from concerns related to industrial growth and capitalism. According to Weyler, in developing countries, environmental initiatives are often driven by livelihood sustainability and resource utilization rather than global issues (2018). Countries like India have a distinct approach compared to the developed world, influenced by local needs and the impacts of globalization (Paprotny, 2020). Notably, Sunita Narayan contrasts the “protection-focused conservation” of the West with the “use-focused conservation” in developing nations, highlighting the reliance on natural resources for essentials like food and water.

Amitav Ghosh and Arundhati Roy discuss the resource overuse during British rule in India, such as excessive logging for British projects (“South Asian Digital Humanities: Postcolonial Mediations across Technology’s Cultural Canon,” 2020). Ghosh’s book highlights the fragile Sundarbans ecosystem. The British started plantations like tea and coffee in India which made money but hurt the environment and local people. Many writers talk about how local communities were moved because of British farming (Mishra, 2018). Roy’s book mentions modern problems in India that started during British rule. The British changed India’s water systems and hunted a lot

for fun, but they also tried to save nature by making parks, which sometimes forced locals to move. Indian writers say that after the British left, India kept using resources in harmful ways (Chae, 2015) and (Mohammadzadeh, n.d.). Some writers believe India should follow its own environmental traditions instead of just copying the West.

Western environmental discourses often view the West as the main player in environmental history. Since the West has moved beyond the industrial age, there's a big focus on environmental care. This is different from developing countries where people often struggle daily with their environment for basic needs. Gadgil and Guha (1994) mention Thurow's idea that richer countries care more about the environment, while poorer ones do not. This view oversimplifies environmental concerns and suggests that developing countries do not really care about the environment. They are seen as stuck in old ways or too focused on modernizing (Folchi, 2019). Gadgil and Guha say that for Americans, once people have a comfortable life, they start to value a clean environment more. Clean surroundings make other parts of life better. Scholars like Nash think that only after meeting basic needs do people think about the environment. In rich societies, being environmentally friendly becomes a luxury. Yet, Gadgil and Guha also hint that in India, environmental care mainly comes from wanting fairness and survival. They suggest that if it were not for these urgent needs, India might not have cared about the environment much.

The primary objective of this study is to question and analyse environmental narratives, with particular emphasis on the depiction of Third World environmentalism as primarily driven by basic survival need. This perspective classifies populations from the Third World as being excluded from the wider context of environmental history, a situation that presents certain challenges. This study examines the construction of the Third World's association with survival-based environmentalism in later parts, highlighting how this impression might undermine the overall effectiveness of their advocacy.

From a Western perspective, it may be said that environmental activism in the Third World is still in its early stages, mostly due to its perceived dependence on the environment for fundamental human sustenance. The existing contrast posits that Western environmentalism is often perceived as a privilege rooted in detachment and impartiality, but Third World environmentalism is seen as closely linked to pressing necessities such as sustenance and access to water (Weyler, 2018). Gadgil and Guha (1994) assert that environmental movements in Western

cultures tend to arise in the aftermath of industrialisation, whereas in agrarian civilizations such as India, they manifest at an earlier stage, within the process of modernization. In Western societies, the conservation movement tends to prioritise the preservation of undisturbed natural environments, but in India, it frequently centres on conserving land, water resources, and the well-being of local communities.

The present narrative posits that Indian environmentalism is predominantly focused on addressing fundamental need, hence exhibiting a tendency to conceptualise it in biological terms (Tripathy, n.d.). The recurrent emphasis placed on the concepts of ‘life’ and ‘livelihood’ within Indian movements suggests that environmental consciousness in this context is inherently tied to the pursuit of physical well-being. On the other hand, the Western perception of environmental consciousness is portrayed as a progressive development stemming from a state of disengagement, in which individuals, having reduced their dependence on the environment, are able to assume the role of its caretakers. Individuals who exhibit a sense of detachment are commonly regarded as the authentic guardians of environmental knowledge. The clear demarcation between Western and Third World environmental methods heightens the apparent disparities between them.

Gadgil and Guha (1994) have notably identified three prominent themes within the realm of Indian environmentalism, including ecological Marxists, devoted Gandhians, and intermediary technologists. The differentiation of Third World activism is further accentuated by the prevalence of ecological Marxists who prioritise the equitable distribution of resources. It is imperative to acknowledge that the categorization of First and Third World ecology, however useful, frequently leads to an exaggeration or oversimplification of the disparities between them. The assertion made by Gadgil and Guha regarding the alignment of Western environmentalism with consumerism and its failure to critically examine its ecological basis, while contrasting it with Third World environmentalism that is grounded in survival and subsistence and provides a comprehensive critique of both consumerism and unregulated economic growth, can be deemed excessively reductionist.

Notably, not all environmental movements in developing countries only consist of criticisms towards capitalism. Within the context of the anti-POSCO campaign, it is important to note that the opposition exhibited by locals was not solely driven by a survivalist standpoint (Das & Pattnaik, 2022). The individuals involved have financial stakes in the production of betel leaf

and prawn farming, and their opposition to the POSCO project was principally motivated by an unfavourable agreement. Experts such as Gomes may hold romanticised perspectives towards sustainability, presuming that indigenous communities had intrinsic ecological knowledge and sustainable methods.

Deep ecologists may argue that postcolonial criticism has an excessive anthropocentric orientation and highlights human interests to the detriment of the wider ecological context. Nevertheless, an increasing recognition is emerging throughout the academic community that the two disciplines are not inherently separate from one another (Varanasi, 2022). The present-day ecological challenges are intrinsically connected to the historical legacy of colonial exploitation (Szabó, 2014). Certain Green movements have been criticised for displaying characteristics of Western liberal universalism or elitism. The universalizing strategy employed by certain actors may give the impression of pushing solutions originating from developed nations onto challenges faced by developing nations, thereby frequently yielding unfavourable outcomes. The task at hand involves formulating ecological solutions that demonstrate consideration for cultural and geographical variations. It is imperative to comprehend that ethical discussions pertaining to the environment are inherently influenced by cultural contexts. The potential effectiveness of an ecological solution in the Western world may not necessarily translate to positive outcomes in the Third World, thereby emphasising the imperative of fostering cross-cultural comprehension.

The concept of an ideal “ecological citizenship” necessitates a mutually reinforcing dedication to both human rights and ecological justice. This necessitates recognising and appreciating both the inherent and external worth of the natural world (Bourban, 2023). The concept that nature solely holds intrinsic value is contradictory, as it unfairly separates humans from the natural world. The author aims to offer an in-depth understanding of various postcolonial discussions by incorporating ecocritical viewpoints. This method underscores the significance of concurrently examining environmental and cultural narratives. Although ecocriticism is mostly spearheaded by scholars from Western countries, there is a noticeable absence of institutional support for the examination of intercultural and cross-cultural aspects within this field. Historically, a considerable body of scholarly work within the field of ecologically informed postcolonial critique has focused mostly on “settler cultures.” This frequently gives rise to a manifestation of

“imperialist nostalgia,” characterised by a sense of longing for what the colonial powers themselves eradicated.

To effectively address ecological and cultural challenges, it is crucial to aggressively engage scholars from non-Western backgrounds who prioritise the interrelated nature of postcolonial and ecological complexities. Prominent academics, including Ramachandra Guha and Vandana Shiva, noted the intrinsic connection between environmental degradation and socio-cultural detriment. Guha and Shiva direct their studies towards not only the issue of Western imperialism, but more specifically towards the neocolonial tendencies demonstrated by the Indian state in the period following independence. The illustrations portray the negative outcomes that arise from the implementation of a centralised approach to resource management and development. These outcomes include environmental degradation and a gradual reduction in cultural diversity.

Arundhati Roy, renowned for her widely acclaimed literary work *The God of Small Things*, has authored two articles that delve into pertinent socio-political concerns within the Indian context. The aforementioned writings, namely *The Greater Common Good* and *The End of the Imagination*, initially appeared in prominent Indian periodicals before attaining global circulation under the title *The Cost of Living*. In these texts, Roy tries to establish a connection with Indian readers who possess knowledge regarding the aforementioned topics, as well as with global readers who may be unfamiliar with them. *The Greater Common Good* pertains to the Narmada Valley Project, whilst the subsequent essay delves into India’s use of nuclear energy. In this collection of essays, Roy strives to leverage her prominence in order to educate and influence the perspectives of numerous readers, both within India and on a global scale. There are many who hold the belief that her motivations are rooted in a desire for increased media exposure or aligning herself with a popular cause. However, it is important to acknowledge that Roy’s concerns are indeed genuine.

In her article, Roy offers a critique of the medias portrayal of these matters and the government’s promotion of a fallacious notion of “national progress.” The concept of “national progress” implies that the government is actively pursuing the welfare of all citizens. Roy contends that this assertion is unfounded. It is noteworthy that India has undertaken numerous dam construction projects following its independence. Among these, the Narmada Valley Project holds considerable prominence. The project entails the construction of more than 3,200 dams in order to effectively control the river system. Although the project holds the potential for advantages such

as enhanced access to electricity and improved agricultural practises, it is accompanied with a multitude of challenges. The displacement of a significant portion of the indigenous population, particularly the Adivasi community, has resulted in adverse consequences for their livelihoods and cultural heritage.

The project's claims to be beneficial have been debunked by various signs. Despite its advanced flood-warning and irrigation techniques, it appears to do more harm than good, sometimes causing disastrous damage to the very land and crops it was meant to safeguard. Moreover, the project's astronomical expenses, once backed by the World Bank until its withdrawal in the early 90s, have further burdened the nation's economy. Protests led by the Narmada Bachao Andolan were met with force. Andrew Rowell describes the Narmada Valley Project as a tragic failure, emphasizing the lack of consideration for local communities in its design and the oppressive response to those who raised concerns. Furthermore, these big dams serve as symbolic representations of India's drive for modernization. Patrick McCully describes these massive dams as emblems of human progress, emphasizing their symbolic value which often overshadows the potential negative consequences they might bring. These structures often indicate a convergence of modernist technological ambitions and heavy-handed governmental control, further incentivized by the global dam industry's massive profits.

Arundhati Roy highlights that the same narrative of exploitation and dissent plays out globally, pointing to the "Iron Triangle" of politicians, bureaucrats, and construction companies, often backed by entities like the World Bank. She warns against the blind trust in such mega-projects and stresses on the ecological and human cost of such endeavours. Her narrative is multifaceted – it is a mix of factual investigation, emotional storytelling, and a call for environmental action.

The Sundarbans as Portrayed in *The Hungry Tide*

Amitav Ghosh's *The Hungry Tide* engages its readers into the ever-shifting landscapes of the Sundarbans—a maze of islands and waterways characterized by its treacherous tides, elusive mangrove forests, and an assembly of fierce wildlife (Amitav Ghosh, 2004/2006). Through intertwining narratives, the novel delves deep into the human struggle to coexist within this unpredictable and often hostile natural domain. Central to the novel is the symbiotic relationship between the Sundarbans' residents and their environment. For inhabitants like Kusum, Fokir, and

Horen, the very soil and waters of the Sundarbans are intrinsic to their identity. Their bloodlines, traditions, and beliefs are seamlessly intertwined with the mangroves, tides, and wild creatures, making the Sundarbans an extension of their own selves. Yet, this profound connection does not diminish the omnipresent fear and respect they harbour for their homeland. The daily dance with danger—whether from menacing tigers, lethal snakes, or merciless crocodiles—renders life in the Sundarbans a perpetual tightrope walks between survival and annihilation.

In this realm of unpredictability, myths and legends serve as a compass, guiding and protecting the locals. The legend of Bon Bibi, the guardian goddess of the forest, represents the residents' means of navigating the perilous landscapes. With tales of her triumph over the man-eating demon, Dokkhin Rai, the myth offers solace, a semblance of control, and a beacon of hope against the otherwise relentless forces of nature. Shrines dedicated to her stand as sanctuaries, signifying spaces of safety in a land where danger lurks at every corner. These legends not only provide spiritual and psychological relief but also underline the communal ethos of the Sundarbans' dwellers, reinforcing shared values and collective memories. Apart from these layers of reverence and mythology, the novel also reveals the unyielding, indiscriminate might of nature. Cyclones, with their disastrous fury, embody nature's disregard for human beings, and makes them vulnerable.

The Hungry Tide elucidates the intricate balance between conservation and the well-being of indigenous communities. While the novel predominantly deals with the tumultuous interplay between man and the overpowering forces of nature in the Sundarbans, it delves deeper into the ethical ramifications of wildlife conservation and its impact on the local populace. Piya, a marine biologist comes to India with the belief that nature and preservation of resources is the highest priority of human beings, a belief she got from the first world environmentalist education. She learns about the tensions between wildlife preservation and the lived realities of the local communities through experience. Kanai introduces her to the nuanced perspective of the Sundarbans inhabitants, the dire consequences they face due to the aggressive conservation agendas, implemented by the state. The frequent human casualties caused by tigers, often ignored or overlooked, epitomize the unfortunate sidelining of human lives for the sake of animals.

The historical Morichjhāpi (Amitav Ghosh, 2004/2006) conflict adds another layer to the narrative, showing how environmental concerns can be weaponized to serve political or other

agendas. The juxtaposition of Nilima's and Nirmal's views on the Morichjhāpi settlers encapsulates the wider debate on conservation. Nilima's perspective, highlighting the environmental ramifications, starkly contrasts with Nirmal's empathetic stance towards the desperate needs of the island's inhabitants. Kusum's poignant reflections on the violent conservation efforts articulate the harsh reality of many who find themselves trapped between the need for survival and global conservation agendas. By the novel's conclusion, Ghosh hints at a more harmonious approach towards conservation, embodied in Piya's evolved perspective. Her proposal, integrating local fishermen into her research and channelling funds towards community welfare, signifies a potential model where environmental and human welfare coexist symbiotically. Ghosh, through *The Hungry Tide*, advocates for a holistic approach to conservation, emphasizing the importance of integrating local communities into the broader environmental discourse, ensuring that their voices are heard, and their rights upheld.

Nirmal and the Cyclone Shelter: A Legacy of Possibility and Regret

Nirmal's character in *The Hungry Tide* presents a complex interplay between ideals and realities, hope and despair, and action and inaction (Amitav Ghosh, 2004/2006). His entire journey in the narrative is an exploration of the chasm between theoretical ambitions and their tangible manifestations in the real world. The cyclone shelter stands as a silent testament to this duality. On one hand, the cyclone shelter symbolizes the tangible outcomes that arise when one acts upon beliefs. It is an embodiment of Nirmal's theoretical interest in storms, made real and beneficial for the community. It is a life-saving infrastructure, proving that knowledge can indeed translate to action and can serve the greater good. Through the shelter, Nirmal leaves behind a legacy that is both practical and invaluable, indirectly saving lives during nature's ferocious outbursts.

On the other hand, the cyclone shelter serves as a poignant reminder of Nirmal's unrealized potential and the vast chasm between his intellectual aspirations and his actual contributions. Nirmal's passion for Marxist theory and his early years as an intellectual promised a life of active engagement and revolutionary change. Yet, this potential was, in many ways, stifled by his own inability to translate theory into pragmatic action, most evident in his interactions with Morichjhāpi. His obsession with the settlement and his subsequent inaction highlights a tragic irony. While he could envision grand narratives of social transformation and was captivated by the

real-life manifestation of his Marxist ideals on Morichjhāpi, he became paralyzed when it came to making meaningful interventions.

Nirmal's notebook, filled with his writings and reflections on Morichjhāpi, represents another layer of this dichotomy. While it captures his thoughts, emotions, and the unfolding tragedy, it's ultimately lost in the floodwaters, just like many of his unfulfilled dreams and aspirations. The transient nature of the notebook contrasts starkly with the permanence of the cyclone shelter, further emphasizing the distinction between fleeting intellectual endeavours and lasting, tangible impact. In the grand tapestry of *The Hungry Tide*, Nirmal's journey and the symbol of the cyclone shelter shed light on the age-old conflict between thought and action. They serve as reminders of the potential within us all and the often-challenging task of bridging the gap between our ideals and their realization in the world.

After gaining independence, postcolonial countries, eager to showcase their potential, often doubted Western environmental ideals. They saw them as barriers to growth and hypocrisy from the West. For example, Malaysia's Prime Minister, Mahathir Mohamad, felt the West was trying to control postcolonial countries' environmental policies after depleting their own resources. India's Nehru wanted progress via big projects, treating the environment as just a setting. Environmental efforts in developing countries do not merely mimic Western luxury-focused views. They also challenge the growth plans of postcolonial governments. Still, it is too simplistic to see these countries' environmental issues as just matters of survival. Although many rely on the environment, not every effort can be branded as "environmental activism", especially when it aligns with global viewpoints. Both state and environmental news often miss the intricate human-nature bond. Governments may see those impacted by developmental projects as old-fashioned, while environmental narratives might hail them as heroes against rampant capitalism. Both views require depth. We need to explore how these stories are crafted, their effects, and their role in defining environmental matters. It is also vital to see how regions are represented in these talks, highlighting the intricate ties of environment, growth, and society in the postcolonial era.

Interconnectedness of Environmental and Cultural Concerns in Arundati Roy's Writings

While ecocriticism has primarily been a movement of the white majority, there is an increasing need to incorporate non-Western perspectives. This inclusive approach can provide a richer understanding of environmental issues faced by postcolonial nations and their cultural

implications. underscores the importance of drawing from various disciplines and scholars, from sociologists like Ramachandra Guha to ecofeminists like Vandana Shiva and literary figures like Arundhati Roy. Their works illustrate that environmental degradation is intrinsically linked to societal disruption, human rights, and issues of social justice. Both Guha and Shiva criticize the post-independence Indian state for its neocolonial approaches, which often prioritize large-scale development projects at the cost of ecological and cultural diversity. The state's role is further problematized by Arundati Roy, who critiques the state-controlled Narmada Valley Project.

Roy's essays, particularly those related to the Narmada Valley Project, provide a scathing critique of the Indian government's dam-building initiatives. While these projects aim to provide water and electricity to millions, they also displace large populations, mainly Adivasis, causing significant disruptions to their lives, economies, and cultures. The passage touches upon the role of media in shaping perceptions and narratives, especially around environmental issues. Roy, given her celebrity status, utilizes the media to draw attention to issues she cares deeply about, though she is also critiqued for potentially over-simplifying or romanticizing certain aspects. The narrative of "national progress" often requires the subjugation of local interests, cultures, and environments. The government's agenda, as reflected in large projects like the Narmada Valley Project, often positions development in opposition to environmental preservation and cultural diversity. The Narmada Valley Project, despite its promise to provide electricity, irrigation, and flood protection, seems to have caused more harm than good. The text suggests it might use more electricity than it produces. The project's modern systems, rather than protecting the land and boosting crop yields, have potentially harmed the land and ecosystems. The project, heavily funded by the World Bank until its withdrawal in the 1990s, has further deepened the country's economic struggles. Opposition to the project, especially from the Narmada Bachao Andolan (Save the Narmada Movement), has been met with violent suppression. Big dams have symbolic importance in the development narrative of modern nations. They represent progress, technological advancement, and the state's power. However, these symbolic values often overshadow their actual economic, environmental, and social impacts. The dam industry is a massive global enterprise, with powerful players like politicians, bureaucrats, construction companies, environmental consultants, and organizations like the World Bank. The influence of this "Iron Triangle" extends far beyond India, touching many countries.

God of Small Things

In Arundhati Roy's novel *The God of Small Things*, the landscape of Kerala is described to be under constant threat from modernizing forces and Western influences (Roy, 1996/2002). The river, for example, which is a symbol of life and purity in many Indian narratives, is portrayed as polluted and stagnant. This can be read as a reflection of the environmental degradation caused by neo-colonial forces. The narrative brings out how the trauma of colonization affects the environment and the relationships that marginalized communities have with nature. The tourism industry's portrayal in the novel indicates how nature, and Kerala's unique culture and landscape, is commodified for Western consumption. This commodification overlooks the rights and well-being of the local communities and the environment.

The novel depicts the close relationship between the marginalized Paravan community and nature. Velutha's character, being a Paravan, has an intimate connection with the river and the natural world. This connection is in stark contrast to the more privileged characters' relationship with the environment, illustrating the deep bond that marginalized communities often have with their surroundings. The novel sheds light on the continuation of exploitation in the postcolonial era. While the British colonialists have left, new forms of exploitation emerge in the form of domestic elites, such as the character of Comrade Pillai and Chako who engages in activities that harm the environment for personal gain.

CONCLUSION

Environmental colonialism, with its dual legacy of ecological devastation and cultural disruption, has been a prominent theme in Indian literature. Works like *The Hungry Tide* and *The God of Small Things* not only capture the profound environmental and sociocultural impacts of colonial rule but also reflect the broader consequences of such actions on postcolonial societies. Through an exploration of these literary pieces, it becomes evident that Indian authors have played a pivotal role in chronicling and critiquing the ramifications of environmental exploitation during the postcolonial era. Their narratives serve as powerful mediums that evoke environmental consciousness, providing readers with a deepened understanding of the intricate link between culture, history, and nature. In the face of present-day environmental crises, such literary insights underscore the pressing importance of adopting sustainable practices, safeguarding indigenous rights, and fostering environmental justice. As India directs its path toward a sustainable future,

revisiting and reflecting upon these narratives can provide valuable lessons, urging us to reconcile with our past and create a more harmonious coexistence with nature.

ABSTRACT

In this study, S. Beckett's *Waiting for Godot* is analysed through the lenses of Absurd Theatre and Existentialism. As one of the prominent genres of 20th century, Absurd Theatre depicts man's miserable but at the same time grotesque condition within life. As humanity has started to ask the aim and meaning of life, this kind of approach has given ways to artists and writers to search this quest through their artistic works, as in Beckett's play in which he puts the characters in weird situations, costumes, sets and nonsensical (but meaningful inside) dialogues in order to draw the audiences' attention to the core question of their existence: "What is the meaning of life?". From Beckett's writing adventure, the deduced conclusion is that the meaning of human life is inexplicable in any certain way. His mindset was always searching for a new and different perspective of writing and this difference gave its way to the absurd theatre and the existentialism in some way, but in the other way; he, as he claimed, is under no categorization because of his way of seeing life from a really different and creative perspective. He searched for a new mindset, so he produced his pieces in other languages to set an original line and angle to his works since he wanted to free himself from the traditional way of thinking in his own mother tongue. And all of these factors add to the originality and creativity of his works and also to the play *Waiting for Godot*, first published in French in 1952, as one of the famous masterpieces of absurd theatre.

Keywords: Beckett, Godot, absurd theatre, existentialism

INTRODUCTION

The aim of this study is to analyze and briefly study Beckett's play *Waiting for Godot*. In this masterpiece, the author interrogates some questions on existence of the world and human, as well. Those questions are mostly about why we are on this world and what the aim of living in this world. Ironically, while at the beginning and ongoing course of the play Beckett sets a world of gloom and misery, through the end of the play those pessimistic feelings turns out to be positive yet weird at the same time. The main characters of the play Estragon and Vladimir displays two unfortunate and miserable characters of whose life the audience has not got any idea. Estragon and Vladimir are two manifestations of actors who are in search of their proof of existence and waiting someone called Godot. Furthermore, who that Godot is remains a misery throughout the game. Although people or experts try to attribute that character to some symbolic figures such as Godot might be God, Beckett denied all those symbolic interpretations. For this reason, this study aims at rendering a general idea about the play without reaching any certain judgement on it.

Beckett

Samuel Beckett is a special writer in that he was both a modern and a postmodern author and his works address to the 20th century society especially bearing the philosophies and ideas of prewar and especially postwar influences. Furthermore, his works, ascending beyond the limits of "time" and "space", are peculiar as they embrace all the adventures and experiences of human in that "time" and "space" from a very profound and different perspective. In this sense, one of the most popular and generally accepted of his masterpieces, as an example of absurd theatre, -though he denies- is *Waiting for Godot*.

Beckett is a modern myth author. In a way he is the writer of the *chaos* beginning from the Greek mythology and lasting to the *chaos* that is constituted by the civilized human of 20th century. In that chaos, man himself is in search of giving a meaning to life, thus bringing the core question: "Why is he in this world?". While in the ancient myths societies try to give answers to such questions as their heroes embark on from one adventure to another to find his identity and place in the universe; Beckett, in the modern world, takes up that core question out of the norms and traditions of modern civilization, and he puts that question into the contemporary world from a different life angle: "Why are we in this world?", "What is the meaning of human existence?" Besides those questions, he purges "time" and "space" out off his literary plots in order to

consciously put human bare and naked with those questions. His main goal is to arise a haunting curiosity from the beginning till the end of his works. The idea is that action is vacant, and life is meaningless and the whole phase of living is nothing more than agony or torment. Thus, in mythologies, for a human being, endeavoring to be immortal and giving in the idea of being mortal are both equally ridiculous for Beckett. Death is inevitable and human being, thrown into the earth without his claim, is stuck between the fine line of birth and death. In this sense, Beckett is profoundly influenced by Dante's *Divine Comedy*; as in this piece he mostly dealt with the character Belacqua who is stuck in the world before purgatory and Sophocles' *Oedipus* whose rebellion against his terrific destiny ends up with disappointment and agony for the rest of his life. Those kind of mythical phenomena for Beckett are universal and life-long issues, beginning from the ancient times, especially starting from the chaos of Greek mythology, and Beckett himself brings that issue into our modern world with a more original and shocking style. In his works he eradicates the "time" and "space" concepts and leave the characters of his works without any past or present background, and they have no identity except for a few details of their names or jobs; and one step further he even isolates his characters from their active bodies and leave them with their pure consciousness as in one of his novels such as *The Unnamable*. Herewith, Beckett revolt against the idea that life has a meaning and human is the primary value of that life. (Yüksel, 2017)

Beckett denied all the *-isms* that he was attributed to at his time, but experts and literature authorities examines *Waiting for Godot* under the category of absurd theatre. "Absurd theatre is a kind of theatre in which standard naturalistic conventions of plot, characterization and thematic structure are ignored or distorted in order to convey irrational and fictive nature of reality and the essential isolation of humanity in a meaningless world."⁵

Waiting for Godot

As for his generally accepted masterpiece, under the category of absurd theatre, *Waiting for Godot* the main characters are actors performing ironically man's miserable but at the same time grotesque condition within life. The play consists of conversations between Estragon, also Gogo, and Vladimir, also Didi, who are waiting for the arrival of a mysterious Godot. Didi and Gogo are the actors improvising their act and they get into the stage in a Charlie Chaplin like costumes. They

⁵ <https://www.dictionary.com/browse/theater-of-the-absurd>

are too old and have been acting together for nearly 50 years, and they have neither energy nor motivation to perform on the stage anymore. However, they have to perform on that stage in order to maintain their life. They have difficulty in finding words to retain the stage dynamic, but they cannot finish any sentence they start. Even they finish their sentences, those sentences are not the processor or the successor of one another:

ESTRAGON: All the dead voices.

VLADIMIR: They make a noise like wings.

ESTRAGON: Like leaves.

VLADIMIR: Like sand.

ESTRAGON: Like leaves.

Silence. ...

VLADIMIR: What do they say?

ESTRAGON: They talk about their lives.

VLADIMIR: To have lived is not enough for them.

ESTRAGON: They have to talk about it.

VLADIMIR: To be dead is not enough for them.

ESTRAGON: It is not sufficient.

Silence...

VLADIMIR: They make a noise like feathers.

ESTRAGON: Like leaves.

VLADIMIR: Likes ashes.

ESTRAGON: Like leaves.

Long silence...

There is no meaningful communication, which is a feature of absurd theatre. Furthermore, Vladimir and Estragon do not feel comfortable in their costumes. Didi's hat itches him and he takes out his hat occasionally during the act. Gogo's shoes squeeze his feet. Here the hat may symbolize the uneasy mind and soul of humanity questioning his value in his world and the shoes may symbolize the flesh of the man who is prisoned into the earth with his body. Although, Didi, not losing his art enthusiasm, gives catchwords to Gogo; Gogo disappoints Didi on all occasions as Gogo falls into dozing. But show must go on, because the audience, whom Gogo calls bog, is

watching them. They hardly continue their relationship, yet they are aware they are nothing without each other's existence. They need talking because that is a kind of relief in their search of entity proof in their world. (For example, in another of Beckett's works, a mirror may become a tool to show the existence of the character.) In all of this chaos they are waiting for someone named Godot who gives them slip every night though he promises to come and sends a messenger child to tell them he won't come. But from the beginning of the play there some questions are left unanswered such as who Godot is, why Gogo and Didi wait for Godot or what will happen when Godot comes... etc. Also, the basic questions whether Godot is the God or a boss or someone else and the waiting process arise the curiosity of the audiences throughout the game. In such a curiosity, the audiences stay and watch the play both patiently and impatiently from the beginning to the very end. And the question of who Godot is becomes the core inquiry what the meaning of this waiting and the meaning of life itself. The search for the meaning of the waiting procedure and the aim of the characters with no obvious answer are the general atmosphere of the play and this case is the same in real life as well. All the endeavors and experiences in life are just waste of time to enjoy ourselves. Death is inextricable so the existence is no use for human being except for entertaining or a way of consolation to forget the exact truth of dying, the end of life. The aim of absurd theatre is also to arise this question in mind, the meaning of life. But from the beginning of the play to the end the question remains with no explanation.

As regards to the setting, the stage is only made up of a country road by a tree. That type of isolation is also available in the plot as there is no previous information about the play and the characters besides that there is no clue about the future of the story and the characters too. This is a feature of absurd theatre since it is comprised of no plot, no past information or no future hints. That is, "time" and "space" concepts are eradicated in order to leave the audience with the bare existence of human mind of his consciousness freed from the past, present and future and also from his environment.

Moreover, in the play there are also the characters called Pozzo and Lucky. In the play, Pozzo is an animal trainer and on his way to fair to sell his slave and once was the star of stages and Lucky, a slave to Pozzo for about 60 years, is a talented employee exploited by Pozzo. In the first act, they are the animations of their real-life counterparts; Pozzo is a bourgeois, making money from Lucky's talents. In the modern sense, Pozzo symbolizes the capitalist class of the age and

Lucky symbolizes the talented artist unfortunately lacking the sense of revolt against the exploiting system of his time. Yet, in the second act, they are in the condition of miserable beings, like Didi and Gogo. Pozzo is blind and isolated from his environment that makes his identity and Lucky is no longer capable of his talented actions. Both of them are in the process of feeling useless.

CONCLUSION

All in all, from Beckett's writing adventure, the deducted conclusion is that the meaning of human life is inexplicable in any certain way. But it is strange that Beckett himself denied all the philosophical classifications and -ism etiquettes all the time when he was asked, however, for me that is also a kind of classification for him unintentionally. His mindset was always searching for a new and different perspective of writing and this difference gave its way to the absurd theatre and the existentialism in some way, but in the other way; he, as he claimed, is under no categorization because of his way of seeing life from a really different and creative perspective. For this reason, he wrote lots of his works in French or German, since he wanted to free himself from the traditional way of thinking in his own mother tongue. He searched for a new mindset, so he produced his pieces in another language to set an original line and angle to his works. And all of these factors add to the originality and creativity of his works and also to the play *Waiting for Godot*, first published in French in 1952, as one of the famous masterpieces of absurd theatre.

ABSTRACT

Disabled lifts enable disabled individuals and their companions, the old and kids, to move up and down safely at specific heights in many indoor and outdoor spaces, such as hospitals, schools, shopping centres, public and commercial buildings, houses, and workplaces. Disabled lifts are produced in two types, generally with scissors or columns. These lifts have a hydraulically driven, electrically driven (home-type lift), or reducer-driven working mechanism. Because hydraulically driven disabled lifts require additional hydraulic cabins and cause environmental pollution in the working environment, they have become less and less preferred. In this study, for the first time, a vertical disabled lift was designed and prototyped with an innovative approach within the Önder Grup Inc. Design Center. Unlike conventional hydraulic-driven systems, the prototype is designed with a new-generation reducer-driven. In the study, electrical circuit drawings were created with the EPLAN program. The designed speed control system ensures the lift's rigid and stable movement. However, higher speeds were obtained compared to hydraulically driven disabled lifts. Stress distributions affecting the different components of the designed lift were determined using finite element analysis (FEA). As a result of the analysis, it has been seen that no plastic deformation will occur in the components and the whole of the disabled lift under service conditions, the stresses in the system are distributed homogeneously, and the design can be used safely. The disabled lift was developed due to innovative design activities that work vertically according to the travel distance and can be mounted on the wall without requiring a shaft. Thus, it is ensured that the lift is suitable for indoor and outdoor environments. Ease of assembly and disassembly has been achieved with its detachable construction. The disabled lift developed within the study's scope will be used in all architectural projects with these superior features.

Keywords: Vertical Disabled Lift, Reducer-Driven, Speed Control, New Generation Design, Stress Distribution

INTRODUCTION

As the services for disabled individuals increase within the scope of social responsibility studies and the average age of countries around the world gradually increases, designs at international standards have begun to be realized so that the elderly and disabled people can continue their daily and social lives independently (Arai et al., 2022). Designing spatial structures such as lifts and step-free walkways for elderly and disabled individuals is a critical social task. Poor location and features of lifts cause deviations from the route and comfort problems, especially for disabled individuals. For this reason, disabled and elderly individuals may be excluded from consumer activities such as shopping and social life (Stock, 2023).

The power drive system that provides lifting and lowering functions in disabled lifts is an essential factor affecting lift performance. Nowadays, scissors or column-type lifts are installed for disabled individuals in many official or private architectural buildings. These platforms are hydraulically driven, electric motor (home lift), or reducer-driven. The hydraulic drive system uses fluid power to raise and lower the lift. The energy in the hydraulic fluid is passed through the cylinders by a pump, enabling the disabled lift to move (Mobility123, 2023). The use of reducer-driven vertical disabled lifts is increasing because hydraulically driven disabled lifts require an extra hydraulic cabin, causing poor working conditions and environmental pollution. Unlike hydraulically driven disabled lifts, reducer-driven disabled lifts which operate according to the desired travel distance in a vertical position, wall mounting can be achieved without requiring a well (Živanić et al., 2020). Reducer-driven vertical disabled lifts have become the centre of attention in recent years with their decorative designs suitable for indoor and outdoor environments (Živanić, 2019). Two of the main advantages of these systems are their simplicity and reliability. They have fewer parts, leading to fewer mechanical failures and fewer maintenance requirements. Working comfort is at a higher level with speed control systems, and they can also reach higher speeds than hydraulically driven disabled lifts. Since the construction of such lifts is detachable, assembly and disassembly take place in a shorter time.

In this study, the design and prototype production of a new generation reducer-driven vertical disabled lift was carried out. This prototype will be used in many architectural structures with its superior technical features and capacity.

MATERIALS and METHODS

Within the scope of the study, electrical and mechanical material selections were made. A frequency control device suitable for the determined motor power value was selected in this context. In order to enable the lift to move between floors, a motor protection switch, leakage current protection relay, automatic breaker, and relay with a value appropriate to the calculated motor power were selected. Schematic drawings were prepared by making the three-line circuit diagram in Figure 1 and the two-dimensional floor sheet layout in Figure 2 with the EPLAN drawing program (Lukac, 2022). Material lists of the control circuit, whose schematic drawings were completed, were created.

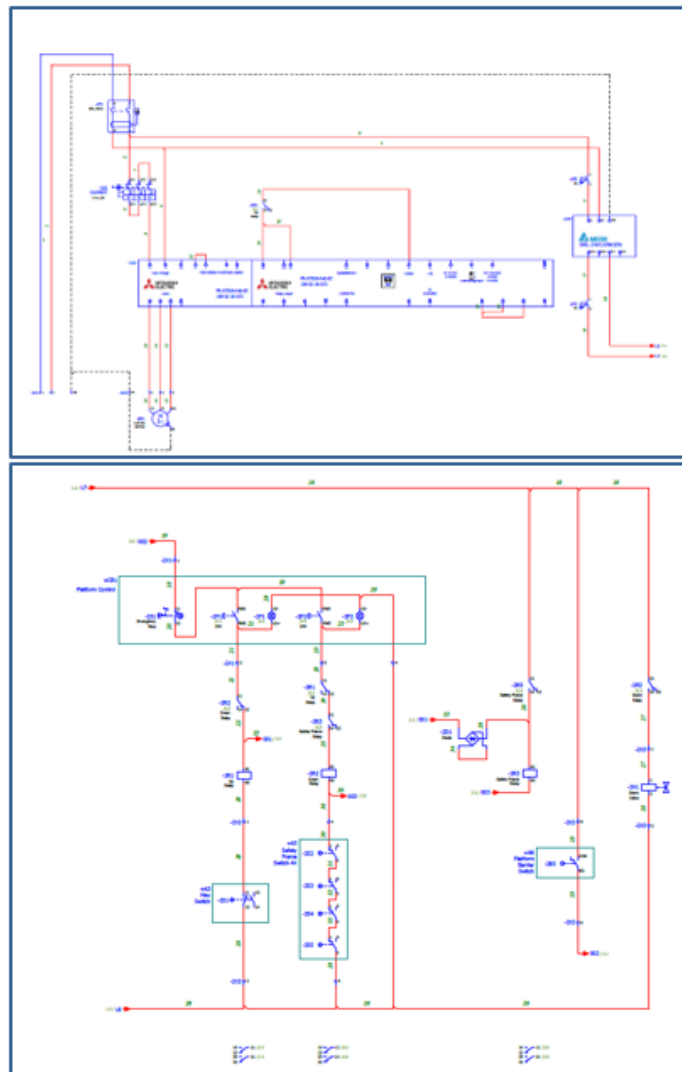

Figure 1. Electrical circuit connections

Figure 2. EPLAN 2D drawing

The reducer-driven disabled lift design is shown in Figure 3. It consists of three sub-groups that can be assembled and disassembled: welded vertical sheet guidance system, disassembled transport cabin, landing and cabin doors. The vertical sheet metal guidance system and removable carrying table are manufactured from mild steel using S235JR (St37-2) steel. Using the same material, door, and railing posts are manufactured from square and rectangular cross-section profiles (Petrina, 2016). The chemical composition and mechanical properties of the construction material used in the study are given in Table 1.

Figure 3. 3D model of reducer-driven vertical disabled lift

Table 1. Chemical composition and mechanical properties of the construction material used in the study (TS EN 10025-2, 2019)

Materials	C	Mn	P	S	N	Cu	Fe
	≤ 0.20	≤ 1.40	≤ 0.035	≤ 0.035	≤ 0.012	≤ 0.55	Bal.
S235JR	R _m (MPa)	R _{eH} (MPa)	KV (J)	A (%)			
	360-510	≥ 235	27	≥ 26			

Within the scope of the study, the working areas and service conditions of disabled lifts were investigated, and the problems encountered were determined. After the service conditions were determined, a vertical reducer chain-driven guidance system was designed to minimize vibration and oscillation so that disabled people could reach the desired floor ergonomically and comfortably (Figure 4).

The general dimensions of the mechanical system were determined within the scope of the design studies (Figure 5). Then, the solid modelling of the parts forming the system was carried out in the computer-aided design environment (SolidWorks/Part Design) (Meshram et al., 2019). In order to examine the kinematic behaviour of the system's mechanism under operating conditions, it was assembled in the SolidWorks Assembly environment, and a mechanism and collision detection analysis of the components was carried out (Uludamar, 2019).

Figure 4. Reducer-driven vertical disabled lift assembly groups

Figure 5. Disabled lift closed and open positions

Table 2. Lift technical specifications

Parameters	Value
Platform dimensions (LxW) (mm)	1450x1200
Capacity (kg)	300
Stroke (H) (mm)	1150
Table floor height (C) (mm)	50
Motor power (kW)	0,75
Weight (kg)	500
Working speed (m/s)	0,15

In the selection of system drive components given in Figure 6, the lift operating speed was determined to be 0.15 m/s, and the chain sprocket pulley diameter was determined to be 0.1 m. The reduction ratio was determined according to the $n = 28$ rpm value obtained due to the calculations based on the parameters in Table 2. According to the transferred torque value, the appropriate B type of single-row chain was selected from the chain diagram. According to the results, the gear motor power value to be used in the system was determined (Közkurt et al., 2012).

As a result of the calculations made by selecting 3 value as the safety factor, determined that the torque required for the table to move was below the torque transferred to the sprocket pulley, and safe working conditions were provided.

Figure 6. System drive components

Chain guidance slides, frequently used in industrial applications, were preferred in chain drive system design (Figure 7). Guidance slides, which extend the service life of chains at high speeds, are of great importance in terms of friction and wear. Thanks to the slides that do not require lubrication, less maintenance is needed, and these slides help distribute the load on the chain during the drive (Karayel, 2010).

Figure 7. Chain guidance system

Material lists were created according to the designed system, and cutting operations were carried out using conventional production methods. The parts' sheet metal and machining processes were carried out, and their welded joints were made. After the construction of the system was completed, the determined reducer and chain drive elements were integrated into the system.

All supplied electrical components are mounted on the panel base sheet. Control panel prototype production was completed by making the necessary connections with cable cross-sections by the drawn diagram. The machine control system was manufactured by providing the necessary cable connections between the panel and the machine.

Finite element analyses were applied to model the operational safety of the new generation reducer-driven disabled lift. In this context, stress and kinematic analyses of the mechanical system, whose solid modelling was created in the SolidWorks environment, were carried out using Static Structural in the SolidWorks Simulation finite element software (Lonkwic, 2018).

RESULTS and DISCUSSION

As a result of the innovative design activities carried out within the scope of the study, a comfortable and aesthetically pleasing disabled lift that can be used in all architectural projects has been designed and developed. Figure 8 shows the solid model of two designs and table movement: reducer and hydraulic drive. With the innovative design of the carrier columns given in Figure 9. a, consisting of chain, sprocket, and chain slides, the movement speed has been more stable than the equivalent hydraulic-driven system in Figure 9. b.

Figure 8. a) Reducer-driven lift 3D model, b) Hydraulic-driven lift 3D model

Figure 9. a) Reducer-driven vertical disabled lift carrier column design, b) Hydraulic-driven vertical disabled lift carrier column design

With the innovative constructions designed, wall mounting is achieved without requiring any lift installation shaft, as seen in Figure 10.

Figure 10. Demountable structure of the new generation reducer-driven vertical disabled lift

An adjustable frequency device controls the electric motor that creates the drive power. Thanks to time-dependent frequency adjustment and ramping in engine speed, comfortable stopping and starting of the system is ensured (Kavak, 2019). The control panel of the disabled lift for which the prototype was manufactured is given in Figure 11.

Figure 11. Control panel of the new generation reducer-driven vertical disabled lift

Figure 12 shows the time-dependent displacements of two reducer-driven and hydraulic-driven lifts. The rigid-stable movements of two different systems were examined, and it was observed that the reducer-driven lift had a more rigid-stable path.

Figure 12. Change in working height of vertical disabled lifts over time

Stress analysis was carried out using the finite element method to determine whether the designed mechanical system undergoes plastic deformation under service conditions. The designed system

is not considered a mechanism but a rigid structure in which the components at the contact points are connected. Figure 13 shows the total deformation and Von Mises stress analysis of the new generation reducer-driven vertical disabled lift.

When the plastic deformation results were examined, it was determined that there was a maximum displacement of 3.5 mm, which was within acceptable limits. When the stress results were examined, it was determined that an average maximum stress of around 72 MPa occurred and that this value was well below the yield strength of the selected materials (235 MPa). Thus, the system could operate with a safety coefficient of approximately 3.2 without plastic deformation under service conditions.

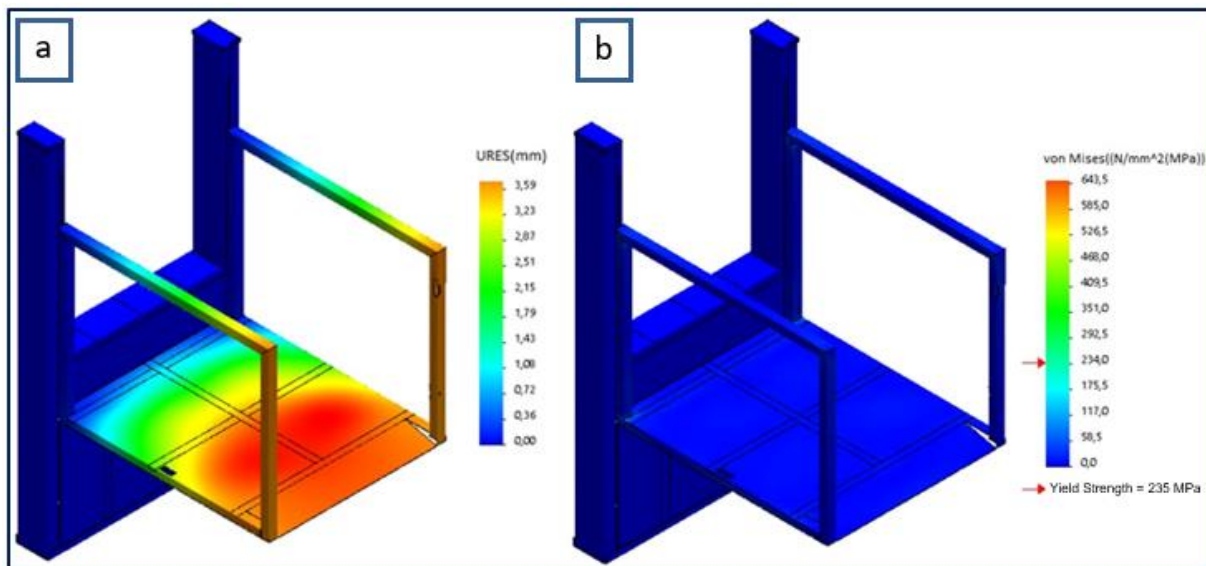

Figure 13. a) Total deformation, b) Von-Mises stress analysis of reducer-driven lift

CONCLUSION

In this study, the design and prototype production of a new generation reducer-driven vertical disabled lift, which does not require a well and can move rigidly and stably, was carried out. The results of the study are presented below.

- Higher speeds have been achieved with the new generation reducer-driven system than hydraulic-driven systems.

- Oil leaks from the hydraulic closed circuit system cause environmental pollution. Thanks to the innovative reducer chain drive system, environmental pollution is prevented compared to hydraulic-driven lifts, and thus, the usage areas are expanded.
- A shaft is required to install many disabled lifts. However, thanks to the construction designed for the reducer-driven vertical disabled lift, wall mounting is achieved without requiring a shaft.
- Ease of assembly and disassembly is provided with its demountable bolted structure.
- Rigid-stable movement and higher speeds were achieved with the speed control device used in the automation system.
- Controllable engine speed ensures comfortable stops and starts.
- With the use of reducers and components, new know-how was gained within the company for disabled lifts.
- This study introduced it into the company's product range as an innovative product, and international customer demands were met.

ABSTRACT

Introduction: Foot problems affect approximately 6% of individuals with type 2 diabetes and include infection, ulceration and destruction of foot tissues. These problems cause disruption of normal gait, loss of sensation and functionality. As a result, patients quality of life deteriorates, their social participation and livelihoods are affected. In this study, it was aimed to examine the relationship between gait parameters and foot protective sense. **Methods:** 103 patients with type 2 diabetes (46 females, 57 males; mean age 57.7±9.8 years) were included in the study. Protective sense was evaluated with Semmes-Weinstein monofilament test for the feet and two-point discrimination test for the tibial nerve. Time Up and Go (TUG) test, gait speed and cadence were measured as gait parameters. **Results:** The monofilament test results showed a poor correlation with HbA1c, TUG, gait speed, and cadence. In addition, there was a poor correlation between tibial sensation and TUG, while left tibial sensation showed a poor correlation with gait speed and cadence ($r:-0.194$ to 0.374 , $p<0.05$). **Discussion:** According to the results of our study, there is a poor relationship between foot protective sense and gait parameters. With this result, our hypothesis was accepted. Loss of foot protective sense is a common problem in individuals with type 2 diabetes. It's even known that the senses of tactile, vibration, proprioception and kinesthesia are reduced in individuals with type 2 diabetes for a long time. Sense feedback from the visual, vestibular and proprioceptive systems is essential for normal gait. Since there is sensory loss in individuals with type 2 diabetes, gait parameters are also affected. Our advice to clinicians is that they should not ignore the evaluation of foot protective sense in individuals with type 2 diabetes.

Keywords: Type 2 diabetes, Gait, Diabetic foot, Foot protection sense.

INTRODUCTION

The most common type of diabetes that Type II Diabetes Mellitus (T2DM) is a disease that occurs as a result of insufficient production of the hormone insulin, its deficiency, or both (Watanabe et al., 2003; Gillibrand and Stevenson, 2006). The main problem in patients with T2DM is hyperglycemia. Long-term hyperglycemia causes chronic complications over time (Watanabe et al., 2003). T2DM is a disease that progresses with various chronic and acute symptoms and negatively affects the individual's quality of life (Bayrak & Çolak, 2012). Risk factors of T2DM are divided into two groups: controllable and uncontrollable factors. Among uncontrollable risk factors, age, gender and genetics play an important role. Controllable factors are obesity, sedentary life, malnutrition, high insulin, insulin resistance and impaired glucose tolerance (Rashidi & Genç, 2020). The most common symptoms of T2DM are numbness, tingling, pain in the lower extremities, muscle atrophies and weakness, foot drop, gastrointestinal symptoms, postural hypotension, intestinal dysfunction and diabetic peripheral neuropathy (Özay et al., 2012; Ward, 2005; Said, 2007).

Peripheral neuropathy causes foot ulcers that lead to loss of protective sensation, muscle strength and reflexes, especially in gait and balance disorders (Said, 2007). In individuals with long-term T2DM, significant impairments are observed in tactile sense, vibration sense, lower extremity proprioception and kinesthesia sense (Menz et al., 2007). When individuals with peripheral neuropathy are compared with individuals with healthy peripheral nerves, it has been reported that these individuals develop loss of protective sensation and postural instability, resulting in an increased risk of falling (Özay et al., 2012; Richardson et al., 2001). The aim of this study is to examine the relationship between foot protection sense and gait parameters in individuals with T2DM.

MATERIALS and METHODS

This descriptive study involved 103 participants selected from the patients with T2DM who were admitted to the University Hospital Endocrine and Metabolic Diseases Outpatient Clinic, Pamukkale University, Denizli, Turkey. All assessments were performed at the Physiotherapy and Rehabilitation Department of the Pamukkale University. The study included participants aged >35 years who were diagnosed with T2DM had not suffered from any other physical or psychiatric disease that would require significant medical intervention within the last year, and had volunteered

to participate in the study. Individuals with a chronic disease or dysfunction other than T2DM and pregnant or lactating women were excluded from this study. All participants provided written informed consent. The demographic characteristics (age, body weight, height, body mass index, and gender) of the participants were recorded. Diabetes' specific values (fasting blood glucose, postprandial blood glucose, and HbA1c) of the participants were obtained from the patient's blood sample records.

Protective sense was evaluated with Semmes-Weinstein Monofilament Test for the feet and Two-Point Discrimination Test for the tibial nerve. The main purpose of the Semmes-Weinstein Monofilament Test and Two-Point Discrimination Test are to test the sense of touch.

Semmes-Weinstein Monofilament Test is done with nylon monofilaments of the same length but varying diameters. If there is loss of sensation in the evaluation made with these filaments that give different pressures to the foot, the participant's foot is in danger and his/her protective sense is lost. 5.07 nylon monofilament is most commonly used in this test and exerts 10 g of force. Pressure is applied to 10 designated points on the plantar and dorsal aspect of the foot (Çelik et al., 2016; Durakbaşı, 2013). The use of monofilament was first demonstrated to the individual by using it in a different area. Individual was asked to close his/her eyes while it was applied to the foot. The monofilament was touched to the designated areas of the foot until it looked like the letter C. Individual was asked to answer "Yes" when he/she felt the pressure of the monofilament. Points where a "Yes" answer could not be obtained were marked as having sensory loss. Within the scope of this study, Semmes-Weinstein Monofilament Test was applied to the participants and the response numbers of the participants were determined.

Two-Point Discrimination Test is performed with a material consisting of two solid, rotating, plastic disks joined together. It is used to test the transfer of innervated tissue for nerve repair, grafting and desensitization, or to determine the level of disruption. Application is made in the participant's sensory area and the smallest distance range that the participant can distinguish is determined (Dellon et al., 1983). Within the scope of this study, a plastic disc was applied to the heel area of the participants. The point where the measurement was taken was the same in all participants, and was determined as the area where the calcaneus contacts the ground. The smallest correct value range that the participants could feel was determined.

Gait speed and cadence were measured as gait parameters. Timed Up and Go Test (TUG) is a test that evaluates the balance function of the individual during mobility. If the test completion time is under 10 seconds, the patient walks independently and the risk of falling is very low. Between 11 and 19 seconds, individual walks independently and there is a moderate risk of falling. If it is between 20-29 seconds, individual may need assistance during walking and the risk of falling is high (Podsiadlo et al., 1991; Shumway-Cook et al., 2000; Gan et al., 2008). For the TUG, a chair was placed at a fixed point and a point 3 meters away from the chair was determined. The test was explained to each participant and verbal instructions were given. At the start of the test, participant sat in the chair and started with the “go” command. Participant stood up from the chair upon command, walked 3 meters, turned around the designated point, walked 3 meters again and sat on the chair. Testing time was recorded in seconds. For every participant, the testing process was repeated 3 times and the average of 3 tests was taken.

A 10-Meter Walking Test was applied to determine walking speed. In the 10-Meter Walking Test, participant walks at normal walking speed between two markers that are 10 meters apart during the test and the elapsed time is recorded (Ringsberg et al., 1999; Shubert et al., 2006). For the test, a fixed point on the ground was determined and defined as the first point. Then, another point was determined 10 meters away from the first point and defined as the second point. Participant’s walking time from the first point to the second point was measured in seconds with a stopwatch. The time was started when the participant’s feet were at the starting line and ended when they crossed the finish line. The test was repeated three times, the shortest time values were recorded in meters per second (m/s).

Cadence is the number of steps in a given time. Usually calculated as steps per minute, its unit is a number of steps/minute (Alsancak, 2015; Watson, 2002). Within the scope of this study, a one-minute time was kept with a stopwatch while calculating the cadence. The number of steps taken by the participant in one minute was counted and recorded as steps/minute.

Statistical Analysis

Shapiro–Wilk and Levene's tests were used to test for the normality of data and homogeneity of variance, respectively. Scale variables are expressed as mean \pm standard deviation, and categorical variables are expressed as numbers. Spearman correlation was performed in the correlations since

the outcome measurements did not conform to the normality distribution. The SPSS software (version 22.0; SPSS, Inc. Chicago, IL) was used for the statistical analysis.

FINDINGS and DISCUSSION

103 participants completed all measurements. Participants' demographic characteristics and diabetes' specific values are presented in Table 1. Associations between functional mobility and gait parameters with loss of protective sensibility are presented in Table 2.

Table 1. Participants' demographic characteristics and diabetes' specific values

	Participants (n=103)
Age (years)	57.7±9.8
Weight (cm)	163.82±9.67
Height (kg)	83.45±14.69
Body Mass Index (kg/m²)	31.20±5.22
Gender, Female/Male (%)	46/57 (45%)
HbA1c (mmol/mole)	7.55±1.86
Fast Blood Glucose (mg/dl)	156.35±71.03
Postprandial Blood Glucose (mg/dl)	204.37±104.49

HbA1c: Glycosylated hemoglobin level, Data are presented as mean±standard.

According to the results of the study, monofilament test results showed a poor correlation with HbA1c, TUG, gait speed, and cadence (r : -0.213 to 0.374, $p < 0.05$). In addition, there was a poor correlation between tibial sensation and TUG (r : -0.194 to -0.247, $p < 0.05$), and left tibial sensation showed a poor correlation with gait speed ($r = -0.267$, $p = 0.006$) and cadence ($r = 0.238$, $p = 0.016$), (Table 2).

Table 2. Associations between functional mobility and gait parameters with loss of protective sensibility

		HbA1c	TUG	Gait Speed	Cadence
Monofilament- Right	r	-0.216	-0.318	-0.234	0.374

	p	0.883	0.012*	0.006*	0.016*

HbA1c: Glycosylated hemoglobin level, TUG: Timed Up and Go test, * p<0.05.

According to the results of our study to examine the relationship between foot protection sense and gait parameters in T2DM patients, there is a poor correlation between the Semmes-Weinstein Monofilament Test and gait speed, cadence, HbA1c, and TUG. There is also a poor correlation between left tibial sensation and TUG, walking speed, and cadence. The conclusion to be drawn here is that there is a weak relationship between foot protection sensation and walking speed, cadence, and TUG.

Peripheral neuropathy is a condition that involves the axons, myelin sheath or both of motor, sensory or mixed nerves, causing disorders in nerve conduction (Özen, 2005). The most common causes of peripheral neuropathy are diabetes and alcohol consumption (DeLisa et al., 2005). In patients with diabetic peripheral neuropathy, significant deficits are observed in tactile sense, vibration sense, lower extremity proprioception and kinesthetic sense. It causes decreases in sensory and motor strength from distal to proximal, balance disorders and changes in walking pattern. As well as the deterioration in body balance, the restoration of balance is also impaired. For this reason, falls occur frequently in patients (Menz et al., 2004; Corriveau et al., 2000; Ashton-Miller et al., 1996). These falls occur during locomotor activities such as walking, turning, standing up and overcoming obstacles (Chen et al., 1994).

Özen included 41 individuals with diabetic peripheral neuropathy and 28 healthy individuals in her study to investigate whether there was a difference between balance and gait parameters in individuals with and without diabetic peripheral neuropathy. In individuals in the study group, standing, walking and sitting times were found to be longer and cadence was lower compared to

the control group. Özen stated that the factor causing this condition is lower extremity muscle atrophy resulting from neuropathy, and that the gait parameters of people with peripheral neuropathy can be brought to normal levels with balance exercises (Özen, 2005). In the study conducted by Gregg et al., impairments in walking speed and balance were found in individuals with DM aged 60 and over (Gregg et al., 2000). In a study conducted by Resnick et al., walking speed of patients diagnosed with diabetic neuropathy between the ages of 70-79 was found to be significantly decreased compared to the age-matched control group (Resnick et al., 2002). In a study conducted by Katoulis et al. using a video recording system, walking speed was found to be significantly lower in the diabetic polyneuropathy patient group than in the control group (Katoulis et al., 1997). In a study conducted by Menz et al., walking speed, cadence and step distance on uneven surfaces of 30 diabetic patients with sensory neuropathy, aged between 55-91, were found to be lower than the control group (Menz et al., 2004). Mueller compared 10 patients with diabetes-related neuropathy with the control group and found that in the neuropathic group, walking speed was slower, step distance was shorter, and peak ankle power, moment and movements were reduced (Mueller et al., 1994). In another study, patients with neuropathy due to various reasons and those without a history of falling were compared in terms of walking parameters. No difference was found on normally illuminated, smooth surfaces, but in patients with a history of falling on poorly illuminated and rough surfaces, walking speed, step duration, step change time, and step width were reduced. /length has been detected as extended (Richardson et al., 2005).

It is known in the literature that high Hba1c is directly related to peripheral neuropathy in T2DM patients (Su et al., 2018; Nozawa et al., 2022; Lai et al., 2019). Our study is parallel to these studies in the literature. Loss of foot protective sense is also a type of neuropathy. In our study, we found that when foot protective sense is affected depending on HBA1c levels, it affects gait parameters.

Limitations

In this study, for cadence measurement, the number of steps taken by the patients per minute was counted by the evaluator. The 10-meter walking test was used to measure walking speed. The most important limitation of our study was that a gait analysis device was not used in the evaluation of gait parameters.

CONCLUSION and RECOMMENDATIONS

It is known that foot protective sensation is affected in T2DM patients due to peripheral neuropathy. In our study, we determined that the Semmes-Weinstein monofilament test and the two-point discrimination test for the tibial nerve affected functional balance, walking speed, and cadence. It is clearly seen in our study that affecting the foot protection sense affects gait parameters.

It is recommended that physiotherapists and healthcare professionals working with patients with T2DM include walking in the rehabilitation programs of people with neuropathy and affected toe protection.

ABSTRACT

This study emphasizes the affective domain of rural learners' oral proficiency. Here, a quantitative method has been employed to gather the data. This paper emphasizes the rural learners' communicative competence, followed by some of the factors that affect the communication and comprehension of their language skills. This survey has been carried out among second-year learners through a structured survey questionnaire to assess the learners' second language knowledge, awareness, practice, and performance. The research findings revealed a lack of exposure, less grammar knowledge, a shortage of vocabulary, a lack of motivation, and mother tongue influence are the hurdles faced by learners. Consequently, traditional teaching approaches like teacher-centered classrooms and exam-oriented system-based learning led to disadvantaged learners. In addition, learners' roles have become passive or they avoid language usage in the learning environment. Furthermore, they face challenges in real-life situational contexts. This study analyses the learners' communicative competence and the affective factors of the traditional teaching approaches. This study suggests that teachers or instructors provide abundant opportunities to practice communication strategies and implement activity-based learning in the classroom. To overcome these limitations, teaching aids, and institutional approaches employ sequence, which helps students get along and interact with each other in real life.

Keywords: Affective Factors, Communicative Competence, Teaching Materials, Curriculum, Communicative Activities

INTRODUCTION

Recent years have witnessed the emergence of English as the global language in general commerce, trade, business, technology, and medicine, but it is especially required in educational contexts and academic fields that promote job placement through employability skills. Hence, the English language has become the lingua-franca and is accepted internationally in the market. It means that the English language is a valuable and in-demand skill all over the world. Recently, the quality of teaching and learning approaches has been shifted from traditional methods, which are replaced by communicative language teaching to acquiring oral communication competence, which enhances communicative competence. Davies and Pearse (2000) say that the primary objective of teaching English to students is for them to be able to communicate with or use the language in a clear and precise manner while communicating. Oral communication is one of the most in-demand skills in the global market. The production of language is possible with an incorporated pragmatic approach with constant practice and mainly authentic resources for integrated language learning skills for communicative competence.

Statement of the problem

Many researchers identified the learners' influencing factors and examined their level of communicative competence. English language skills are the main objective of numerous language learners. Some of the affective factors are a lack of teaching strategies, which confine the language knowledge of students and a limited curriculum framework, and learners' passive participation in the classrooms. In addition, the English language cannot be learned simply through the mastery of grammar principles or through lecture-based instruction. Instead, English is acquired through contextualized conversation and constant interaction through practice. Despite the importance of English language ability in the learner's day-to-day life, many students continue to view English speaking as a challenging subject to master. Oral communication skills are difficult to acquire.

Numerous rural learners lack the ability to speak fluently. Some of the barriers are mother tongue influence, lack of exposure, shortage of vocabulary, less grammar knowledge and lack of motivation resulting in poor performance in English language skills.

Literature Review

Communicative competence is one integral part of communication skills. Basically, communicative competence is the first and foremost skill in today's challenging world to accomplish the needs and build up social status in any field. Linguistic competence is primarily concerned with having adequate vocabulary, syntax, and grammar to communicate in a second language (Nunan, 1999). Here, linguistic competence is the gateway to reaching competence. Further, socio-linguistic competence is the required or wanted skill to participate in this global level to accomplish communicative competence. Factors are affecting the speaking performances. The following lack of uniformity is followed in the constructive classrooms: less curriculum input and traditional teaching methods in the heterogeneous classes; time pressure; and the traditional way of teaching strongly affords passive learners. In conclusion, the students' problems come from the environment, the classroom, and the way things work. It results in anxiety, hesitation, and less speaking exposure.

Learners are heavily influenced and begin using their mother tongue language. It has been reported that both teachers and students find it easier to complete academic progress tests. English language learning skills have been neglected in the classroom and environment. After many years of studying the English language, there are no utterances that have been followed and regulated in the learning environment. It leads learners to be ineffective in the learning process, which shows ambiguities (Samaranayake, 2016). In this challenging world, learners should be aware of communicative competence but affecting factors leave listeners, observers, and passive participants.

Krashen (1982) emphasizes that multiple affecting factors have been approved to be accomplished in second language learning and acquisition and have been carried out for almost a decade to be examined and proved to initiate and formulate motivation, self-confidence, constant practice, and awareness of language skills.

Numerous reasons are the root cause of poor performance in language learning because of the curriculum scheme. The teaching mode is monotonous. Therefore, it condenses the environment into one filled with passive listeners and poor performance. John & Ehow (2011) affirmed that the complications arise due to various factors like classroom size and student population, teachers' language proficiency and teaching style, students' exposure to learning, and the learning environment to expose their skills to performances. According to Murray and Christison (2010),

the majority of the students think English is a subject and the importance of language awareness is unknown to the students.

English language learning is one of the most challenging tasks for students. Students are afraid of making mistakes, so they come from poor backgrounds. Socio-cultural and cultural differences are the backdrop of the lack of English-speaking problems. Apart from students, there are some weaknesses such as unqualified teachers in English proficiency and lack of language knowledge, unstructured curriculum design, and insufficient textbooks and materials.

Because speaking skills entail a variety of skills that may be correlated or may not show them well enough for regular assessment, testing speech is difficult (Kitao & Kitao, 1996) suggests that learning the English language requires something beyond memorization of grammar rules or lectures. However, learning English involves engaging in conversation and having relevant ideas. This is appropriate considering that learning the four language skills of speaking, listening, reading, and writing is the main objective of learning English. Regardless of the value of being able to speak English in daily life, many students still think it's challenging to learn or master the language. Due to their limited exposure to vocabulary and grammar, English language learners struggle when speaking the language.

Objectives

1. To find out the knowledge of students' language skills.
2. To identify the factors that influence language skills.

Significance of the study

The importance of study needed to concentrate on ensuring that teachers, students, and institutional members have insights on affective factors that take place in the breakthrough process of oral communication skills efficiently. Further, English language teachers should improve their style of teaching to make rural learners active and productive in the classroom. It can be done through some of the communication strategies like role-play, debating, information-gap, group discussion, building a wall, and so on. These tasks can easily involve the learners so they can participate, learn and communicate with ease.

Speaking is the active production of oral communication skills, which plays a vital role in the exchange of information, ideas, and opinions with other people. Even though learners have virtuous knowledge of language skills, consequently, the majority of the learners face challenges in speaking in public or in peer interaction. Hence, speaking skills can be acquired through a continuous process of interaction with a target language speak regularly. Rarely, self-learning and do self-practice take place among learners. Here, awareness of the importance of oral communication skills is highly demanded in any sector. Finally, learners should be equipped with some trainees to maximize their oral communication practise skills. Therefore, learners can enhance their skills with the loaded stuff of communication skills, which empowers their attitude towards challenges at work. Additionally, learners are provided the information and oral communication skills they need to succeed in building successful careers.

Inference of the study

1. Throughout the process of acquiring English speaking skills, students face numerous obstacles.
2. All English teachers are able to teach speaking skills using the numerous learning resources and instructional methods available.
3. Students make mistakes when using English contextually.
4. All college English teachers conduct their classes in English.

Theoretical Framework

Krashen's (1985) This study was based on the principle of Second Language Learning-Language Acquisition. Krashen asserts that substantial implementation of conscious grammatical rules or tiresome exercises are not necessary for language learning. It does, however, actually require meaningful interaction in the target language, where the emphasis is on the messages being sent and understood rather than the way in which words are constructed.

According to Krashen (1985), these techniques should really not pressure students to create in the Language learners too early; instead, they should let them produce when they are aware that communication and comprehension-improving input is more effective than demanding and rectifying performance. The silent phase of language development is highlighted in this concept. Additionally, it emphasises emotional readiness (anxiety) for acquisition to emerge by emphasising exposure to material rather than grammatical practise. This method places a strong focus on teaching "communicative abilities" since it believes that language's fundamental purpose is "communication." In this sense, the supremacy of "meaning" is emphasised. According to Krashen (1985), "acquisition" can only be achieved as a result of an individual's comprehension of English-language communications. The messages must also be well organised. The input, monitor, and emotional filter theories of Krashen served as the foundation for this research.

Monitor Hypothesis

The target language skills can be understood in one of two ways by second-language learners. Learning begins with a conscious learning process in which students are aware of form, make decisions about norms, and are usually aware of their own learning. The monitor revises and corrects what has been taught at the end in this respect (starting to learn). As a result, the student's acquisition of topic information was filtered via the teaching strategies and language guidelines at the school. Therefore, while developing communication skills, the monitor should be employed.

Input Hypothesis

Learning and acquisition are more closely related to the input hypothesis. Krashen (1985) said that the ideal technique for individuals to learn a language is by understanding input that is just a little kind of above their present level of proficiency. He therefore thinks it is necessary to get "comprehensible input" ($i+1$). The input should be really pertinent, and the phrases should include proper language and terminology. Learning happens both unconsciously and consciously. Not properly ordered and in sufficient amount. Children learn largely via active participation and step-by-step listening. The content information that was taught to learners during teaching is included

in the input hypothesis. After understanding this material, students need to examine it while being attentive to the grammatical rules. After understanding this material, students examine it while being attentive to grammar rules in order to become proficient English speakers. Additionally, the teaching resources that are employed to teach speaking should always be accessible, sufficient, and available. The more learners practise speaking English, the more likely it is that they will become fluent. This suggests that in order to help students improve their language and communication skills, there should be ample chances and situations for verbal conversation. More so than learning, input is connected to acquisition. According to Krashen (1985), people learn language most effectively by comprehending material that is just a little somewhat beyond their current level of competency. Therefore, in his opinion, "comprehensible input" (i+1) should be offered. The input should really be relevant, and appropriate grammar and vocabulary should produce whole sentences. Then, subconscious and conscious learning should be appropriately provided and presented in a grammatical order. Children primarily listen and actively participate in the learning process as it unfolds. The content information that is imparted to students during instruction and learning is included as an input hypothesis. Simple codes that make it easy to comprehend this information should be used to present it. After this material is learned, it passes through a process called sifting where learners deliberately pay attention to the grammatical rules in order to become proficient English speakers. Additionally, the teaching materials employed to teach speaking should always be accessible, sufficient, and easily available. The potential that students will become proficient in English increases as they practise speaking it more. This suggests that in order for pupils to develop their verbal communication, they need be provided adequate chances and settings to do so.

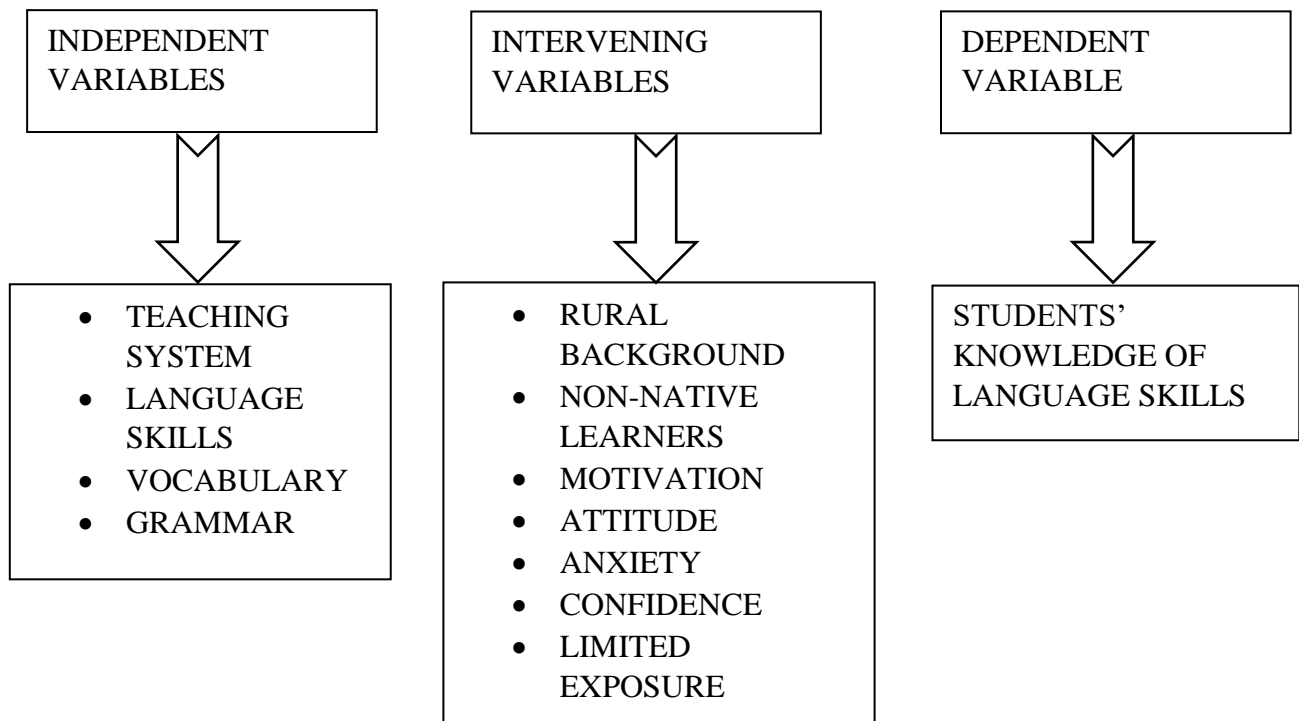

Affective filter Hypothesis

In this hypothesis, Krashen (1985) argues that the emotional state of the learner can be compared to a filter that can be adjusted to permit or prevent input necessary for acquisition. Learners have succeeded in an environment with low anxiety because acquirers with a low affective filter receive more input and interact with self-assurance. Consequently, the filter regulates the strengths using strategies. Emotional barriers to language acquisition include self-assurance, motivation, and

anxiety level. As students attempt to learn how to communicate and express themselves in English, anxiety, low self-esteem, or lack of motivation may cause filtering.

Therefore, learners with a low affective filter not only become effective acquirers of comprehensive input but also increase the quantity of that input, as they are more likely to interact with other learners without fear of embarrassment.

Conceptual framework

Research Methodology

The study employed a descriptive survey approach, which allowed the researcher to obtain information regarding the students' perspectives on the factors influencing their acquisition of English-speaking skills.

Researchers have designed a structured survey questionnaire to determine the attitudes of the study participants. The study's population and sample size. The population of the present study consists of 45 second-year college women from a variety of institutions. The sample is chosen at random.

The Instrument of the Study

English is the Global Language

		Frequency	Percent	Valid Percent
Valid	Strongly agree	22	48.9	48.9
	Agree	14	31.1	31.1
	Strongly disagree	7	15.6	15.6
	Disagree	2	4.4	4.4
	Total	45	100.0	100.0

From the above table (48.9%) Majority of the respondents are strongly agreed that English is the Global Language and only (2%) of the respondents were disagreed. Therefore, the majority of the learners have agreed that English is the common language to exchange the ideas and thoughts between people globally.

English is the better medium to learn all the subjects

		Frequency	Percent	Valid Percent
Valid	Strongly agree	14	31.1	31.1
	Agree	21	46.7	46.7
	Strongly disagree	6	13.3	13.3
	Disagree	4	8.9	8.9
	Total	45	100.0	100.0

From the above table (46.7%) Majority of the respondents are agreed that English is the better medium to learn all the subjects. (31.1%) of the respondents have strongly agreed, only (8.9%) respondents were disagreed. At this point, Majority of the learners accept that English is the better medium to learn all the subjects.

Fear of Making Mistakes

		Frequency	Percent	Valid Percent
Valid	Strongly agree	19	42.2	42.2
	Agree	21	46.7	46.7
	Strongly disagree	3	6.7	6.7
	Disagree	2	4.4	4.4
	Total	45	100.0	100.0

From the above table (46.7%) Majority of the respondents are agreed, (42.2%) of the respondents were strongly agreed, (6.7%) of the respondents were strongly disagreed and only (4.4%) of the respondents were disagreed. The results of the respondents shows that Majority of the learners were having fear of making mistakes during language learning and practicing the language skills.

Mother Tongue influence

		Frequency	Percent	Valid Percent
Valid	Strongly agree	11	24.4	24.4
	Agree	26	57.8	57.8
	Strongly disagree	4	8.9	8.9
	Disagree	4	8.9	8.9
	Total	45	100.0	100.0

From the above table (57.8%) of the respondents are agreed, (24.4%) of the respondents are strongly agreed and (8.9%) of the respondents are strongly disagreed again (8.9%) of the respondents answered disagreed. Here, Majority of the learners hinderance due to the influence of mother tongue. Many studies proved that mother tongue influence is one of the major obstacles.

Lack of self-confidence

		Frequency	Percent	Valid Percent
Valid	Strongly agree	10	22.2	22.2
	Agree	19	42.2	42.2
	Strongly disagree	2	4.4	4.4
	Disagree	14	31.1	31.1
	Total	45	100.0	100.0

From the above table (42.2%) of the respondents are agreed (22.2%) of the respondents are agreed on contrast (31.1%) of the respondent disagreed about their self-confidence and only (4.4%) of the respondents are strongly agree. Therefore, most of the learners responded that they lack self-confidence while communicating or answering in English. It is also one of the drawbacks among the learners.

Lack of exposure

		Frequency	Percent	Valid Percent
Valid	Strongly agree	7	15.6	15.6
	Agree	24	53.3	53.3
	Strongly disagree	6	13.3	13.3
	Disagree	8	17.8	17.8
	Total	45	100.0	100.0

From the above table (53.3%) of the respondents are agreed, (15.6%) of the respondents are strongly agreed, (17.8%) of the respondents are disagree, (13.3%) of the respondents are strongly disagree. However, Majority of the learners responded that lack of exposure, unknown vocabularies, sentences are new to them. Hence, earlier days limited words and sentences were used.

Shortage of vocabulary

		Frequency	Percent	Valid Percent
Valid	Strongly agree	7	15.6	15.6
	Agree	30	66.7	66.7
	Strongly disagree	4	8.9	8.9
	Disagree	4	8.9	8.9
	Total	45	100.0	100.0

From the above table (66.7%) of the respondents are agreed, (15.6%) of the respondents are strongly agreed and (8.9%) of the respondents are strongly disagreed and (8.9%) of the respondents are disagreed. Evidently majority of the students are given the data as shortage of vocabulary. Limited vocabularies were used in the classroom and same thing repeated again and again less interaction and less outside usage of language. Vocabulary is the basic skill to connect the word to build.

Less grammar knowledge

		Frequency	Percent	Valid Percent
Valid	Strongly agree	6	13.3	13.3
	Agree	23	51.1	51.1
	Strongly disagree	6	13.3	13.3
	Disagree	10	22.2	22.2
	Total	45	100.0	100.0

From the above table, (5.1%) of the respondents agreed, (13.3%) of the respondents are strongly agree and (22.2%) of the respondents are disagreed and followed (13.3%) of the respondents are strongly disagreed. Therefore, majority of the learners are agreed less grammar knowledge and moreover grammar is highly required part in any language and cannot connect sentence without grammar knowledge.

Lack of Motivation

		Frequency	Percent	Valid Percent
Valid	Strongly agree	13	28.9	28.9
	Agree	19	42.2	42.2
	Strongly disagree	5	11.1	11.1
	Disagree	8	17.8	17.8
	Total	45	100.0	100.0

From the above table, (42.2%) of the respondents are agreed, (28.9%) of the respondents are strongly agreed and (17.8%) of the respondents are disagreed followed by (11.1%) of the respondents are strongly disagreed. Therefore, majority of the learners agreed that lack of motivation, due to teachers and institutions followed exam-oriented and system-based education. When teaching strategies or activities provided with proper training of basic language skills among learners. It will solve the crisis in the language skills. Encouragement and motivation are highly recommended among learners inside the classrooms.

CONCLUSION

Traditional teaching methods and classrooms centred on the teacher facilitates memorization. In contrast, learner-centered, self-directed, and strategy-based learning methods can facilitate the learning process. Several affective factors, such as rural background and students' lack of exposure to their environment, impede the development of language skills. The focus of classroom instruction is on completing the curriculum for upcoming exams, and logistical constraints prevent them from repeating the same routine. Therefore, speaking or interaction has never been emphasised among students. Students are incapable of constructing sentences with the proper vocabulary and grammar. Thus, the influence of the mother tongue and the lack of exposure obtain the student passive. Success is typically associated with a positive outlook. Therefore, it is the teacher's responsibility to help students develop a positive attitude toward speaking English through the use of learner-centered teaching methods, by motivating students who make commendable progress, and by serving as an excellent role model. As a role model, the teacher

should also strive to use grammatically correct English. The key to an effective teaching and learning process is motivation. A lack of motivation can hinder the accomplishment of a given objective. Teachers should encourage and motivate students to develop the self-motivation to read a wide variety of reading materials, including newspapers, educational magazines, and story books. Some of the classroom teaching strategies must include role play, storytelling, flashcards, picture description, etc. And extensive reading will assist students in expanding their vocabulary when speaking English. Students should practise speaking English at school and at home, as opposed to only being required to comply with the language policy at school. Students must practise taking turns when speaking. Teachers should also serve as role models for their students by speaking and teaching English.

ÖZET

Ülke olarak derin bir üzüntü yaşadığımız ve asrın felaketi olarak tanımlanan Kahramanmaraş merkezli depremlerde farklı kullanım sınıfı ve taşıyıcı sistem özelliklerine sahip birçok yapıda; az – orta – ağır hasarlar meydana gelmiştir. Bu depremler mevcut yapı stokunun hızlı ve güncel teknolojiler kullanılarak değerlendirilmesi konusunu bir kez daha gündeme getirmiştir. Hali hazırda birçok mevcut kamu ve özel kullanım amaçlı yapıların deprem performansı ve risk analizleri gerçekleştirilmektedir. Bu analizler neticesinde yapıların yıkılarak dönüştürülmesine, güçlendirilmesine veya performans seviyesini sağladığına karar verilebilmektedir. TÜRKİYE Bina Deprem Yönetmeliği (TBDY 2018) 'ne göre betonarme, çelik, yığma ve prefabrik yapıların performans değerlendirilmesi yapılabilmektedir. Bu kapsamda incelenmesi gereken mevcut yapı stoku oldukça geniştir. Mevcut bir yapının performans analizi, statik rölöve aşamasından başlayıp yapının bilgisayar ortamında modellenmesi, analizi ve değerlendirilmesi süreciyle tamamlanmaktadır. Mevcut bir yapının statik rölöve aşaması, yapının bilgisayar modellenmesini direkt olarak etkilemektedir. Bina deprem performans düzeyi yapı hakkında en önemli değerlendirme parametresidir. Bu değerlendirmelerin doğru bir şekilde yapılabilmesi için modelleme aşamasının hassasiyetle tamamlanmış olması ve yapının muhtemel beklenen etkilere karşı, gerçek duruma en yakın analizlerinin gerçekleştirilmesi gerekmektedir. Makale kapsamında 3D yapısal modellemede güncel teknolojilerin ve yöntemlerin kullanılabilirliği irdelenmiştir. Bu kapsamda modelleme hatalarını minimize edebilmek için Lazer Tarama ve Yapı Bilgi Modellemesi (BIM) yöntemlerinin birlikte uygulanabilirliği araştırılmıştır. 3D lazer tarama, teknolojik bir cihaz ile uygulanan ve 1mm'lik aralıklara yapıya zarar vermeden tarama yapılabilen bir yöntemdir. Bu uygulama sonucunda veriler nokta bulut şeklinde elde edilmektedir. Nokta bulut şeklinde elde edilen veriler farklı yazılımlarla 3D model formatına dönüşebilmektedir. Çalışma kapsamında nokta bulutu şeklinde elde edilen verilerin BIM tabanlı yazılımlar aracılığıyla yapısal model şekline dönüştürülebilmesi ve bu modelin sonlu elemanlara dayalı analiz programlarına aktarılabilmesi incelenmiştir. Bu sayede 3D yapısal modellemelerin daha hassas ve hızlı yapılabilirliği araştırılmıştır. Çalışma kapsamında geliştirilecek metot ile mevcut yapı stokunun en güncel teknolojilerden faydalanılarak incelenebilmesine yönelik literatüre ve sektöre bir katkı sunulabilmesi amaçlanmıştır.

Anahtar Kelimeler: Yapısal Modelleme, 3D Lazer Tarama, Yapı Bilgi Modellemesi (BIM)

INVESTIGATION OF THE LASER SCANNING AND BIM TECHNOLOGY TOGETHER USAGE IN 3D STRUCTURAL MODELING

ABSTRACT

We have felt deep sadness as a country for the earthquakes centered in Kahramanmaraş which is defined as the disaster of the century. In the earthquakes minor – moderate - severe damages occurred in many structures with different usage classes and bearing system characteristics. These earthquakes once again reawaken of evaluating the existing building stock using fast and up-to-date technologies. Earthquake performance and risk analyzes of many existing public and private structures are currently being performed. As a result of these analyzes, it can be decided the structures are demolished, retrofitted or provided the performance level. According to the TÜRKİYE Building Earthquake Code (TBEC 2018), performance evaluation of reinforced concrete, steel, masonry and prefabricated structures can be performed. The existing building stock that needs to be examined in this context is quite large. The performance analysis of an existing structure starts from the static surveying stage and is completed with the modeling, analysis and evaluation of the structure in the computer environment. The static survey stage of an existing building directly affects the computer modeling of the structure. The earthquake performance level of the building is the most important evaluation parameter about the structure. In order for these evaluations to be made correctly, the modeling stage must be completed with precision and the realistic analyzes of the structure should be performed against the possible expected effects. Within the scope of the article, the usability of current technologies and methods in 3D structural modeling has been examined. In this context, the applicability together of Laser Scanning and Building Information Modeling (BIM) methods was investigated in order to minimize modeling errors. 3D laser scanning is a method that is applied with a technological device and can be scanned at 1mm intervals without damaging the structure. As a result of this application, the data is obtained in the form of point clouds. Data obtained in the form of point cloud can be converted into 3D model format with different software. Within the scope of the study, it has been examined that the data obtained in the form of point cloud can be transformed into a structural model through BIM-based software and this model can be transferred to structural analysis programs based on finite elements. In this way, it was investigated that 3D structural models could be made more sensitive and faster. With the method to be developed within the scope of the study, it is aimed to make a contribution to the literature and the construction sector in order to examine the existing building stock by using the most up-to-date technologies.

Keywords: Structural Modelling, 3D Laser Scanning, Building Information Modelling (BIM)

1. GİRİŞ

Ülkemizde mevcut kamu ve özel kullanım amaçlı yapıların TBDY 2018' e göre deprem performans analizleri gerçekleştirilmektedir. Bu analizler neticesinde yapıların performans seviyelerini sağladığına, güçlendirilmesine veya yıkılarak dönüştürülmesine karar verilebilmektedir. Betonarme mevcut bir yapının performans analizi öncesinde yapıya ilişkin bazı verilerin belirlenmesi gerekmektedir. Bu süreçte ilk olarak yapının statik rölevesi çıkarılmaktadır. Günümüzde bu uygulama genellikle dijital ya da manuel ölçüm ekipmanları (dijital ya da çelik metre) ile gerçekleştirilmektedir. Yapıda gerçekleştirilen ölçümler teknik personel tarafından bilgisayar ortamına aktarılmaktadır. Böylece yapının performans analizine esas statik modeli elde edilmektedir. Bu yöntem taşıyıcı sistemi kompleks olmayan yapılarda minimum hata ile uygulanabilmektedir. Ancak taşıyıcı sistem geometrisi ve detayları karmaşık olan yapılarda hata oranını artırabilmektedir. Muhtemel bu hatalar ise yapının performans sonucunu etkileyen sonuçlar ortaya çıkarabilmektedir. Makalemizde bu hataları minimize edebilmek ve güncel teknolojinin sunmuş olduğu imkanlardan yararlanmak için yapısal modellemede 3D lazer tarama yönteminin ve yapı bilgi modellemesi teknolojisinin birlikte kullanılabilirliği irdelenmiştir.

3D lazer tarama yöntemi; bu kapsamda özelleşmiş teknik ekipmanlar ile yapının dışından ve içerisinden 1mm'lik kesitlerde yapının geometrisinin nokta bulut verisi şeklinde elde edildiği bir uygulamadır. Günümüzde 3D lazer tarama cihazları ilave bazı özellikler de kazandırılarak yapıdan daha detaylı veri almaya imkan sunmaktadır. Örneğin makalemiz kapsamında basit uygulamalarla incelenen Z+F IMAGER 5010 3D lazer tarama cihazı (Kırşehir Ahi Evran Üniversitesi Merkezi Araştırma ve Uygulama Laboratuvarı), üzerinde bulunan termal kamera ile yapıdaki ısı geçişlerini de belirlemeye imkan sunmaktadır. Gelişen teknoloji ile birlikte 3D lazer tarama cihazları daha pratik uygulamaya imkan sunacak formata dönüşmektedir. Örneğin teknik bir personelin tek başına bir yapıyı hızlı ve tüm detayları ile tarayabileceği cihazlar geliştirilmiştir. 3D lazer tarama yaklaşımı genellikle arkeolojik çalışmalar veya tarihi yapıların restitüsyon uygulamalarında kullanılmaktadır. Örneğin Uzunel ve Özdemir tarafından (2022) gerçekleştirilen bir çalışmada kültürel mirasın belgelenmesinde lazer tarama uygulamasının önemi vurgulanmıştır. Çalışmada mimari ve arkeolojik alanlarda 3D lazer tarama yaklaşımının çok yaygınlaştığı, 3D lazer tarama ile yüzeyle fiziksel bir bağlantı olmadan yapının 3D modelinin elde edildiği belirtilmiştir. 3D lazer tarama ile 3 boyutlu verilerin daha doğru, hızlı ve kullanışlı hale geldiği ancak lazer tarama

uygulamasında ölçüm noktalarının doğru seçilmemesi sonucunda büyük hataların oluşabileceğine makalede yer verilmiştir. Çalışmada lazer tarama uygulamalarında ki genel sorunlarda ele alınmıştır (Uzunel & Özdemir, 2022). Graczyk vd. (2022) tarafından gerçekleştirilen başka bir çalışmada 3D lazer tarama ile bir tarihi yapıdaki döşeme deformasyonunun belirlenmesi yapılmıştır. Çalışmada bu döşeme üzerindeki yükler esas alınarak dayanım hesaplaması yapılmıştır. Makalede 3D lazer tarama yönteminin (TLS: Terrestrial laser scanning) nokta bulutu şeklinde x, y, z koordinatlarında 3D verinin hızlı bir şekilde elde edilmesi için mühendislikte kullanımının yaygınlaştığı belirtilmiştir. 3D lazer tarama yönteminin tarihi ve kültürel mirasın korunmasının yanında yapısal denetim amaçlı veya deneysel verilerinin doğrulanmasında kullanılabildiği vurgulanmıştır. Bu yöntemin geleneksel yöntemlere göre iyi bir alternatif olduğu, ancak bu çalışmada da büyük veri setlerinin oluşmasından dolayı bilgisayar donanım gereksinimi belirtilmiştir. Çalışma sonucunda lazer tarama yönteminin yapıların veya yapısal elemanların geometrilerinin, yapısal elemanların yapı içerisindeki konumlarının ve deformasyonlarının belirlenmesi için yapılan analizlerde çok etkili bir yöntem olduğu söylenmiştir (Szymczak-Graczyk et al., 2022). Liu vd. ise tarihi yapı bilgi modellemesi ile lazer tarama yöntemini birlikte değerlendirdikleri çalışmada bir iş akış diyagramına yer vermişlerdir. Bu diyagramda öncelikle yapı bilgi modellemesinin Lod seviyesini belirleyip sahada veri elde etme aşamasına geçildiği görülmektedir. Veri elde etme aşamasında TLS tarama yöntemi kullanılmaktadır. Nokta bulutu şeklinde elde edilen veriler Autodesk ReCap ile 3D model haline getirilmektedir. Bu model Autodesk Revit' e aktarılarak model detayları tanımlanmakta ve model değerlendirmesi yapılmaktadır. Çalışmada buna ilişkin örnek uygulamalara yer vermişlerdir (Liu et al., 2023). 3D lazer tarama yöntemi sadece yapının geometrik detaylarının belirlenmesine yönelik değil yapıların, yapısal elemanların hasarları ile yapı malzemelerinin fiziksel değişimlerinin belirlenmesinde kullanılabilmektedir. Örneğin Zhang vd. (2021) betonun içerisinde kullanılan donatının, donatı korozyonu karakteristiğini 3D lazer tarama yaklaşımı ile belirlemişlerdir. Çalışmada uniform olmayan korozyon etkisinin akma dayanımı, nihai dayanımı, elastisite modülü üzerindeki etkisi incelenmiştir. Makalede 3D lazer tarama yöntemiyle korozyona uğramış donatıların yüzey morfolojilerinin korozyon çukurlarının tespitinde etkin bir yöntem olduğu belirtilmiştir (Zhang et al., 2021). Başka bir çalışmada Olsen vd. lazer tarama yaklaşımı ile yapısal hasar tespiti üzerinde bir çalışma gerçekleştirmişlerdir. Çalışmada lazer tarama yönteminin 3D modellemede hızlı

uzaktan algılama tekniği sağladığı, lazer tarama yönteminin kiriş deformasyonu ve mevcut yapı modellenmesinde etkili bir yöntem olduğu belirtilmiştir. Makalede 1/1 ölçekli bir deneysel bir yapı modelinin hasar tespiti lazer tarama yaklaşımı ile gerçekleştirilmiştir. Çalışmada lazer tarama uygulamasına yönelik bir iş akış diyagramına yer verilmiştir. Çalışma sonucunda yapısal deformasyon, hacim değişimi ve çatlak konumu haritalaması detaylarına yer verilmiştir (Olsen et al., 2010). Lazer tarama yaklaşımı farklı metotlarla birlikte yapısal analiz yöntemlerine katkı sağlamak içinde kullanılabilir. Örneğin Yang vd. (2018) lazer tarama teknolojisine dayalı tepki yüzeyi metodolojisi ile betonarme yapılarda optimum sonlu eleman modelinin elde edilmesine yönelik bir çalışma gerçekleştirmişlerdir. Çalışmada lazer tarama yaklaşımının rölöve ve yapısal deformasyonun izlenmesi için çok önemli bir yöntem olduğunu belirtmişlerdir. Makalede betonarme yapıların sonlu eleman modelini lazer tarama teknolojisi ile elde edilmesi ve bu modelin tepki yüzey metodolojisi ile optimize edilmesini detaylandırmışlardır (Yang et al., 2018). Yapısal modellemede lazer tarama yaklaşımının kullanıldığı başka bir çalışmada Hong vd. (2022) betonarme köprülerin yüzeylerinin otomatik olarak çıkarılması işlemi lazer tarama yaklaşımı ile elde etmişlerdir. Çalışmada 3 boyutlu köprü geometrik modelinin köprünün incelenmesinde, değerlendirilmesinde önemli bir rol oynadığını, lazer tarama yaklaşımının bu kapsamda doğru topografik yüzey datasının elde edilmesinde kullanıldığı belirtilmiştir. Çalışmada örnek olarak seçtikleri köprünün nokta bulutu yüzeylerinden yapısal detaylarının elde edilmesi teorik olarak sunulmuştur (Truong-Hong & Lindenbergh, 2022). Yapmış olduğumuz literatür araştırmalarında 3D lazer tarama yaklaşımının rölöve, modelleme, hasar tespit ve yapısal analizde kullanıldığı görülmüştür. Ancak bu çalışmalar sadece rölöve, modelleme veya hasar tespit amaçlarından birine yönelik gerçekleştirildiği görülmüştür. Makalemiz ile 3D lazer tarama yönteminin yapısal performans değerlendirmesinde rölöve, modelleme, yapının yerinde incelenmesi ve yapısal analiz modelinin kurulması aşamalarının bütünlük olarak bir metot şeklinde sunulabilmesi araştırılmıştır. Çalışmamızda 3D lazer tarama yaklaşımının yapı bilgi modellemesi yöntemi ile birlikte kullanılabilirliği incelenmiştir. Nokta bulutu şeklinde elde edilen verilerin yapı bilgi modellemesi metodolojisinde kullanılan yazılımlar ile 3D formata dönüştürülmesi ve bu veriden yapısal analiz modelinin elde edilebilirliği irdelenmiştir. Makalemizde yapısal performans ve değerlendirmede 3D lazer tarama yaklaşımı ile yapı bilgi modellemesi teknolojisinin efektif olarak kullanılabilirliğinin bir metot olarak sunulabilmesi

amaçlanmıştır. Bu metot ile mevcut yapı stokunun deprem performansı değerlendirmesinin teknolojik yaklaşımlarla daha hızlı ve efektif incelenebilmesi çalışmalarına katkı sağlanması hedeflenmiştir.

2. MATERYAL ve YÖNTEM

Çalışma kapsamında yapısal performans analizlerinde statik rölöve, yapının yerinde incelenmesi, analiz modelinin oluşturulması aşamalarında 3D lazer tarama ile yapı bilgi modellemesi yazılımlarının efektif olarak kullanılabilirliği incelenmiştir. Bu kapsamda ilk olarak Kırşehir Ahi Evran Üniversitesi Merkezi Araştırma ve Uygulama Laboratuvarında bulunan Z+F IMAGER 5010 3D lazer tarama cihazı çalışma prensibi ve sahada uygulama detayları çalışılmıştır (Şekil 1.) (Şahin, 2023).

Şekil 1. Z+F IMAGER 5010 3D Lazer Tarama Cihazı

Bu kapsamda ilk olarak lazer tarama cihazı ile Kırşehir ilinde bulunan tarihi Cacabey Medresesinde TÜRKİYE CUMHURİYETİ Vakıflar Genel Müdürlüğünden gerekli araştırma izni alınarak bir tarama gerçekleştirilmiştir (Şekil 2.) (Şahin,2023).

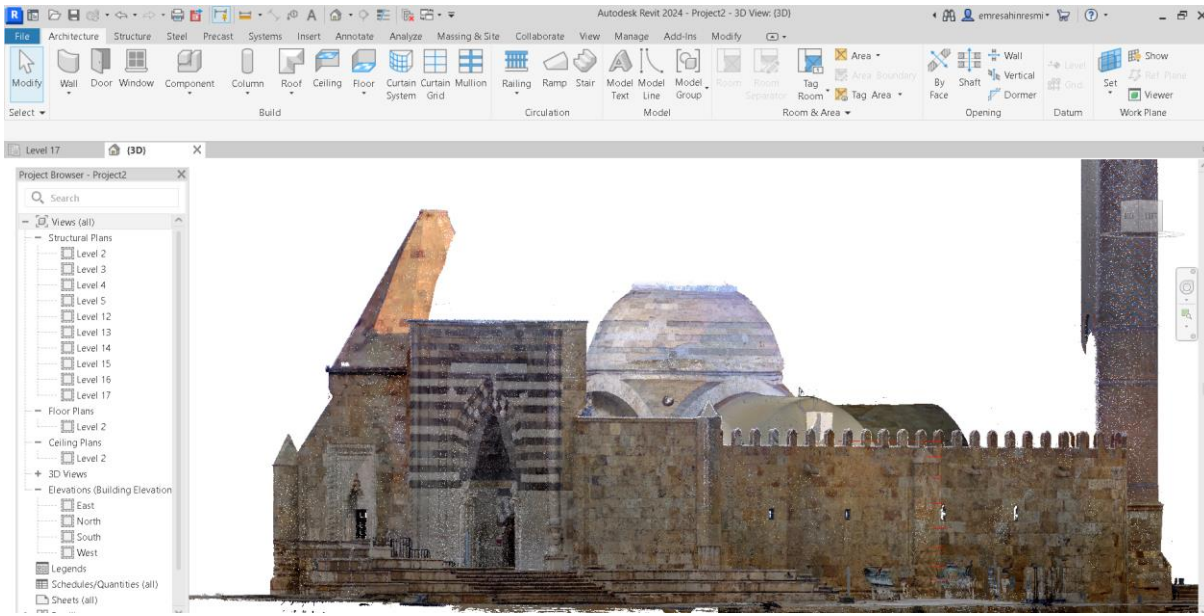

Şekil 2. Kırşehir İli Cacabey Medresesi 3D Lazer Tarama Uygulaması

3D Lazer tarama çalışması 10 metre aralıklarla 1mm'lik hassasiyetle yapının hem dışından hem de içinden gerçekleştirilmiştir. Tarama sonucunda elde edilen nokta bulutu verisi düzenlendikten sonra Autodesk ReCap ile 3D görüntü formatına dönüştürülmüştür (Şekil 3.).

Şekil 3. Autodesk ReCap ile 3D Nokta Bulutu Görüntüleme (Autodesk ReCap)

Sonrasında 3D nokta bulutu verisi Autodesk Revit yazılımına aktarılmıştır (Şekil 4.). Bu örnek uygulama ile lazer tarama yönteminin detayları ve uygulama metodolojisi anlaşılmıştır.

Şekil 4. Autodesk Revit ile 3D Modelin Elde Edilmesi (Autodesk Revit)

Bu aşamaya kadar yapılan çalışmalar ile mevcut bir yapının geometrik detayları 3D lazer tarama yöntemi kullanılarak bilgisayar ortamına doğru bir şekilde aktarılabilmiştir. Çalışmanın bu aşamasından sonra Revit yazılımına aktarılan bir modelin yapısal analiz modeline dönüştürülmesi detayı incelenmiştir. Bu kapsamda Revit yazılımında oluşturulan bir tasarımın sonlu elemanlara dayalı analiz programına aktarılması yöntemi çalışılmıştır. Bunun için Revit üzerinden örnek bir tasarım oluşturularak (Şekil 5.) bu tasarım yapısal analizlerde kullanılan Sap2000 yazılımına aktarılmıştır (Şekil 6.).

Şekil 5. Örnek Betonarme Bir Çerçeve Revit Modeli (Autodesk Revit)

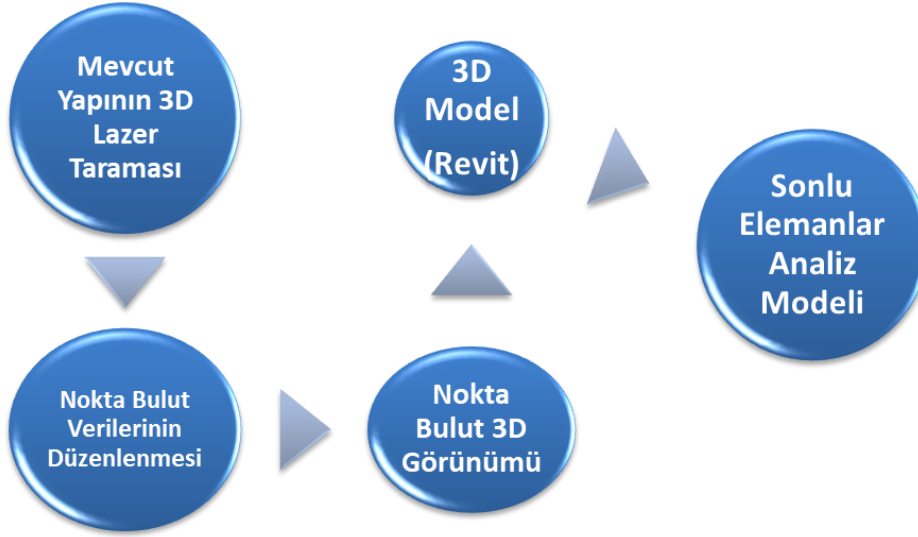

Şekil 6. Revit Modelden Aktarılan Yapı Analiz Modeli (Sap2000 Trial)

3. BULGULAR ve TARTIŞMA

Makale kapsamında gerçekleştirilen örnek uygulamalar ile lazer tarama verisinin yapı bilgi modellemesinde kullanılan Revit yazılımına aktarılabilmesi gerçekleştirilmiştir. Revit yazılımında elde edilen bir modelin ise yapısal analizde kullanılan bir paket programa hızlı bir şekilde aktarımı

yapılabilmektedir. Çalışmada bu aşamalar bir metot olarak Şekil 7.' de iş akış diyagramı şeklinde gösterilmiştir.

Şekil 7. 3D Lazer Tarama ve Yapı Bilgi Modellemesi ile 3D Model İş Akışı

Yapılan çalışmalarda 3D lazer tarama aşamasında doğru bir veri elde edebilmek için yapı da uygulamanın gerçekleştirileceği noktaların doğru belirlenmesi ve uygulamada belirli bir sıra izlenerek lazer taramanın gerçekleştirilmesi önemlidir. 3D lazer tarama uygulaması gerçekleştirilmeden önce bir planlama yapılmalıdır. Uygulama yapılacak yapının özelliklerine ve tarama hassasiyetine göre çalışma sahada uzun sürebilmektedir. 3D lazer tarama sonucunda çok büyük bir veri oluşmaktadır. Bu verinin düzenlenmesi için yüksek kapasiteli bilgisayar gereksinim ortaya çıkabilir. Nokta bulut verilerinin düzenlenmesi 3D model öncesinde en önemli aşamadır. Bu kapsamda geliştirilmiş yazılımlar mevcuttur. Nokta bulut verilerinin 3D olarak görüntülenmesi bu kapsamda özelleşmiş yazılımlar ile oldukça pratik yapılabilmektedir. Bu verilerin yapı bilgi modellemesi kapsamında kullanılan yazılımlara aktarımı ve sahadan elde edilen verilerin bilgisayar ortamında 3D model olarak tanımlanması çalışmalarda statik rölöve aşamasını oldukça kolaylaştırmaktadır. Bu 3D model ile sadece statik rölöve çalışması değil yapının mevcut durumunun çok detaylı değerlendirilmesi de yapılabilmektedir. Çalışma kapsamında örnek 3D lazer taraması gerçekleştirilen tarihi yapının yapısal analiz modelinin oluşturulması yüksek kapasiteli bilgisayar kullanımı gereksiniminden dolayı devam etmektedir. Ancak makale kapsamında örnek bir Revit modelinin Sap2000 ' e aktarımı sağlanabilmiştir. Burada ele alınan bu

metodoloji ile ileriki çalışmalarımızda yöntem, örnek mevcut betonarme bir yapıya uygulanarak yapının sonlu elemanlar modeli elde edilecektir. 3D lazer tarama teknolojisi ve yapı bilgi modellemesi araçlarının yapısal analiz ve performans değerlendirilmesi çalışmalarında efektif kullanımı birçok aşamayı daha hassas ve pratik formata dönüştürecektir.

4. Sonuç ve Öneriler

Çalışma kapsamında 3D yapısal modellemede lazer tarama teknolojisi ve yapı bilgi modellemesi araçlarının yapı analiz modelinin hızlı şekilde elde edilmesinde kullanımı incelenmiştir. Bu doğrultuda örnek uygulamalar gerçekleştirilmiştir. Yaptığımız çalışmalarda lazer tarama teknolojisinin mevcut yapının bilgisayar modelinin elde edilmesinde oldukça efektif ve pratik bir yöntem olduğu belirlenmiştir. Günümüz yazılım teknolojisinin gelişmesiyle birlikte lazer tarama sonucunda elde edilen nokta bulutu verilerinin tasarımcı açısından anlamlı model haline getirilmesi ve bu modellerin yapısal analizde esas alınan sonlu elemanlar dönüştürülmesi mümkün olmaktadır. Teknolojinin bu araçlarının yapıların performans değerlendirilmesinde kullanımı çalışmaların daha hızlı ve daha hassas gerçekleştirilmesine olanak sağlayacağı düşünülmüştür. Teknolojinin hızla gelişimi sonucu ortaya çıkan cihazlar ve yazılımların bu alanda da efektif kullanımını kaçınılmaz hale getirmiştir. İleriki çalışmalarımızda farklı taşıyıcı sistem özelliklerine sahip yapılarda bu yöntem uygulanarak örnek çalışmalar gerçekleştirilecektir. Makalemiz ile bu alanda gerçekleştirilen sektör ve akademik çalışmalar ile mevcut yapı stokunun daha hızlı değerlendirilmesi uygulamalarına bir katkı sunulabilmesi amaçlanmıştır.

5. Teşekkür

Bu çalışmanın gerçekleşmesinde gerekli izni veren TÜRKİYE CUMHURİYETİ Kültür ve Turizm Bakanlığı Vakıflar Genel Müdürlüğüne, Araştırma İzni Sürecinde Yardımlarını Esirgemeyen Kayseri Vakıflar Bölge Müdürlüğüne, Sanat Eserleri ve Yapı İşleri Şube Müdürü İnşaat Yüksek Mühendisi Sayın Taha DEMİRCİ' ye ve Lazer Tarama Cihazının Kullanım İzni İçin Kırşehir Ahi Evran Üniversitesi Merkezi Araştırma ve Uygulama Laboratuvarı Yönetimine ve Verilerin Düzenlenmesinde Yardımlarını Esirgemeyen Dr. Öğr. Üyesi Sayın Ömer UZUNEL' e Teşekkür ederiz.

KOYULHİSAR'DA SAYA TÖRENİ FAKELORE MU GELENEĞİN ÖZLEMİ Mİ?

Dr. Seyit GEZER (ORCID 0000-0002-1039-6980)

Emniyet Genel Müdürlüğü
Email: gezerseyit@hotmail.com

ÖZET

İnsanları yeniden doğuşu ya da doğanın tekrar canlanmasını, bolluk ve bereketin işareti olarak görürler. İnanişâ göre güz dönemi ile birlikte kış uykusuna yatan insan dışındaki canlılar, baharın gelişiyile birlikte tekrar dirilmektedir. Bu diriliş, sembolik unsurları içinde barındıran gösterime dayalı oyunlarda kutlanmaktadır. Kutlamalar, sadece kültürel bir form olmasının dışında toplumlarda ortak olan unsurlarla dikkat çekmektedir. Bu kutlamalardan biri de saya törenidir. Tören, geçimini hayvancılıkla sağlayan topluluklar için hayatın devamının göstergelerindedir. Törenler Anadolu'nun farklı yörelerinde olduğu gibi Sivas ilinin Koyulhisar ilçesinde de kutlanmaktadır. Fakat törenin kutlanması doğal ortamda icradan ziyade geleneğin tekrar yaşatılması şeklinde uygulanmaktadır. Yazıda, Koyulhisar'daki kutlamanın fakelore mu geleneğe özlem mi olduğu tartışılmaktadır. Verilerin toplanması sırasında hem görüşme hem de gözlem teknikleri uygulanmış olup elde edilen verilerin folklor kuramları dâhilinde tahlili yapılmaya çalışılmıştır. Özellikle fakelore ve folklorizm kavramlarının taşıdıkları anlamlar verilerek, genel eşleştirmelerle örneklendirilmiştir. Farklı yörelerde yapılan uygulamalar ve bu uygulamalara bağlı pratikler örneklerin içinde verilmiştir. Sonraki aşamada ise Koyulhisar'da icra edilen saya töreninin niçin fakelore örneği olmadığı ilmî açıdan izah edilmeye çalışılmıştır. Uygulamanın uydurma olmayıp, geleneğin yeniden canlandırılması gayesiyle hareket edildiği görülüp, özellikle ikinci hatta üçüncü kuşaklara geleneğin aktarımı konusunda sağlayacağı yarar ifade edilmiştir. Konu birey kimliğinden sıyrılıp kültürel bellekte kodlanan geleneğin aktarımının ne denli önemli olduğu gerçeği ile sonuçlandırılmıştır.

Anahtar Kelimeler: Fakelore, Koyulhisar, saya, tören, bereket.

IS THE SAYA CEREMONY IN KOYULHİSAR FAKELORE OR A MISSING FOR TRADITION?

ABSTRACT

People see rebirth or the revival of nature as a sign of abundance and fertility. According to the belief, non-human creatures that go into hibernation with the fall period are resurrected with the arrival of spring. This resurrection is celebrated in performance-based games that contain symbolic elements. Celebrations are not only a cultural form, but also draw attention with common elements in societies. One of these celebrations is the saya ceremony. The ceremony is one of the indicators of the continuation of life for the communities that make a living from animal husbandry. Ceremonies are celebrated in the Koyulhisar district of Sivas province as well as in different regions of Anatolia. However, the celebration of the ceremony is practiced in the form of re-living the tradition rather than performing it in the natural environment. In the article, it is discussed whether the celebration in Koyulhisar is fakelore or longing for tradition. During the collection of the data, both interview and observation techniques were applied, and the analysis of the obtained data was tried to be made within the folklore theories. In particular, the meanings of the concepts of fakelore and folklorism are given and exemplified with general pairings. Applications made in different regions and practices related to these applications are given in the examples. In the next stage, it was tried to explain scientifically why the saya ceremony performed in Koyulhisar was not an example of fakelore. It has been seen that the practice is not a fabrication, it is aimed at revitalizing the tradition, and it has been stated that it will benefit especially the second and even third generations in transferring the tradition. The subject was concluded with the fact of how important it is to transfer the tradition that is stripped of individual identity and encoded in cultural memory.

Keywords: Fakelore, Koyulhisar, saya, ceremony, abundance

GİRİŞ

Birey, zaman içinde yaşamı ve edindiği tecrübeler ile kişiliğinden sıyrılıp toplum içinde varlığını sürdüren bir kimliğe bürünmektedir. Bireyin içinde yaşadığı toplum aslında onun öz varlığı ya da başka bir ifadeyle benimsenmiş ruhu olur. Gelenek terkip edilen varlıkların bütünü ifade ederken, gelenek içinde özümseme kültürüyle beslenen insan da edinimlerini yetinime dönüştürme kabiliyetini taşır. Bu nedenle insanlar aynı kültür havzasından beslendiği kişilerle ortak bir bağ kurmaktadır. Kurulan bağ çıkar amaçlı sürülen hayatın meşgalelerinden azade, değişim ve dönüşümlere açık, kolektif kimlikle örtüşen, ben merkezli yaklaşımların yerine biz odaklı törenlerde gösterilen tarzıdır.

Dönüşüm halka ait olan her ne varsa bunların içinde olacağı gibi dönüşümün yaşanmasının pek çok sebebi olabilir. Özümseme değerler hayat şartlarının değişmesiyle birlikte bazen yok olurken, bazen de güncellenerek devam ettirilmektedir. Çünkü birey yeni dünya düzenini kavrarken mevcut şartlara adapte olabilmek, istenilen durumu sergilemek, yaşadığı hayatın zorluklarını kolaya çevirmek zorundadır. Değişim ve dönüşüme uğrayana kültürel varlıkların başında sözlü kültür ürünleri gelmektedir. Sözlü kültür ürünleri tarihî kimliği ile yüzyıllardır süregelen gelenek içinde pişirilerek günümüzde varlığını sürdürmektedir. Bu ürünler kendine sahip olan toplumun aynası vasfında olup, o toplumla anlam kazanmakta, topluluğun yok oluşuyla manasını yitirmektedir. Bu nedenlerle sözlü kültür ürünlerinin ele alınması ve değerlendirilmesi, farklı kuramsal yaklaşımların bir arada kullanılması ile mümkündür.

Araştırma Sahası

Araştırma sahası Sivas ilinin Koyulhisar ilçesine bağlı Gölcük köyüdür. Koyulhisar ilçesi Sivas il merkezine yaklaşık yüz seksen üç km. uzaklıktadır. Gölcük köyü ise Koyulhisar'ın güneydoğusunda dağlık engebeli bir alandadır ve ilçe merkezine on yedi km. uzaklıktadır.

Koyulhisar; güneyinde Zara, güneydoğusunda Suşehri, batısında Doğanşar ve Reşadiye (Tokat), doğusunda Şebinkarahisar (Giresun), kuzeyinde Mesudiye (Ordu) ilçeleri ile komşudur. İlçe tarihî yapısıyla dikkat çekmektedir. Önceleri Şebinkarahisar'a bağlı bir kaza iken 1934 yılında

Şebinkarahisar'ın idari açıdan statüsünün değişmesiyle Sivas'ın ilçesi olmuştur. Koyulhisar, Sivas'ın rakımı en düşük ilçesi olarak bilinse de etrafında engebeli arazi yapısı dikkat çekmektedir⁶.

İlçe merkezinde bir yılı aşkın süreyle ikamet ettiğimiz için hemen hemen her köyü ziyaret edilmiş ve orada bulunanlarla yapılan görüşmeler kaydedilmiştir. Bunun yanında Koyulhisar Kaymakamlığı'nda mahfuz belgeler de ilgimizi çekmiş, yer yer notlar alınmıştır. Ama en önemlisi yapılan gözlemlerdir.

İlçede yaşayan insanlarca 2005 yılında Sugözü köyünde meydana gelen heyelan hadisesi dillendirilmektedir. Hatta her yıl o hadisede ölen vatandaşlar için anma töreni düzenlenmektedir.

Başka dikkat çeken bir husus ise ilçenin Karadeniz sınırında oluşu ve bölücü örgüt mensuplarınca Karadeniz'e geçiş için güzergâh olarak kullanılmasıdır. Özellikle ilçe merkezinin kuzeyinde kalan engebeli arazi ve yaylalar teröristlerin saklanması için müsait olduğundan ilçede yaşayanlar arasında terör korkusu bulunmaktadır. Son olarak 2016 senesinde altı terörist Küplüce köyünde etkisiz hâle getirilmiştir. Özellikle yayla yaşamı sonrası kışın ilçe ve köylere göçler başlarken, vatandaşlar yayla evlerinde erzak bırakmamaları konusunda bugün bile uyarılmaktadır.

Araştırma konusu sözlü kültür olduğu için Koyulhisar kültüründen de bahsetmek gereklidir. Koyulhisar her ne kadar idari açıdan Sivas'a bağlı bir ilçe olsa da kültürel açıdan daha çok Karadeniz kültür ikliminden ve Tokat yöresinin kültür havzasından beslenmektedir. Örneğin düğünlerinde kemeçe çalınır horon tepilmektedir. Benzer kültür zenginliklerini Sivas'ın doğu ya da güney tarafındaki ilçelerinde görmek mümkün değildir. Bu nedenle idari açıdan bağlı olduğu Sivas'tan kültürel farklılığı hemen göze çarpmaktadır.

Koyulhisar'ın kültürel açıdan dikkat çeken başka özelliği ise köy adlarıdır. Sisorta, Fitense, Zunar, Evkerek, Sahnaçimen, Mudasan, Kan, Turhu, Kesresun, Zuham, Geley, Eksi, Hais, Cüne, Pünk, Cörgü, Gebe, Harun köy adları köylerin eski isimleri olarak tarafımızca not edilmiştir. Toponim açıdan açıklanması gerekli olan bu konu ayrı makale konusu olmalıdır. Fakat günümüzde bu yer adlarının resmî olarak kullanılmaması, sadece köylerde yaşayanlarca bilinmesi de dikkat çekmektedir. Bu konu sözlü tarih-folklor ilişkisi münasebetinde değerlendirilmeli ve çıkarımlarda bulunulmalıdır.

⁶ Araştırma konusu ilçe tarihi ya da coğrafi özellikleri olmadığı ve bildiriyle sınırlandırıldığı için ilçenin yapısı hakkında detaylı bilgi verilmemiştir. Araştırma sahası ile ilgili olarak detaylı bilgi alabilmek için bkz (Karaca, 2007), (Duygulu, 2012).

MATERYAL ve YÖNTEM

Araştırmada iki tekniğe başvurulmuştur. Bunlardan biri gözlem diğeri ise görüşmedir. Gözlem tekniği, sözlü kültür ürününün icra edildiği ânın seyredilip kayda alınması için kullanılmıştır. Kayıt işlemi yapılırken görseller arşivlenmiş, mümkün olduğunca topluluk içinde kalmaya özen gösterilmiştir. Gözlem tekniği uygulanırken etik yaklaşım sergilenmiş fakat emik yaklaşıma da başvurulmuştur.⁷

Fakelore

Kültürel kuram kültür unsurunun doğasını ve toplumsal yaşam üzerindeki anlamlarını açıklayan bir terimdir. Bu terim *içerik*, *toplumsal anlam* ve *eylem temelleri* üzerinden tanımlanabilir (Smith, 2005: 17-18). Kuramsal yaklaşımların anlamlandırılabilmesi için kullanılan birtakım terimlerin de içinin doldurulması ve izah ettiği nesne, olay, olgu için manalandırma yetisine sahip olması gerekmektedir. Bu nedenle folklor ürünlerinin yorumlanabilmesi için kullanılan terimlerin de yerli yerinde kullanılması önemli bir gerekliliktir. Fakelore terimi de yaklaşık yetmiş yıldır bilim adamlarınca kullanılmış ve içinde sakladığı anlam ile folklor a ait ürünlerin tahlili için ayırıcı özelliği içinde saklayan kimliği üzerinde taşımıştır. Dorson'a göre fakelore "Gerçek oldukları iddia edilen sahte ve sentetik eserlerin sergilenmesidir. Bu ürünler, alandan toplanmazlar, ancak sürekli bir tekrarlama zincirinde evvelki edebi eserlerden ve gazete kaynaklarından yararlanarak yeniden yazılırlar veya yazınsal sömürsünün başlangıcında en azından sözlü gelenekten alıntılara sahip olan Paul Bunyan figüründe olduğu gibi yazılan muhtelif 'halk kahramanları' örneklerinde bütünüyle değişikliğe uğrayarak ortaya çıkmış olabilirler" (akt. Dundes, 2006: 92). Dorson burada gerçek olduğu düşünülen derken aslının yeniden üretiminden ziyade onun başka amaçlar için gerçek gibi sergilenmesinden bahsetmektedir. Bunun en güzel örneği ülkemizde ziyaret fenomeni çevresinde icra edilmektedir. Çünkü bundan uzun yıllar önce olmayan yatırlar, türbeler özellikle kurumsal kimliği olan işletmelerin eliyle varmış gibi gösterilmekte, âdeta dinî anlamda cazibe hâline gelmesi için çaba harcanmaktadır. Sebebi ise daha çok maddi kaygıdır. Kurumlar ya da kamu iktisadi teşebbüsleri buraları kullanarak kendi beldelerine ziyaretçi akını olmasını istemekte, böylelikle ziyaret turizmini canlandırarak kültür

⁷ Gözlem tekniği, görüşme tekniği, etik yaklaşım, emik yaklaşım, katılımlı gözlem ve katılımsız gözlem terimleri ile ilgili ayrıntılı bilgi için bk. (Goldstein, 1983: 54-98), (Çobanoğlu, 1999: 56-67).

ekonomisine de katkıda bulunmayı amaçlamaktadır. Kayseri’de Seyyid Burhaneddin türbesi buna örnek gösterilebilir. Öğrencisi olduğu düşünülen Mevlana’nın makamı çevresinde gerçekleştirilen uluslararası organizasyonlar Kayseri için de Seyyid Burhaneddin etrafında teşekkül ettirilmeye başlanmıştır (Güngör vd. 2015: 156). Burada konu ziyaretin oluşu değil ziyaret kültürünün kültür ekonomisi olarak görülüp kutsal kabul edilen yerin cazibe hâline getirilmesidir. Bununla birlikte aslında daha önce olmayan pratiklerin o ortamda önceden beri varmış gibi icra edilmesi fakelore örneğidir. Örneğin Kayseri’de evlenecek kişilerin oraya gitmesi, Kur’an okumayı bilenlerin ziyaretçilerin yanına gidip ücret karşılığı Kur’an okuması, türbe önünde yapılan meydanda dinî işlevi olan nesnelere satılması için bir çarşı kurulması gibi.

Fakat fakelore ile folklor arasındaki ince çizgiyi ayırt edebilmek gerekir. Bu nedenle fakelore yaşama ve yeniden canlanma ile de karıştırılmamalıdır. Yaşama geleneğin sürekliliğidir. Folklor ürününün ne kadar değiştiği ya da küçüldüğü önemli değildir. Yeniden canlanma, devam etmeme, geleneğe ara verme anlamına gelir. Yeniden canlanma, geçmişe serpilmiş bir folklor ürününü canlandırmak için bilinçli bir karara gönderme yapar. Buna karşın fakelore, asla var olmamıştır. En azından sunulduğu şekliyle var olmamıştır (Dundes, 2006: 93). Burada vurgulanmak istenen asıl husus uzun yıllar öncesi icra edilen bir geleneğin ara verildikten sonra yeniden icrası ile hiç olmayan bir geleneğin sanki önceleri o yöreye has olup da bugünlerde icra edilmemesi nedeniyle yeniden canlandırılıyormuş gibi gösterilmesidir. Bu konuda da verilebilecek en güzel örneklerden biri yağlı güreşlerdir. Gelenek temelli Türk sporu kabul edilen yağlı güreşler artık festival vesilesi yapılmaktadır. Özellikle belediyeler yağlı güreş müsabakalarını ilçe tanıtımı için sebep, buradan elde edilecek popülerliği ise sonuç olarak görmektedir. Yağlı güreşi ilgili yörenin geleneksel oyunu gibi göstermek fakelore unsurudur. Ya da buğday festivali, patates festivali, ceviz festivali gibi etkinlikleri geleneksel hâle getirip ticari amaç gütmek de fakelore örneğidir. Fakat uzun yıllar köy düğünlerinde *değirmenci dayı* gibi seyirlik oyunların oynanamayıp, onu bilen insanlarca bir düğünde icra edilmesi geleneğin yeniden canlandırılmasıdır. Aradaki çizgiyi ayırt etmek önemlidir.

Fakelore ile birlikte anılan bir başka terim ise Alman folklorcuları tarafından kullanılan folklorizm kelimesidir. Kelime genel itibarıyla folklorlara ait zenginliklerin kendi doğal ortamlarında sergilenmesinin dışında farklı icra mekânlarında ticari, siyasi, reklam vs. gibi isteklerle kullanımını ifade eder. Moser, üç tür folklorizmden söz eder: İlki halk biliminin orijinal yerel bağlamından

koparılarak uzak bir biçimde kullanılması, ikincisi popüler motiflerin başka sosyal sınıf tarafından gerçekleştirilen oyunbaz imitasyonu ve üçüncüsü de bir geleneğin dışında farklı amaçlar için halk biliminin icadı, yeniden yaratımı (Newall, 2004: 80). Aslında her iki terim de birbirini karşılamaktadır. Sonuçta olmayan bir gelenek çıkar amaçlı icat edilmekte, onun icrasından beklenti duyulmaktadır. Fakat gelenek içinde pratiği bulunmayan bir zenginliğin sürekliliği halk nazarında onu icra ettirmek isteyenin gücü kadardır. O güç olmayınca gelenek de yok olur. Çünkü suni yapı arz eder, doğal kimliği olmadığı için de yok olmaya mahkumdur.

BULGULAR

Koyulhisar'da Saya Töreni

Saya gezdirmenin diğer adı *kış yarısı* bayramıdır. Kış yarısı denilmesinin sebebi ise kışın ortasında icra edilmesiyle ilgilidir. Saya bir tören olarak kutlanırken iki anlam ifade etmektedir. Birinci anlam kış yarısı olmasıdır. Çünkü kış iki bölüm olarak bilinmektedir. Kışın yarısı zemheri, diğer yarısı da zahmetidir. Kış yarısı, zemherinin bitip zahmetinin başladığı güne denk gelmektedir. İkinci anlamı ise koç katımı sonrası yüz günlük sürenin geçmesiyle birlikte koyunun karnındaki kuzunun canlandığına inanılmasıdır (Gezer, 2022: 254). Sayanın anlamlandırılması aslında koç katımı töreniyle alakalıdır. Çünkü koç katımı denilen pratiğin devamı niteliğindedir. Koç katımı, 1 Ekim-20 Kasım tarihleri arasında koç ve koyunun buluşmasına verilen isimdir. Kuzunun doğmasına vesile olunmasıdır. Koç katımı içinde barındırdığı birtakım inanmalarla tören olarak kabul edilmektedir. Saya koç katımı sonrası törenin devamıdır. Bu hâliyle saya geleneği geçimini hayvancılıkla sağlayan insanlar için aynı zamanda bereket kapısıdır. Çünkü sürüsüne bir kuzu daha eklenmesi varlığının artmasına neden olmaktadır.

Saya gezmesi, saya bayramı, saya töreni, davar bayramı gibi farklı isimler verilen bu pratiğin Anadolu coğrafyasında daha önceleri yaygın olmasının başlıca nedeni insanların çoğunun köy toplumunun bir parçası olmasından kaynaklanmaktaydı. Günümüzde ise saya törenleri eskiye nazaran çok daha az icra edilmekte, dahası icraya katılanların bir kısmı niçin böyle bir uygulamanın olduğundan haberdar bile olmamaktadır. İşte günümüz hayat şartlarında o dönem görevli olduğumuz Sivas ili Koyulhisar ilçesine bağlı Gölcük köyünde saya bayramı kutlanacağı haberini alınca ilçenin Kaymakamlığının yazı işleri müdürü ve müftü vekili ile birlikte bu törene katıldık.

Kara kış günü 27 Ocak 2018 günü akşam saatlerinde Koyulhisar'dan hareket edip yaklaşık yirmi km. dağlık bir yol gittikten sonra Gölcük köyüne ulaşıldığında yerler karlıydı [görsel 1].

İlçede ikamet eden insan sayısı çok az olduğu için saya töreni yapmaya gelenlerin İstanbul'dan geldikleri tespit edildi. Bu durum folklor ilmi açısından tartışmaya açıldı. Çünkü Gölcük köyünden yaşayan insan sayısı kış aylarında birkaç haneyi geçmezken İstanbul'da yaşayan Gölcüklüler otobüs ve kendi araçlarıyla saya töreni için yaklaşık sekiz yüz km. yol gelmişlerdi. İstanbul'daki Gölcük Köyü Dernek başkanı Ayhan Genç tarafından tertiplendiği anlaşılan bu organizasyonda gurbetten gelenlerin hem sıla hasretini giderme hem de geleneksel hayat şartlarını yaşatma gayesi içinde oldukları tespit edilmiştir.

Önce gözlem yoluyla o gün yaşananlar da kaydedilmiştir. Gölcük köyü camisinin hemen karşısında bulunan bir binada çok sayıda insanın toplandığı ve katılımcıların çoğunun İstanbul'dan geldiği görülmüştür. Orada bulunan ve köy dışından olan bizim gibi misafirlere bu törenin niçin icra edildiği yaşlılar tarafından anlatılmıştır. Katılımcılardan altı-yedi kişinin kılık değiştirdiği, saya geleneğindeki seyirlik oyun nedeniyle bunun bir gereksinim olduğu da görülmüştür. Kılık değiştirenlerin deve [görsel 2], şeytan [görsel 3], dede [görsel 4] ve kızlar [görsel 5] rolünü üstlendiği, dedenin kızlara yaklaşmak isteyenlere engel olma görevini yaptığı, şeytanın kızları kaçırmak için fırsat kolladığı, devenin ise kızları kaçırmak isteyenleri cezalandırdığı not edilmiştir. Törenin sembolik yapıldığı ve çok uzun sürmediği söylenebilir. Sonraki safhada ikramlarda bulunulmuştur.

Gözlem esnasında alınan notlar orada bulunan kaynak kişilere sorulmuştur. Bize mihmandarlık yapan kaynak kişi saya geleneğinin köylerinden evvelden beri yapıldığını, kendi ailesinden bunu gördüğünü, fakat günümüz şartlarında köyde nüfus kalmadığı için rağbetin olmadığını dile getirmiştir (K.K.2).

Başka bir kaynak kişi sayanın bir tören olarak önceki dönemlerde kutlandığı ve ne şekilde icra edildiği hakkında bilgi vermiştir.

“Ebeden dededen beri yaparlar. Koç katımından sonra olur, zemheride yaparlar. Bunu töremiz var diye yaparlardı. Önceden kalabalık olurdu. Sadece erkekler yapardı. Dede kızlara bakar, oyun yaparlar. Deve el sallar, şeytan kızları kollar, kızları kaçırlar. Kızı kaçıınca hemen devenin altına verirler ” (K.K.1).

Başka bir kaynak kişi ise aslında bu törenin çobanlara has bayram olduğundan bahsetmektedir:

“Büyüklerimizden duyduğumuza göre çobanların eğlencesi olarak biliniyormuş bu. İşte koç katıp da yavrusu canlandığı gün eğlence yaparlarmış. Sayayı gezerek yapınca bunun bereket getireceğine inanırlarmış. O yüzden bulgur toplarlarmış. Bulgur, yağ, çerez bunları toplarlardı sonra sabaha kadar gezerlerdi” (K.K. 3).

Diğer bir kaynak kişi de tören esnasında söylenen manilerden ve evlerden toplanan yiyeceklerden bahsetmektedir. Özellikle bulgur toplandığı ayrıca dile getirilmiştir. Bunların dışında saya töreninde seyirlik oyunun nasıl icra edildiği ve katılımcıların rolleri hakkında da bilgi aktarmıştır.

“Biz yetiştik ondan beri yaparlar. Önceden koyun kuzu çoktu, herkes çobandı. Koç ayında on birinci ayın on beşinde koç katıyorduk. Ondan sonra şubatın on beşine yakın elli gün kala:

Ey hayadan hayadan
Say geldim sayadan
Ne kaldı elli gün kaldı
Elli gün sonra faşır faşır sağarlar
Gümbür gümbür yayarlar...

İşte öyle öyle geçip giderdi, biz de boğuşuyorduk. Yatıyor yuvarlanıyorduk. Deve üstümüze biniyordu. Kız yapıyorlardı, deve yapıyorlardı, şeytan yapıyorlardı, dede yapıyorlardı. Tek tek evleri geziyorlardı, yarma bulgur toparlardı. Pilav yapmak için toplarlardı. Evvelden tura oynuyorlardı. Böyle çevriliyordu turayı kaparsa vur babam vur” (K.K. 4).

Kaynak kişilerin aktarımları ve gözlemlerden elde edilen kayıtlardan birtakım çıkarımlarda bulunmak mümkündür. Anadolu'nun farklı yörelerinde benzer ritüeller çerçevesinde kutlanan saya töreni aynı zamanda gelenekli bir halk gösterisidir. Abdülkadir İnan'a göre köy seyirlik oyunlarının ilk çıkış yeri Orta Asya'dır. Yani bu oyunların kökeni, Orta Asya Şamanizm'i etrafında teşekkül etmiş ayinlerdir (İnan, 2006: 97-119). Törendeki oyunda, çok sayıda oyuncunun rol alması dikkat çekmektedir. Bu rolleri üstlenmek için *kadı*, *eşek*, *deve*, *karnapa*, *zaptiye*, *sazcı*, *gelin*, *toplayıcı*, *ambar memuru*, *kâhya* görevinde gençler olur. Koyulhisar'da bu rollerde deve, dede, şeytan ve kızlar vardır. Bulgur ayrıntısına özellikle değinmek gerekir. Çünkü bulgur bereketin sembolü olarak bilinmektedir. Bu bağlamda saya gezme, hayvanların bol üremesi ve doğa ile barışık olmak

için bir nevi büyü anlamıyla icra edilmektedir (Karadağ, 1978: 9-15,124). Kültür varlığı olan bu oyunlarda, soya yani kültür tarihine, yaşanılan yere ve dine ait değerler iç içe geçmiş durumdadır (And, 1974: 85). Saya töreninde dilek, istek, yeniden dirilmeye, bolluğa ve berekete özlem vardır. Ritüeller bu bağlamda icra edilir.

Eliade göre tarım, bitki hayatının yeniden doğuşunun gizemini ortaya koyar. Bu gizem, insanın çiftçilik ritüellerinde aktif rol almasına sebep olur. Tarım konusu *tohumda, toprakta, yağmurda ve bitkide* bulunan hayatın büyümesidir. Bu nedenle tarım sadece bir yaşama şekli değil, aynı zamanda kutsal bir iş ve ritüeldir (Eliade, 2005: 389). Bu sözler hayvancılık için de geçerlidir. Koyuna katılan tohum, rahimde olan kuzu ve bu kuzunun bereketle bir anılması kutsal bir eylemdir. Kutsal olması nedeniyle ritüelistik formları da beraberinde getirmiştir.

Sayanın bir tören olarak algılanması özellikle geçmiş dönemlerde geçimin tarım ve hayvancılıkla sağlanmış olmasıyla alakalıdır. Günümüzde de tarım ve hayvancılık vardır fakat geçmiş yıllarda olduğu gibi değildir. Bu törenlere ayrıca önem verilmesi ise geçmişe işaretir. Çünkü insanlar bolluk ve bereket algısını birtakım ritüeller etrafında sembolleştirerek bayram olarak kutlamıştır. Tıpkı koç katımında olduğu gibi kuzunun ana rahmine düşmesi nasıl bereketin başlangıcı ise saya da canlanmasına işaretir. Yani yeni bir başlangıç ve yeni bir kuzu müjdesidir. Bu nedenle bitkilerin yeniden canlanmasının adı olan Nevruz gerçeğinde olduğu gibi ve hayvanların üremesi de bereketle ilişkilendirilmiştir.

TARTIŞMA

Saya Töreninin İcrası ve Fakelore

Başlıklar hâlinde izah edilmeye çalışılan törenin bugün için taşıdığı kimlik önemlidir. Çünkü günümüzde Gölcük köyünde özellikle kış aylarında nüfus yok denecek kadar azdır. Dolayısıyla geleneksel anlamda birtakım uygulamaların icra edilmesine vesile olacak bir hayat tarzı da bulunmamaktadır. Çünkü insanların öncelikleri farklılaşmış, gelenek merkezli yaşam yerini geçim istekli hayata bırakmıştır. Gelenekli yaşamın gayelerinden birinin de geçim derdi olduğu inkar edilemez fakat günümüzde olduğu gibi geleneğin göz ardı edildiği durumlar geçmişte yoktu.

2018 yılında katıldığımız saya törenine katılanlar İstanbul'dan kendi imkanlarıyla Gölcük köyüne gelmişlerdir. Onların kış ayında köylerini ziyaret etmelerinin altında yatan iki sebep vardır. Birincisi sıra hasretini dindirmek, ikincisi ise geçmiş dönemlerde köylerinde icra edilen saya

törenini yeniden gösterim olarak sunabilmektir. Bu ziyaretin temelinde çıkar amacı ya da herhangi bir beklenti bulunmamaktadır.

Yukarıda bahsedildiği gibi fakelore konusunda araştırmacıların üzerinde en fazla durdukları nokta, ticari amaçlarla yaratılan ve halk geleneğinde olmayan uydurma geleneklerdir. Katıldığımız törende uydurma bir geleneğin varlığından söz edilemez. Tam tersine katılımcılar kendi imkanlarıyla uzak yoldan gelip geleneği canlandırma gayesi ile hareket etmişlerdir. Ayrıca geleneksel olarak icra edilen formlar da geçmiş dönemlerdeki ritüellerle benzerlik göstermektedir. Ortada uydurma denilebilecek bir durum söz konusu değildir.

Kültür ortamları içerisinde birçok farklı kültürel öge aktarım sürecine girebilmektedir. Örneğin Kars'ın Kağızman ilçesinde yapılan Hıdırellez kutlamalarına son zamanlarda yöre âşıkları da katılmaya başlamış ve böylece kültür ortamı içerisinde çok katmanlı bir kültür aktarımı meydana gelmiştir. Aynı şekilde Hamamönü Hıdırellez Şenliği içerisinde dâhil edilen bu tür uygulamalar hem eğitimsel bir görev üstlenmekte hem de çok katmanlı bir kültür ortamı oluşturmaktadır. Dolayısıyla ticari, siyasi vb. bir kaygıyla ortaya çıkmayan bu tür uygulamaları folklorun değişken yapısıyla ilişkilendirmek daha doğru olacaktır (Aslan, 2020: 78). Bu noktada Koyulhisar'da 2018 kışında icra edilen saya törenlerini de geleneğin aktarımı olarak görmek mümkündür. Değişen hayat şartları ile birlikte yok olmaya yüz tutmuş bir gelenek, geleneğine bağlı topluluk tarafından tekrar icra edilmek suretiyle canlandırılmak istenilmektedir. O topluluk içinde bulunan çocukların tanıklığı ise bu geleneğin üç kuşak sonrasına da aktarılabilceği sezisine araştırmacıları sevk etmektedir. Çünkü bu tür uygulamaları görenlerin, üç kuşak sonra yaşayanlara, icra edemese bile anlatması geleneğin varlığının dillendirilmesi açısından önemlidir.

Orada bulunan topluluk için ki bunlarında başında çocuklar gelmektedir. Kültürün “biz” deme ve kültür unsurunu geleceğe nakledebilme vasfı karşımıza çıkmaktadır. Assmann'a göre “Kültürün iki yönü, yani kuralcı ve anlatsal, yönlendirici ve nakledici yönü bireylere “biz” deme imkânı veren kimlik ve aidiyet temellerini yaratır. Tek tek bireyleri böyle bir “biz” de birleştiren, bir yandan ortak kurallar ve değerlere bağlılık, öte yandan ortak yaşanmış geçmişin anılarına dayanan, ortak bilgi ve kendini algılayış biçiminin oluşturduğu bağlayıcı yapıdır.” (Assmann, 2015: 23). Bağlayıcı yapının oluşması için hatıraların birliktelik duygusunu güdülemesi gerekmektedir. Genel kanaate göre hatırlama zihinsel bir faaliyettir. Hatırlama kavramı etrafında üç farklı bellek yaklaşımından bahsedilmektedir. Bireysel bellek, yani insanın içkin anılarından

hareketle hatırlamadır. Kolektif yani toplumsal bellek ise toplum içindeki anıların yine o kolektif alan içinde hatırlanacağını ileri süren bir yaklaşımdır. Üçüncü yaklaşım olan kültür bellekteyse anahtar kelime gelenektir. Bireysel ve toplumsal bellekteki hatırlama gelenek kadar uzun süreli değildir. Gelenekte yani kültürel bellekte hem geçmiş kavranmış hem de bellek kültürel form kazanmıştır (İlhan, 2018: 24-25). Asmann'ın vurguladığı biz duygusu ve Emir İlhan'ın dillendirdiği kültürel bellek kavramı bir araya gelince anlam kazanmaktadır. Çünkü bireyin kendi kimliğinden sıyrılıp bir aileye, topluluğa, topluma üye olması onlarla birlikte hareket edip, belli kültürel formlar etrafında benlik duygusunu yaşaması insanı birey olmaktan çıkararak ait olduğu yerin parçası hâline getirir. Ait olunan yerdeki kültürel zenginlikler ise kültürel hafızada kodlanmış olarak saklanır. Gelecek kuşaklara aktarılacak bireyler arasında bağ kuracak yapıda önem arz eder. Ulus devletlerin ortaya çıkışı ile birlikte hayati önem taşıyan kültürel zenginlikler sonraki süreçte aynı kültüre mensup olan bireylerin arasında sıkı münasebetlerin kurulmasına dolayısıyla birlikte hareket etme yetisi kazanmasına vesile olmaktadır.

Sonuç ve Öneri

Koyulhisar Sivas'ın bir ilçesi olmakla birlikte kültürel anlamda kendine has yapısı ile önem arz etmektedir. İlçeyle ilgili yapılan çalışmalar daha çok jeoloji alanıyla sınırlı kalmış olup, ilçenin ve orada yaşayanların kültürel zenginlikleri derinlemesine incelenmemiştir. 2018 yılında icra edilen saya töreni de bunlardan biridir.

Saya törenleri Anadolu coğrafyasında uzun zamandan beri kutlanan bir gelenek olmasıyla birlikte son dönemlerde değişen hayat şartları nedeniyle eski gelenekli yapısından uzaktır. Hayvancılıkla geçimini sağlayan insanların bolluk ve bereket algısının nişanelerinden olan bu tören koyunun kuzulaması, olanın artması, eve, köye bereket gelmesi için icra edilen birtakım ritüelleri içinde barındırır. Ritüellerde geleneksel halk gösterimine ait rollerin olduğunu ve bu rollerin farklı mekânlarda farklı topluluklarca icrası sırasında değişkenlikler olabileceğini tespit etmek mümkündür.

Geleneğin yaşatılması için İstanbul'dan gelen misafirler tarafından Gölcük köyünde icra edilen bu etkinlik kültürel zenginliğin gelecek kuşaklara aktarılmasına adına hem bir yeti hem de özlem duygusunun yansımasıdır. Geleneğin bu formda icra edilmiş olmasının uydurma olarak

görülmesi yanlış olur. Çünkü herhangi bir çıkar güdülmediği, insanların tek gayelerinin eskiye özlem ve geçmişte olanı bugün de canlandırabilmek olduğuna tanıklık edilmiştir.

Bu bağlamda geleneğin yaşatılması için icra edilen her türlü uygulamanın aynı zamanda somut olmayan kültürel mirasın yaşatılmasına vesile olduğu, Koyulhisar gibi kültürel varlıkları çok fazla gün yüzüne çıkarılmamış alanlarda farklı disiplinlerce ortak araştırmalar yapılmasının Türk kültürüne katkısının olacağı gerçeğinden hareket edilmesi gerektiği tarafımızca önerilmektedir.

Ekler

1- Gölcük Köyü

2- Sığirci geleneği deve ve çoban rolü

3- Saya geleneği şeytan rolü

4- Saya geleneği dede rolü

5- Saya geleneği kızlar rolü

6- Saya geleneği

7- Saya geleneği kız kaçıрма

8- Saya geleneği ceza verme

9- Saya geleneği

ÖZET

Ekolojik ayak izi, bireylerin çevre üzerindeki etkilerinin neler olabileceğini öngörmemize yarayan sayısal bir göstergedir. Bu nedenle çevreye yönelik davranış ve tutumların olumlu yönde geliştirilmesine farkındalık oluşturması adına ekolojik ayak izi bir hesaplama aracı olarak kullanılmaktadır. Bu bağlamda araştırmanın amacı sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarını belirlemektir. Araştırmanın modeli nicel araştırma yöntemlerinden tarama modeli olarak belirlenmiştir. Araştırmanın örneklemini 207 sınıf öğretmeni oluşturmaktadır. Araştırmanın veri toplama aracı olarak, Tekindal ve diğerleri (2021) tarafından tasarlanan 30 maddeden oluşan ve 5'li likert tipinde hazırlanmış Ekolojik Ayak İzi Farkındalık Ölçeği kullanılmıştır. Elde edilen verilere göre sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarının yüksek düzeyde olduğu tespit edilmiştir. Ayrıca sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarının deneyim ve cinsiyet değişkenlerinde anlamlı farklılık gösterdiği, çalışılan bölge değişkenine göre ise herhangi bir fark bulunmadığı sonucuna ulaşılmıştır. Çevre eğitiminin erken yaşlardan itibaren çocuklara kazandırılması gerekliliği göz önüne alındığında sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarına yönelik eğitimlerle kendilerini geliştirmeleri ve sınıf içi etkinliklerde ekolojik ayak izine yönelik etkinlikleri kullanmaları önerilmektedir.

Anahtar Kelimeler: İlkokul, Çevre Eğitimi, Ekolojik Ayak İzi, Sınıf Öğretmeni

ECOLOGICAL FOOTPRINT AWARENESS LEVELS OF PRIMARY SCHOOL TEACHERS

ABSTRACT

Ecological footprint is a numerical indicator that allows us to predict the effects of individuals on the environment. For this reason, ecological footprint is used as a calculation tool in order to create awareness for the positive development of behaviors and attitudes towards the environment. In this context, the aim of the research is to determine the ecological footprint awareness of primary school teachers. The research model was determined as survey model from quantitative research methods. The sample of the study consists of 207 primary school teachers. The Ecological Footprint Awareness Scale designed by Tekindal et al. (2021), consisting of 30 items and prepared in 5-point Likert type, was used as the data collection tool of the study. According to the data obtained, it was determined that the average ecological footprint awareness scores of primary school teachers were at a high level. In addition, it was concluded that the mean scores of ecological footprint awareness of primary school teachers showed a significant difference in experience and gender variables, while there was no difference according to the region of work. Considering that environmental education should be provided to children from an early age, it is recommended that primary school teachers should improve themselves with trainings on ecological footprint awareness and use ecological footprint activities in classroom activities.

Keywords: Primary School, Environmental Education, Ecological Footprint, Primary School Teacher.

GİRİŞ

İnsanların hayatını devam ettirdiği ve gereksinimlerini karşıladığı alana çevre denir. İnsanlar buldukları çevre aracılığıyla yiyecek, barınma, giyinme gibi temel ihtiyaçlarını karşılamaktadırlar (Engin, Demiriz ve Koçyiğit, 2023). Bu sebeple çevrenin hayatımızdaki rolü yadsınamaz. İnsanlığın ilk yıllarında insanların çevreye ilişkin yapmış olduğu çalışmalar herhangi bir tehlike oluşturmamaktaydı. Fakat zaman geçtikçe insanlar değişim ve gelişim içine girmişlerdir. Bu sebeple insanların hayatlarında da zamanla değişimler meydana gelmiştir. Meydana gelen bu değişimler, insanların doğaya karşı tutumlarına da etki etmiştir. Sanayi devriminin ön plana çıkmasıyla birlikte kaynaklar gereğinden fazla kullanılmaya başlanmıştır. Çünkü bu dönemde iyileşen yaşam standartları birlikte nüfusta da artış olmuştur. Bu artış beraberinde tüketimin de artmasına neden olmuştur. Tüketimin bir hayli fazla kullanılması da çevre ile ilgili problemlere sebep olmuştur (Özbuğutu, Karahan ve Tan, 2014).

Ortaya çıkan çevre problemleri giderek artarak canlıların da hayatını olumsuz etkilemiştir. 2022 yılı Küresel Riskler Raporu'na bakacak olursak önümüzdeki on yılda gerçekleşmesi muhtemel on riskte beş farklı çevresel problemle karşılaşmaktayız. Bu çevresel problemlerden ilk üçü; iklim için faaliyete geçmede karşılaşılan başarısızlık, hava olaylarında meydana gelen aşırılık ve biyoçeşitliliğin azalması (World Economic Forum, 2022) şeklinde sıralanmıştır. Buradan hareketle çevre sorunlarına karşı tedbir almanın gerekliliği ortaya çıkmaktadır. Çevre ile ilgili problemleri konu edinmiş birçok araştırma uzun süredir alan yazında varlığını sürdürmektedir. Ancak son yıllarda çevre konusunda yapılmış kayda değer ilerlemeler, bu konuya yönelik gerçekleştirilecek araştırmaların da önemini vurgulamıştır (Küçükbaş Duman ve Atabek Yiğit, 2022). Yapılan çalışmalarda çevre ile ilgili problemlerin kaynağında insanların önemli bir etkiye sahip olduğu görülmektedir (Atabek Yiğit, 2009; Atabek Yiğit ve Darçın, 2014). Çevre korumaya yönelik yapılan çalışmalardan hareketle çevre farkındalığı, çevreye yönelik tutum, çevre dostu davranışlar ve çevre bilinci gibi birden fazla kavramın ön plana çıktığı görülmektedir (Engin, Demiriz ve Koçyiğit, 2023). Stockholm'de düzenlenen İnsan ve Çevre Konferansı ile çevre sorunları uluslararası bir platformda tartışılmıştır. Ardından 22 Ekim 1975 tarihinde UNESCO, "Uluslararası Çevre Eğitimi Programı" düzenlemiştir. Bu programın sonrasında ise "Belgrat Şartı" isimli bir bildirge yayınlamıştır. 1977'ye gelindiğinde Tiflis'te "Hükümetler Arası Çevre Eğitimi Konferansı" yapılmış burada da Tiflis Bildirgesi adlı bir bildirge yayınlanmıştır. Düzenlenmiş olan

bu konferanslar neticesinde insanlar için çevreyi korumanın ve geliştirmenin gelecek nesiller için kuşkusuz önemli bir görev olduğu ortadadır. Bunun sağlanabilmesi için gerekli görülen en önemli konunun ise çevre eğitimi olduğu görüşü savunulmuştur (Karakaş, Doğan ve Sarıkaya, 2016).

Yeryüzünde bulunan kaynakların tükenebileceği düşüncesinin ortaya çıkmasıyla birlikte bu kaynakların kullanımında daha dikkatli ve sürdürülebilir bir bakış açısıyla tüketiminin daha doğru sonuçlar ortaya çıkaracağı belirtilmiştir (Caba, 2021). Çevre eğitiminin amacı da sürdürülebilir kalkınmayı sağlayacak bilinçlenmeyi gerçekleştirmektir (Karakaş, Doğan ve Sarıkaya, 2016). Bu bağlamda sürdürülebilir anlayışla birlikte 'Ekolojik Ayak İzi' kavramı ortaya atılmıştır. Kavram ilk kez 1990'lı yıllarda William Rees ve Mathis Wackernagel tarafından ortaya atılmıştır. Ekolojik ayak izi; insanların yaşamlarını sürdürebilmek için tabiat üzerindeki isteklerini, atıkların ortadan kaldırılması için gerekli görülen biyolojik açıdan üretkenliğe haiz bölgelerin miktarı ve kaynak sağlama ile karşılaştırır (WWF, 2016). Ekolojik ayak izi, bireylerin çevre üzerindeki etkilerinin neler olabileceğini öngörmemize yarayan sayısal bir göstergedir. Bu nedenle çevreye karşı davranış ve tutumların olumlu yönde geliştirilmesinde etkili bir hesaplama aracı olarak kullanılmaktadır (Çıkrık ve Yel,2019). Ekolojik ayak izi hesaplamasıyla biyokapasitesiyle yenilenebilir kaynakların tüketimini kıyaslanarak insanların biyosferden talebi araştırılır. Ekolojik Ayak İzi'nde küresel hektar (kha) diye adlandırılmış olan ortak bir birimle hesaplamalar yapılır. Ekolojik ayak izi tüketime dair farklı bileşenler ortaya konularak ortaya çıkarılmaya çalışılır. Karbon tutma, otlak, orman, tarım arazisi, balıkçılık sahası ayak izi ve yanı sıra yapılaşmış alan da ekolojik ayak izinin bileşenleridir. Okyanuslar tarafından tutulan CO₂ emisyonu, fosil yakıt tüketimi ve bunların emisyonu karbon ayak izi bileşenini oluşturmaktadır. Odun ürünleri, kâğıt hamuru, tüketilen tomruk ile yakacak odunu karşılamak için gerekli görülen ormanlık bölgelerin hesaplanması ile de orman ayak izine ulaşılmaktadır. Et, deri, süt ve yünün elde edildiği, hayvancılık yapılan bölgelerin hesap edilmesiyle otlak ayak izi hesaplanır. Balıkçılık sahası ayak izi; deniz ürünlerinin çıkarıldığı denizler ve tatlı su kaynaklarının hesaplanmasıyla elde edilir. Bireysel gereksinimlerin karşılandığı üstyapı ve altyapı alanlarının (enerji santralleri, ulaşım ve konut dahil olacak şekilde) hesaplanması ile ulaşılan alan yapılaşmış alan ayak izi olarak tanımlanmaktadır (WWF, 2012). Tüm bu tüketim alışkanlıklarına bakılarak bireylerin ekolojik ayak izi hesaplamalarına yapılmakta, bireyin çevreye karşı daha duyarlı ve tüketim alışkanlıklarına yönelik farkındalık kazanmaları beklenmektedir.

Çevre bilincinin kazandırılması ile birlikte sürdürülebilir bir hayat için ihtiyaç duyulan ve çevre ahlakını oluşturmayı hedefleyen çevre eğitiminin, insanlara küçük yaşlarda verilmesi önemle vurgulanır (Güngör ve Cevher Kalburan, 2021). Bu çağlarda çocukların zamanlarının önemli kısmını okul ortamında geçirmektedirler. Kendilerine rol model olan öğretmenler, öğrencilerin çevreye ilişkin farkındalık kazanmasında, çevreye yönelik olumlu davranış ve tutum geliştirmelerinde etkili olmaktadır (Engin, Demiriz ve Koçyiğit, 2023). Ayrıca çevre bilinci kazanmış, sürdürülebilir davranış özellikleri gösteren kuşaklar yetiştirmek istiyorsak bunu öğretmenler aracılığıyla yapmak mümkündür. Bu nedenle çevre konusunda öğrencilere rol model olacak öğretmenlerin konu ile ilgili alan bilgileri önemli görülmektedir. Çünkü öğretmenlerin sahip oldukları alan bilgisini derslerde öğrencilere aktarabilmeleri onlarda istenen özelliklerin gelişiminde etkilidir (Arslan ve Yağmur, 2022). Görev yapmakta olan öğretmenlerin nesilleri sürdürülebilir kalkınma bilinciyle yetiştirerek geleceği şekillendirmektedirler (Mckeown, 2012). Hiç şüphesiz sınıf öğretmenleri de geleceği şekillendiren öğretmenlerin başında gelmektedirler. Eğitimin temellerinin küçük yaşta atıldığını düşünülürken sınıf öğretmenlerinin bu konuda ne kadar büyük bir öneme sahip olduğunun farkına varmaktayız. Literatüre baktığımızda ekolojik ayak izi ile ilgili fen bilimleri (Keleş ve Aydoğdu, 2010; Sivrikaya, 2018), okul öncesi (Güngör, 2019; Güngör ve Cevher Kalburan, 2021), biyoloji (Akyüz, 2019; Çıkrık ve Yel, 2019), beden eğitimi (Küçükbaş-Duman ve Atabek-Yiğit, 2022) öğretmenleriyle veya farklı branşlardaki öğretmen adaylarıyla (Caba, 2021; Çelenk, 2019; Günal, Yücel-Işıldar ve Atik, 2018; Özyürek, vd., 2022; Yıldız, 2018; Yiğitkaya, 2019) yönelik yapılan çalışmalar mevcuttur. Ancak alan yazında sınıf öğretmenlerinin bilgilerini ortaya koyan çalışmalar sınırlıdır. Bu bağlamda sınıf öğretmenleriyle yapılacak bir çalışma araştırmacılarca önemle görülmüştür. Araştırmanın amacı sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarını belirlemektir. Bu amaç doğrultusunda aşağıda belirtilen alt problemlere cevap aranmıştır:

1. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarında cinsiyet değişkenine göre anlamlı bir farklılık var mıdır?
2. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarında okulun bulunduğu bölgeye göre anlamlı bir farklılık var mıdır?
3. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarında kıdem değişkenine göre anlamlı bir farklılık var mıdır?

YÖNTEM

Araştırma Modeli

Araştırmanın modeli nicel araştırma yöntemlerinden tarama modeli olarak belirlenmiştir. Bu model, geçmişte gerçekleşmiş veya halen devam etmekte olan bir durumu açık bir biçimde betimlemeyi amaçlarken (Karasar,2012) aynı zamanda belirli bir konu hakkında bireylerin tutumlarını gösteren ya da onların görüşlerini alan bir yöntemdir (Büyüköztürk, vd., 2016). Modelle sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarını tespit edilmek istenmiştir. Ayrıca farkındalıklarını etkileyen değişkenlerle ilgili verilere de ulaşılmıştır.

Evren ve Örneklem

Araştırmanın evreni, 2022-2023 eğitim öğretim yılında Türkiye sınırları içindeki ilkokullarda görevini sürdürmekte olan sınıf öğretmenleridir. Sınıf öğretmenleri kolay ulaşılabilir örnekleme göre belirlenmiştir. Kolay ulaşılabilir örneklem; araştırmacının evrenden çalışmak istediği örnekleme ulaşabilmek için kolay ulaşılır öğelere yer vermesidir (Patton, 2005). Buradan hareketle Türkiye'deki birçok şehirden çevrimiçi olarak ulaşılan ve formu gönüllü olarak dolduran 207 sınıf öğretmenine ulaşılmıştır. Ulaşılabilen sınıf öğretmenlerinin demografik özellikleri Tablo'1 de sunulmuştur.

Tablo 1. Ulaşılan sınıf öğretmenlerinin demografik özellikleri

Değişkenler	Gruplar	Öğretmen Sayısı	Yüzde (%)
Cinsiyet	✓ Kadın	123	59.4
	✓ Erkek	84	40.6
Hizmet Süresi	✓ 1-5 Yıl	77	37.1
	✓ 6-10 Yıl	52	25.0
	✓ 11-15 Yıl	29	14.0
	✓ 16-20 Yıl	22	10.5
	✓ 21 Yıl ve Daha Fazlası	27	13.4
Okulun Bulunduğu Bölge	✓ Şehir Merkezi	135	65.2
	✓ Kırsal Bölge	72	34.8
Toplam		207	100

Tablo 1'de katılımcıların öğrenim durumu, hizmet süresi, cinsiyet ve okulun bulunduğu bölge dağılımları gözlemlenmektedir. Tabloya göre katılımcıların hizmet süresi 1-5 yıl olanların oranı %37.1; 6-10 yıl olanların oranı %25.0; 11-15 yıl olanların oranı %14.0; 16-20 yıl olanların oranı %10.5 ve 21 yıl ve daha fazla olanların oranı ise %13.4 olduğu; %59.4'ünün kadın, %40.6'sının erkek olduğu; %34.8'inin kırsal bölgede %65.2'sinin ise şehir merkezinde çalışmakta olduğu belirlenmiştir.

Veri Toplama Aracı

Bu araştırmada veri toplama aracı olarak Tekindal vd., (2021) tarafından oluşturulan 30 maddelik 5'li likert tipinde yer alan Ekolojik Ayak İzi Farkındalık Ölçeği kullanılmıştır. Ekolojik Ayak İzi Farkındalık Ölçeği beşli likert tipinde hazırlanmış ve ölçekte puanlama; "Kesinlikle Katılıyorum" (5), "Katılıyorum" (4), "Kararsızım" (3), "Katılmıyorum" (2), "Kesinlikle Katılmıyorum" (1) şeklinde oluşturulmuştur. Bu bağlamda bakıldığında ölçekten elde edilen en düşük puan 30 olarak bulunurken, en yüksek puan 150 olarak hesap edilmiştir. Ölçekten alınan ortalama puanın yüksekliği veya düşüklüğü katılımcıların ekolojik ayak izi farkındalıklarını ifade etmektedir. Bu ölçeğin çalışma amacını yansıttığı görülerek bu araştırmada kullanılmasına karar verilmiştir. Ölçeğin Crombach Alpha güvenirlik katsayısı 0,96 olarak hesaplanmış ve veri toplama aracının yüksek derecede güvenilir olduğu görülmüştür.

Verilerin Analizi

Çalışmada yer alan maddelerin analizinden önce uygulanan değişkenler için veri dağılım normalliğine bakılmıştır. Bu verilerin normalliği için Shapiro Wilk ve Kolmogorov-Smirnov^a testleri gerçekleştirilmiştir. Veri sayısının 207 olduğundan Kolmogorov-Smirnov testi sonuçları ile karşılaştırılmış olup, 0.05'ten büyük olması ve çarpıklık ile basıklık katsayılarının +1 ile -1 aralığında bulunması verilerin normal dağılım gösterdiğinin kanıtı olarak sunulmuştur. Sınıf öğretmenlerine uygulanmış olan Ekolojik Ayak İzi Farkındalık Ölçeği sonuçları Tablo 2'de sunulmuştur.

Tablo 2. *Ekolojik Ayak İzi Farkındalık Ölçeği Normallik Dağılım Sonuçları*

Kolmogorov-Smirnov ^a			Shapiro-Wilk			Çarpıklık Aralığı	Basıklık Aralığı
Statistic	df	Sig.*	Statistic	df	Sig.		
0.160	207	0.000	0.767	207	0.000	-2.562/0.169	10.159/0.337

* $p < 0.05$

Tablo 2'de görüldüğü üzere, Kolmogorov-Smirnov^a normallik analizinde verilerin normal dağılım göstermediği ($p < 0.05$) hesaplanmıştır. Çarpıklık ve basıklık katsayı kontrol edilmiş ve katsayıların +1 ile -1 aralığında da bulunmadığı tespit edilmiştir. Bu hesaplamalar dikkate alınarak veri analizlerinde nonparametrik ölçümlerin kullanılmasına karar verilmiştir. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanları cinsiyet ve çalıştıkları bölge değişkenine göre Mann-Whitney U testi ile karşılaştırılırken, mesleki deneyim değişkenine göre Kruskal-Wallis H

Testi ile karşılaştırma yapılmıştır. Etki büyüklüğünün hesaplaması için Cohen tarafından oluşturulmuş hesaplamalar (*Cohen's f* ve *Cohen's d*) kullanılmıştır.

BULGULAR ve TARTIŞMA

Bu çalışmada, sınıf öğretmenlerinin ekolojik ayak izi farkındalıkları belirlenmiştir. Bu amaç doğrultusunda sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanları Tablo 3'te sunulmuştur.

Tablo 3. *Sınıf Öğretmenlerinin Ekolojik Ayak İzi Farkındalık Ortalama Puanları*

	N	Min	Max	S.S.	\bar{X}
Ekolojik Ayak İzi Farkındalık Ortalama Puanları	207	1,07	5.00	0.45	4.34

Yukardaki tabloda sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarına ilişkin ortalama puanlarına yer almaktadır. Bu bağlamda tablo incelendiğinde sınıf öğretmenlerinin ekolojik ayak izine ilişkin farkındalık ortalama puanlarının ($\bar{X}=4.34$) tamamen katılıyorum düzeyinde olduğu görülmektedir. Buradan hareketle sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarının yüksek olduğu tespit edilmiştir.

Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanları cinsiyet değişkeni esas alınarak hesaplanmış ve Mann-Whitney U testi sonuçları Tablo 4'te sunulmuştur.

Tablo 4. *Ortalama Puanların Cinsiyet Değişkenine Göre Karşılaştırılması*

Cinsiyet	N	Sıra Ortalaması	Mann-Whitney U	z	p	η^2
Kız	123	116.09	3679.00	-3.519	0.000	0.30
Erkek	84	86.30				

Mann-Whitney U=3679.00; z=-3.519; p=0.000; $\eta^2=0.21$

Sınıf öğretmenlerinin ekolojik ayak izi farkındalık sıra ortalama puanları cinsiyet değişkenine göre anlamlı bir farklılığın gerçekleştiği görülmektedir ($p<0.05$). Cinsiyet değişkeninde sınıf öğretmenlerinin sıra ortalamaları incelendiğinde kadın öğretmenlerin ortalamalarının (116.09) erkek öğretmenlerin ortalamalarından (86.30) yüksek olduğu sonucuna ulaşılmıştır. Buradan hareketle sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarında cinsiyet değişkenine göre

kadın öğretmenler lehine anlamlı bir farklılık olduğu gözlemlenmektedir. Ancak yapılan araştırmada ulaşılan veriler etki büyüklüğünün ($\eta^2=0.30$) ise zayıf olduğunu göstermektedir. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanları çalıştıkları bölge değişkenine göre hesaplanmış ve Mann-Whitney U testi sonuçları Tablo 5’te sunulmuştur.

Tablo 5. Ortalama Puanların Çalışılan Bölge Değişkenine Göre Karşılaştırılması

Bölge	N	Sıra Ortalaması	Mann-Whitney U	z	p	η^2
Şehir Merkezi	135	104.38	4808.50	-0.126	0.900	-
Kırsal	72	103.28				

Mann-Whitney U=4808.50; z=-0.126; p=0.900

Sınıf öğretmenlerinin çalıştıkları okulun yer aldığı bölge değişkenine göre sıra ortalamaları incelendiğinde şehir merkezinde çalışan sınıf öğretmenlerinin sıra ortalamasının (104.38) kırsal bölgede çalışan sınıf öğretmenlerin sıra ortalamasından (103.28) yüksek olduğu tespit edilmiştir. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık sıra ortalama puanları okulun yer aldığı bölge değişkenine göre anlamlı farklılığın meydana gelmediği görülmektedir ($p<0.05$). Buradan hareketle sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarında okulun yer aldığı bölge değişkeni esas alındığında anlamlı bir farklılık olmadığı sonucuna ulaşılmaktadır. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanları mesleki deneyim değişkenine göre hesaplanmış ve Kruskal-Wallis H Testi ile Tablo 6’da sunulmuştur.

Tablo 6. Ortalama Puanların Mesleki Deneyim Değişkenine Göre Karşılaştırılması

Deneyim	N	Sıra Ortalaması	Chi-Square χ^2	sd	p	η^2	Anlamlı Fark
1-5 yıl deneyim	77	89.16	12.047	4	0.017	0.26	6-10 yıl 16-20 yıl
6-10 yıl deneyim	52	117.35					1-5 yıl
11-15 yıl deneyim	29	101.26					-
16-20 yıl deneyim	22	131.34					1-5 yıl
21 yıl üzeri deneyim	27	101.30					-

$\chi^2(4, n=207) = 12.047$; $p=0.017$ $\eta^2=0.25$

Deneyim değişkeni esas alınarak yapılan incelemeler ışığında sınıf öğretmenlerinin ekolojik ayak izi farkındalık sıra ortalamalarının 16-20 yıl deneyimine sahip sınıf öğretmenlerinin en yüksek, 1-

5 yıl deneyimine sahip sınıf öğretmenlerinin ise en düşük (89.16) olduğu gözlemlenmiştir. Deneyim değişkeni esas alınarak yapılan incelemeler sonucunda sınıf öğretmenlerine ait ekolojik ayak izi farkındalık sıra ortalamaları karşılaştırıldığında anlamlı farklılık olduğu tespit edilmiştir ($\chi^2 = 12.047$ $p = 0.017$). Meydana gelmiş olan anlamlı farklılık detaylı incelendiğinde 1-5 yıl deneyime sahip sınıf öğretmenleri ile 6-10 yıl ve 16-20 yıl; 6-10 yıl deneyime sahip sınıf öğretmenleri ile 1-5 yıl; 16-20 yıl deneyime sahip sınıf öğretmenleri ile 1-5 yıl deneyime sahip sınıf öğretmenleri arasında ve 1-5 yıl deneyime sahip sınıf öğretmenlerin aleyhine bir durumun mevcut olduğu saptanmıştır. Ayrıca yapılan araştırmada ulaşılan veriler etki büyüklüğünün ($\eta^2 = 0.25$) orta düzeyde olduğunu göstermektedir. Bu bağlamda mesleki deneyim artışı sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarını arttırmaktadır yorumu yapılabilir.

SONUÇ ve ÖNERİLER

Bu çalışmada sınıf öğretmenlerinin ekolojik ayak izi farkındalıkları farklı değişkenler (okulun bulunduğu bölge, cinsiyet ve öğretmen deneyimi) esas alınarak incelenmiştir. Çalışma sonucunda sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarının yüksek olduğu tespit edilmiştir. Ayrıca sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarında cinsiyet değişkenine göre kadın sınıf öğretmenleri ve 16-20 yıl mesleki deneyime sahip sınıf öğretmenleri lehine anlamlı bir farklılık olduğu, görev yapılan bölge değişkenine göre ise herhangi bir farklılık bulunmadığı sonucuna ulaşılmıştır.

Çevre bilincinin kazandırılması ile birlikte sürdürülebilir bir hayat için ihtiyaç duyulan ve çevre ahlakını oluşturmayı hedefleyen çevre eğitiminin, insanlara küçük yaşlarda verilmesinin önemi büyüktür (Güngör ve Cevher Kalburan, 2021). Uğraş ve Zengin (2019) tarafından yapılmış olan araştırmada sürdürülebilir bir çevre için verilmesi gereken eğitimin okul öncesi dönemden itibaren başlamasının daha faydalı olacağı vurgulanmıştır. Ayrıca çalışmada okul dışında gerçekleştirilen gezilerin bu konuda en etkili metot olacağı da ifade edilmiştir. Küçük yaşlarda kazandırılması gereken çevre eğitiminin bu denli önemli görülmesi öğretmenlerin de çevre bilinci sahibi olmalarını kaçınılmaz kılmaktadır. Bu sebeple yapılan araştırmada sınıf öğretmenlerinin ekolojik ayak izine ilişkin farkındalık düzeylerinin ($\bar{X} = 4.34$) görüş ortalamalarının tamamen katılıyorum düzeyinde olduğu görülmektedir. Buradan hareketle sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarının yüksek düzeyde olduğu yorumu yapılabilir.

Araştırmada, sınıf öğretmenlerinin ekolojik ayak izi farkındalık ortalama puanlarının cinsiyete göre istatistiksel olarak anlamlı farklılık gösterdiği görülmüştür. Yapılan çalışmada tespit edilen bu bulgu, daha evvel yapılmış çalışmalar ile kıyaslandığında bazı araştırmaların sonuçlarıyla benzer olduğu gözlemlenirken, bazı araştırmaların sonuçları ile farklılaştığı görülmektedir. Alan yazın incelendiğinde ekolojik ayak izi farkındalık düzeylerinin cinsiyete göre herhangi bir değişikliğe neden olup olmadığını belirlemeye yönelik çalışmalar incelendiğinde, bazılarının (Yıldız, 2014; Günal ve diğ., 2018; Yiğitkaya, 2019) sonuçları kadın ve erkekler arasında anlamlı farklılık olmadığı yönünde iken; bazılarında da cinsiyete göre ekolojik ayak izi farkındalık düzeylerinin kadın ve erkekler arasında anlamlı bir farklılığa neden olduğu yönündedir (Keleş, Uzun ve Özsoy, 2008; Akıllı, Kemahlı, Okudan ve Polat, 2008; Çıkrık ve Yel, 2019). Puruçcuoğlu (2008), üniversite öğrencileri ile yaptığı araştırmasında kadınların enerji tasarrufuna erkeklere kıyasla daha yatkın olduklarını vurgulamıştır. Günal, Işıldar ve Atik (2018)'in yaptığı araştırma incelendiğinde erkekler ve kadınlar arasında “Gıda”, “Enerji” ve “Atıklar” alt boyutlarında anlamlı farklılık bulunmuştur. Yıldız (2014), fen ve teknoloji öğretmen adayları ile yürüttüğü çalışmasında ekolojik ayak izi farkındalık düzeylerinin cinsiyet değişkenine göre anlamlı farklılıklar tespit ettiğini belirtmiştir. Hatta kadın öğretmen adaylarının, erkek öğretmen adaylarına göre farkındalık düzeylerinin enerji, atıklar, ulaşım, barınma ve gıda boyutlarında anlamlı olacak şekilde yüksek olduğu sonucuna ulaşmıştır. Sınıf öğretmenlerinin ekolojik ayak izi ölçeğinden elde edilen sonuçlara bakıldığında ve bu çerçevede genel bir karşılaştırma yapıldığında elde edilen diğer sonuçlar ile benzerlik olduğu gözlemlenmiştir. Ekolojik ayak izi farkındalık ölçeğinden kadın öğretmenlerin ekolojik ayak izi farkındalık düzeylerinin erkek öğretmenlerin farkındalık düzeylerinden daha yüksek bulunması, kadınların erkeklere göre çevreye karşı daha duyarlı ve daha hassas davrandıklarından kaynaklanıyor olabilmektedir.

Sınıf öğretmenlerinin ekolojik ayak izi farkındalık düzeyleri çalıştıkları okulun yer aldığı bölge değişkenine bakıldığında anlamlı bir fark oluşturmamıştır. Bu bulgu Uyanık (2020), Demirkol ve Aslan (2021)'in yaptıkları çalışmalarla çelişmektedir. Araştırmacılar, sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarının okulun yer aldığı bölge değişkenine bakıldığında oluşan anlamlı farkın barınma ve ulaşım başlıklarında şehir merkezinde görev yapan öğretmenlerin lehine olduğunu vurgulamışlardır. Bu çalışmada ise sınıf öğretmenlerinin çalıştıkları okulun bulunduğu bölge değişkenine göre sınıf öğretmenlerin sıra ortalamaları incelendiğinde şehir merkezinde

çalışan sınıf öğretmenlerinin sıra ortalamasının (104.38) kırsal bölgede çalışan sınıf öğretmenlerin sıra ortalamasından (103.28) yüksek olduğu tespit edilmiş ancak anlamlı bir fark bulunamamıştır. Sınıf öğretmenlerinin ekolojik ayak izi farkındalık düzeyleri deneyim değişkeni esas alınarak sınıf öğretmenlerine ait sıra ortalamaları karşılaştırıldığında anlamlı farklılık olduğu tespit edilmiştir ($\chi^2 = 12.047$ $p=0.017$). Meydana gelmiş olan anlamlı farklılık detaylı incelendiğinde 6-10 yıl deneyime sahip sınıf öğretmenleri ile 1-5 yıl; 1-5 yıl deneyime sahip sınıf öğretmenleri ile 16-20 yıl; 16-20 yıl deneyime sahip sınıf öğretmenleri ile 1-5 yıl; 1-5 yıl deneyime sahip sınıf öğretmenleri ile 6-10 yıl deneyime sahip sınıf öğretmenleri arasında ve 1-5 yıl deneyime sahip sınıf öğretmenlerinin aleyhine bir durumun mevcut olduğu saptanmıştır. Baş (2011) da yaptığı çalışmada mesleki deneyime ilişkin çevre bilinci düzeylerini inceleyerek ölçeğin genelini yanı sıra alt boyutlarında da 6-10 yıl deneyime sahip öğretmenler ile yöneticilerin, 11 yıl ve üzeri deneyime sahip öğretmenler ve yöneticilerden daha az çevre bilinci edindiklerini tespit etmiştir. Yine Demirkol ve Aslan (2021) yaptıkları çalışmada, Ahi ve Özsoy (2015) ile paralel olarak 6-10 deneyime sahip öğretmenlerin çevreye ilişkin tutumlarının 1-5 yıl deneyime sahip öğretmenlere göre daha az olduğunu belirtmişlerdir. Mesleki deneyim arttıkça ekolojik ayak izi farkındalığının arttığı yorumu yapılabilir.

Öneriler

Araştırma sonuçlarında elde edilen bulgular ışığında ekolojik ayak izi farkındalığının geliştirilmesi ve gelecekte yürütülecek çalışmalar için öneriler sunulmuştur:

- ✓ Mesleğe yeni başlayan sınıf öğretmenlerinin ekolojik ayak izi farkındalıklarına yönelik eğitimlerle kendilerini geliştirmelerinin faydalı olacağı düşünülmektedir.
- ✓ Sınıf öğretmenlerinin farkındalıklarının yüksek olduğu görüldüğünden, sınıf içi etkinliklerde ekolojik ayak izine yönelik etkinlikleri kullanmaları önerilmektedir.
- ✓ Düzenlenecek etkinliklerin ilkökul öğrencilerinin de ekolojik ayak izi kavramını kazanmalarında yardımcı olabileceğinden aktif katılıma dayalı olması önerilmektedir.

ÖZET

Bu çalışmada motivasyon ve verimlilik arasındaki ilişki incelenmiştir. Bilindiği üzere motivasyon ve verimlilik arasındaki ilişki uzun yıllardan beri irdelenen ve açıklığa kavuşturulmaya çalışılan bir meseledir. Dört üretim faktöründen biri olan çalışanların (emeğin) verimi, işletmelerin verimlilik artışında önemli bir unsur olmaktadır. Ancak emeğin verimli olabilmesi için ne yapmak gereklidir? İşte motivasyon teorileri de bahsedilen ilişkiyi ortaya koymayı hedeflemektedir. Bu kapsamda, literatür taramasına dayanarak hazırlanan, çalışmada öncelikle motivasyon kavramı tarif edilmiş ve motivasyon çeşitleri üzerinde durulmuştur. İkinci aşamada ise motivasyon teorileri ele alınarak incelenmiştir. Bu itibarla önce kapsam teorileri incelenmiş sonrasında da süreç teorileri araştırılmıştır. Çalışmanın sonraki aşamasında ise öncelikle verimlilik kavramı ve olgusu üzerinde durulmuştur. Bu açıdan kavram târif edildikten sonra verimliliğin önemi açıklanarak verimliliği etkileyen faktörler irdelenmiştir. Tüm bunlardan sonra da motivasyon ve verimlilik arasındaki ilişkiler çeşitli açılardan ele alınarak açıklanmıştır. Bu çerçevede çalışanın örgütle olan etkileşiminin yanı sıra kişinin yaptığı işle olan etkileşiminin de önemli olduğu anlaşılmaktadır. Yine ekonomik, psiko-sosyal ve örgütsel-organizasyonel motivasyon araçları ile verimlilik artışı arasında ilişkilerin olduğu görülmektedir. Sonuçta yüksek işgücü motivasyonu verimlilik artışını beraberinde getirmektedir.

Anahtar Kelimeler: Motivasyon, verimlilik, insan kaynakları yönetimi

THE RELATIONSHIP BETWEEN MOTIVATION AND PRODUCTIVITY

ABSTRACT

In this study, the relationship between motivation and productivity has been examined. In fact, the relationship between motivation and productivity is an issue that has been examined and tried to be clarified for many years. The productivity of the employees (labour), which is one of the four production factors, is an important factor in the productivity increase of the businesses. But what needs to be done for labour to be productive? Motivation theories developed based on this question also aim to reveal this relationship. In this context, this study, which is based on a literature review, firstly describes the concept of motivation and focuses on the types of motivation. In the second stage, motivation theories are discussed and analysed. In this respect, scope theories were examined first and then process theories were investigated. In the next stage of the study, the concept and phenomenon of productivity was emphasized. In this respect, after defining the concept, the importance and essence of productivity is explained and the factors affecting productivity are examined. After all these, the relationship between motivation and productivity is explained from various perspectives. In this context, it is understood that besides the interaction of the employee with the organization, the interaction of the person with the job is also important. Again, it is seen that there are relationships between economic, psycho-social and organizational motivational tools and productivity increase. As a result, it is revealed that high labour motivation leads to increased productivity.

Keywords: motivation, productivity, human resource management

GİRİŞ

Motivasyon ve verimlilik ilişkisi işletmeler (ve pek tabii diğer örgütler) açısından uzun bir geçmişe sahip araştırma konusudur. Çünkü her işletme kâr etme amacı ve anlayışı üzerine organize edilmiştir. Kâr etmenin ve pek tabii olarak kâr maksimizasyonunun en önemli ayaklarından birisi de hiç şüphesiz verimliliktir. Verimlilik artışı ise, diğer faktörler saklı kalmak kaydıyla, işletmelerin en büyük güçleri arasında yer alan çalışanlarının, yani emeğin, verimlilik artışı ile ilişkili bir husustur. Bu bakımdan verimlilik artışı ile çalışan motivasyonu arasındaki bağlantı dikkate değer bir konudur ve çalışmada literatür taramasıyla bu meseleye dair bir inceleme yapılmıştır.

Motivasyon Kavramı

Motivasyon sözlükte “[b]ir işi yapma, işe ve öğrenmeye geçme isteği” diye açıklanırken (Ayverdi, 2011: 2123) literatürde eşanlamlı olarak bazen isteklendirme (Türko, 1973: 1) ve güdüleme ifâdelerinin de kullanıldığı görülmektedir (Bilecen, 2008: 3). Bununla birlikte motivasyon kavramı; insanı harekete geçiren ve hareketlerinin yönlerini tayin eden, düşünceleri, umutları, inançları yani arzu, ihtiyaç ve korkuları kapsayan durumu ifâde eden bir kavram olarak tanımlanmaktadır (Altok, 2009: 5). Yine önemle belirtmek lazımdır ki aslında motivasyon bir ihtiyaç ile başlayan sürece verilen isimdir; birbirine bağlı adımlardan oluşmaktadır (bkz Şekil1). Yani kişi bir ihtiyaç hissettiği anda uyarılma söz konusu olmakta ve bu da kişiye itici bir güç vererek onu davranışa yönlendirmektedir. Burada kişinin amacı da ihtiyaçlara karşı duyduğu isteği, tatminle sonuçlandırmak olmaktadır (Keser, 2013a: 29-30). Bu kapsamda motivasyonun kaynağı olan motiv çeşitlerine bakıldığında ise bunları iç motivler (güdüler), fizyolojik motivler, sosyal motivler ve psikolojik motivler olarak sıralamanın mümkün olduğu anlaşılmaktadır (Altok, 2009: 15-16).

Şekil 7 Motivasyon Süreci

Kaynak: (Altok, 2009: 20) ve (Keser, 2013a: 29-30)'dan faydalanılarak yazar tarafından oluşturulmuştur.

Motivasyon Teorileri

Motivasyon konusu daha evvel de işaret edildiği üzere çeşitli araştırma ve tartışmalara konu olmuştur. Bu bakımdan motivasyonu açıklamaya çalışan birçok teori mevcuttur. Bunlar temelde kapsam (içerik) ve süreç teorileri olmak üzere iki başlıkta toparlanmaktadır (en bilinen örnekleri için bkz. Şekil 2). Birinci gruptaki motivasyon teorileri adlandırmadan da anlaşılacağı gibi insanın güdülenmesinin sebeplerini yani açıkçası içeriğini araştırın kuramlardır. Bunlar güdülenmeyi ortaya çıkaran durumları, olayları, insanın ihtiyaçlarını bulmaya çalışmaktadırlar. İkinci grupta yer alan süreç teorileri ise, güdülenmenin nasıl oluştuğunu bir başka deyişle teşekkül aşamalarını araştırmaktadır. Yani süreç teorileri ihtiyacın doğuşundan kişinin doyumuna kadar gözlenebilen güdülenme sürecinin niteliğini tanımaya çalışmaktadır (Ergül, 2005: 69).

Şekil 8 Motivasyon Teorileri

Kaynak: (Keser, 2013b: 85-96)'dan faydalanılarak yazar tarafından oluşturulmuştur.

Verimlilik

Verimliliği, üretim faaliyetinde girdi olarak kullanılan emek, sermaye, toprak veya teknik bilgi gibi unsurların bir birimi başına üretilen mal ve hizmet miktarı şeklinde târif etmek mümkündür. Bir başka deyişle üretim sürecinde istifâde edilen faktörlerle bunun neticesinde elde edilen ürünler/çıktılar arasındaki ilişkidir; kaynakların savurganlıktan uzak ve en iyi şekilde değerlendirilmesine dayanmaktadır (Emiroğlu vd., 2006: 966). Türkçede müstahsiliyet, üretkenlik ve prodüktivite terimleriyle de karşılanmaya çalışılan verimlilik kavramı esâsen belirli üretim vasıtalarıyla âzami hâsılayı sağlamak veya belirli bir miktar hâsılayı asgarî üretim vasıtaları ile temin etmek olarak tarif edilebilmektedir (Zaim, 1997: 291). Yine bununla beraber verimlilik girdi-çıkıtı ilişkisinden ziyâde çalışma ve yaşama çevresinin kalitesinin de iyileştirilmesi ve geliştirilmesi şeklinde de anlaşılmaktadır. Gelişmiş ülkelerde sürdürülebilir ekonomik büyüme ile fiyat istikrarını korumanın temel unsuru olarak görülen verimlilik gelişmekte olan ülkelerde ise yapısal değişimi de içinde barındıran kalkınma ve gelişme problemlerinin çözüme ulaştırılması için etkin bir araç konumunda ele alınmaktadır (Emiroğlu vd., 2006: 966).

Verimliliğin niçin önemli olduğuna bakıldığında ise bugün hemen herkes tarafından kabul gören husus olarak karşımıza verimliliğin millî refahın artırılmasında son derece etkili olduğu gerçeği çıkmaktadır. Yine bununla beraber verimliliğin hızlı ekonomik kalkınmayı sağladığı, insanlara daha yüksek yaşama standardı getirdiği, ödemeler dengesine ve enflasyonun kontrol altında tutulmasına olumlu etki ettiği gibi başkaca pek çok ekonomik ve sosyal olayı da zikretmek mümkündür. Hâliyle bunlar da, ücret düzeylerini, maliyet/fiyat ilişkisini, sermaye yatırımı ihtiyacını ve istihdamı etkilemektedir. Bunlara ilaveten verimliliğin bir ülkenin mallarının uluslararası pazarlardaki rekabet gücünü de belirlediğini söylemek lazımdır. Bu bilgiler doğrultusunda verimliliği etkileyen faktörlere bakıldığında da bir çok etkenin var olduğu bir tabloyla karşılaşmaktadır. Çünkü üretim süreci, son derece karmaşık bir sosyal sistemdir; emek, sermaye ve sosyo-örgütsel çevre arası ilişkiler dengelenerek ve bir bütünlük kazandırılarak hareket edilmelidir (Prokopenko, 2003: 22-25). Bu kapsamda temel olarak verimliliği ekonomik faktörlerin, teknolojik faktörlerin ve sosyo-ekonomik faktörlerin etkilediğini söylemek mümkündür. Burada ekonomik faktörlerin de makro seviyede (konjoktür hareketleri, pazar hacmi, kaynak mobilitesi, hammadde temini ve kalitesi, sermaye ve kredi imkânları, vergileme vb.) ve işletme seviyesinde (kapasite kullanımı, kişi başına düşen sermaye miktarı, firma ölçeği, ücret sistemleri vb.) olmak üzere iki aşamada ele alındığı görülmektedir. Yine sosyo-ekonomik faktörler de işgücünün yapısı, eğitim ve nihayet işletmenin sosyal organizasyonu şeklinde alt dallara ayrılmaktadır (Delican, 1986: 58-79; Prokopenko, 2003: 25-37).

Motivasyon ve Verimlilik İlişkisi

Yönetimin temel fonksiyonlarından biri olarak görülen motivasyon (Erkut, 1993: 3) hiç şüphesiz işletmede verimliliği artırıcı hususlardan bir tanesini teşkil etmektedir. Öyle ki bir mânâda çalışanın gönül gücünü de belirten motivasyon kavramı çalışmada harekete geçmenin veya başlanılan hareketin kısa zamanda bitirilmesinin yani verimlilik artışının bir ifadesi olmaktadır. Bu durumun en mühim sebebi ise motive edilmiş kişinin işin başarılabilmesi için gereken fizikî ve zihnî kabiliyetlerini, bilgisini, becerisini ve diğer bütün özelliklerini sadakatle işine hasretmesidir (Delican, 1986: 210).

Motivasyon-verimlilik ilişkisine örgüt/işletme düzeyi açısından bakıldığında en önemli sacayaklarından birisinin hiç şüphesiz bireyin örgütle olan etkileşiminin olduğu anlaşılmaktadır.

Örgütün verimliliğini doğrudan etkileyebilen insan kaynaklarının verimlilik sağlanmasındaki durumunu;

- Örgütün çalışanlarına karşı tutumu
- İşletme ile çalışanların amaçlarının uyumlaştırılması ve çalışanların örgütsel amaçlarla güdülenmesi
- İş uğraşımı diğer deyişle çalışanların kendilerini işlerine vermelerinin sağlanması

olmak üzere üç başlıkta ele almak mümkündür (Pekel, 2001: 78-87).

Bireyin örgütle etkileşiminden başka motivasyon verimlilik ilişkisinde kişinin/bireyin işiyle olan etkileşimi de son derece önemli bir husustur. Nitekim bu çerçevede de;

- iş tatmini,
- devamsızlık,
- özerklik,
- görevin anlamı ve kimliği,
- beceri çeşitliliği,
- geri besleme,
- iş zenginleştirme,
- iş rotasyonu,
- iş basitleştirme

gibi birbirine benzer ve birbiriyle ilişkili hususları verimlilik artışının sağlanması noktasında göz önünde tutmak gerekmektedir (Yapar, 2001: 99-118).

Şekil 9 Motivasyon Araçları

Ekonomik Araçlar	<ul style="list-style-type: none">• Ücretlerin performansa bağlı olarak artırılması• İkramiyeler, primler, para ödülleri• Şirket kârından işgörenlere pay verilmesi• İşgörenlerin şirkete ortak edilmesi
Psiko-Sosyal Araçlar	<ul style="list-style-type: none">• Çalışmada bağımsızlık• Değer ve statü• Öneri sistemi• Psikolojik güvence
Organizasyonel Araçlar	<ul style="list-style-type: none">• Hedef belirleme• Terfiler• Yetkilendirme, Katarlara işgören katılımı• Eğitim imkanlarının sunulması• Esnek çalışma saatleri, evde çalışma imkan• İşyerindeki fiziki şartların iyileştirilmesi• Grup ve takım çalışmasının verleştirilmesi

Kaynak: (Örücü & Kanbur, 2008; Pekel, 2001)'den faydalanılarak yazar tarafından oluşturulmuştur.

Motivasyon ve verimlilik ilişkisine işletme düzeyi açısından yaklaşıldığında farklı durumlarla karşılaşıldığını belirtmek lazımdır. Çünkü işletmelerde motivasyonu özendirici çeşitli araçlar (bkz. Şekil 3) kullanılmaktadır, fakat her örgütte her zaman aynı etkiyi gösteren bir motivasyon faktörü ve aracı bulunamayabilmektedir. Yani bir çalışan için özendirici olan bir araç, başka bir çalışanda aynı etkiyi ortaya çıkartamayabilir. Yine ayrıca bu özendirici faktörlerin etkisi bireyin ihtiyaçları kadar toplumsal düzeye, eğitim durumuna, değer yargılarına ve çevreye de bağlı olabilmektedir (Örücü & Kanbur, 2008: 86-87).

SONUÇ

Uzunca bir müddetten beri motivasyon konusunda ortaya konulan araştırmalar bu konunun ne kadar çetrefilli ve esâsen çok boyutlu olduğunu göstermektedir. Ancak buna rağmen işgücünün verimliliğe etkisinin diğer üretim faktörlerine nazaran son derece fazla olduğunu da belirtmek lazımdır. Bu itibarla bakıldığında aslında konu belli başlı durumlar etrafında kümelenmektedir. Bunlardan ilki çalışanın örgütle olan etkileşimidir. Çünkü ancak sağlıklı bir etkileşim olduğunda bireyin veriminin artması mümkündür ki zaten bu da ister istemez işletme verimliliğine tesir edecektir. Yine bu meseleyle alâkalı olarak bir diğer durumun ise kişinin işiyle alâkalı olan etkileşimidir. Bu konuda mutlaka bilinmesi gereken bir husus da motivasyon araçlarının verimliliğe olan etkileri olmaktadır. Çünkü yapılan araştırmalar ortaya çıkarmaktadır ki ekonomik, psiko-sosyal ve de organizasyonel motivasyon araçları ile verimlilik artışı arasında ilişkiler mevcuttur. O hâlde yöneticilerin tüm bu hususlara dikkat ederek verimliliği artırmaları mümkündür. Bahsedilen bu hususlar yüksek işgücü motivasyonunun verimlilik artışını da beraberinde getireceğine işaret etmektedir.

ABSTRACT

Penetration resistance, also known as soil compaction, is one of the most important factors affecting soil productivity, fertility and sustainability. penetration resistance of the soil; Physiological properties such as sand, silt, and clay are closely related to moisture and bulk density, and this resistance directly affects the penetration of plant roots into the soil. This study was carried out in Sivas Science and Technology University Agricultural R&D and Application land. Relationships between some soil properties and penetration resistance were investigated in a total of 48 samples taken from 24 points from the surface and subsurface depth at 100*100 m intervals in a total of 240 da study area. As a result of the analyzes made on the soils taken, 58.33% of the surface soils have clayey texture, while this ratio has increased to 70.83% in the subsurface soils. As a result, the penetration resistances of the study area were high at a rate of 66.67% in surface soils and 54.17% in subsurface soils. Penetration resistance in surface soils varies between 1,16 and 2.65, while it is low in the northern part, this ratio increases towards the south and the penetration resistances increase, albeit partially. On the other hand, while the resistance in subsurface soils varies between 1,47 and 3.81, it shows a high characteristic especially in the northeast of the area, while it is at medium and low levels in the remaining parts.

Keywords: penetration resistance, soil, properties, texture, plant root development

INTRODUCTION

Soil used as agricultural production material consists of solid particles, liquid particles (soil water) and soil air, which is described as gas. In addition to the intensive use of agricultural tools and machinery, excessive and unconscious grazing is the main cause of soil degradation (Kunz et al., 2013; Negiş et al., 2020). Soil, whose natural structural structure deteriorates under mechanical effects and precipitation, comes together more tightly after disintegration, creating mass density and soil compaction (Turgut et al., 2010). Cultivation of agricultural lands for centuries causes soil compaction, causing significant loss of productivity in crop production. Soil aeration, plant root development, uptake of nutrients by plant roots and movement of water in the soil have an impact on yield.

Texture, structure, porosity, water content and cementing agents and compaction are among the soil properties that affect penetration resistance (Grunwald, 2001; Turgut and Öztaş, 2018). In soils where compaction occurs, plant root development is prevented due to mechanical resistance and root distribution is irregular (Turgut et al., 2010). In other words, achieving the desired yield in crop production is closely related to dynamic physical properties such as aeration, porosity, root penetration resistance and soil water content, as well as the availability of sufficient nutrients (Da Silva et al., 1994). The penetration resistance of soils is significantly affected by soil moisture and is easy to determine (Alaboz and Işıldar, 2021). Soil penetration resistance is a feature that can be easily and instantly determined in the field using a digital penetrometer.

Geostatistical approaches are widely used to determine spatial variability in soil properties (Turgut and Öztaş, 2012). It is known that soil properties change with distance, even at the series level (DeCourt et al., 1996). Geostatistics, an applied branch of statistics, is based on the principle of estimating regions without data using statistical methods, taking into account the distance between data that have a spatial relationship on a point-by-point basis (Karaman et al., 2012). Geostatistical techniques are widely used in soil science to examine the spatial variation of different soil properties at scales ranging from centimeters to kilometers (White et al., 1997; Goovaerts, 1998; Castrignano et al., 2000; Yang et al., 2001). Zhao et al (2007) determined the effect of grazing frequency on soil properties using geostatistical methods and revealed that exponential and global models best reflect the local variability of soil properties.

The aim of this study is to determine the relationship between some soil properties and penetration resistance of Sivas Science and Technology University agricultural application land by using geostatistical methods.

MATERIALS and METHODS

General characteristics of the research area

Sivas is located in the Central Anatolia Region of Turkey and is one of the oldest and most important cultural provinces of the region. Sivas province is surrounded by Tokat, Ordu, Giresun from the north; Erzincan from the east; Malatya, Kahramanmaraş and Kayseri from the south; It borders Yozgat provinces from the west. In the province of Sivas, which has a harsh continental climate, the winters are cold, hard and abundant with snow, and the summer months are hot, dry and short-term rains (Anonymous, 2023).

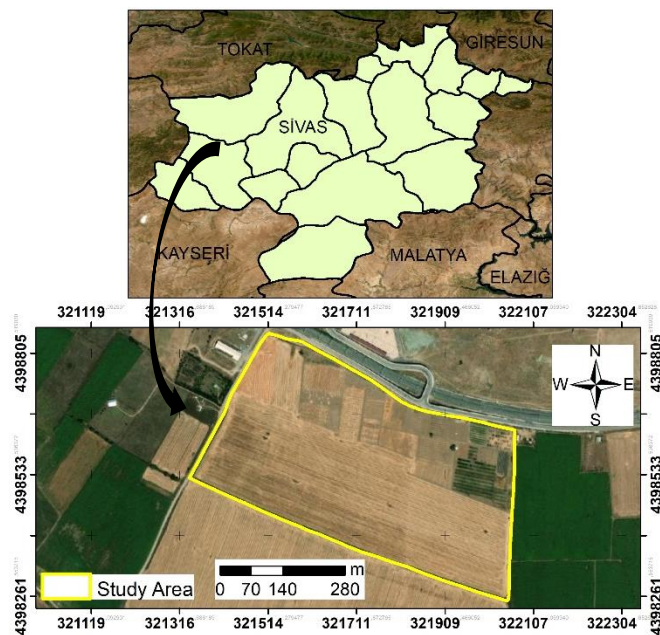

Figure 1. Study area location map

Soil sampling and laboratory analysis methods

The study was carried out on a 240-decare Agricultural R&D and Application land belonging to Sivas Science and Technology University, located in the city center of Sivas. A total of 48 samples were taken from 24 points at the surface and subsurface depth at intervals of 100 x 100 m within the study area and brought to the laboratory (Figure 2). After the samples brought to the laboratory

became air dry, they were crushed and sieved through a 2 mm sieve to make them ready for analysis.

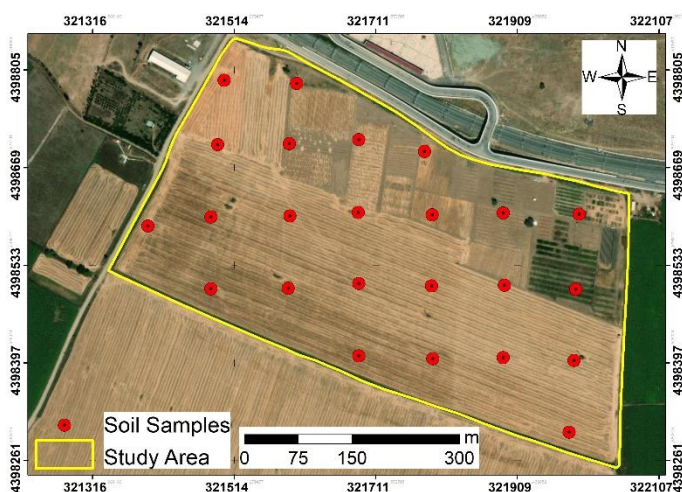

Figure 2. Study area soil sampling

In soil samples; Structure by Bouyoucos hydrometer method (Bouyoucos, 1951), lime volumetrically by Scheibler calcimeter (Soil Survey Staff, 1993), organic matter by modified Walkley-Black method (Jackson, 1967), pH in a 1:2.5 soil-water mixture (Bayraklı , 1987) and electrical conductivity (Richards, 1954) were determined according to the method, and penetration resistance (PR) measurements of the soils were carried out in the field using a penetrometer (Eijkelkamp).

FINDINGS and DISCUSSION

General properties of soils

Descriptive statistical results such as the lowest and highest value, mean, variance, standard deviation, kurtosis and skewness regarding the analysis values performed on soils belonging to surface (0-20 cm) and subsurface (20-40 cm) depths were calculated and given in Table 1. Disturbance in the symmetry of the normal distribution on a data set is referred to as skewness, and if these data are long-tailed to the right, they are defined as skewed to the right (positive), and if they are long-tailed to the left, they are defined as skewed to the left (negative). In the study, both surface and subsurface values of sand, clay, pH values and bulk density values of subsurface soils show negative skewness, while all the remaining values show positive skewness. In addition, the degree of sharpness or roundness of the distribution curve is also considered as kurtosis (Yıldız et al., 1999). In other words, positive values indicate that the kurtosis coefficient is positive, that is,

the curve is steeper than normal, and negative values indicate that it is flatter than normal. In the samples taken from the study area, it was observed that the surface soil moisture, OM and PR values were negative, while the remaining values were positive, that is, the curve was steeper than the normal. In subsurface soils, sand, bulk density and OM values are negative, that is, flatter than normal, while other values are steeper. The coefficient of variation is classified as low (<15%), medium (15-35%) and high (>35%), respectively. In cases where the value is below 10%, the local variability of the examined feature is very low, and in cases where the value is above 100%. It can be said that the local variability is very high (Wang et al 2008). In the study: While bulk density and pH are low, OM is high, other parameters have medium variability.

As soil organic matter increases, penetration resistance is expected to increase as soil aeration and porosity will increase. When the correlation results in the study are examined, it is seen that there is a significant positive relationship between organic matter and penetration resistance, especially in terms of surface soils. Among the soil textural properties, the sand penetration relationship exhibits a significant negative relationship, while the clay penetration resistance relationship correlation relationship is at a linear level. It has been observed that there is a significant positive relationship between moisture content and penetration resistance of surface soils. While there was a very significant negative relationship between moisture content and sand regarding the penetration resistance of surface and surface soils, it was observed that there was a very significant relationship between clay. In their study, Turgut and Öztaş (2012) found the correlation coefficient between the penetration resistance value and bulk density, aggregate stability and moisture content to be statistically significant (P<0.01). Similarly, (Kılıç et al 2004; Carrara et al 2007) found a positive correlation between the penetration resistance value and bulk density, and a negative correlation between aggregate stability and moisture content values. There are also many studies

in which penetration resistance has positive relationships with bulk density and negative relationships with moisture content (Blainski et al., 2008; Ribon and Tavares Filho, 2008).

Interpolation models and distribution maps

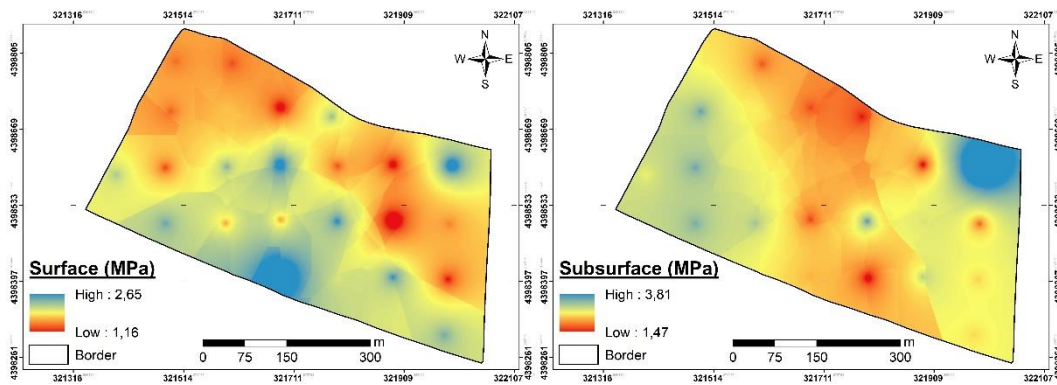

Spatial distributions of point soil samples taken in a coordinated manner were carried out using ArcMap software. In the study, 15 methods were compared, taking into account the lower levels of Ordinary Kriging (OK), Simple Kriging (SK), Universal Kriging (UK) and the deterministic methods Inverse Distance Weighted Interpolation (IDW) and Radial Basis Function (RBF) methods. An attempt was made to determine the most appropriate interpolation method by taking into account the Root Mean Squared Error (RMSE) and Mean Absolute Error (MAE) values. In the study, using surface and subsurface penetration resistance values, the most appropriate method was determined as kriging, simple, gaussian and distribution maps were produced (Table 3).

Table 3. Interpolation models and RMSE values of penetration resistance

Analysis	IDW			RBF			Kriging								
							Ordinary			Simple			Universal		
	1	2	3	CRS	ST	TPS	G	S	E	G	S	E	G	S	E

CRS: Complete Regulaziton Spline, ST: Spline with Tension, TPS: Thin Plate Spline, G: Gaussion, S: Spherical, E: Exponential

Aldabaa and Yousif (2020). In their study to evaluate land suitability for some crops in the Toshka region of Egypt, they produced distribution maps using kriging interpolation methods for parameters such as texture, pH, EC, CaCO₃, ESP and CEC. In the study, Gaussian, Exponential and Spherical geostatistical models were used to describe the spatial variability of soil properties based on RMS, MSE and RMSE.

Penetration resistance is evaluated in 3 classes: low (<0.10), medium (0.10-2.00) and high (2.0-8.0) (Schoeneberger et al., 2012). Accordingly, the penetration resistance of the soils taken from the study area was high at a rate of 66.67% in surface soils and 54.17% in subsurface soils. It is seen that the penetration resistance in surface soils increases depending on the increase in the ratio from north to south. In subsurface soils, it is particularly high in the northeast of the area, while it is at medium and low levels in the remaining parts.

CONCLUSION and RECOMMENDATIONS

High penetration resistance, which is an indicator of the physical structure and quality of the soil, slows down plant root development, makes it difficult to process the soil, and also makes it difficult to absorb water and nutrients. For this reason, practices such as the use of barnyard manure with high organic matter content in the soil, growing forage crops, and green manuring not only facilitate soil cultivation but also increase soil fertility by reducing penetration resistance. Most of the surface and subsurface soils of the study area were high due to their clayey texture. While the penetration resistance in surface soils is higher in the southern part of the area, it is higher in the northeast of the subsurface area compared to other regions.

ABSTRACT

Producing high-quality forage as silage while reducing dry matter losses can be challenging. Before the active fermentation phase can begin, biological and chemical activities that use up nutrients and energy result in the production of water, carbon dioxide, heat, and free ammonia due to the oxygen present in the packed feed. When the silo becomes anaerobic, a large number of facultative and anaerobic bacteria flourish and mostly ferment the crop's organic acids and sugars. The main bacteria responsible for silage spoiling are specifically yeasts that break down lactic acid in the presence of air. Fungal development causes nutritional and dry matter loss, reduced palatability, and decreased silage consumption, all of which have a negative impact on animal performance. Mycotoxins are produced by two types of fungi, known as storage fungi and field fungi, respectively. Silage mycotoxin levels may be higher than the legal limits. Using cultivars with good resistance and identifying particular markers for the selection and development of cultivars with good resistance to mycotoxin contamination is the most effective and consistent method for managing mycotoxins. Additionally, using appropriate silage-making techniques is still essential to stop degradation. Continuous silage monitoring will enable data gathering and the building of a database containing the mycotoxins and fungi species that may be present in silages under various environmental circumstances. The most promising instruments for on-site silage mycotoxin analysis at current time include sensor analysis, NIRS, and antibody-based techniques (ELISA test).

Keywords: Silage, fermentation, bacteria, fungi, mycotoxins

1. INTRODUCTION

Particularly in emerging countries, the cattle industry is one of the fastest-growing sectors in agricultural economies. There are concerns about how and by whom the growing demand for meat and dairy products will be satisfied. Ruminants' physiological needs and farmers' economic interests both depend on access to a reliable fodder source. In many regions of the world, forage production is seasonal, with an abundance accessible during harvest and a shortage during the winter or the dry season (Duniere et al., 2013). Domestic animals usually consume fresh forage, crop byproducts, and residue. These can, however, be stored for use in the event of future feed shortages. Sun drying (for hay), artificial drying (for meal), adding acids, or fermentation (for silage) are different methods of conservation (Mannetje, 2000). Ensiling and haymaking are the two most popular methods for keeping forages in storage. A region's major storage method changes primarily according to climate. Most fodder is preserved as hay in nations with primarily dry climates, such the United States and Australia. In contrast, due to their humid climates, the majority of northern European nations preserve forages as silage (Hutnik and Kobiela 2012).

2. Silage quality

For the possibility of reducing dry matter (DM) and quality losses during the ensiling process, it is necessary to understand how to measure losses on the farm, determine the status of the silage during feed-out, and put into practise the best management techniques to prevent air exposure during conservation and reduce silage aerobic deterioration during feeding. Producing high-quality forage as silage while reducing DM losses can be challenging. All forages that aren't immediately harvested and stored need to be given a field wilting period to reduce their moisture content, increase their ensilability (that is, to increase the amount of water-soluble carbohydrates fed to animals and decrease water activity), and stop seepage losses from the silo. A quick withering in the field is required to minimise DM and nutritional value losses. With regard to dry matter losses, particularly leaves, the forage DM concentration at the time of treatment and the level of conditioning were directly associated (Borreani et al., 2018).

It is widely known that forage legumes might have a very low ratio of water-soluble to buffering carbohydrates; as a result, improving the amount of fermentable carbohydrates in the crop is essential to prevent DM losses as a result of insufficient fermentation. Before the active fermentation phase can begin, biological and chemical activities that use up nutrients and energy

result in the production of water, carbon dioxide, heat, and free ammonia due to the oxygen present in the packed feed. During ensiling, chopped forage is still metabolically active and breathes as long as oxygen is present. Although aerobic bacteria can also contribute, plant tissue respiration is the primary method of removing oxygen from the silo and generating heat (Borreani et al., 2018).

When feeding the majority of legume and grass forages, prolonged exposure to temperatures above 40°C can degrade proteins, which affects the amount of available amino acids. Temperature affects the lactic acid bacteria (LAB) growth rates required for the initial fermentation of ensiling, among other variables (e.g., availability of sugars, degree of anaerobiosis, and moisture levels). When the silo becomes anaerobic, a large number of facultative and anaerobic bacteria flourish and mostly ferment the crop's organic acids and sugars. How much DM is lost during fermentation depends on the dominant bacterial species and the materials fermented. Many fermentation pathways are well recognised and have been for many years. LAB that ferment glucose homofermentatively only produce lactate as opposed to LAB that ferment glucose heterofermentatively and produce 1 mol of carbon dioxide per mol of glucose, which results in a 24% DM loss but only a 1% increase in gross energy loss from the silage. As a result, there is no DM loss. When bacteria other than LAB are engaged in the fermentation process, there is typically a large loss of DM in the form of carbon dioxide. This is especially true for yeasts that make ethanol out of glucose (like sugarcane silage) or for clostridial organisms that make butyrate out of lactate or glucose. A portion of the DM loss from the fermentation of glucose or lactate is accounted for by higher gross energy losses from clostridial activity, which are mostly caused by the production of hydrogen gas (Borreani et al., 2018).

3. Aerobic stability

Nutritionists use the term "aerobic stability" to describe how long silage keeps cool and resists spoilage after being exposed to air. Yeasts typically start heating in the silo and feed bunk when fermentation is finished and silage is exposed to air during feedout or storage (e.g., leaky silos, holes in bag silos, poorly packed silage) (and to a lesser extent sometimes by some bacteria). The first domino to fall in a series of events that ultimately lead to ruined feed is exposure to air. The main bacteria responsible for silage spoiling are specifically yeasts that break down lactic acid in the presence of air. These yeasts primarily belong to the species *Candida*, *Hansenula*, *Pichia*, *Issatchenkia*, and *Saccharomyces*. By raising the pH of the silage due to lactic acid degradation,

opportunistic bacteria and moulds including *Aspergillus*, *Fusarium*, and *Pencillium* can develop and further degrade the silage's quality. Although their significance is less clear, bacteria from the species *Acetobacter* may occasionally start aerobic deterioration in maize silages. An important point to remember is that silages may be exposed to air days, weeks, or months prior to actual feeding (Kung Jr, 2010).

Fig. 1. Tires and gravel bags on plastic at the feeding face of the silo to prevent air from contaminating the silage mass (Kung Jr, 2010).

Artificial ecosystems that are used as feed storage systems maintain the feed's quality and nutritional content through interactions between physical, chemical, and biological factors. One of the biggest concerns of stored silage is microbial deterioration and mycotoxin contamination. Fungal development causes nutritional and dry matter loss, reduced palatability, and decreased silage consumption, all of which have a negative impact on animal performance (O'brien et al., 2008). Critical water activity for safe storage is 0.7–0.8 (Magan and Aldred, 2007). When this limit is exceeded, deteriorating fungi like the *Eurotium*, *Penicillium*, and *Aspergillus* species can grow, and the increase in respiratory activity provokes the silage's temperature to rise, which can

encourage the growth of other fungi, particularly thermophilic ones that will cause further deterioration. Mycotoxins are produced by two types of fungi, known as storage fungi and field fungi, respectively. Plant pathogens that thrive on aged or stressed plants, such as *Fusarium graminearum* (deoxynivalenol, nivalenol), *F. verticillioides* (fumonisins), and occasionally *Aspergillus flavus* (aflatoxins), as well as fungi that initially colonise the plant and predispose the commodity to mycotoxin contamination during storage, such as *Penicillium verrucosum* (Alonso et al., 2013).

For instance, crops with a high starch and sugar content will typically contain more yeasts. Hence, high moisture silage can be extremely susceptible to spoiling under the proper conditions. Some fermentation byproducts are more effective than others at inhibiting the growth of mould and yeast. Although lactic acid at large concentrations is particularly desirable since it quickly lowers the pH of silage, it has poor antifungal properties. The quantities of acetic and propionic acids, which are effective antifungal acids, can be raised chemically or using particular microbial inoculants. However, it should be emphasised that large amounts of acetic acid generated by "wild-type" pathways might not be as preferable as those generated by "controlled" pathways (e.g. from controlled inoculation with *Propionibacteria* or *Lactobacillus buchneri*). Ironically, one of the most antifungal acids produced is butyric acid. Despite the fact that this clostridial fermentation byproduct actively inhibits the growth of yeasts, it is not aimed in silages due to the other negative aspects of this form of fermentation (i.e. large dry matter loss and protein degradation). Although ammonia has significant antifungal properties as well, it is unlikely that silage yeast populations will be impacted by naturally occurring quantities of this substance. Since silages are rich in moisture, they frequently go through more extensive fermentations that lead to larger concentrations of acetic, propionic, and butyric acids (Ward, 2000), making them more stable when exposed to air than their drier counterparts. Drier silages, on the other hand, go through a more limited fermentation and produce less acid end products, making them frequently more susceptible to aerobic deterioration. Even yeasts cannot thrive in a harvested crop with little water activity, and the dry fodder is stable as a result (this is why dry hay does not spoil). Any circumstance (such as holes in silo bags, a lack of weight to keep the plastic on silos, etc.) or action (such as inadequate pack density, ineffective bunker face management, etc.) that permits more air to enter the silo mass may also promote the growth of yeasts and heighten aerobic instability. Silage's exposure to air can

be reduced by harvesting forages at ideal moisture levels (not too dry), the right particle size (not too long), swiftly filling and sealing, and feeding out sufficient amounts of silage from the silo each day. Less air infiltration into the silage mass is possible by the clean, effective removal of silage from the face of bunkers and bag silos (Kung Jr, 2010).

4. Mycotoxin in silage

In silage, the distribution of the major fungal contamination is relatively consistent between nations. The main fungi isolated were *Aspergillus*, *Penicillium* and *Fusarium* genera followed by *Byssoschlamys*, *Mucor*, *Absidia*, *Geotrichum*, *Arthrinium*, *Monascus*, *Stachybotrys*, *Scopulariopsis* and *Trichoderma*. A high incidence of potentially toxicogenic species such as *A. flavus*, *A. fumigatus*, *A. parasiticus*, *F. verticilloides*, *P. roqueforti* and *F. graminearum* among other species can be observed (Alonso et al., 2013).

According to reports from Argentina and Brazil, different areas of silos have varying fungal counts: the upper section is often more susceptible to fungal contamination, the middle region is the best-preserved area, and the lower section is less well-preserved (Keller et al. 2013). The levels were the same in the upper and lower areas, but there was little fungal contamination in the middle section. The degree of compaction has an impact on storage; the more compact the silo, the lower the risk of pH loss and the development of anaerobic conditions. According to Keller et al. (2012), the physical characteristics of silages differed depending on the portion that was sampled. Certain samples contained aW, temperature, and pH values that permitted microbial growth and the synthesis of mycotoxin. pH is a physical element that ensures the preservation of silage.

5. Mycotoxin analytical detection in silages

Silages frequently contain mould and mycotoxins in various parts of the world. The E.U. has established maximum tolerable levels of a number of mycotoxins in feed material based on the toxin, animal species, type of feedstuffs, and animal age. These values take into account both the treatment of animals and the exposure of humans to animal products. Given that silage is an essential part of ruminants' diets and that this kind of forage is used all over the world, it is crucial to ascertain whether silage has any health risks and serves as a substantial source of pollutants in the food supply. Many publications discuss fungi and the dynamics of their presence and growth in silages, however there is a lack of data on epidemiology. Silage mycotoxin levels may be higher than the legal limits. It is challenging to establish connections between silage mycotoxins and field

occurrences, and few connections have been definitively demonstrated. Mycotoxins may be exposed considerably more frequently in the subclinical stage, which might cause vague symptoms and reduce animal productivity (Cheli et al., 2013).

Current agricultural and silagemaking methods appear to make it impossible to completely avoid contamination, hence preventive is essential. Using cultivars with good resistance and identifying particular markers for the selection and development of cultivars with good resistance to mycotoxin contamination is the most effective and consistent method for managing mycotoxins. Additionally, using appropriate silage-making techniques is still essential to stop degradation. The feed out phase must be taken into account since the introduction of oxygen into the mass causes the commencement of mould growth. Organisms with a wide range of mycotoxin production and various environmental niches are responsible for silage contamination. To get a clear picture of the toxicological concerns associated with silage eating, more research is needed to address the apparent biodiversity of these fungal species and the prevalence of multi-mycotoxin contamination. New researches should focus on finding uncommon moulds and unexpected toxins in addition to the mycotoxins thought to be the most likely to occur. Continuous silage monitoring will enable data gathering and the building of a database containing the mycotoxins and fungi species that may be present in silages under various environmental circumstances. The coexistence of many mycotoxins with distinct chemical characteristics and modes of action poses a severe risk due to the possibility of additive and/or synergistic effects. Researching the effects and dangers associated with silage contamination by numerous mycotoxins will be a difficult task for scientists. To achieve this, further research must concentrate on sampling strategies and the production of increasingly quick and trustworthy analytical instruments (Cheli et al., 2013).

Toxic fungal species must be quickly and accurately identified, and various mycotoxin contamination must be detected under field settings. There have been several rapid analytical methods described. Unfortunately, suitable and dependable methods for routine quantitative examination of silages remain unavailable, and satisfactory and sufficient validations are still missing. The complexity of silage as an analytical matrix, the frequent co-occurrence of several mycotoxins with distinct chemical characteristics, and the resulting difficulties in validating analytical methods are the primary factors to be taken into account. Even while encouraging results have been found for a number of commodities using NIR and related technologies, the same results

cannot be predicted for mycotoxin detection in silages. "Smell" mould odour and can serve as a quick in-field tool for assessing fungal deterioration and non-quantitative multi-mycotoxin detection (Cheli et al., 2013).

A combination of PCR and HPLC–MS methods allowed identification of four groups of potentially toxigenic fungi and the quantification of seven major mycotoxins. The issue of multimycotoxin detection methods arises from the frequent co-occurrence of fungal metabolites in silages in mycotoxin analyses. Since silages contain a complex matrix of organic acids, sugars, chlorophyll, and other small molecules, these procedures must be particularly validated for silages (Storm et al., 2008). Few multi-mycotoxin methods have been fully validated in silage. Rasmussen et al. (2010) and van Pamel et al. (2011) designed a validated LC-MS/MS and a UHPLC-MS/MS method for the determination of 27 and 26 mycotoxins and other secondary metabolites, respectively, from common fungal contaminants of maize silage. Yet, it is essential to emphasise the necessity of these mycotoxin quantification methodologies at the levels established by the European Commission for feedstuffs because they could be a difficult analytical process that is not appropriate for the task (Cheli et al., 2013). An improved alternative might be implementing a quick, inexpensive, high-throughput analytical technique. Costs associated with sampling and analysis must be weighed against potential end-user losses as a result of measurement errors. This is one of the most important reasons for simpler and rapid analytical approaches and further implementation of specifically dedicated statistical data analysis. The application of so-called "Rapid Approaches" is crucial for expanding our understanding of the distribution and presence of mycotoxins in food and feed as well as for building a trustworthy database. Biosensors, fluorescence polarisation immunoassays, electrochemical immunoassays, membrane-based immunoassays, non-invasive procedures based on NIR spectroscopy, and analyses based on "artificial senses" like electronic nose are quickly becoming commonplace (Rasch et al., 2010; Cheli et al., 2013).

The most promising instruments for on-site silage mycotoxin analysis at current time include sensor analysis, NIRS, and antibody-based techniques (ELISA test). ELISA-based rapid screening methods have been in use for many years and are available commercially. There are three types of kits: quantitative, semi-quantitative, and qualitative. Non-instrumental (visible) membrane-based immunoassays (dipstick, lateral flow, and flow-through tests) have been

developed and are commercially available for a number of mycotoxins and matrices as part of flexible, outside-laboratory testing. Non-instrumental ELISA methods provide the following main benefits: field portability, no need for specialised equipment, and straightforward sample preparation processes. In comparison to instrumental ELISA methods, the main drawbacks include subjective interpretation, lesser sensitivity, and higher cost per test (Zeng et al., 2006). For the purpose of detecting silage zearalenone, ELISA was chosen and compared with an immunochemical nano-immunosensor. Moreover, "Dc-ELISA" (direct competitive ELISA) was used to identify a variety of mycotoxins in silages, including TA toxin, cyclopiazonic acid, DON, fumonisin B, and ZEA. Applications of NIRS analysis to the detection of fungi and mycotoxin in cereals have been reported, showing that NIRS can be a useful screening method (Singh and Jayas, 2011). NIR and MI spectroscopy with attenuated total reflection (IR/ATR and FT-IR/ATR) have been used to quantify the levels of mycotoxins and metabolites in naturally and intentionally contaminated foodstuffs, respectively (Fernandez-Ibanez et al., 2009).

ABSTRACT

In recent decades, there has been a gradual weakening of the relationship between humankind and the natural world. The topic of the environment, on the other hand, has generated attention not only in academic circles but also in popular culture, particularly cinema. Wall-E is a film directed by Andrew Stanton that shows an environmental dystopia in which the Earth has been ravaged to the point where it is unable to support any form of life because people have created a civilization that is focused on their own self-gratification and consumerism. The film recreates a visual illustration of the harmful implications of letting two things go unchecked: the unquenchable need of a society to consume, and the greed of private enterprise for profit. I use an eco-critical framework to investigate how the tumultuous interaction between humans and nature manifests itself as a dynamic interplay between humans, nature, capitalism, and technology. In the movie "Wall-E," humans are shown to be the ones to blame for the impending environmental catastrophe that would force them to relocate. The destruction is a direct consequence of the unchecked greed that characterises capitalism, which was further exacerbated by an excessive reliance on various forms of technology. If anything, Wall-E reveals itself to be an innovative warning tale about the perils of living in a capitalist society and a plea to protect our natural resources before it is too late. **Methods:** This study employed qualitative research methods. The qualitative study's findings were gathered from a variety of secondary sources, including media articles, academic journal articles, and past theses. A discourse analysis method was used throughout this study, and several references were gathered from news articles and journals to provide a brief overview of the devastations the environment is facing currently. **Results:** There is a worldwide concern about the climate crisis. All of these problems have their roots in the past. The paper investigates the unfavourable effects of global warming on Earth and how an antiquated robot struggles to restore life. Global warming is defined as a decline in Earth's capacity to sustain life. *Wall-E* ends up being a bold allegory for the perils of capitalism and an urgent plea to protect the planet before it's too late.

Keywords: Wall-E, eco-critical analysis, scrimmage

INTRODUCTION

Global warming concerns are now being framed as "climate change". The human-nature relationship has been fraught with conflict and upheaval. Mankind has repeatedly waged war on nature, not treating it as a protagonist of life but rather as a tool for mindless technological and civilizational advancement. Because of the looming dangers of environmental abuse, environmental issues have become a source of increased provocation for academics and artists alike, appearing both in literature and in films. There are numerous environmental concerns ranging from population growth to the exploitation of natural resources, pollution of vast water bodies, deforestation of land, etc. On the other side, nature gives back what we give in the form of natural destruction that affects our livelihood. Starting from the floods that devastate the country to the earthquakes that strip out millions of lives. Now the world is searching for strategies to combat environmental destruction. It is ironic to learn that the cause of the destruction is now looking forward to a measure to safeguard against it.

In *Wall-E*, Earth is shown as a filthy, trash-covered wasteland where human beings formerly walked. It is an American science fiction film that was released by Pixar Studios for Walt Disney Pictures. The movie very clearly tells the viewers that when the earth's limit is pushed too far, eventually the planet will be overwhelmed with toxicity and threaten every life form with extinction. By showing the relationship between corporations, consumerism, and waste, the film critiques contemporary consumption patterns. This paper examines the relationship between humanity, nature, and technology controlled by capitalism from an ecocritical perspective.

WALL-E

After 700 years of doing what he was built for - he'll discover what he's meant for. (Wall-E)

The story takes place in a post-apocalyptic world devoid of human habitat and filled with waste caused by anthropocentric activities. The post-apocalyptic world is left devoid of all forms of habitat, except for an outdated robot. The post-apocalyptic landscape that has been caused by humans could give rise to a number of different situations. The animated film *Wall-E* depicts one potential future in which humanity is compelled to abandon planet earth. As humanity begin to return, they will need to adjust to the new world they find themselves in. The future world depicted in the movie is caused by overpopulation and extreme consumerism in a capitalist society. What remains on earth is the robot *Wall-E*, who is struggling to clean up to make human existence

possible. *Wall-E* tries to serve as a warning for humankind's excesses. The movie's concept is that people are eating themselves to death. The remaining humanity has to evacuate aboard a spaceship that is essentially a floating spa because the world has been reduced to a corporate organisation named BnL (Buy and Large), which has presided over the destruction of the Earth's resources.

Wall-E is the story of a small robot abandoned on Earth to clean up after humans. It depicts an earth in squalor, completely covered in trash left behind by its former human inhabitants. The large amount of trash has turned the green, habitable land into an uninhabitable one, forcing the human population to evacuate. The soil has become infertile and unfit for agriculture. The climate there has turned hostile, allowing any form of life to perish. Using this situation to convert the needs and necessities into lifesaving strategies, the mega corporation Buy-n-Large meets all the needs of the people by using advanced technology. The movie depicts the struggle of people to build a paradise after leaving their home planet for about seven hundred years due to unliveable conditions brought on by imprudent contamination. After several long years, reality hits people about the crimes they once committed on their planet. They, along with the outdated robots, launch a rebellion against the consumption-oriented dictatorship of the corporation they live under. They then get back to their planet to make it habitable.

For instance, "*An Inconvenient Truth*," a documentary by AI Gore, describes the problem of climate change against the backdrop of the political climate of the time. Both movies portray humans as the main cause of the disaster. Already, human activity has wiped out several plant and animal species, damaged water sources, and permanently changed the atmosphere. The next catastrophic time for the planet may result in its own death at this predicted pace of destruction, or it may serve as the impetus for the development of a new environmental reality that may not enable regeneration as it has in the past.

In the movie *Wall-E* the beginning scene shows us how big and beautiful outer space is. The outer space, the enchanting cosmos, stars, and galaxies are all awe-struck marvels. After showing them, when the attention is focused on Earth, it causes a big disappointment. We remember Earth to be green and blue, and now, due to human activities, it all seems like black and grey. The lush greenery is replaced by skyscrapers and waste dumped all over the planet. Our beautiful habitat looks like a poet's apocalyptic vision, with deserted buildings, a littered neighbourhood, and diminishing greenery. The world looks as depicted in Margret Atwood's '*Oryx*

and Crake’, in which the habitable world is destroyed by the protagonist in the novel. ‘*Oryx and Crake*’ opens with an empty post-apocalyptic world. In the movie *Wall-E*, the world has been destroyed by the consumerist habits of the people, which are being aided by the Buy-n-Large (BnL) corporation. As the world is destructed and no longer suitable for life, all the habitats have abandoned the planet to live on the corporation’s large cruise ship called Axiom. The picture of the disastrous planet would be a warning to humanity, letting people know what would happen if the measures to protect nature were not taken.

The habitat on the devastated planet has become unsuitable for life except for the old robot left there to clear and the cockroach that has accompanied. Humans continually send EVE (the Extra-terrestrial Vegetation Evaluator) to Earth to check if it has any traces of habitat. Bill McKiblen, in his book "The End of Nature," writes that "in pursuit of warm houses, eternal economic growth, and agriculture so productive it would free most of us from farming, we were destroying the atmosphere and causing heat, dryness, and storms. These would breed deserts across the Earth and eventually end nature" (719). Throughout the movie, it is evident that the planet is unsustainable because nature has been violated, which paves way for the creation of a world that is covered in dust and garbage. The movie ends in such a way that humans realize their moral obligation to save the planet Earth. They rebel against the capitalist corporation and recolonize the earth for a better habitat.

The movie *Wall-E* blends science fiction into an animated genre. The New Yorker film columnist David Denby stated that the movie examines a post-apocalyptic world in a science genre. The movie serves as a critique of environmental practises and addresses most environmental anxieties and fears of the human race.

Eco-Criticism

In the introductory scene, viewers get to appreciate the beauty of outer space. The bright cosmos, the luxurious spaceship, the faraway galaxies, and slowly the picture of Earth are zoomed in. The earth appears to be grey and brown. The earth that most people came across in pictures was always blue and green, but now it is obviously jaw-dropping to see the pathetic condition of the planet that gives us a place to dwell in. The city scrappers are full of garbage dumped in. The planet exactly looks like a post-apocalyptic world where the buildings are deserted, there is piled-up waste, and there are no traces of greenery. Although the human species was born as a part of the

environment, its evolution has made its actions so powerful and far-reaching that they have become a threat and may lead to precocious destruction. The planet was destroyed due to consumerist activities aided by the mega-BnL corporation. Due to the uninhabitable location, the human race moves out of the planet in a spaceship owned by the corporation and leaves behind two outdated robots to clean up the mess they created. The movies depict the human race as an agent who caused the destruction of the environment.

The wasted Earth depicted in the movie is one that is predicted by Bill McKibben in 'The End of Nature'. He warned that the gases people produce in pursuit of warm houses, eternal economic growth, and a productive agriculture would free most of us from farming.

Films like 'An Inconvenient Truth' (2006) and 'Wall-E' (2006) show people as agents who will be responsible for the next environmental crisis. These movies are problematic because they portray humans as the cause of environmental degradation. The human species has already rendered the world uninhabitable for any form of life to exist on it. If the current trend of destruction continues, it is possible that this may usher in a new geological epoch known as the Anthropocene. The word "anthro" refers to "man," and "cene" means "new." Following the annihilation of the previous world as a result of consumerist capitalism, man created a brand-new planet. If this keeps happening, the planet may bring about its own demise at the predicted rate of destruction, or it may serve as the impetus for the development of a new environmental reality that may not enable regeneration in the same way that it has in the past. Both of these outcomes are possible if this situation is allowed to persist. The human race will always be a contributing factor to the end of the world that we have brought on ourselves. "In the past half billion years, asteroids and other natural occurrences have been responsible for five cataclysmic extinction events that wiped out large populations of species and planets. It's possible that humans are responsible for a sixth of the world's " (Neumann et al. 78). The film's upbeat message that people can save the planet by reestablishing their connection to nature is the last element that gives WALL-E the appearance of following the pattern of an ecological jeremiad. The humans' lives improve throughout the film as they come to understand how important the earth is. For instance, WALL-E understands where she is and appreciates the stars outside the window when she runs across Mary, a person, and shuts off her virtual phone. She gradually reverts to being "human" again, making friends in person and having fun in the pool. Her mental capacity is slowly recovered by her enjoying and valuing nature

again. The movie's hopeful return to the ideas that can save the planet is further evidenced by the way it ends.

Analysing Lawrence Buell's Eco Critical Components:

Throughout the entire film, the ideals of these environmental writers may be observed as an influence. They demonstrate that there is unquestionably environmental content in *Wall-E*. *Wall-E* becomes an environmental film rather than merely a kid's movie with environmental overtones when it satisfies critic Lawrence Buell's four criteria for a "environmentally-oriented" production. The nonhuman environment is present not just as a framing device but also as a presence that starts to imply that human history is entangled in natural history, which is the first of Buell's four components. *Wall-E* satisfies this requirement since the environment serves as the film's main theme rather than just a backdrop for a narrative about human interaction. Robots are attempting to right the wrong that humans caused by destroying nature, forcing them to escape aboard spaceships. Since people no longer have the natural environment as their foundation, human history has evolved during the past 700 years. Without the planet to care for, the human species has grown fat and lethargic, which has caused bone loss over many generations and removed the need for human impulses like walking and interpersonal interactions. The absence of Earth, the nonhuman environment of the film, is the reason why human history has changed, making it a significant presence in the narrative.

The second part of Buell's argument asserts that there are legitimate interests in environmental activity that are not limited to those of humans. In the film, this conflict arises when the robot brings a plant to the spaceship. As the plant symbolizes earth's sustainability, the mega corporation is afraid that it would make the humans realize their job is to protect the nature. The plant here becomes the legitimate interest of the film. And that is why plant survival, along with human survival, is stressed.

Buell's third stipulation is that the ethical stance must include human responsibility for the environment. It is clearly seen when the ship's captain realizes the importance of nature. He waters the plant bought by the outdated robot *Wall-E*, stating it has come a 'long way for a drink of water'. He then realizes that it is the human's duty to preserve nature and asks the spaceship's information system to explain the idea of 'farming' because was a concept lost among humans after they abandoned earth. 'This is called farming! You kids are gonna grow all kinds of plants—vegetable

plants, pizza plants. Oh, it's good to be home!' – Captain B. McCrea. (Stanton,2008). At the end, the humans return to the same planet as a result of their acknowledgement of their accountability for its protection.

The final component creates awareness of the environment as a process rather than a constant in an environmentally oriented work. Nature is not constant in *Wall-E*; it changes from a flourishing land to a devastated land. The Earth, however, eventually returns to a condition where it can once more support plant and animal life since it is a process. At this point, *Wall-E* discovers a little, green plant that is presented as evidence that people can return because the world is once again sustainably populated. The environment in *Wall-E* changes during the course of the movie, demonstrating that Earth is a process rather than a given or a constant.

Technology: Adjuvant Of Ecological Disaster

Humans have evolved to threaten the environment due to their far-fetched evolution. This revolution has made destruction anthropocentric. The negative impacts created by humans have caused great damage to the ecosystem. Negative impact must be controlled, or else a future as predicted in *Wall-E* is waiting.

Scientists are now looking for habitats on Mars. An entrepreneur named Elon Musk launched a spacecraft from Earth's orbit, named SpaceX. The purpose of SpaceX was formed in the hopes of revolutionizing the aerospace industry and making affordable spaceflight a reality, as well as with the ultimate goal of enabling people to live on other planets. It is at this place that fantasy meets reality. Humans have to relocate to space, more like the spaceship Axiom owned by the BnL corporations. Humans' imaginable needs are met by technological advancement. Humans have relied on technology to such an extent that even though they are connected to other people online, they are still separated physically. Technology has made them inactive and led to health complications.

Devall and Sessions view technology as alienating humans from nature, from other humans, and from themselves. Technology is leading humanity towards destruction. In the present, technology has hijacked our daily lives through the use of the internet. Humans depend on AI a lot. Starting from the daily news tonight, emergency feeds Through technology, people are connected all the time, which also makes us feel disconnected from each other. Avatar is a battle between the Erilre, who wanted to protect their land, and humans. The reality of a technologically advanced

world where technology has permeated every aspect of life, including relationships, is depicted in Spike Jonez's *Her* (2013).

The push away from self-interest, selfishness, and the individual in society has created a digital world in which people are emotionally distant and isolated, further paving the way ideologically for AI technology. This movie explores a romantic relationship between a human and an artificially intelligent operating system. We now know how people in the future will be glued to technology. "We believe that individual trans humanizing will also allow us to form relationships, cultures, and policies of unprecedented innovation, richness, freedom, and responsibility," Man more writes in his essay "A letter to Mother Nature" (450). The optimism of transhumanists is countered by the pessimism of critics who view the arrival of posthumanism as portending doom. One such critic is Francis Forkuyama, who is concerned that tampering with "Nature" may result in the loss of personal and political equality. The possibility that modern biotechnology will change human nature and push us into a "posthuman" stage of history is the most significant risk posed by this field of study. Does a technology that is capable of reshaping who we are and the nature of politics itself have the potential to have negative repercussions for liberal democracy and the nature of politics in general?

Like *Her* (2013), in a similar way, the people living in the spaceship are always dependent on technology and gadgets, to the point that they avoid human contact. People navigate in their multipurpose hovering chains that are connected all over the ship. They do not even move to meet their basic needs. Similarly, in *Wall-E*, technology is not necessarily the problem, but it plays an unmistakable role in alienating humans from other humans, thus creating an atmosphere of indifference towards nature and human bonds.

Eco-Criticism And Capatilism

Although it is said that technology is a result of ecological failure, the megacorporation BnL uses it to advance capitalism. The biggest cause of destruction of nature is overconsumption. Consumerism is strongly associated with capitalism. As a capitalist giant, BnL understands humans' deepest desires. Hence, they have succeeded in creating the illusion of the consumer being the most important utility, which nourishes all the anthropocentric attitudes. In one scene, Mary is seen catching a glimpse of contemporary clothing advertising proclaiming that "Red is the new blue." She scarcely needs more than a few seconds to buy into the catchphrase and 'devour' the

newest style by rapidly changing her blue clothing to crimson. It is stated that members of consumer society who reside in urban and suburban areas frequently fall victim to the capitalist cycle system and struggle to overcome it. For instance, the corporation BnL goes to the extreme extent of using environmentalism as a marketing strategy by advertising their spaceship as a holiday destination, while on the other hand, they even project themselves as being committed to the act of rejuvenation.

A late-stage capitalist society is similar to a profoundly capitalist society. The term "late-stage capitalism" refers to a society's disproportionate demand and distribution, which highlights the system's inconsistencies and absurdities. The present reflects what might be referred to as "late-stage capitalism," with an emphasis on the powerhouse corporation, a declining middle class, and extreme inequality. This company uses the tagline "Buy,shop,Line" in all of their marketing materials. Their wares—toys, clothing, food, and drink—all lend credence to the tagline by implying that one must constantly add to their collections in order to achieve happiness. In the future depicted by *Wall-E*, corporations take precedence over natural environments. For instance, Sussane Collins depicts the disparities between the present and modern life in her novel *The Hunger Games*. The work depicts an internal conflict with the external pressures of a capitalist society. To survive the present, one has to combat the hardships put forth by the capitalist society. People of the capital choose to go by the ways of the capitalist society rather than carry on with their normal lives. The capitalist answer offered here is that only through adaptation can a person have a complete life. *Wall-E* depicts a world where people are enjoying their new habitat. It's a paradox here where people must be worried about the destruction of the resources and a questionable future.

CONCLUSION

I don't want to survive. I want to live. (Wall -E)

The playful animated comedy explores some of the greatest problems of the modern generation and warns about the imminent dangers evoked by human behaviour. It takes nonhuman characters to truly understand the power of nature and open humans' eyes to what they had willingly thrown away. Technology has a redeeming aspect, although it contributes to the issue that has alienated individuals and created unstable communities. Robots like *Wall-E* remove mountains of debris in an effort to revive the world. Consumerism's foreboding presence is a mirror of a capitalist society, which is depicted as the cause of the planet's demise and eventual

suffocation. Because of how grandiose human behaviour is, consumerist tendencies lead to a cycle of production and consumption that severely abuses nature's resources. WALL-E preaches that if humanity will return to valuing earth, then it can restore the damage it has done and live in harmony with nature once again. The irony here is that the movie uses the same technology to teach humans the importance of respecting earth.

Due to human greed many species have become extinct. It is each individual's responsibility to protect the land that supports our livelihood. The movie throws a light on man's ignorant attitude and its high time he changes his way or else the movie would definitely become our real future. We must protect earth and its resources because leaving it behind cannot effectively preserve humankind.

ABSTRACT

This study assessed pre-treatment SUV_{max} of the primary tumor and lymph nodes for the treatment response in cervical cancer patients. The present study included 40 patients with a histologically confirmed cervical cancer underwent pelvic radiotherapy between 2010 and 2012. The patients whose PET CT scans were evaluated in a different clinic, who had inflammatory bowel disease, irritable bowel syndrome, or autoimmune disease were excluded and a total of thirty-four patients' records were retrospectively evaluated. PET CT scan was performed on the patients before the treatment. Pre-treatment SUV_{max} of the primary tumor and lymph node were reported. The median value of SUV_{max} was found for this study and patients were divided into two groups according to the median SUV_{max} value of primary tumor and lymph node ($<$ median SUV_{max} or \geq median SUV_{max}). The correlation between SUV_{max} value and tumor response was evaluated. The median follow-up period was 20 months (range: 1-36). Complete treatment response was 75% in primary tumors with $14 > SUV_{max}$, however, treatment response was 55% for tumors with $SUV_{max} \geq 14$ (p: 0,2). Regarding the median lymph node SUV_{max} value; complete treatment response was 76 % for lymph node with $4 > SUV_{max}$, however, treatment response was 52 % for lymph node with $SUV_{max} \geq 4$ (p: 0,1). The predictive value of the metabolic parameter from pretreatment PET CT scan in cervical cancer patients treated with chemoradiotherapy was found in the literature. However, we did not find any statistical significance with SUV_{max} of the primary tumor and lymph node in our study.

Keywords: cervical cancer, radiotherapy, FDG uptake, PET CT

INTRODUCTION

Cervical cancer is the second most commonly diagnosed cancer in underdeveloped countries and approximately 40% of patients have advanced disease at the time of diagnosis (Benedet, Bender, Jones III, Ngan, & Pecorelli, 2000; Colombo et al., 2012). Radiotherapy (RT) is an important treatment modality either adjuvant or definitive purposes in the treatment (Leenstra et al., 2007). In recent years, positron emission tomography (PET CT) has become an increasingly important component of tumor evaluation in cervical cancer patients and standardized uptake value (SUV_{max}) correlates with tumor proliferation. The principle of the working mechanism of the PET CT is based on the detection of radioactivity in tumor tissue emitted after radioactive tracer is injected into a peripheral vein. For radioactive tracer, [^{18}F]-fluorodeoxyglucose (FDG) is used generally and SUV_{max} is a marker of tumor glucose metabolism detected by FDG (Tanaka et al., 2018).

We evaluated patients with inoperable cervical cancer who were treated with definitive RT + chemotherapy and analyzed pre-treatment SUV_{max} for primary tumor-lymph nodes for the treatment response in this study.

MATERIALS and METHODS

The present study included 40 patients with histologically confirmed cervical cancer who underwent pelvic radiotherapy between 2010 and 2012. Patients who had PET-CT scans were evaluated at a different clinic was excluded and a total of 34 patient records were retrospectively evaluated. We classified patients according to SUV_{max} value before treatment. Patients were classified according to the 2009 International Classification of Gynecology and Obstetrics (FIGO) system. Patient characteristics are listed in Table 1. The primary tumor and associated lymph nodes were delineated by PET imaging and physical examination findings. The median radiotherapy dose was 59.4 Gy (range: 50.4- 64.8 Gy) in 33 fractions (range: 28-36 fr). The mean brachytherapy dose is 21 Gy in 3 fractions. Concomitant chemotherapy with cisplatin 40 mg/m² was administered weekly. Pretreatment SUV_{max} of the primary tumor and lymph nodes was reported. Patients were divided into two groups according to the median SUV_{max} value. The correlation between SUV_{max} value and tumor response was evaluated. The median SUV_{max} was found 14 for the primary tumor, whereas the median SUV_{max} was found 4 for the metastatic lymph node. All analyses were performed with SPSS version 22.0 (IBM, NY, USA). The chi-square test and Fisher's exact test were used to determine the prognostic value of SUV_{max} for tumor response. Survival analyzes were

estimated using the Kaplan-Meier method. Univariate and multivariate analyzes were performed with Cox-regression analyses.

Table 1: The patients' characteristics

Age (median)	55 (range: 27- 84)
Pathology Squamous cell cancer (SCC) Adenocancer	33 1
Tumor size <4cm ≥ 4cm	12 22
Lymph node involvement Positive Negative	24 10
FIGO Stage (2009) 2A 2B 3A	2 10 4
Menopausal Status <i>Premenopausal</i> <i>Perimenopausal</i> <i>Postmenopausal</i>	 9 2 23

FINDINGS

Median follow-up was 20 months (range: 1 to 36 months). Nine patients had local or regional while seven patients had distant metastases. Five patients died of disease during the study period. Regarding the prognostic significance of the primary tumor's SUV_{max} for the treatment response, 75% of patients had complete or near complete response if SUV_{max} value under 14. However response was only 55%, if SUV_{max} value was 14 and above ($p:0.2$). Regarding the prognostic significance of the lymph nodes' SUV_{max} ; 76% of patients had complete or near complete response, if SUV_{max} value under 4. However treatment response was only 52%; if SUV_{max} value was 4 and above ($p:0.1$). Anemia was found to be a poor prognostic factor for overall survival in this study ($p:0.05$).

DISCUSSION

This study evaluated the predictive value of the metabolic parameters from pretreatment PET CT scan in cervical cancer patients treated with chemoradiotherapy. SUV_{max} of the primary tumor was not the predictor for local control however complete treatment response was 75% in tumors with $14 > SUV_{max}$.

Historical outcomes demonstrated a poor prognosis with the anemia in cervical cancer. Our study had a similar outcome. Local control was decreased in patients with an involved lymph node. But SUV_{max} of lymph node did not correlate local control.

PET/CT is an important imaging method in cervical cancer patients. And this imaging method is used for the assessment of local tumor spread, pelvic nodal involvement, and detection of distant metastases. For some cervical cancer patients, postoperative RT was administered because of the negative prognostic factors. Morbidity was increased by 28 % in these patients when compared to the treated definitive RT patients (Landoni et al., 1997). PET/CT is a predictor of response to therapy and prognosis, especially SUV_{max} . SUV_{max} of the primary tumor can demonstrate the presence of lymph node involvement, local control after treatment, and pelvic disease recurrence. A high SUV_{max} of the primary tumor could influence the management of therapy and aggressive treatment was recommended (E. Kidd, Siegel, Dehdashti, & Grigsby, 2007). In our study, complete treatment response was 75% in tumors with low median SUV_{max} , however, treatment response was

55% for tumors with higher median SUV_{max}. However we did not find any relation between the increase in SUV_{max} and the possibility of lymph node metastasis.

Some studies found that FDG uptake varied by histologic features and SCC or poorly differentiated tumors had higher SUV_{max}. However, in our study, only one patient's pathology is adenocancer (E. A. Kidd et al., 2009). Another study reported that SUV_{max} was significantly higher with deep stromal invasion on the other hand there was no significance for the presence of lymph node involvement and microscopic parametrial invasion (Lee et al., 2009). This study was similar to our study about SUV_{max} and lymph node involvement correlation. Our study has several limitations. First, the study has a retrospective and small sample size. Second, the study had a short follow-up time.

CONCLUSION

The predictive value of the metabolic parameter from pretreatment PET CT scan in cervical cancer patients treated with chemoradiotherapy was found in the literature. However, we did not find any statistical significance with SUV_{max} of the primary tumor and lymph node in our study.

**PATIENT COMFORT IN PSYCHIATRIC CLINIC AND ITS IMPORTANCE IN
NURSING PRACTICES**

Kardelen KAYIRAN

Selçuk University, Department of Mental Health and Diseases Nursing, KONYA

Assoc. Dr. Neslihan LÖK

Selçuk University, Department of Psychiatric Nursing, KONYA

ABSTRACT

One of the most important and current topics of nursing theories, which is accepted as an indicator of nursing science, is "Comfort Theory". Comfort in the nursing profession; It is a process in which the comfort needs of the patient, family or society are determined, the interventions for their needs are implemented and the comfort level, which is the result of nursing practices, is evaluated. The purpose of nursing care is; psychospiritual, physical, social and spiritual support, helping the person to feel valuable, helping to increase treatment compliance and quality of life, meeting their needs, in other words, increasing the comfort level. Nurses should also ensure the comfort of the patient and take measures for this; It provides care and assistance by encouraging the individual, family and society, and supporting coping methods. Meeting these needs is very important for people with physical illness as well as people with psychiatric illness. In addition to the treatment and care applied during the recovery period of patients with a psychiatric diagnosis, "providing the comfort of the person" should be the primary goal in the interior and exterior design of the clinics. In this context, a psychiatric nurse; In addition to protecting and improving the health of patients, it is responsible for ensuring that patients feel safe and comfortable at home, be more active in social environments, and be an individual who can express themselves correctly. In short, nurses are responsible for providing comfort by meeting the needs of patients in therapeutic environments. From this point of view, the aim of this review is to determine the importance of patient comfort and nursing practices in the psychiatry clinic.

Keywords: Psychiatric clinics, Comfort, Nursing

Comfort Theory And Nursing

The foundation of the nursing profession; It is accepted as a health discipline founded on research, philosophy and theories (Aydın and Kukulcu 2020). One of the most important and current topics of nursing theories, which is accepted as an indicator of nursing science, is "Comfort Theory". (Tailor and Kaya 2017). Comfort as a concept is derived from the Latin word "confortare" which means "to strengthen" (Duman et al. 2020). In the dictionary meaning; It is also explained by using expressions such as "well-being by getting rid of distress and pain, meeting physiological needs, getting support, getting rid of mental distress, comforting, encouraging, helping, soothing, strengthening, providing ease of life and being trouble-free" (Güleş and Üstün 2020).). This concept, mentioned by many nurse theorists such as Watson, Orlando, Roy, Peterson, was developed by Katharine Kolcaba as Comfort Theory in 1990 and this theory is also based on the relaxation function, which is one of the functions of the nursing discipline (Terzi and Kaya 2017; Üstündağ et al. Eti Aslan 2010). Orlando, Peterson, and Henderson contributed greatly to the formation of comfort theory, and were also influenced by three similar ideas: "Human Needs", "Holism", and "Necessity Pressure Theory". Kolcaba comfort; It is a result that emerges in a physical, social, psycho-spiritual and environmental integrity regarding helping the individual's current needs, overcoming his problems, and providing peace (Kolcaba 1995). Accordingly, he developed the taxonomic structure of Comfort Theory as a result of his studies on comfort and the comfort of sick individuals. There are three levels of this structure, namely relief, relaxation, and superiority, respectively; It has four dimensions: physical, environmental, psychospiritual and sociocultural comfort (Kolcaba et al., 2006; Karabacak and Acaroğlu 2011; Terzi and Kaya 2015; Kolcaba and Kolcaba 1991; Üstündağ and Eti Aslan 2010; Zengin 2010). In order to test this taxonomic structure, Kolcaba started to develop the General Comfort Questionary (GCQ), which consists of 48 items in total, in order to measure the expected comfort results in sick individuals, after the conceptual studies of comfort were completed and published its results in 1992. (Yücel 2011). Based on this, the basic assumptions of the Comfort Theory are explained as follows (Kolcaba 1995):

- People give holistic responses to complex stimuli.
- Comfort is a primary outcome that nurses set as a goal for their caregivers.

- Individuals should either meet their basic comfort needs themselves or these needs should be met by other people.
- Comfort is based on a patient-centered system and is a descriptive, holistic requirement with specific rules.

As explained above, the concept of comfort, which is specific to the individual, holistic and directly associated with nursing science, is also the outcome criterion of the care given. It is aimed that the care given to patients in therapeutic environments with special interventions will increase the comfort level of patients (Kolcaba 1991). The purpose of nursing care; It is to make individuals feel valuable with psychospiritual, physical, social and spiritual supports, to help them increase their adherence to treatment and quality of life, to meet their needs, in other words to increase their comfort level (Kolcaba and Fox 1999).

Patient Comfort In Psychiatric Clinic And Its Importance In Nursing Practices

In line with the comfort theory, people have various needs in physical, sociocultural, environmental and psychospiritual dimensions. Meeting these needs is very necessary and important for people with a physical illness as well as for people with a psychiatric illness (Cığerci and Özbayır 2016). In some cases, people are admitted to inpatient treatment units after being diagnosed with a mental disorder (Morse et al., 1994). For this reason, evaluation of the biopsychosocial status of patients, planning and implementation of targeted holistic nursing care, meeting the comfort needs are an important nursing duty that should not be overlooked for patients who continue their inpatient treatment in psychiatry clinics (Spector and Echternacht 2010). During this hospitalization period, some needs of individuals regarding physical comfort, security, and the ability to comfortably carry out daily life activities should be met (Morse et al., 1994). However, for psychiatry clinics, treatment services are provided in locked and inpatient units in many hospitals, and various restrictions are applied to the freedoms of individuals during hospitalization (Morse 2000). Compared to other psychiatric care, the main feature of inpatient psychiatric care is that the environment or environment can be controlled (Arslan and Konuk 2009; Arslan Özkan and Bilgin 2016; Down et al., 2000). Service environments are not environments where sick individuals waste their time. Therefore, in addition to physical needs, socialization, medication and treatment, socialization, individual interests and needs are met; enabling patients to gain feelings of

protection, support, trust and comfort; there should be environments that help sick individuals to re-know themselves and increase their self-confidence and self-esteem (Oliveira 2013; Peterson and Bredow 2012). From this point of view, it is stated that especially in the care process, sick individuals are greatly affected by therapeutic environments and environments that increase the emotional, physical and spiritual well-being and comfort of individuals are accepted as a healing environment. For this reason, the therapeutic environments of individuals in the care and treatment process are very important (Arslan and Konuk 2009; Arslan Özkan and Bilgin 2016; Down et al., 2000). Nurses, on the other hand, are the members of the team who spend uninterrupted time with patients for 24 hours and take responsibility for the therapeutic environment. Daily care activities such as teaching, washing, feeding, counseling, dressing, socializing and comforting practiced by nurses in clinical settings and often unstructured are not considered to have therapeutic effects. On the other hand, instant interactions between nurses and patients during daily practice have a therapeutic and powerful effect (Johnson and Maas 1997; Perry 2009; Turasan 2010). Some mental health problems cause deterioration in cognitive functions and thought content of sick individuals, difficulties in fulfilling their roles due to perception disorders, problems in managing and perceiving health, nutrition problems, harming themselves or their environment, and problems in social relations (Cleary 2003). . For this reason, psychiatric patients are usually addicted and leave the solution of their problems to the staff through addiction. Thus, they provide comfort in the first place. In this way, nurses move more easily. First of all, they need to control the patients. In a dependent state, patients are less at risk. Thus, nurses also meet the need to be the person in need. However, addiction is not curative, and nurses cannot solve every problem. Nurses need to support patients' independence as time goes on (Kunikata et al., 2011; Maree 2001; Oflaz 2006). For this, environments that allow patients to participate in treatment should be created. Because therapeutic environments, which include creating environments that enable patients to participate in treatment, reducing hospital stay, increasing treatment compliance, and including approaches that support recovery, also serve to increase the comfort levels of patients (Newman et al., 2015). In this context, nurses working in psychiatry clinics are people who are in close contact with patients. Therefore, it is responsible for the management of the therapeutic environment and thus increasing the comfort level of its patients (Ergun et al., 2017; Alexiou et al., 2016).

In a systematic review, a total of 43 studies by nurses about the comfort levels of patients in Turkey were reached. It has been reported that these studies are in areas such as birth, surgical intervention, oncology and diabetes. In addition to the characteristics of the therapeutic environment; variables such as nursing care received by patients, gender, age, disease duration and diagnosis, environmental conditions of hospitals.

CONCLUSION and RECOMMENDATIONS

Nurses have a very large and active role in increasing the comfort level of patients during the hospitalization process, especially in psychiatry clinics. There are few studies on the comfort level and nursing practices of psychiatric patients in our country and in the international literature. It is recommended to increase these studies and to organize in-service trainings for this purpose.

SUMMARY

The high incidence of bladder cancer has become an important public health problem with increasing costs for diagnosis and treatment. Although many treatment methods are used in the treatment of bladder cancer, surgery has been the most preferred method in recent years. For this reason, anxiety and stress are common in the preoperative period in patients scheduled for surgery for bladder cancer. While the thought of having surgery increases the level of anxiety in individuals, it can also prolong hospital stay. The purpose of this study; It can evaluate the relationship between the sociodemographic characteristics of the stress and anxiety states before the surgical intervention of the patient who is admitted to the urology service with a bladder tumor and who is planned for surgical treatment. The sample of this descriptive study consists of 78 individuals who were admitted to the urology service of the university hospital for surgical intervention. The data of the research was collected by face-to-face survey method. In collecting data; "Personal Information Form", "Surgical Anxiety Scale for Adults" and "Perceived Stress Scale", which were prepared by the researchers and questioned the socio-demographic characteristics, were used. The results were evaluated at a 95% confidence interval and a significance level of $p<0.05$. As a result of the research, individuals' perceived stress scale total score average was 32.25 ± 4.88 , health-related concerns subscale average score was 11.32 ± 5.26 , recovery-related concerns subscale average score was 2.87 ± 2.18 , and surgical procedure The average score of the concerns about anxiety subscale was 6.56 ± 4.15 , the average score of the concerns about invasive procedures subscale was 3.85 ± 2.72 , and the total score average of the surgical anxiety scale was 24.76 ± 12.34 . As a result, patients scheduled for bladder tumor surgery reported experiencing stress and anxiety. Taking into account the sociodemographic and disease characteristics of the patients; It is important to investigate the causes of individuals' stress and anxiety and offer solution suggestions before the planned surgical intervention.

Keywords: Bladder Cancers, Surgical Anxiety, Surgical Stress

INTRODUCTION

Cancer disease; It appears as a chronic disease that progresses through a debilitating process for the patient and their relatives (Noyan, 2012). Among the types of cancer diseases; It has been reported that the malignancy of bladder tumors, which are the most common in the urinary system, is high (Chen et al., 2022). Bladder cancer has become an important public health problem due to its high incidence worldwide, environmental factors having an important role in its formation, and increasing expenditures for diagnosis and treatment (Malats N, 2008). According to 2017 data published by the Republic of Turkey Ministry of Health, Turkish Public Health Institution Cancer Department, bladder cancer is the 4th most common type of cancer in men (Ministry of Health, 2017).

The occurrence of bladder cancer is associated with environmental (occupational deformation, smoking history) and genetic (age, gender) factors (Babjuk et al., 2013; Kelly et al., 1996). Li et al. (2016) reported that male and elderly individuals are more likely to develop bladder cancer and have a higher mortality rate.

The most typical symptom of bladder cancer is painless hematuria. Tanoyho and Mcaninch (2004) state that 80-90% of patients admitted to the hospital complain of hematuria, or 20-30% show symptoms such as frequent urination, urinary incontinence, painful urination, and sudden feeling of urination. Treatment of bladder tumor; It varies depending on the spread, grade and stage of the tumor. Although radiotherapy, umminotherapy, chemotherapy or surgical treatment can be applied alone, these treatment methods can also be applied in combination (Sözen et al., 2006). Studies conducted in recent years have accepted surgical resection as the primary treatment option for bladder tumors (Broughton et al., 2017, Calverasi et al., 2014, Games J, 1996).

Preoperative anxiety and stress may occur when planning a surgical intervention for a patient diagnosed with bladder cancer (WHO2013). Patients are in a state of anxiety before bladder cancer surgery; Due to their ignorance and uncertainty regarding the surgery, they may be influenced by what they hear from their surroundings, their friends and family members. As a result, patients may give up on the planned surgical intervention (Çevik, 2012). Because any mental problem that occurs in an individual can negatively affect the course of the disease and the course of treatment (Noyan, 2012). The fear and anxiety experienced increases morbidity in the

postoperative period, can prolong hospital stay and delay recovery (Ali et al. 2014; Diez et al., 2012).

The increase in cancers in the world has led to an increase in surgical treatment. According to the World Health Organization, more than four million people undergo surgical operations every year, and it is estimated that nearly three-quarters of individuals experience anxiety before surgery (Ali et al. 2014). Consultation liaison psychiatry (CLP) nurse; It has an active role in determining the factors that cause anxiety and stress, detecting anxiety and stress levels, and planning, implementing and evaluating the nursing process according to the patient's condition (Dolgun and Candan, 2010; Erdil, 2001). For this reason, determining the pre-operative anxiety and stress levels of individuals will affect the recovery process of post-operative patients. The aim of this research is; It was planned to determine the anxiety and stress levels of individuals diagnosed with bladder cancer before the planned surgical procedure.

Research Questions

1. What are the stress and anxiety levels of individuals before surgical intervention?
2. What is the effect of individuals' socio-demographic and health-disease characteristics on their perceived stress level before surgical intervention?
3. What is the impact of individuals' socio-demographic and health-disease characteristics on their surgical anxiety level before surgical intervention?
4. Is there a relationship between the perceived stress level of individuals before surgical intervention and the level of surgical anxiety?

MATERIALS and METHODS

Model of the Research

This research was planned as a descriptive study to determine the stress and anxiety levels of individuals diagnosed with bladder tumors before the planned surgical intervention.

Place and Characteristics of the Research.

The population of the study consisted of 220 patients who applied to the urology outpatient clinic of Ankara Gazi Hospital and were diagnosed with bladder cancer and accepted to undergo surgery. G*Power program, version 3.1.9.2 was used for sample size calculation. was used (Faul et al., 2007). The sample size of the study; With 95% power and 95% confidence interval, and an

effect size of 0.30, Topçu et al. It was calculated as 78 individuals, taking into account the surgical anxiety scale mean score in the study (19.07±13.15). Random sampling method was used in sample selection.

Dependent Variables: Perceived stress level scale, Adult surgical anxiety level scale.

Independent Variables: Socio-demographic characteristics; age, gender, marital status, educational status, perceived income status, height, weight, BMI, place of birth, occupation, smoking/alcohol use history, smoking/alcohol cessation history.

Research Inclusion Criteria: Planning bladder tumor surgery, being between the ages of 18-65.

Exclusion Criteria from the Study: Having a psychiatric diagnosis, having revision surgeries.

Exclusion Criteria for the Study: Cancellation of surgery.

Collection of Data

In data collection, the "Personal Information Form" created by the researchers to question the socio-demographic characteristics and health-disease status of the participants, the "Surgical Anxiety Scale for Adults" to measure the anxiety level before surgical intervention, and the "Perceived Stress" to evaluate stress levels. scale was used. Data were collected by researchers through face-to-face interviews with individuals and a survey.

Personal Information Form: 12-question socio-demographic (age, gender, marital status, education status, perceived income status, height, weight, BMI, place of birth, occupation, smoking/alcohol use status, past smoking/alcohol use) created by the researchers based on the literature. usage status) and 9 questions about health-disease characteristics (any chronic disease other than cancer, perceived health status, reason for first admission to the hospital, how many months/years ago the patient was diagnosed with a bladder tumor, what stage of cancer it is, the status of having surgery due to bladder tumor, It is a form with a total of 21 questions, including the status of receiving radiotherapy and chemotherapy due to bladder tumor.

Perceived Stress Scale: Perceived stress level scale: Developed by Cohen, Kamarck and Mermelstein (1983). The Perceived Stress Level Scale, consisting of a total of 14 items, is designed to measure the extent to which a person perceives certain situations in his or her life as stressful. It is designed to determine how stressful an individual perceives certain situations in his or her life. The Turkish adaptation of the scale was made by Eskin et al. (2013). The lowest score that can be obtained from the 5-point Likert type scale consisting of 14 items is 0 and the highest score is 70.

On a 5-point Likert scale: 0: "Never", 1: "Almost Never", 3: "Sometimes", 4: "Quite Often", 5: "Very Often" taken as . As a result of the reliability and validity studies of Eskin et al. (2013), the internal consistency coefficient of the scale was calculated as 0.84 and the test-retest reliability coefficient was calculated as 0.87.

Surgical Anxiety Scale for Adult Patients: The scale was published in 2018 by Burton et al. Developed by. The Turkish adaptation of the scale was made by Topçu et al. (2021). The subscales of the scale are concerns about health (items 7, 9, 10, 11, 12 and 13), concerns about the recovery period (items 14, 15, 16 and 17) and concerns about the surgical procedure. (Articles 1, 2, 4, and 8) and concerns about invasive procedures (Articles 3, 5, and 6). Scale items are scored as 0 = "I don't worry at all", 1 = "I worry very little", 2 = "I worry partially", 3 = "I worry a lot" and 4 = "I worry extremely". There is no reverse item in the scale. Total and subscale total scores are calculated by summing the items they contain. The lowest score that can be obtained from the scale is 0 and the highest score is 68. The scale does not have a cut-off point, and high scores indicate that patients have a high level of anxiety. Cronbach's alpha coefficient in the Turkish version of the scale is 0.890.

Statistical Analysis

The data of the study were evaluated using the statistical package program SPSS for Windows 22.0 (Statistical Package for Social Science). Number of units (n), percentage (%), mean±standard deviation (Mean (SD)) values were used as summary statistics. Normal distribution of the data was evaluated with the Kolmogorov–Smirnov test and Q-Q plot. Since the data showed normal distribution, t-test and One-Way Anova were used in independent groups. Pearson correlation analysis was used to evaluate the relationship between the perceived stress scale and the Surgical Anxiety scale. The results were evaluated at a 95% confidence interval and a significance level of $p<0.05$.

Ethical Procedure

Before starting the research, S.Ü. Ethics committee approval was obtained from the Faculty of Nursing Non-Interventional Clinical Research Ethics Committee (Number: 2022/10, Decision no: 2022/74) and institutional permission was obtained from the Chief Physician of Gazi University Faculty of Medicine Hospital. The purpose of the research was explained to the participants before filling out the survey forms, and their participation was voluntary. provided. Before filling out the

survey forms, individuals were given the "Informed Volunteer Consent Form" and asked to read it and those who wanted to participate voluntarily were asked to sign the form. Participants were told that the research was voluntary, that they could withdraw from the research at any time, that their answers would not be used for purposes other than scientific purposes, and that their confidentiality would be protected.

RESULTS

When the socio-demographic characteristics of individuals are examined, 84.6% are between the ages of 56-65, 89.7% are male, 94.9% are married, 38.5% are primary school graduates, 51.3% are low income. It was observed that 76.9% of them were good and did not work in any job. When the health and disease characteristics of individuals are examined, 43.6% have a body mass index of 18.5-24.99, 57.7% are non-smokers, 65.4% have another chronic disease, 69.2% have a body mass index of 18.5-24.99. They perceived their health as good, 74.4% said the time to diagnosis of bladder tumor was between 1-5 years, 64.1% were in the 1st stage of cancer, 71.8% had surgery due to bladder tumor, 61.5% It was observed that 85.9% of the patients did not receive chemotherapy and 85.9% did not receive radiotherapy (Table 1).

Table 1. Distribution of Sociodemographic and Health Characteristics of Individuals

Variables	Number (Percentage)
Age	
40-55 years old	12 (% 15,4)
56-65 years old	66 (% 84,6)

Individuals' perceived stress scale total score average is 32.25 ± 4.88 , health-related concerns subscale average score is 11.32 ± 5.26 , recovery concerns subscale average score is 2.87 ± 2.18 , concerns about surgical procedure The subscale mean score was found to be 6.56 ± 4.15 , the concerns about invasive procedures subscale mean score was 3.85 ± 2.72 , and the total score mean of the surgical anxiety scale was 24.76 ± 12.34 (Table 2).

Table 2. Distribution of Individuals' Perceived Stress and Surgical Anxiety Scale Average Scores

Scales	Mean±SD	Min-Max
Perceived Stress Scale Total	32,25±4,88	15-43
Health-related concerns sub-dimension	11,32±5,26	0-24
Concerns about recovery subscale	2,87±2,18	0-9
Concerns about the surgical procedure subscale	6,56±4,15	0-15
Concerns about invasive procedures sub-dimension	3,85±2,72	0-10
Surgical Anxiety Scale Total	24,76±12,34	0-54

When the individuals' sociodemographic and health disease characteristics and perceived stress scale total score averages were examined, the perceived stress scale average score of those aged 56-65 was higher than that of those aged 40-55, and the difference was found to be statistically significant ($p<0.05$). It was observed that men's perceived stress scale total score averages were higher than women, and the difference was found to be statistically significant ($p<0.05$). A significant difference was found between educational status and perceived stress scale total score averages, and it was determined that the difference was caused by primary school graduates ($p<0.05$). It was observed that the total score averages of the perceived stress scale of non-smokers were higher than those of smokers and the difference was found to be statistically significant ($p<0.05$). It was observed that the total score average of the perceived stress scale of those who had other chronic diseases was higher than those who did not have other chronic diseases, and the difference was found to be statistically significant ($p<0.05$). A significant difference was found between the time of bladder tumor diagnosis and the perceived stress scale total score averages, and it was determined that the difference was caused by those aged 6 years and above ($p<0.05$). A significant difference was found between the stage of the bladder tumor and the perceived stress

scale total score averages, and it was determined that the difference was due to those at stage 1 ($p < 0.05$).

It was observed that there was no statistical significance between the total averages of marital status, BMI, income status, employment status, perception of health, having surgery due to bladder tumor, receiving chemotherapy and radiotherapy, and the perceived stress scale ($p > 0.05$) (Table 3).

When the sociodemographic and health disease characteristics of the individuals and the surgical anxiety scale total score averages were examined, it was seen that the surgical anxiety scale total score averages of the singles were higher than the married ones and the difference was found to be statistically significant (p <0.05). The surgical anxiety scale total score averages were determined by educational status. A significant difference was found between the two groups and it was determined that the difference was due to primary school graduates (p<0.05). A significant

difference was found between income status and surgical anxiety scale total score averages, and it was determined that the difference was caused by those with medium income ($p<0.05$). It was observed that the surgical anxiety scale total score average of smokers was higher than that of non-smokers and the difference was found to be statistically significant ($p<0.05$). It was observed that the surgical anxiety scale total score averages of those who perceived their health as fair were higher than those who perceived their health as good, and the difference was found to be statistically significant ($p<0.05$). A significant difference was found between the time of diagnosis of bladder tumor and the surgical anxiety scale total score averages, and the difference lasted 6 years. It was determined that it was caused by those at and above ($p<0.05$). A significant difference was found between the stage of the bladder tumor and the surgical anxiety scale total score averages, and it was determined that the difference was caused by those at 3 stages ($p<0.05$). It was observed that the surgical anxiety scale total score averages of those who had surgery due to bladder tumor were higher than those who did not have surgery, and the difference was found to be statistically significant ($p <0.05$). It was observed that the surgical anxiety scale total score averages of those who did not receive radiotherapy were higher than those who did not receive radiotherapy, and the difference was found to be statistically significant ($p <0.05$).

It was observed that there was no statistical significance between the total averages of age, gender, employment status, presence of another chronic disease, receiving chemotherapy, and the surgical anxiety scale ($p>0.05$) (Table 4).

Table 4. Distribution of Surgical Anxiety Scale Total Score Means of Individuals According to Sociodemographic and Health Disease Characteristics

The relationship between individuals' perceived stress and surgical anxiety levels is evaluated in table 5. A moderate positive relationship was found between perceived stress and surgical anxiety level (r:0.372, p:0.001). It can be said that as individuals' perceived stress levels increase, their surgical anxiety levels also increase.

DISCUSSION

Bladder cancer is one of the most common malignant tumors of the urinary system. It accounts for roughly 3.0 percent of new cases and 2.1 percent of cancer-related deaths (Chen et al., 2022). In the literature; Surgical resection is considered the primary treatment for bladder cancer (Broughton et al., 2017; Calvaresi et al., 2014; Games J, 1996). Preoperative anxiety and stress are common in patients scheduled for surgery (Bader et al., 1990).

Olt et al. (2021) in his study; They found that the anxiety scores of patients whose bladder tumor diagnosis period was less than 1 year were lower than those whose diagnosis period was more than 1 year. In our study; A significant difference was found between the time of diagnosis of bladder tumor disease and the surgical anxiety score, and it was concluded that this difference was due to those whose diagnosis time was over 6 years. This study is similar to the results of other studies. It is thought that if patients are diagnosed with bladder cancer late, recovery will be delayed and as a result, mortality will increase in advanced stages.

According to 2017 data published by the Republic of Turkey Ministry of Health, Turkish Public Health Institution Cancer Department, bladder cancer is the 4th most common type of cancer in men, while this rank is higher in women (Ministry of Health, 2017). Based on this, the study conducted by Lii et al. concluded that men are more likely to get bladder cancer than women (Lii et al., 2016). According to the findings of this study, the number of men included in the study is much higher than women. The findings confirm these published data. The reason for this is that the two main factors in the etiology of bladder cancer are environmental exposures and smoking. In this regard, it is thought that the reason why bladder cancer is more common in men than women is due to the fact that men use tobacco products more and are more likely to be exposed to chemicals than women.

In the study conducted by Uras and Beydağ (2022), they concluded that receiving chemotherapy due to disease is a stressful situation. Based on the findings of this study, it was concluded that receiving chemotherapy due to disease did not significantly affect preoperative stress and anxiety, but individuals who received radiotherapy felt more anxiety than those who did not. It is thought that the reason for this is the idea that bladder cancer surgery will harm the body and that patients will experience pain or a feeling of pain due to the surgery.

When the literature is scanned, there are studies indicating that previous surgery experience does not affect the level of anxiety (Vermişli et al., 2016; Taşdemir et al., 2013; Berhe et al., 2018). According to the results of this research, the Perceived Stress Scale is not affected by whether or not you have had surgery before; The Surgical Anxiety Scale for Adult Patients is affected by this condition. In other words, it was concluded that individuals who had previous surgery due to bladder tumor had higher surgical anxiety than those who did not. Because it suggests that past surgery experience creates awareness in patients.

In some studies, it has been determined that as the education level increases, patients will better evaluate the risks of surgery, and therefore the anxiety level of the patient group with a higher education level is higher than other groups (Taşdemir et al., 2013; Dayılar et al., 2017). According to the findings of this study, it was concluded that the educational status of the individuals affected both the perceived stress score and the surgical anxiety score before the surgery, but contrary to the studies, the difference was due to primary school graduates. It is thought that the reason is the lack of information about the surgical intervention planned for individuals due to bladder cancer.

In their study, Boztaş et al. (2006) stated that the relationship between tobacco use and cigarette smoking has been increasing the risk of bladder cancer for a long time. In addition, they stated that smoking has the same effect on the formation of bladder cancer for men and women. Özen and Türkeli (2007) suggested in their study that smoking is responsible for almost half of all bladder cancers today and increases the risk of cancer by an average of 2-3 times. There is no clear finding that supports or rejects the results of this research. Regarding this issue, it was concluded that only smokers of the individuals included in the study had higher preoperative anxiety scores than non-smokers.

In line with the findings of this study; Marital status, BMI, income level, perception of health, previous bladder tumor surgery, chemotherapy and radiotherapy, perceived stress scale total score average were not found to be statistically significant. On the other hand, no statistical difference was found between the surgical anxiety scale total score averages of age, gender, employment status, presence of another chronic disease and chemotherapy status.

CONCLUSION AND RECOMMENDATIONS

A moderate positive relationship was found between perceived stress and surgical anxiety level ($r:0.372$, $p:0.001$). It can be said that as individuals' perceived stress levels increase, their surgical anxiety levels also increase.

As a result, patients scheduled for bladder tumor surgery reported experiencing stress and anxiety. Taking into account the sociodemographic and disease characteristics of the patients; It is important to investigate the causes of individuals' stress and anxiety and offer solution suggestions before the planned surgical intervention.

ÖZET

Yapısal elemanların tasarımında beton malzemesinden beklenen en önemli mekanik özellikler, betonun basınç dayanımı ve elastisite modülü parametreleridir. Bu iki parametre düşey ve yatay yüklere karşı yapısal eleman performansı ve enerji tüketme kapasitesi açısından oldukça önemlidir. Yapı malzemesi teknolojisinin gelişmesi ile birlikte yapısal performans artışına yönelik betonun mekanik özelliklerinin iyileştirilmesi için birçok literatür çalışması ve beton türleri bulunmaktadır. Bunlar arasında en güncel beton türü çimento esaslı kompozit (ECC) betondur. ECC beton lif içeriği ile oldukça yüksek enerji tüketim kapasitesi ortaya çıkarabilen bir beton türüdür. Bu beton türünde çatlaklar kontrol edilebilir seviyede tutulabilmektedir. Ayrıca ECC beton, amaca yönelik tasarımlar için istenilen performansta (basınç, çekme, eğilme, tokluk) üretilebilmektedir. Ancak, yapısal elemanların ve yapıların tasarımında bu beton türlerinin kullanımı oldukça sınırlı düzeydedir. Bu kapsamda bu beton türlerinin yapı tasarımında kullanımına yönelik deneysel ve analitik daha fazla araştırmaya ihtiyaç duyulmaktadır. Çalışma kapsamında öncelikle ECC betonun yapısal elemanların üretiminde kullanılabilirliğine yönelik detaylı bir araştırma yapılmıştır. Makale kapsamında tasarım detayları referans alınan ECC beton, literatürde yer alan ECC betonlardan farklı olarak sürdürülebilirlik özelliğine de sahiptir. Çalışmada bu kapsamda iki farklı çerçeve tasarımı modellenmiştir. Makale kapsamında geleneksel betondan üretilmiş çerçeve (A1) ve ECC betondan üretilmiş çerçevelere (A2) statik itme analizi uygulanmıştır. Analiz sonucunda kapasite eğrileri karşılaştırılmıştır. Bu karşılaştırma neticesinde ECC betonun yapısal çerçevelerde kullanımına yönelik değerlendirilmelerde bulunulmuştur. Makale ile ECC betonun yapısal elemanların ve çerçevelerin üretiminde kullanımına yönelik literatüre katkı sunulması amaçlanmıştır.

**ANALYTICAL INVESTIGATION OF RC FRAMES LATERAL LOAD CAPACITIES
MADE WITH SUSTAINABLE ENGINEERED CEMENTITIOUS COMPOSITE (ECC)**

ABSTRACT

The most important mechanical properties expected from concrete material in the design of structural elements are the compressive strength and modulus of elasticity parameters of concrete. These two parameters are very important in terms of structural element performance against vertical and horizontal loads and energy consumption capacity. With the development of building material technology, there are many literature studies and concrete types for improving the mechanical properties of concrete to increase structural performance. Among these, the most current concrete type is cementitious composite concrete (ECC). ECC concrete is a type of concrete that can produce a very high energy consumption capacity with its fiber content. In this type of concrete, cracks can be kept at a controllable level. In addition, ECC concrete can be produced with the desired performance (compressive, tensile, flexural, toughness) for purpose-oriented designs. However, the use of these concrete types in the design of structural elements and structures is very limited. In this context, there is a need for more experimental and analytical research on the use of these concrete types in structural design. Within the scope of the study, firstly, a detailed research on the usability of ECC concrete in the production of structural elements was carried out. ECC concrete, whose design details are taken as reference within the scope of the article, also has a sustainability feature unlike the ECC concretes in the literature. In this context, two different frame designs were modeled in the study. Within the scope of the article, static pushover analysis was applied to the frame made of conventional concrete (A1) and frames made of ECC concrete (A2). Capacity curves were compared as a result of the analysis. As a result of this comparison, evaluations were made for the use of ECC concrete in structural frames. The article aims to contribute to the literature on the use of ECC concrete in the production of structural elements and frames.

GİRİŞ

Geleneksel beton, çimento, su, agrega ve gereksinime göre kimyasal veya mineral katkının belirli oranlarda karıştırılması ile elde edilen bir yapı malzemesidir. Beton, yüksek basınç dayanımı, kolay işlenebilirliği, ülkemizin çimento sektöründe gelişmiş olmasından ötürü ulaşılabilirliği ve maliyetinin performansına göre makul oluşu gibi avantajlarından dolayı inşaat sektöründe kullanılan temel yapı malzemesi olma özelliğini sürdürmektedir. Fakat her geçen gün mekanik ve kimyasal özellikleri gelişmiş yeni beton türleri ortaya çıkmaktadır. Yapısal bir sistemin enerji tüketme kapasitesi, yapı taşıyıcı sisteminin tasarımı, yapısal elemanların kesit özellikleri ile birlikte tasarımda kullanılan betonun tokluk parametresi ile de ilgilidir [Köseömür, 2023]. Bu kapsamda literatürde enerji yutma kapasitesi yüksek beton türleri yaygınlaşmaktadır. Ancak bu beton türlerinin inşaat sektöründe kullanımı yaygınlaşmamıştır. Çünkü tasarımda kullanılan standart ve yönetmeliklerimizde henüz bu beton türü yer almamaktadır. Yapı malzemesi alanında bu beton türlerine yönelik birçok çalışma yapılmakla birlikte yapısal elemanların tasarımında bu betonların kullanımına yönelik araştırmalar oldukça sınırlıdır. Bu beton türleri arasında en güncel olan ECC “Tasarlanmış Çimento Esaslı Beton” dur. ECC, 1990’lı yıllarda geliştirilmiştir ve yol, bina, tünel, köprü ve diğer uygulamaların yapımında ve bakımında başarıyla kullanılmaktadır [Cai, vd., 2022]. Yapısal elemanlarda beton malzemesinden beklenen en önemli özellik betonun basınç dayanımı ve enerji yutma kapasitesidir. Geleneksel betonarme yapı tasarımında betonun en önemli özelliği basınç dayanımıdır, ancak artan basınç dayanımıyla birlikte beton gevrek davranış sergilemektedir [Taşdemir vd., 2002]. ECC beton içerisindeki hacimce $\leq 2\%$ süreksiz lif içeriği ile [Ling vd., 2019] gevrek davranış sergileyen betonun bu zayıf özelliğini iyileştirip yapının süneklik ve buna bağlı olarak enerji yutma özelliğini artırmaktadır. Ayrıca bu lifler sayesinde çatlak genişlikleri de kontrol edilebilir seviyelerde tutularak betonun çekme direnci ve durabilite özelliği de geliştirilebilmektedir. Çatlakların kontrol edilebilmesi ve lif içeriği ile birlikte ECC beton, kendiliğinden iyileşebilme özelliğinde büyük bir potansiyele sahiptir. Bu da özellikle onarım gerektiren fakat altyapı, kanalizasyon, liman yapıları gibi onarımı zor ve maliyetli olabilecek durumlarda betona çok önemli bir özellik katmaktadır. ECC betonun yapı elemanlarında, özellikle güçlendirme amaçlı kullanıldığında da birçok faydalı etkisi görülmüştür. Bahsedilen tüm bu özelliklere ek olarak; Gür (2017) ECC beton ile güçlendirilmiş bölme duvarların kayma dayanımlarını incelediği çalışmada geleneksel betona kıyasla kayma dayanımında %90’a varan artış gözlemlenmiştir. Ayrıca ECC beton, sargı etkisi göstererek duvarların göçme sonrası

dağılmasını engellemiştir [Gür, 2017]. Bir başka çalışmada ise ECC kirişlerin ters döngüsel yükleme altındaki mekanik davranışı incelenmiş, ECC kaplamasında pullanma veya ezilme gözlemlenmemiş, ECC kirişlerin akma sırasındaki tepe deplasmanı beton kirişinkinin yaklaşık 3 katı olduğu görülmüştür. Ayrıca bu çalışmada da ECC kirişte liflerin çatlak köprüleme yaparak çimentolu matrisi tutmaya çalıştıklarından dolayı daha az hasar gözlemlenmiştir [Hwan vd., 2014]. Literatür incelendiğinde ECC beton ile pek çok çalışma olduğu görülmüş fakat statik itme analizi ile analitik olarak incelenmesi konusunda örneklerin artırılması gerektiği düşünülmüştür. Statik itme analizi, yapıların yatay yükler altındaki davranış özelliklerinin ve performanslarının anlaşılmasına yönelik olarak geliştirilen sayısal bir analiz yöntemidir. Makale kapsamında iki katlı, tek açıklıklı geleneksel ve ECC betondan üretilmiş iki farklı çerçevenin statik itme analizleri gerçekleştirilmiştir. Analizler sonucunda çerçevelerin kapasite eğrileri karşılaştırılmıştır. Çalışmada ECC beton ile üretilmiş bir çerçevenin geleneksel bir betondan üretilmiş bir çerçeveye göre enerji yutma kapasitesi analitik olarak incelenmiştir. Çalışma ile yapısal sistemlerin tasarımında veya güçlendirilmesinde ECC betonun kullanılabilirliğine yönelik gerçekleştirilen araştırmalara katkı sunulabilmesi amaçlanmıştır.

MATERYAL ve YÖNTEM

Makale kapsamında 400x400 mm kolon kesit boyutları, 250x450 mm kiriş kesit boyutlarına sahip tek açıklıklı iki katlı kat yükseklikleri 3000 mm olan betonarme çerçeveler analiz modeli olarak kullanılmıştır. Kolonların donatı oranı için 0,01 değeri dikkate alınmıştır (Şekil 1-2). Tasarım kolonların kirişlerden güçlü olması prensibine göre oluşturulmuştur. Modelde kolonlarda N/N_0 0,1 olacak şekilde kirişlere 250 kN/m yayılı yük uygulanmıştır.

Şekil 1. 400x400 mm Kolon Kesit Modeli ve 250x450 mm Kiriş Kesit Modeli (Sap 2000).

Şekil 2. Betonarme Çerçeve Modeli ve 3 Boyutlu Görünümü (Sap 2000).

Çerçeve modelleri C35 geleneksel beton ve C35 ECC beton parametrelerine göre ayrı ayrı analiz edilmiştir. Analizlerde kullanılan geleneksel beton modelinin basınç nihai şekil değiştirme değeri 0,005 iken, ECC beton modelinin şekil değiştirme değeri 0,016 olarak kabul edilmiştir. Çekmede ise ECC betonun nihai şekil değiştirme değeri 0,0035 iken geleneksel betonun nihai şekil değiştirme değeri yaklaşık olarak 0,0012 dikkate alınmıştır. Her iki modelde sadece beton gerilme-şekil değiştirme eğrileri değiştirilerek statik itme analizi uygulanmıştır. Statik itme analizinde

Şekil 4. C35 Geleneksel Beton Çerçeve Kapasite Eğrisi

ECC beton kullanılarak yapılan analizde ise plastik mafsallı ve yapı kapasitesine göre itme analizinin 242,25 mm değerine kadar devam ettiği doğrusal olmayan davranışın 172,1 kN taban kesme kuvveti, 123,85 mm tepe deplasmanı değerinde oluştuğu görülmüştür (Tablo 2).

Tablo 2. ECC Betonun Statik İtme Analiz Verileri

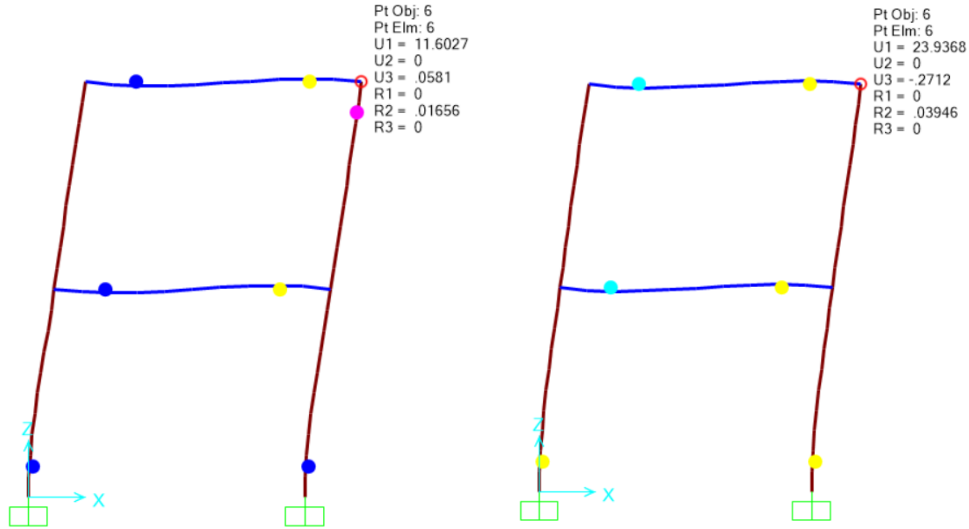

Adım	Deplasman		Taban Kesme Kuvveti	
	m	cm	kN	Ton
0	0	0	0,0000	0
1	0,007315	0,7315	0,9451	0,09451

13	0,233351	23,3351	181,254	18,1254
14	0,242251	24,2251	180,87	18,087

Şekil 5. C35 ECC Beton Çerçeve Kapasite Eğrisi

Bu değer geleneksel beton kullanılarak elde edilen analiz sonucuyla karşılaştırıldığında 4 kat deplasman kapasitesinde artış görülmüştür. Geleneksel betonlu çerçeve kat ötelenmeleri

incelendiğinde maksimum 117,45 mm tepe deplasmanında 1. katta yatay ötelenmenin 0,016 seviyesinde, 2. katta ise 0,02 seviyesinde olduğu görülmüştür. ECC betonlu analizde ise maksimum tepe deplasmanı 242,25 mm değerinde 1. katta yatay ötelenmenin 0,033, 2. katta ise 0,043 değerinde olduğu görülmüştür (Şekil 6).

Şekil 6. ECC ve Geleneksel Betondan Üretilmiş Çerçevelerde Yatay Ötelenme

Bu değerler karşılaştırıldığında maksimum tepe deplasmanda yatay ötelenme değerinin 2,15 kat arttığı belirlenmiştir. Ayrıca ATC-40 kapasite spektrumu (ATC-40, 1996.) performans noktası geleneksel betonlu analizde 48 kN değerine karşılık 6 mm tepe deplasmanında gerçekleşirken, ECC betonlu analizde 48 kN değerine karşılık 28 mm değerinde oluşmuştur. Bu değerler karşılaştırıldığında ECC betonlu çerçevenin yatay deplasman performans noktasının geleneksel betona göre 4,66 kat arttığı tespit edilmiştir. Şekil 7’de geleneksel ve ECC betonlu statik itme analiz sonuçlarının karşılaştırılması verilmiştir.

Şekil 7. ECC ve Geleneksel Betonun Kapasite Eğrilerinin Karşılaştırılması.

SONUÇLAR ve ÖNERİLER

Makale kapsamında geleneksel beton ve ECC beton parametreleri dikkate alınarak modellenmiş tek açıklıklı, iki katlı çerçevelerin statik itme analizi gerçekleştirilmiştir. Bu analizler sonucunda çerçevelerin kapasite eğrileri karşılaştırılmıştır. Karşılaştırma neticesinde ECC beton ile modellenmiş çerçevenin enerji tüketme kapasitesinin geleneksel betondan üretilmiş çerçeveye göre %72 daha fazla olduğu analitik olarak görülmüştür. Çalışmada ECC beton ile üretilmiş yapısal çerçevelerin geleneksel betonlu çerçeveye göre yatay deformasyon kapasitelerinin oldukça fazla olduğu analitik bir çalışma ile ortaya konulmuştur. İleriki çalışmalarımızda bu sonuçlarımızın deneysel verilerle irdelenmesi çalışmaları gerçekleştirilecektir. Makalemiz ile ECC betonun yapı sektöründeki kullanımına ve bu alanda gerçekleştirilen akademik çalışmalara katkı sunulabilmesi amaçlanmıştır.

ÖZET

Bu çalışmada ortaokul 7. sınıf öğrencilerinin yaptığı su, metan, karbondioksit molekülü modellemeleri ile verilen modellemelerden saf madde, element, bileşik, karışım kavramlarına göre yapılan sınıflandırmalardan öğrenci imajlarını belirlemek ve yanlış kavramalarını ortaya koymak amaçlanmıştır. Saf madde ve karışımlar konusundaki; element, bileşik, karışım saf madde, molekül kavramları ortaokul ve sonraki eğitim düzeyleri için önemlidir. Bu konularda edinilen alternatif kavramalar öğrencilerin kimyanın birçok konusunu öğrenmede zorluk yaşamasına neden olmaktadır. Çizimlerden yararlanarak öğrencilerin alternatif kavramalarını belirlemek ve gerekli önlemlerin alınması onların eğitim hayatları için önemlidir. Araştırma 2021-2022 öğretim yılının ikinci döneminde Sivas ili bir ilçesinde ilköğretim kurumunda öğrenim gören 13 yedinci sınıf öğrencisi ile yürütüldü. Nitel bir sürecin izlendiği araştırmada yedinci sınıf öğretim programında yer alan saf madde ve karışımlar ünitesindeki kavramlarla ilgili çizim ve açıklama yaptıran çalışma yaprağı veri toplama aracı olarak kullanıldı. İlk soruda öğrencilerden yaygın bilinen üç bileşiğin molekül modelini çizmeleri ve açıklama yapmaları istenildi. İkinci soruda öğrencilere çalışma yaprağında verilen modelleri saf madde, karışım, element, bileşik kavramlarına göre sınıflandırmaları istenildi. Verilerin analizinde içerik analizi kullanıldı. Araştırma sonunda öğrencilerin su, metan, karbondioksit molekülü modellemeleri ve saf madde, element, bileşik, karışım kavramları konusundaki imajlarından kavramlarla ilgili anlamalarının yetersiz olduğu belirlendi. Öğrencilerin çizimlerinden sahip oldukları alternatif kavramalar tespit edildi.

Anahtar Kelimeler: Saf madde, karışım, imaj, alternatif kavrama

**EVALUATION OF 7TH GRADE STUDENTS' UNDERSTANDINGS OF THE
CONCEPTS OF PURE SUBSTANCE, ELEMENT, COMPOUND AND MIXTURE WITH
DRAWINGS**

ABSTRACT

In this study, it is aimed to determine the students' images and to reveal their misconceptions from the modeling of water, methane and carbon dioxide molecules made by the 7th grade secondary school students and the classifications made according to the concepts of pure substance, element, compound and mixture. Regarding pure substances and mixtures; The concepts of element, compound, mixture, pure substance, and molecule are important for secondary school and later education levels. Alternative understandings acquired in these subjects cause students to have difficulty in learning many subjects of chemistry. Determining students' alternative understandings by using drawings and taking the necessary precautions are important for their educational lives. The research was conducted in the second semester of the 2021-2022 academic year with 13 seventh grade students studying at a primary school in a district of Sivas province. In the research, in which a qualitative process was followed, a worksheet that required drawings and explanations of the concepts in the pure substances and mixtures unit in the seventh grade curriculum was used as a data collection tool. In the first question, students were asked to draw the molecular models of three commonly known compounds and explain them. In the second question, students were asked to classify the models given in the worksheet according to the concepts of pure substance, mixture, element and compound. Content analysis was used to analyze the data. At the end of the research, it was determined that the students' understanding of the concepts based on their modeling of water, methane and carbon dioxide molecules and their images of the concepts of pure substance, element, compound and mixture was insufficient. The alternative conceptions that the students had were determined from their drawings.

Keywords: Pure substance, mixture, image, alternative conception

GİRİŞ

Kavram öğrenme içinde bulunduğumuz dünyayı bilmek, anlamak ve bu dünyaya uyum sağlamak için gereklidir. Kavramlar bilginin yapı taşlarını, kavramlar arası ilişkiyi, bilimsel ilkeleri oluşturur. İnsanlar yaşamları boyunca temel kavramları öğrenir, sınıflandırır ve aralarında ilişki kurarlar (Yağbasan & Gülçiçek, 2003).

Öğrenciler ders başlangıcında önyargı ve hayat tecrübelerini de beraberlerinde getirirler. Öğrencilerin yanlış inançları, deneyimleri ile ortaya çıkan alternatif kavramlar kabul edilen bilimsel anlamından önemli derece farklılık gösterir. Öğrenciler kavramlar üzerinde tam anlamıyla öğrenmektense yüzeysel olarak kavramaya çalışmaları kavram yanlışlarına sebep olmaktadır (Coştu, Ayas , & Ünal, 2007).

Son yıllarda, fen öğretimi konusunda bilimsel kavramların anlaşılması üzerine yapılan araştırmalarda, fen derslerinde öğrencilerin kavramları bilimsel olarak kabul edilen anlamından farklı algıladıkları saptanmıştır. (Nakhleh, 1992; Çalık ve Ayas 2005; Ünal, Çalık, Ayas & Coll,2006; Demirbaş, Tanrıverdi, Altınışik ve Şahintürk, 2011).

Fen bilimlerinin önemli bileşeni olan kimya, kendine özgü soyut kavramlarının olmasına bağlı kavramsal olarak öğrenilmesi zor olan doğa bilimlerinin önemli bir dalıdır (Nakhleh, 1992; Johnstone, 1991). Somut kavramların öğrenilmesi günlük yaşamla ilişkilendirilerek sağlanabilirken, soyut kavramların öğrenilmesi ise çok daha zorlu süreçleri içermektedir (Türk, Akkuş & Tüzün, 2014). Bu konuda özellikle alternatif kavramlar, öğrencilerin doğru anlamasını engelleyebilecek yaygın zorluklardan biridir. Kimyanın öğrenilmesinde sıkça karşılaşılan yanlışlar, öğrencilerin yanlış anlamasına, eksik kavram oluşturmaya veya zorluğa düşmesine neden olabilir (Nakhleh, 1992 ; Johnstone, 1991).

Fen Bilimlerinin en temel kavramlarından biri olan saf madde ve karışımlar konusunda tanecik boyutunda öğrencilerin doğrudan gözlemleyememeleri, bu konu hakkında gözlem veya deney yapacak yeterli donanımların bulunmamasından kaynaklı olarak öğrencilerin zihinlerinde alternatif kavramlar oluşmaktadır (Altay ve Balım, 2021). Zaten hali hazırda kimyanın molekül, saf madde, element, bileşik, karışım kavramları ile ilgili öğrencilerin sahip oldukları yanlış inanışların var olması (John, 1991; Taber, 2001; Chittleborough & Treagust, 2007) ve bunlar üzerine bu kavramlarla ilgili ayrımların yapılamayacak olması ve birbirleri ile karıştırılması beklenen bir sonuçtur.

Kimya; çeşitli aktiviteler, deney ve gözlemlerle anlayabildiğimiz makroskobik boyut, dizgelerle anlayabildiğimiz sembolik boyut, çizimlerle veya modellerle ortaya koymaya çalıştığımız mikroskobik boyut olarak üç boyutlu doğaya sahiptir. Öğrencilerin kimyayı öğrenmesi için bu üç boyut arasında bağlantı kurması ve ilişkilendirme yapması zorunludur. Kimya'nın makroskobik ve sembolik boyutu klasik sorular ve testlerle ölçülebiliyorken, mikroskobik boyutu ancak çizim ve çizime bağlı oluşturulan mülakatla ortaya konulabilir (Türk, Akkuş & Tüzün, 2014). Kimyasal olguların çizimlerle ifade edilme şekillerinin araştırılması alternatif kavramalarını belirlemek ve gerçekleştirilecek eğitim açısından önemlidir (Çelik, Oluk, Üner, Ulutaş & Akkuş, 2017).

Kimyayının soyut dünyasının anlaşılabilmesi için denklemler, semboller, modellemeler kullanmak ve bunların temsil yeterliliği bir gereklilik haline gelmiştir (Chittleborough & Treagust, 2007). Sağ ve sol el arasındaki fark gibi iki farklı molekülün gösterimindeki incelik kadar önemli olan kimyada şekiller önemli yere sahiptir. Kimyada bir yapısal bilginin üç boyutlu aktarılması iki boyutlu kağıt üzerinde oldukça karmaşık olsa da kendisine özgü gösterimlerinin olması dil fark etmeksizin bu alanın parçası haline gelmiştir. (Hoffmann & Laszlo, 1991).

Kimyanın mikroskobik boyutu ile ilgili öğrenmeler klasik test tekniklerinden çok çizimler ve modeller yolu ile ortaya çıkarılabilen bir boyuttur (Türk, Akkuş & Tüzün, 2014). Çizimler, alternatif kavramaları belirlemek ve öğrencilerin bilimsel modele uygun zihinsel modeller oluşturmalarını sağlamak için önemli bir araçtır (Devetak & Glazar, 2009). Çizim tekniğinin öğrencinin anlama düzeyinin, zihinsel modellerinin ve alternatif kavramalarının ortaya çıkarılmasında kullanılması gereken tekniklerden biri olduğu savunulmaktadır (Novick & Nussbaum, 1978).

Her ne kadar birçok stratejinin öğrencilerin kavram yanılgılarını gidermede geleneksel öğretimden daha etkili olduğu öne sürülse de, bilimsel kavramların kazanılmasındaki başarı oranları mükemmel olmaktan uzaktır. Bazı durumlarda, öğrencilerin yarısından fazlası öğretim müdahalesinden sonra hala birçok kavram yanılgısına sahiptir (Basili ve Sanford, 1991; Rogan, 1988). Bu nedenle, öğrencilere temel kimya kavramları arasında anlamlı bağlantılar kurabilmeleri için daha fazla fırsat sağlanmasına büyük ihtiyaç vardır (Noh & Scharmann, 1997).

Saf madde ve karışımlar konusundaki; element, bileşik, karışım saf madde, molekül kavramları ortaokul ve sonraki eğitim düzeyleri için önemlidir. Bu konularda edinilen alternatif

kavramalar öğrencilerin kimyanın birçok konusunu öğrenmede zorluk yaşamasına neden olmaktadır. Ancak bu kavramlar arasındaki farklılıkları ve özellikleri doğru anlamak kimyanın diğer konularında olduğu gibi karmaşıktır. Çizimlerden yararlanarak öğrencilerin alternatif kavramalarını belirlemek ve gerekli önlemlerin alınması onların sonraki eğitim hayatları etkileyecek öneme sahiptir.

Bu çalışmada ortaokul 7. sınıf öğrencileri tarafından yapılan su, metan, karbondioksit molekülü modellemelerinden ayrıca verilen modellemelerden saf madde, element, bileşik, karışım kavramlarına göre yapılan sınıflandırmalardan yola çıkarak öğrenci imajlarını belirlemek ve kimyanın öğrenilmesi zor olan mikroskobik doğasını içeren bu kavramları ile ilgili alternatif öğrenmelerini ortaya koymak amaçlanmıştır.

Bu çalışma ile kimyanın mikroskobik dünyasını öğrenmede sıkıntı yaşayan öğrencilerin sahip oldukları zihinsel imajların belirlenmesi alternatif öğrenmelerden kaynaklı ileriye dönük olumsuzluklar için kaynak oluşturacağı düşünülmektedir.

MATERYAL ve YÖNTEM

Bu araştırmada nitel bir süreç izlenmiştir. Nitel araştırma yöntemleri veriden anlam üretebilmesi, verileri sınıflandırması ve benzer boyutlara indirgemesi ile sonuçların yorumlanmasına olanak tanır (Glesne, 2012). Nitel araştırmada toplanan veriler gözlem notları, görüşme kayıtları, dokümanlar, resimler ve diğer grafik sunumlar şeklinde farklı veri toplama tekniklerini içerebilir. (Yıldırım ve Şimşek, 2008).

Çalışma Grubu

Araştırma 2021-2022 öğretim yılının ikinci döneminde Sivas ilinin bir ilçesinde ilköğretim kurumunda öğrenim gören 13 yedinci sınıf öğrencisi ile yürütüldü. Bu çalışmada, 7. sınıfların fen bilimleri dersinin saf madde karışım ünitesi ile çalışıldığından amaçlı örneklem çeşitlerinden ölçüt örnekleme kullanıldı.

Veri Toplama Aracı:

Saf madde ve karışımlar ile ilgili imajları mikroskobik boyutta çizimlerle tespit etmek için iki açık uçlu sorudan oluşan çalışma yaprağı veri toplama aracı olarak kullanıldı. İlk soruda öğrencilerden yaygın bilinen üç bileşiğin molekül modelini çizmeleri istenildi. Modellerin çizilebilmesi için atomlar için örnek modeller verildi. Yaygın kullanılan moleküller oldukları için formülleri bildikleri varsayıldı ve unutmaya durumuna karşı hatırlatma yapıldı. İkinci soru öğrencilere verilen modelleri saf madde, karışım, element, bileşik şeklinde sınıflandırmalarını isteyen bir soruydu.

Nitel bir sürecin izlendiği araştırmada yedinci sınıf öğretim programında yer alan saf madde ve karışımlar ünitesindeki kavramlarla ilgili çizim, çizimlere bağlı açıklama, verilen modellemeleri doğru kavramlarla eşleştirme istenilen çalışma yaprağı veri toplama aracı olarak kullanıldı.

Verilerin Analizi:

Araştırmada içerik analizi kullanıldı. İçerik analizi nesnel, ölçülebilir, doğrulanabilir bilgilere ulaşmak amacıyla doküman, metin ve evrak gibi pek çok farklı materyali belli kurallar dahilinde analiz etmeyi amaçlayan bir tekniktir. İçerik analizinde amaç toplanan verileri açıklayabilecek kavramlara ve ilişkilere ulaşmaktır. Yapılan işlem, birbirine benzeyen verileri belirli kavramlar ve temalar çerçevesinde bir araya getirmek ve bunları okuyucunun anlayabileceği bir biçimde düzenleyerek yorumlamaktır (Yıldırım ve Şimşek, 2008, s. 227).

Öğrencilerden 1. soru için beklenen örnek atomik gösterimdeki çizimleri ve bileşiklerin formüllerini kullanarak temsili bir molekül çizimi yapmasıdır.

Öğrencilerden beklenen tabloda verilen tanecik modellerine, tanecik sayılarına ve su molekülünün sahip olduğu açısız görünümüne dikkat ederek çizim yapmalarıdır.

Şekil 1. Öğrencilerden beklenen doğru su molekülü çizim örneği

Öğrencilerden beklenen tabloda verilen tanecik modellerine, tanecik sayılarına dikkat ederek çizim yapmalarıdır.

C

H

4

Şekil 2. Öğrencilerden beklenen doğru metan molekülü çizim örneği

Öğrencilerden beklenen tabloda verilen tanecik modellerine, tanecik sayılarına ve karbondioksit molekülünün sahip olduğu doğrusal görünümüne dikkat ederek çizim yapmalarıdır.

C

O

2

Şekil 3. Öğrencilerden beklenen doğru karbondioksit molekülü çizim örneği

Çalışma yaprağının 2. sorusunda öğrencilerden soruda istenilen görsel numaralarını seçmeleri istenilmiştir. Soruda istenilen seçimler dışında fazladan seçim yapan ya da eksik seçim yapan öğrenciler yanlış kategoride değerlendirilmiştir. İkinci soru için ayrıca her görsel numarasının her bir soru kökünü için kaç kez seçildiği belirleyen bir tablo oluşturulmuştur.

2. soru için öğrencilerin uygun sınıflandırılmaları gerçekleştirebilmeleri ve en çok hangi kavramlar birbiri ile karıştırılmış olabileceklerinin değerlendirmesinin yapılması için hazırlanmıştır.

BULGULAR ve TARTIŞMA

Birinci soru için öğrenci cevapları bulguları:

Tablo 1: Öğrencilerin Su molekül modeli çizimleri

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru					+						+			2
Kısmen Doğru			+			+			+	+		+	+	6
Yanlış	+	+		+			+	+						5

Öğrencilerin su molekülü çiziminde tanecik sayısına dikkat eden ama molekül açısına dikkat etmeyen öğrenciler; tanecik modelinde verilen örnek çizimlere göre çizilmeyen ama tanecik sayısı ve açısal forma göre çizim yapan öğrenciler kısmen doğru kategorinde yer almıştır. Taneciklerin sayısına uymayan çizimler yanlış kategoride yer almıştır.

Kısmen doğru yapanların en fazla olduğu su molekülü çiziminde doğru yapan öğrenci sayısı yanlış yapan öğrenci sayısına göre daha azdır.

Tablo 2: Öğrencilerin Metan molekül modeli çizimleri

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru			+			+			+		+		+	5
Kısmen Doğru														0
Yanlış	+	+		+	+		+	+		+		+		8

Metan molekülü çiziminde tanecik sayısına ve modeldeki gösterimlere göre çizim yapan öğrenciler doğru kategorisinde yer almıştır. Tanecik sayısına ve modeline göre çizim yapmayan öğrenciler yanlış kategoride yer almıştır.

Kısmen doğru yapan öğrencinin olmadığı metan molekülü çiziminde doğru yapan öğrenci sayısı yanlış yapan öğrenci sayısından azdır.

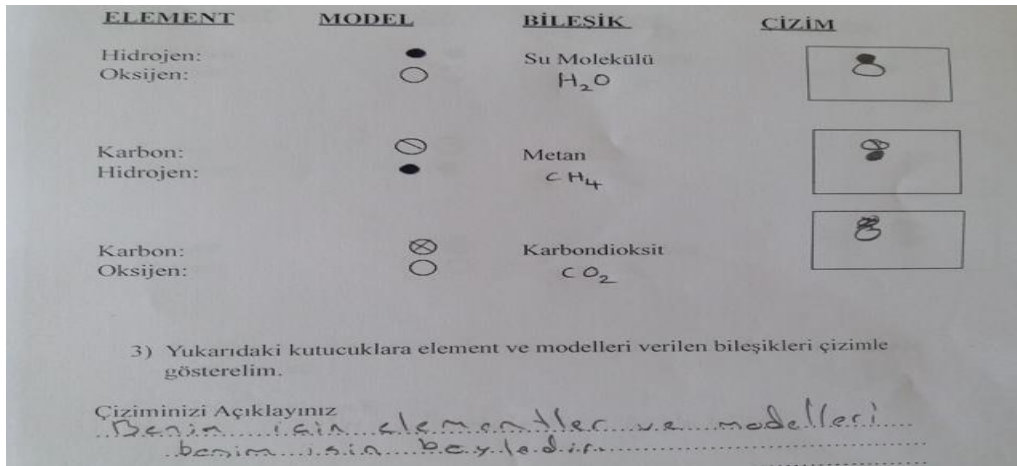

Tablo 3: Öğrencilerin Karbondioksit molekül modeli çizimleri

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru			+			+								2
Kısmen Doğru									+		+		+	3
Yanlış	+	+		+	+		+	+		+		+		8

Öğrencilerin karbondioksit molekülü çiziminde tanecik sayısına dikkat eden ama molekül doğrusal formuna dikkat etmeyen öğrenciler; tanecik modelinde verilen örnek çizimlere göre çizilmeyen ama tanecik sayısı ve doğrusal forma göre çizim yapan öğrenciler kısmen doğru kategoride yer almıştır. Taneciklerin sayısına uymayan çizimler yanlış kategoride yer almıştır.

Yanlış yapan öğrenci sayısı doğru ve kısmen doğru yapan öğrenci sayısına göre fazladır.

Birinci soru için öğrenci cevaplarından bazı örnekler:

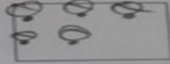

Şekil 4. Üç molekül için de yanlış bir modellemedir. Öğrenci sadece birer tanecik kullanarak modellemiştir. Açıklama yetersizdir.

ELEMENT	MODEL	BİLESİK	CİZİM
Hidrojen: Oksijen:	● ○	Su Molekülü H_2O	
Karbon: Hidrojen:	○ ●	Metan CH_4	
Karbon: Oksijen:	⊗ ○	Karbondioksit CO_2	

3) Yukarıdaki kutucuklara element ve modelleri verilen bileşikleri çizimle gösterelim.

Çiziminizi Açıklayınız
Yapılan çizimde, ilk önce bir büyük daire çizildi. Bu daireye dört küçük daire dokunarak bağlandı. Her biri için bir çizim yapıldı. Çizimdeki dairelerin büyüklükleri aynıdır. Her biri için bir çizim yapıldı. Çizimdeki dairelerin büyüklükleri aynıdır.

Şekil 5. Üç molekül için de yanlış modellemedir. Öğrenci sadece birer tanecik kullanarak modelleme yapmıştır. Öğrenci açıklamasında büyüklüklerinin aynı olduğunu belirtmiştir.

ELEMENT	MODEL	BİLESİK	CİZİM
Hidrojen: Oksijen:	● ○	Su Molekülü H_2O	
Karbon: Hidrojen:	○ ●	Metan CH_4	
Karbon: Oksijen:	⊗ ○	Karbondioksit CO_2	

3) Yukarıdaki kutucuklara element ve modelleri verilen bileşikleri çizimle gösterelim.

Çiziminizi Açıklayınız
modeller boyledir

Şekil 6. Üç molekül için de yanlış bir modellemedir. Öğrenci sadece birer tanecik kullanarak modellemiştir. Açıklama yetersizdir.

ELEMENT	MODEL	BİLESİK	CİZİM
Hidrojen: Oksijen:	● ○	Su Molekülü H_2O	
Karbon: Hidrojen:	○ ●	Metan CH_4	
Karbon: Oksijen:	⊗ ○	Karbondioksit CO_2	

3) Yukarıdaki kutucuklara element ve modelleri verilen bileşikleri çizimle gösterelim.

Çiziminizi Açıklayınız
Modellemler... Moleküller... birleştirirsek... bu şekli.
C. kar

Şekil 7. Üç molekül için de yanlış bir modellemedir. Öğrenci sadece birer tanecik kullanarak modellemiştir. Açıklama yetersizdir.

ELEMENT	MODEL	BİLESİK	CİZİM
Hidrojen: Oksijen:	● ○	Su Molekülü H_2O	
Karbon: Hidrojen:	○ ●	Metan CH_4	
Karbon: Oksijen:	⊗ ○	Karbondioksit CO_2	

3) Yukarıdaki kutucuklara element ve modelleri verilen bileşikleri çizimle gösterelim.

Çiziminizi Açıklayınız
1. Modeli 2 tane Hidrojen, 1 tane oksijen olarak algıladım.
2. Modeli 1 Karbon, 4 Hidrojen olarak algıladım.
3. Çizimi 1 karbon, 2 oksijen olarak algıladım.

Şekil 8. Su, metan moleküllerinin çizimleri doğru kabul edilmiştir. Karbondioksit molekülü tanecik sayısı doğru olsa da doğrusal formda olmadığı için kısmen doğru kabul edilmiştir. Öğrenci açıklaması tanecik modellemesiyle uyumludur.

Şekil 9. Karbondioksit, metan moleküllerinin çizimleri doğru kabul edilmiştir. Su molekülü tanecik sayısı doğru olsa da açılal formda olmadığı için kısmen doğru kabul edilmiştir. Öğrenci açıklamasında modeli formüllere göre yaptığı düşünülmektedir.

İkinci soru için öğrenci cevapları bulguları:

Tablo 4. Saf madde sorusunda doğru ve yanlış yapan öğrenci sayısı

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru														0
Yanlış	+	+	+	+	+	+	+	+	+	+	+	+	+	13

Saf maddelerin seçilmesinin istenildiği soruda hiçbir öğrenci doğru cevap verememiştir.

Tablo 5. Element sorusunda doğru ve yanlış yapan öğrenci sayısı

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru														0
Yanlış	+	+	+	+	+	+	+	+	+	+	+	+	+	13

Elementlerin seçilmesinin istenildiği soruda hiçbir öğrenci doğru cevap verememiştir.

Tablo 6. Bileşik sorusunda doğru ve yanlış yapan öğrenci sayısı

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru		+		+				+						3
Yanlış	+		+		+	+	+		+	+	+	+	+	10

Bileşiklerin seçilmesinin istenildiği soruda 3 öğrenci doğru cevap verirken diğerleri doğru cevap verememiştir.

Tablo 7. Karışım sorusunda doğru ve yanlış yapan öğrenci sayısı

	Ö1	Ö2	Ö3	Ö4	Ö5	Ö6	Ö7	Ö8	Ö9	Ö10	Ö11	Ö12	Ö13	Toplam
Doğru											+			1
Yanlış	+	+	+	+	+	+	+	+	+	+		+	+	12

Karışımların seçilmesinin istenildiği soruda 1 öğrenci doğru cevap verirken diğerleri doğru cevap verememiştir.

Tablo 8. Görsellere numarasına göre saf-bileşik-element-karışım sorularında öğrenci seçimleri

	1. görsel Saf- element	2. görsel karışım	3.görsel Saf- bileşik	4.görsel karışım	5.görsel Saf-element	6.görsel Saf-bileşik	7.görsel Saf-element
Saf	6	2	2	3	3	3	10
Element	6	5	4	5	9	3	4
Bileşik	5	3	9	1	5	8	0
Karışım	1	6	6	8	0	6	0

Çalışma yaprağının ikinci sorusunda görsellerin her birinin her bir soru kökü için kaç kez seçildiğinin gösterildiği tabloda koyu renkle gösterilmiş sayılar doğru seçim sayısını bize vermektedir. Saf madde ve element kavramlarını temsil eden 1. görsel saf madde sorusu için 6 kez, element için de 6 kez seçilerek doğru yapılmıştır. Burada saf element kavramlarını temsil eden 1. görsel en çok bileşikler sorusu için seçilerek yanlış yapılmıştır.

Karışımlar kavramını temsil eden 2. görsel karışımlar sorusu için 6 kez seçilerek doğru yapılmıştır. Karışımlar kavramını temsil eden 2. görsel en çok elementler sorusu için 5 kez seçilerek yanlış yapılmıştır.

Saf madde ve bileşik kavramlarını temsil eden 3. görsel saf madde sorusu için 2 kez, bileşikler sorusu için de 9 kez seçilerek doğru yapılmıştır. Burada saf bileşik kavramlarını temsil eden 3. görsel en çok karışımlar sorusu için 6 kez seçilerek yanlış yapılmıştır.

Karışımlar kavramını temsil eden 4. görsel karışımlar sorusu için 8 kez seçilerek doğru yapılmıştır. Karışımlar kavramını temsil eden 4. görsel en çok elementler sorusu için 5 kez seçilerek yanlış yapılmıştır.

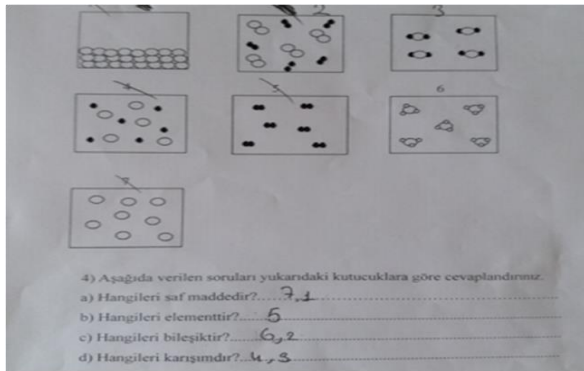

Saf madde ve element kavramlarını temsil eden 5. görsel saf madde sorusu için 3 kez, element için de 9 kez seçilerek doğru yapılmıştır. Burada saf element kavramlarını temsil eden 5. görsel en çok bileşikler sorusu için 5 kez seçilerek yanlış yapılmıştır.

Saf madde ve bileşik kavramlarını temsil eden 6. görsel saf madde sorusu için 3 kez, bileşikler sorusu için de 8 kez seçilerek doğru yapılmıştır. Burada saf bileşik kavramlarını temsil eden 6. görsel en çok karışımlar sorusu için 6 kez seçilerek yanlış yapılmıştır.

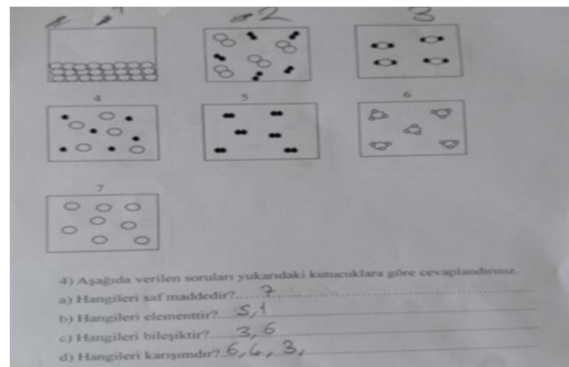

Saf madde ve element kavramlarını temsil eden 7. görsel saf madde sorusu için 10 kez, element için de 4 kez seçilerek doğru yapılmıştır. Diğer sorular için hiç seçim yapılmamıştır.

Saf madde ve element kavramını temsil 7. görselde hiç seçim yapılmamış olsa da 1. görsel ve 5. görselde elementlerin en çok bileşikler ile karıştırılmış olabileceği düşünülebilir. Saf madde bileşik kavramlarını temsil eden 3. görsel ve 6. görselde bileşiklerin en çok karışımlar ile karıştırılmış olabileceği düşünülebilir. Burada 5. görsel ve 7. görselde saf madde ve element seçimlerinde sayıların farklı olmasından elementlerin ayrıca saf madde olduklarının düşünülmediği çıkarılabilir. Ayrıca 3. görselde bileşiklerin de saf madde olabileceğinin düşünülmediği çıkarılabilir. Karışımları temsil eden 2. görsel ve 4. görselde karışımların en çok elementler ile karıştırıldığı çıkarılabilir.

SONUÇ ve ÖNERİLER

Çalışma yaprağında öğrencilerden molekül modellerinin çizilmesi istenilen soruda su molekülü modelini kısmen doğru yapan öğrencilerin sayısı en fazla olup, tamamen doğru yapanların sayısı yanlış yapanlardan azdır. Öğrencilerin su molekülü modeli kısmen doğru çizen öğrencilerin modeli doğrusal formda çizdikleri açıl formunu kavramadıkları görülmüştür. Öğrencilerin metan molekül modelini doğru çizen öğrenci sayısı yanlış çizen öğrenci sayısından yine az sayıda olup, kısmen doğru yapan öğrenci olmadığı görülmüştür. Öğrencilerin karbondioksit molekül modelini doğru yapan öğrenci sayısı yanlış yapan öğrenci sayısından azdır. Kısmen doğru yapabilen 3 öğrencinin karbondioksit modelini doğrusal modelleme ile değil de su molekülündeki açılı çizime benzeterek çizdikleri görülmüştür. Yanlış çizim yapan öğrencilerin geneli birer tanecik kullanarak bileşik oluşturmuş. Tanecik sayılarına dikkat edilmemiş ve öğrenciler formüller ile modeller arasında bağ kuramamıştır.

Genel olarak öğrencilerin molekülleri tanecikle modellemede sıkıntı yaşadıkları gözlemlenmiştir. Bu da onların kimyanın öğrenilmesi zor olan mikro boyutundaki tanecik modellerinin zihinlerinde yeterince oturmadığını göstermektedir.

Çalışma yaprağında saf madde, element, bileşik, karışım kavramlarının yer aldığı soruda öğrencilerin çoğunun yanlış cevap vermiş olması saf madde, element, bileşik, karışım gibi kavramların yeterince anlaşılmadığını göstermektedir. Ayrıca ikinci soru için oluşturulan her görselin soru için seçilme sayısını veren tabloda kavramların birbirleri ile karıştırıldığı görülmektedir. Öğrenci seçimlerine göre element kavramını temsil eden görsel ile bileşik kavramı; bileşik kavramını temsil eden görsel ile karışımlar kavramını eşleştiren öğrenciler olmuştur. Elementleri temsil eden görselleri element kavramı ile eşleştiren öğrencilerin saf madde ile eşleştirmemeleri, elementlerin ayrıca saf madde olarak düşünülmediğini göstermektedir. Bileşikleri temsil eden görselleri bileşik kavramı ile eşleştiren öğrencilerin saf madde ile eşleştirmemeleri, bileşiklerin de ayrıca saf madde olarak düşünülmediğini göstermektedir.

Öğrenci seçimlerine bakıldığında saf madde- bileşik kavramlarında hatalı seçim sayısının saf madde- element kavramlarına göre daha fazla olduğu gözlenmiştir. Karışımları temsil eden görselleri element kavramı ile eşleştiren öğrenciler de mevcuttur.

Kavramların verilen modellere göre zihinlerde yeterince oturmadığı ve genelinde öğrencilerin kavramları birbiri ile karıştırdıkları gözlemlenmiştir.

Kimyanın kavramsal öğreniminde zorluk yaratan görülmeyen dünyanın anlaşılabilmesi için etkili bir öğrenme ortamının oluşturulmasına ihtiyaç vardır. Bu nedenle kimyanın öğrenilmesi zor olan bu kavramlarının anlaşılmasının sağlanması için teknolojinin sunduğu olanaklardan faydalanmakta fayda vardır (Pekdağ, 2010).

ABSTRACT

Fresh cobs of sweet corn deteriorate rapidly after harvest due to their high sugar and water content. It is very important to determine appropriate preservation techniques and storage conditions to protect the quality losses in cobs after harvest. This study was conducted to determine the effect of different storage temperatures and packaging materials on the quality characteristics of Batem Tatlı sweet corn varieties cobs. In the study, sweet corn cobs were stored at +4°C (refrigerator) and -18°C (deep freeze) temperatures for 30 days in unpackaged (control), plastic bag, MAP (Modified Atmosphere Packaging) and paper bag packages with relative humidity of $90 \pm 5\%$. The study was conducted in Isparta University of applied Sciences, Faculty of Agriculture, Department of Field Crops laboratories according to a completely randomized design with 3 replications. At the end of the storage period, weight loss, dry matter content, total soluble sugar content, ash content, protein content and color parameters (L^* and C^*) were examined. As expected, quality losses increased as the temperature increased. Weight loss and dry matter ratio were highest at +4°C, total soluble sugar content, ash content, protein ratio and color parameters were highest at -18°C storage conditions. According to the packaging materials, the least quality loss was determined in MAP packaging, while the highest quality loss was determined in the control group. In the study, it was determined that packaging materials and storage temperature are very important for fresh storage of sweet corn. Considering the characteristics examined in the study, it was determined that sweet corn can be stored in modified atmosphere packaging at -18°C with good quality.

Keywords: Sweet corn, Storage temperature, Packaging material, Quality losses

INTRODUCTION

Sweet corn (*Zea mays* L.) is an important corn species grown worldwide. The sweet corn cultivation area in the world is approximately 1 million ha and the USA is one of the countries with the highest production (FAO, 2023). Sweet corn, which is rich in carbohydrates and various nutrients (vitamins, fiber and minerals) (Swapna et al., 2020), is widely consumed as fresh, frozen or processed products (Siddiq & Pascali, 2018). Harvested during the milking period, sweet corn has high levels of respiration after harvest due to its high moisture and sugar content. This causes serious nutrient loss, loss of freshness, softness, sweetness, hardening of the grains and growth of pathogenic microorganisms (Wang et al., 2023). Therefore, sweet corn is a perishable product with a short shelf life, especially in hot summer months (Tefera, 2012; Xiao et al., 2024). Accordingly, it is very important to develop strategies to reduce post-harvest quality losses and extend the storage period of sweet corn.

Post-harvest management of sweet corn is critical in maintaining product quality and reducing wastage along the entire supply chain (Xiang et al., 2019). Temperature is an important factor affecting the preservation of sweet corn. An increase in temperature leads to an increase in the respiration rate and metabolism of sweet corn, accelerated ripening, shorter shelf life, and consequently loss of economic and food value (Xie et al., 2017). Low temperature is one of the most common methods to extend the shelf life of fruits and vegetables due to its ease and efficiency (Moretti et al., 2012). The use of low temperature reduces respiration rate (Lv et al., 2022), inhibits microbiological growth and delays quality losses (Qadri et al., 2015). Besides the temperature factor, many packaging materials (modified and controlled atmosphere, vacuum packaging, perforated packaging, stretch film, plastic containers) are also used to preserve the quality of sweet corn after harvest (Riad & Brecht, 2002; Bakry et al., 2015). These packages reduce moisture loss during distribution and retailing by creating high relative humidity in surrounding environment. By reducing the respiration rate of sweet corn using controlled and modified atmosphere techniques, sugar and flavor loss, leaf yellowing, grain pitting and pathogen development can be delayed (Riad & Brecht, 2003). Determining and applying the appropriate packaging technique for sweet corn is also very important to maintain the quality of the product and facilitate shipment.

Fresh sweet corn is popularly consumed in Turkey due to its delicious taste. Therefore, the amount of production and consumption is increasing day by day. In Turkey, the sweet corn harvest in the summer months is taken by wholesalers and kept in the public markets in high ambient temperature and inappropriate storage conditions, which causes the product to deteriorate and lose its economic value. In addition, consumers cannot consume fresh sweet corn cobs immediately after they obtain them, but keep them in refrigerators or deep freezers with different packaging materials for a certain period of time. During this time, the losses that occur in sweet corn are not negligible. Accordingly, it is very important to determine the changes that occur in sweet corn during the storage period until it reaches the consumer and to develop strategies to reduce storage losses. This study was carried out to determine the changes in some quality characteristics of sweet corn at different storage temperatures and packaging materials.

MATERIALS and METHODS

Material and treatments

The sweet corn cobs used in the study were obtained from the sweet corn experiments carried out in Isparta University of Applied Sciences, Faculty of Agriculture, Department of Field Crops in 2021 and traditional maintenance procedures were carried out. In the study, Batem Tatlı sweet corn variety was used as experimental material. Batem Tatlı, which is a standard type sweet corn variety, has an average fresh cob yield of 15.130 kg ha⁻¹ and an average fresh cob yield of around 70-80 days, depending on the region and climatic conditions (TAGEM, 2023).

In this study, sweet corn cobs harvested at the milk maturity period were brought to the laboratory immediately and the homogenous and undamaged ones were selected. The cob leaves of the selected sweet corns were peeled and placed in control (unpackaged), plastic bag, paper bag and Modified Atmosphere Packaging (MAP) packages. Then, the mouths of the packaging materials were closed with clips and stored at +4°C (refrigerator) and -18°C (deep freezer) temperatures for 30 days at 90 ± 5% relative humidity. In the study, 3 replicates were established according to the

randomized plots experimental design and each replicate contained 6 sweet corn cobs. At the end of the study (30th day), some physical and quality characteristics were analyzed on 144 sweet corn cobs (2 storage temperatures x 4 packaging materials x 3 replicates).

Quality parameters

At the beginning of the study, sweet corn cobs were weighed one by one (6 in each replicate), labeled and their weights were determined and at the end of the experiment, these labeled cobs were removed from the storage and their weights were measured again. Weight losses were weighed with a balance (Radwag AS 2020 R2 model) with a precision of 0.01 g and calculated according to Eq.1.

$$\text{Weight loss (\%)} = \frac{\text{Initial weight} - \text{Latest weight}}{\text{Initial weight}} \times 100 \quad (\text{Eq.1})$$

For dry matter content, grains were separated from the cob and weighed 100 g and their initial weights were recorded. Then they were kept in an oven at 65°C until they reached constant weight. After reaching constant weight, the final weights of the samples were weighed again. Dry matter content was calculated according to Eq.2.

$$\text{Dry matter content (\%)} = \frac{\text{Initial weight} - \text{Latest weight}}{\text{Initial weight}} \times 100 \quad (\text{Eq. 2})$$

Seeds labeled for weight loss (6 in replicate) were used to determine the color changes in the fruit peel during storage. For this purpose, measurements were made with a color device (CR 300 model Minolta) from the bottom of the labeled point on the fruit samples taken out of storage in each analysis period and CIE L* and Croma (C*) values were determined (Koyuncu et al., 2019).

For the extraction of total soluble sugars, 20 mL of 80% ethanol was added to 2 g of sample and digested using a homogenizer. Samples were incubated overnight at -20°C and centrifuged at 2000 g for 5 min and the supernatant was used for determination of both total soluble sugars. Total soluble content was determined by phenol sulfuric acid assay (Dubois et al., 1956) and results are expressed in mg g⁻¹.

For ash and crude protein content, the grains were first dried in an oven at 65°C until they reached constant weight and then ground in a mill with a sieve diameter of 1 mm and prepared for analysis. For ash content, the ground grains were first kept in an oven at 65°C until the weight was constant in order to lose moisture. Then, 3 g of each sample was treated in a muffle furnace at 550°C for 5 hours and the value obtained was expressed as % (Yılmaz, 2005). Again, the nitrogen content of the ground grains was determined by Kjeldahl method and the value obtained was multiplied by a coefficient of 6.25 and the crude protein content of the grains was calculated as % (Bremner, 1965; Kacar & İnal, 2010).

Statistical analysis

The results obtained from the experiment were subjected to analysis of variance (Minitab v.17.2.1) according to the random plots experimental design. Tukey multiple comparison test was used to determine the differences between the means of the treatments ($P < 0.05$).

FINDINGS and DISCUSSION

Weight loss

Post-harvest weight loss in sweet corn is a very important commercial parameter because it directly translates into a reduction in product weight and quality, especially appearance. At room temperature, sweet corn has high transpiration and respiration, which increases weight loss (Liu et al., 2021). Different temperatures, packaging materials and temperature x packaging material interaction significantly affected the weight loss of sweet corn during storage (Table 1). The weight loss of sweet corn increased at both storage temperatures (Figure 1). According to the packaging materials, weight loss was highest in the control treatment (27.68%) followed by paper bag (21.45%), plastic bag (11.29%), and MAP (1.13%). It was found that the cobs in the control group suffered a rapid loss of quality at the end of the trial (30 days) and the cobs became non-consumable. The low weight loss of MAP was due to the fact that it retained the moisture content of the products and water loss was relatively low. Similarly, Manolopoulou & Mallidis (1997) reported that high CO₂, low O₂ and high humidity in MAP with long-term storage effectively

preserved water loss and hence weight loss from the products. In this study, the weight loss varied between 0.31-30.31% for different temperatures and packaging materials. The weight loss of sweet corn stored at +4°C was higher than those stored at -18°C (Figure 1). This may be explained by better respiratory suppression and slower metabolic rate at lower temperatures. In addition, the least weight loss was determined in MAP at both temperatures, which may be due to the fact that MAP allows the formation of an atmosphere that can inhibit respiration and transpiration, thus reducing water consumption and evaporation. These results are in line with other related research findings (Mangaraj et al., 2009; Shao & Li, 2011; Liu et al., 2021).

Table 1. Analysis of variance results of different packaging materials and storage temperatures on the properties of sweet corn during storage

Dry matter content

Dry matter content refers to the residual moisture content of the products. Knowing the moisture content or dry matter content of products with high moisture content during storage allows the development of preservation techniques specific to that product. Sweet corn with high moisture content loses moisture rapidly after harvest and during storage, which reduces the quality and storage time of the product (Hao et al., 2019). Therefore, taking appropriate measures to reduce moisture loss will improve the storability and edible quality of fresh corn. In this study, different

temperatures, packaging materials and their interaction (storage temperature x packaging material) caused significant changes in the dry matter content of sweet corn during storage (Table 1). As shown in Figure 1, the highest dry matter content of sweet corn was found in the control treatment and the lowest in the paper bag and MAP. Since packaged storage slows down the respiration rate and metabolism of the products, the packaging materials (especially paper bags and MAP) were very effective in maintaining the moisture content of sweet corns, resulting in low dry matter content. Shao & Li (2011) reported that the moisture content of sweet corns decreased during storage, but the packaged products lost less moisture content. On the other hand, dry matter content decreased at both storage temperatures and the lowest dry matter content was found at -18°C. According to temperature and packaging materials, the highest dry matter content was determined in the control (unpacked) treatment at +4°C and the lowest was determined in sweet corn stored in paper bags and MAP at 18°C (Figure 1). Karaman & Türkay (2021) found that the dry matter content of sweet corn increased during storage and this increase varied according to the varieties. Again, many researchers reported that moisture content decreased in different plant species during storage (Tu et al., 2000; Aqil, 2020) and this supports the findings in this study. As a result, it can be stated that the dry matter content increased.

Figure 1. Effect of different packaging materials and storage temperatures on weight loss, dry matter content, L*, and C* of sweet corn

Color parameters (L* and C*)

Hull color is one of the most important quality parameters for sweet corn (Özen et al., 2021), which has an impact on the commercial value and storage time of the products. Consumers especially buy cobs with bright and full grain color of sweet corn and consume them with pleasure. In this study, L* (brightness) and C* (saturation) values of sweet corn were significantly affected by storage temperature and packaging materials (Table 1). L* and C* values decreased as the storage temperature increased (Figure 1). The lower L* and C* values in sweet corn stored at lower temperatures can be explained by the slow rate of water loss and pigment breakdown. According to the packaging materials, the highest L* and C* values were determined in MAP (72.73 and 54.83, respectively) and the lowest in control treatment (68.95 and 49.01, respectively). There was no difference between MAP, which had the highest mean L* value, and plastic bag and paper bag. In the C* value, there was no statistical difference between the control treatment, which had the lowest value, and the plastic bag and paper bag (Figure 1). It was concluded that the packaging materials (MAP, paper bag, plastic bag) were quite successful in maintaining the brightness (L*) of sweet corn, while the other packaging materials (except MAP) failed in maintaining the saturation (C*). Similar to the findings in this study, Üstünel et al. (2008) reported that L* and C*

values of cherry fruits decreased during storage and this decrease was the least in MAP packaging. Again, Erbaş et al. (2022) found that L* and C* values of pomegranates decreased with the increase in storage time and temperature and this decrease was due to the increase in water loss.

Ash content

The particles that do not burn after the combustion of materials at high temperatures are called ash. In other words, ash is the inorganic residue remaining after the combustion of organic materials and is an indicator of the quality of foodstuffs (Karaman & Türkay, 2022). In the study, it was determined that the effects of different temperatures, packaging materials and storage temperature x packaging material interaction on the ash content of sweet corn were statistically significant (Table 1). According to the packaging materials, ash content varied between 1.85-2.66%, the highest ash content was determined in MAP and the lowest in the control treatment (Figure 2). Compared to the control treatment, the ash content of sweet corn grains stored in other packaging materials was higher and MAP gave the best result among the packaging materials. In addition, in the study, the ash content of sweet corn grains increased as the storage temperature decreased. At both temperatures (+4°C and -18°C), the highest ash content was found in MAP (2.62 and 2.69%, respectively) and the lowest in control (1.80 and 1.88, respectively) (Figure 2). Since the water content, respiration rate and weight loss of sweet corns stored in MAP were low during storage, the ash content was high because the grains retained their nutrients. Similarly, Karaman & Türkay (2022) reported that the ash content ranged between 2.72-2.85% at the end of the 30th day and the ash content decreased during the storage period. Bello & Badejo (2017) and Karaman & Türkay (2021) found that the ash content of sweet corn decreased with the extension of the storage period. Although there are very limited studies on the change in ash content of sweet corns during storage, differences in other studies may be due to sweet corn varieties and preservation techniques.

Protein content

Proteins are macromolecules that are involved in every stage of plant growth and development and contribute significantly to the healthy development of humans. Sweet corn is used as one of the

main sources of protein and energy in the preparation of different foods in many parts of the world (Öktem et al., 2010). It is very important to preserve the protein content of sweet corn after harvest. In this study, different temperatures, packaging materials and temperature x packaging material interaction significantly affected the protein content of sweet corn (Table 1). The highest protein content according to storage temperatures -18°C (11.56%), the protein content decreased as the storage temperature increased (Figure 2). This is due to the fact that at low temperatures, the respiration rate and moisture content of sweet corn decreases and the breakdown of macromolecules such as protein is less. According to the packaging materials, the highest protein content was determined in MAP (12.49%) and the lowest in control (9.94%) treatment. Compared to the control treatment, the protein content of sweet corn stored in other packaging materials was higher and MAP provided the best preservation. However, at both temperatures ($+4^{\circ}\text{C}$ and -18°C), the highest protein content was found in MAP (12.22% and 12.77%, respectively) and the lowest in the control treatment (9.13% and 9.61%, respectively) (Figure 2). In this direction, it was concluded that sweet corn stored at low temperature (-18°C) and MAP was very effective in preserving the protein content. Xie et al. (2017) stated that as the storage temperature increases, the respiration rate of sweet corns increases and therefore the soluble protein content decreases. Xie et al. (2014) reported that the optimum storage condition of sweet corns was below 4°C and soluble protein content varied significantly. Karaman & Türkay (2021) determined that the protein ratio of sweet corn decreased as the storage period increased and showed significant differences according to the varieties.

Figure 2. Effect of different packaging materials and storage temperatures on ash content, protein content and total soluble sugar content of sweet corn

Total soluble sugar content

Total soluble sugar content is one of the most important post-harvest quality criteria that directly affects the sweetness of sweet corn. Since it has a high respiration rate, the sugar content decreases during storage due to the formation of sucrose and some organic compounds (Karande et al., 2014). The effect of storage temperatures on total soluble sugar content was significant (Table 1) and total

soluble sugar content decreased as storage temperature increased (Figure 2). This decrease may be related to respiration and conversion of soluble sugars into other molecules. Low temperatures generally cause the conversion of starch to reducing sugars (Ji et al., 2017). Similarly, Brecht (2004) reported that sweet corn loses 60% of its sugar content at 30°C and 6% at 0°C. In the study, total soluble sugar content varied between 8.66-11.56 mg g⁻¹ according to packaging materials (Figure 2) and significant differences were found between them (Table 1). Among the packaging materials, the highest total soluble sugar content was determined in MAP and the lowest total soluble sugar content was determined in control (without packaging) treatment (Figure 2). Storage of sweet corn at 18 °C and with MAP packaging significantly preserved the total soluble sugar content. The soluble sugar content of sweet corn varies depending on variety, harvest time and post-harvest treatments (Wang et al., 2019; Karaman & Türkay, 2021). The findings in this study are similar to the results of other researchers (Shao & Li, 2011; Calvo-Brenes, 2020; Wang et al., 2022).

CONCLUSION and RECOMMENDATIONS

In this study in which the effects of storage temperature and packaging materials on the quality of sweet corn were investigated, weight loss, dry matter content increased, total soluble sugar content, ash content, protein content, L*, and C* values decreased with increasing storage temperature. According to the packaging materials, the least quality loss was determined in MAP packaging, while the highest quality loss was determined in the control group. At both storage temperatures, MAP packaging was more effective in maintaining quality than the control treatment. As a result, it was determined that sweet corn can be stored in modified atmosphere packaging at -18°C with good quality. However, since the effects of such post-harvest treatments may be affected by many factors such as variety, harvest time, storage time, storage conditions, further studies are needed in different varieties and species.

ABSTRACT

The primary aim of this study is to optimize the Bank's net return on loans granted to its customers. The Bank is confronted with the task of efficiently allocating funds among five distinct types of loans: Home loans, Personal loans, Car loans, Business loans, and Organization loans, all of which have the potential to yield substantial net returns. Utilizing linear programming techniques, this research employs a solution approach to maximize the net return of loans disbursed by the Bank. The findings reveal an optimal allocation strategy: Home loans should receive no allocation (₦0.0), Business Loans should be allocated ₦10 million, Personal Loans should be allocated ₦110.0 million, Car loans should be allocated ₦80.0 million, and Organization loans should receive no allocation (₦0.0). These allocations are determined from a total available loan pool of ₦200.0 million. The calculated annual rate of return stands at 12.34%, which is slightly lower than the highest net interest rate of 12.61% observed for Personal loans (L_3). Another noteworthy observation pertains to the constraint that car and organization loans combined must account for at least 45% of the total loans (constraint 2). This requirement compels the solution to assign ₦10 million to Business loans, even though they yield a lower net rate of 13.028%. It is evident that translating these insights into concerted efforts could undoubtedly enhance the Bank's profitability in terms of net return.

Keywords: Net Revenue, Linear Programming, Loan

1. INTRODUCTION

The future of banking will manifest in various ways, and this paper takes theory a step further to elucidate the influence of financial technology and the Internet on the banking landscape. It offers an analytical framework for scholarly exploration, shedding light on the emerging patterns that are moulding academic investigations in this arena. To achieve this, it conducts a fresh examination of the essence of financial intermediation and transactions [12].

Asset Liability Management has become increasingly prominent in the banking sector. In the past, banks predominantly concentrated on allocating assets, but today, managing both assets and liabilities has acquired equal significance. Asset liability management aims to achieve an optimal allocation of funds in assets while effectively managing liabilities [13]. This strategy enables banks to enhance profits and reduce risks. In this paper, we focus on optimizing the assets and liabilities of Indian banks through the application of mathematical models

A portfolio represents an investment held by either individuals or corporations, which can be professionally managed or overseen by financial institutions. Such a portfolio typically comprises financial assets, including stocks, bonds, and cash, that are either held or overseen by an individual investor. Its composition is carefully crafted to align with the investor's risk tolerance, investment timeframe, and financial objectives. In the work of Papahristodoulou and Dotzauer [1], the concept of "optimal" is defined as the most favourable choice among a range of alternatives, and they characterize an optimal portfolio as one that takes into account the investor's inherent "greed" for returns and their aversion to risk. The challenge of optimizing a portfolio is a critical facet of the investment and finance domain, and it has far-reaching implications for portfolio holders and managers who play pivotal roles in allocating their resources across various asset categories.

Linear Programming is a mathematical method employed for the purpose of efficiently allocating limited resources among competing activities, as long as all the connections between the variables are linear in nature. Its primary focus lies in identifying the most advantageous value (whether it's a maximum or minimum) for a function involving n variables.

2. LITERATURE REVIEW

In their work, Meng and Yang [1] explored diverse applications and methodologies related to linear programming. They emphasized that among these applications, aggregate production planning emerges as a central and pivotal component of linear programming analysis. In the realm of

portfolio management and financial research, Markowitz [2] delved into the critical area of portfolio optimization, which stands as a fundamental aspect of managing investment portfolios. His study introduced the concept of portfolio theory as an elegant approach to risk management in financial markets. Konno and Yamazaki [3] focused on Markowitz's model, treating it as a one-period framework where the primary goal of the investor was to maximize the expected return of the portfolio. William [4] introduced the Capital Asset Pricing Model (CAPM), a model grounded in empirical observations, which aimed to provide the highest expected return. In doing so, he compared and contrasted Markowitz's model and developed a streamlined variant that reduced the demand for extensive data and computational resources. This perspective was further explored and supported by William [5]. Furthermore, Ogryczak [6] delved into the intricacies of establishing investment policies, offering insights into asset allocation models that employ the simplex algorithm, a linear programming application, to estimate expected returns for asset classes. Kostreva and Ogryczak [7] examined portfolio management from the angle of benchmark tracking, focusing on minimizing portfolio return volatility against benchmark constraints. This approach primarily concerned itself with the price efficiency of equity markets. Marcus [8] centered on the concept of price efficiency in financial markets, emphasizing that market prices incorporate all relevant information pertaining to security valuation. Olayinka et al. [9] extended linear programming techniques to entrepreneurial decision-making, specifically addressing profit maximization for a fast-food firm grappling with challenges such as product selection and cost optimization due to rising raw material prices. Meanwhile, Oladejo et al. [10] underscored the value of optimization principles in maximizing profits and minimizing production costs, applying linear programming to address specific challenges faced by a bakery production company through the use of the AMPL software. Yutin et' al (2023) delves into Proposing a new loan recommendation framework for loan allocation strategies in online P2P lending The crucial factors that play a substantial role in gauging the likelihood of loan default for Lending Club loans are identified. This empirical investigation is founded on a comprehensive dataset comprising 1,863,491 loan records disbursed by Lending Club spanning the period from 2007 to 2020Q3. To forecast loan defaults, they constructed a logistic regression model is developed to predict loan default [11].

MATERIAL and METHOD

3.1. Formulation of The Linear Programming (Lp) Model

The following general LP model was considered:

Optimize:

$$f(x)$$

Subject to the following constraints:

$$\left. \begin{array}{l} g_i(x) \leq b_i \quad \text{For } 1 \leq i \leq p \\ g_i(x) = b_i \quad \text{For } p + 1 \leq i \leq k \\ g_i(x) \geq b_i \quad \text{For } k + 1 \leq i \leq n \end{array} \right\} \quad (1)$$

Additionally, $x \geq 0$ for all decision variables x_i

Where

$f(x)$ is the objective function of a vector variable.

$x = (x_1, x_2, x_3, \dots, x_n)^T$ represents the measure of effectiveness of a decision $g_i(x)$ ($1 \leq i \leq m$) is the constraint function of x . The variable $x_j = (j = 1, 2, 3, \dots, n)$ is the activity level associated with the decision-making problem. The term b_i ($1 \leq i \leq m$) represents the upper or lower limit of the i^{th} constraint functions. Constraint $x \geq 0$ restricts the decision variables $x_j = (j = 1, 2, 3, \dots, n)$ to nonnegative real numbers. Since the objective and constraint functions are linear, they are precisely defined in the form

$$f(x) = c_1x_1 + c_2x_2 + \dots + c_nx_n = \sum_{j=1}^n c_jx_j \quad (2)$$

$$g_i(x) = a_{i1}x_1 + \dots + a_{in}x_n = \sum_{j=1}^n a_{ij}x_j \quad (3)$$

From (2) and (3), we then write the linear programming

As:

$$Z = \sum_{j=1}^n c_jx_j \quad (4)$$

$$\text{Subject to: } \left. \begin{array}{l} \sum_{j=1}^n a_{ij}x_j \quad \text{For } 1 \leq i \leq p \\ \sum_{j=1}^m a_{ij}x_j \quad \text{For } p + 1 \leq i \leq k \\ \sum_{j=1}^n a_{ij}x_j \quad \text{For } k + 1 \leq i \leq n \\ x_j > 0 \quad 1 \leq j \leq n \end{array} \right\} \quad (5)$$

where, $a_{i,j}$ and c_j are called technological and cost coefficients, respectively. b_i is the main parameters of the models.

Equations (4) and (5) can be expressed in the forms of the

Matrix:

$$\text{Maximize } Z = CTx \quad (6)$$

Subject to the following constraints:

$$\begin{array}{l} 1. \quad Ax \leq b \\ 2. \quad x \geq 0 \end{array} \quad (7)$$

Where C is a column vector represented as $C = [c_1, c_2, \dots, c_n]^T$.

Where, K is a feasible set standard LP while $K = \{x \in R^n : Ax = b, x \geq 0\}$ If $x \in K$ or if x satisfies $Ax = b$ and $x \geq 0$, then x is a feasible solution. Let $C^T x$ be the objective function of a LP to be optimized. $x \in K$ is an optimal solution if for all $y \in K$, $C^T x > C^T y$. Let x be a basic solution of $Ax = b$. If $x \geq 0$, then it is called a basic feasible solution (BFS). An artificial variable $A_i \geq 0$ is a dummy variable added for the specific purpose of generating an initial basic feasible solution. It has no economic meaning.

Thus

$$A = \begin{pmatrix} a_{11} & a_{12} & a_{13} & \cdots & \cdots & a_{1n} \\ a_{21} & a_{22} & a_{23} & \cdots & \cdots & a_{2n} \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{n1} & a_{n2} & a_{n3} & \cdots & \cdots & a_{nn} \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \end{pmatrix} \quad (8)$$

3.2 Formulation of Mathematical Model

Mathematical formulation, description of objective function and constraints of the model will be presented.

3.3 Model Assumption:

1. A subtle assumption in the preceding formulation is that all loans are issued at approximately the same time. This allows us to ignore differences in the time value of the funds allocated to the different loans.

2. That the bank would want to loan out all ₦200 million.

3.4 Model Data

Types of Loan	Interest Rate	Bad – debt ratio
Home	0.150	0.10
Business	0.140	0.07
Personal	0.130	0.03
Car	0.125	0.05
Organization	0.100	0.02

Source: First Bank Plc (2022).

Decisions variables

L_1 =Home loans (in million naira)

L_2 =Business loans

L_3 =personal loans

L_4 = Car loans

$$\begin{aligned} \text{Total interest} = & 0.150(0.9L_1) + 0.140(0.93L_2) + \\ & 0.130(0.97L_3) + 0.125(0.95L_4) + 0.100(0.98L_5) \end{aligned} \quad (9)$$

$$\begin{aligned} \text{Total interest} = & 0.135 L_1 + 0.1302L_2 + 0.1261L_3 + \\ & 0.11875L_4 + 0.098L_5 \end{aligned} \quad (10)$$

$$\begin{aligned} \text{Bad debt} = & 0.10L_1 + 0.07L_2 + 0.03L_3 + \\ & 0.05L_4 + 0.02L_5 \end{aligned} \quad (11)$$

$$\text{Net Return} = \text{Total interest} - \text{Bad debts}$$

(4)

$$\begin{aligned} \text{Net return} = & 0.035L_1 + 0.1302L_2 + 0.1261L_3 + \\ & 0.11875L_4 + 0.098L_5 \end{aligned} \quad (12)$$

The objective function combines interest revenue and bad debt as:

$$\text{Maximize } z = 0.035L_1 + 0.1302L_2 + 0.1261L_3 + 0.11875L_4 + 0.098L_5$$

(13)

Subject to:

The problem has five constraints:

(1) Total funds should not exceed ₺200 (million):

$$L_1 + L_2 + L_3 + L_4 + L_5 + L_6 \geq 200 \quad (14)$$

(2) Personal, car loans and farm equal at least 40% of all loans:

$$L_4 + L_5 \geq 0.4(L_1 + L_2 + L_3 + L_4 + L_5) \quad (15)$$

$$0.4L_1 + 0.4L_2 - 0.4L_3 - 0.6L_4 - 0.6L_5 \leq 0 \quad (16)$$

Home loans should equal at least 45% of Business, car, organization and home loans:

$$L_3 \geq 0.45(L_1 + L_2 + L_3 + L_4) \quad (17)$$

$$0.45L_1 + 0.45L_2 - 0.45L_3 \leq 0 \quad (18)$$

Bad debts should not exceed 4% of all loans:

$$\begin{aligned} \text{Bad debt} &= 0.10L_1 + 0.07L_2 + 0.03L_3 \\ &+ 0.05L_4 + 0.02L_5 \leq 0.04(L_1 + L_2 + L_3 + L_4 + L_5) \end{aligned} \quad (19)$$

$$= 0.06L_1 + 0.03L_2 - 0.01L_3 + 0.01L_4 - 0.02L_5 \leq 0 \quad (20)$$

Non negativity:

$$L_1 \geq 0, L_2 \geq 0, L_3 \geq 0, L_4 \geq 0, L_5 \geq 0, L_6 \geq 0$$

(21)

4.0 RESULTS and DISCUSSION

4.1 Analysis of Results

In this study, we presented the results of the model objective function and constraints for optimal net return in Bank. We used the linear programming method of solution to solve the model

4.1.2 Table 4.1 Results for objective function values to various Loans considered.

Loan	Net Return (₺ million)
Home (L_1)	0.0
Business (L_2)	10.0
Personal (L_3)	110.0
Car (L_4)	80.0
Organization	0.0
Objective function (z)	24.673

Source field work 2022

From Table 4.1. It could be seen that ₺0.0 is net return for Home loans, ₺10 million is net return for Business Loan, ₺110.0 million is net return for personal Loan, ₺80.0 million is net return for car loans and ₺0.0 is net return for organization loans.

The return for the investment is:

$$\text{Rate of returns} = \frac{z}{200} = \frac{24.673}{200} = 0.123365$$

The result above shows that the annual rate of return is 12.34%, which is less than the best net interest rate = 12.61% for Personal loans L3.

Another important observation here is that the car and organization loan loans must account for at least 45% of all loans (constraint 2) forces the solution to allocate ₺ 10 million to Business loans at the lower net rate of 13.028%, The lowering overall interest rate is given as:

$$100 \left(\frac{0.1302 \times 10.0 \times 0.11875 \times 80}{200} \right) = \frac{1236.9}{200} = 6.1845 \%$$

Figure 4.2:- Figure for types of Loans, net return and total interest

Figure 4.2 shows the line graph of the types of loans against the optimal net return. It is observed from the graph that the Home loan is zero(million) Business loan is ₦10 (million), Personal loan is ₦110 Million car loan is ₦80 (million) and organization loan is ₦ 0 (million)

Figure 4.2:- Figure of total interest, interest rate and net return.

Figure 4.2 shows the line graph of the total interest, interest rate and net return of the loans. It is observed from the graph that the net return increases to 100 and decreases to zero when total interest steadily increases 15 and decreases to zero and interest rate maintain straight line. This means that the total interest is not that much as against the net return which the profits is making on the loans.

5.0 CONCLUSIONS

The study deals with the investments of loans by Bank. The purpose for establishing any commercial Bank is to make profits. The persistent challenges faced by Bank industries in Nigeria when estimating net return of her loans giving to the societies has continued to engage our attention towards the risks of the financial institution’s capital. Through constant interrogation of the Bank

industries over the years, we have therefore proposed the engagement of linear programming technique to tackle the problem. In this research, we noted that the model can solve this problem well enough if the problems of Bank Loan investments which constitute the constraints are handle

ÖZET

Müzikte Dada akımı ile ses kaynağı alternatifleri sıradan nesne lehine çoğalır. Özellikle John Cage'in (1912-1992) eserlerinde, mekanizmaları değiştirilmiş enstrümanların kullanılması ve klasik müziğin yüzyıllardır süregelen icra tekniklerinden farklı şekillerde ses üretilmesi enstrüman kavramına bakış açısını genişletir. Cage'in Avrupa'da tanınması icra anının teatral bir deneyime dönüşmesine olanak sağlayan 'Enstrümantal Tiyatro' türüne etki eder. 'Enstrümantal Tiyatro'da günlük nesnelere, mekanizmaları değiştirilmiş enstrümanlar ve mekân, ses kaynağı olarak kullanılır ve hem nesnelere hem de eylemler teatralleşir. Bu çalışmada 'Enstrümantal Tiyatro'da nesnelere teatralliği ele alınmış ve enstrüman kavramının değişen konseptine dair bir okuma yapılmıştır.

Anahtar Kelimeler: Enstrümantal Tiyatro, John Cage, Dada, Mauricio Kagel, Staatstheater

**INSTRUMENT AS A THEATRICAL OBJECT IN THE INSTRUMENTAL
THEATER**

ABSTRACT

With the Dada movement in music leads to an proliferation of alternatives sound sources in favor of ordinary objects. Especially in the works of John Cage (1912-1992), the perspective on instruments changes both technically and conceptually by the production of sounds in ways different from the traditional performance techniques and the alteration of mechanisms. Cage's recognition in Europe influences the 'Instrumental Theatre' genre, which allows the enabling moment of performance to transform into a theatrical experience. In 'Instrumental Theatre,' ordinary objects, instruments with modified mechanisms, and space are used as sound sources, and both objects and actions are theatricalized upon. In this study, the theatricality of the objects used as sound sources in the works of Georges Aperghis and Mauricio Kagel in the genre of 'Instrumental Theatre' were discussed and an interpretation is offered regarding the evolving concept of the instrument.

Keywords: Instrumental Theatre, John Cage, Dada, Mauricio Kagel, Staatstheater

GİRİŞ

Mauricio Kagel'in ve eleştirmen Heinz-Klaus Metzger'in çalgı performansını içerdiği için 'Enstrümantal Tiyatro' adını verdikleri deneysel müzik tiyatrosu türünde, eylemler [müzik üretimiyle eş değer şekilde] dikkat çekme, işaret etme, altını çizme ve yapmayı gösterme üzerinden kurgulanır. Kagel, 'Enstrümantal Tiyatro' fikri ile Dieter Schnebel, György Ligeti, Vinko Globokar veya Georges Aperghis gibi Avrupalı müzik tiyatrosu bestecilerini doğrudan veya dolaylı yoldan etkiler (Heile, 2016). 'Enstrümantal Tiyatro' türü melez bir tür olarak müziğin ve tiyatronun ortak noktasında öncelikle eyleme ve ses kaynağına yönelir. Son yüzyılda, gündelik seslerin ve gürültülerin dönüştürülmesi, bunların müzik malzemesi olarak kullanılması birçok besteci için kompozisyon stratejisi olarak yerini alır. Sesin ve gürültünün eşit şekilde ele alınması ve gürültünün özgürleşmesi, sonik demokratikleşme sürecini beraberinde getirir. 'Enstrümantal Tiyatro'da seslerin deneysel kullanımı hem kurgusal hem de tematik olarak önemlidir. Çağdaş besteciliğin tüm bu araçlarını sağlamak için enstrüman kavramı yeni bir tanımlama alanı olur. Mauricio Kagel, 'Enstrümantal Tiyatro' konseptini kelimenin tam anlamıyla enstrüman kavramını sorgulama üzerinden geliştirir. 'Enstrümantal Tiyatro'daki kavramsal alan, müzisyenin kimi zaman kendi vücudu da olabilen enstrümanı ile fiziksel bir oyun içerisinde kalabilmesi ve ses ile ses üretimine dair bütün aktiviteyi birleştirmesi üzerine kuruludur. Böylece müzikte eylem önem kazanır ve müzik görünür hale gelir. 'Enstrümantal Tiyatro'ya yakıştırılan "görsel müzik", "teatralleştirilmiş müzik", "sahne müziği" ve "müzikleştirilmiş tiyatro" tabirlerinin kaynağı bu kavramsal alana dayanır. 'Enstrümantal Tiyatro'da enstrüman, sahne kompozisyonunda "akustik bir destek" olarak merkezi roledir. Dilsel aracın kullanılmadığı bu tiyatro türünde eldeki malzeme sosyolojik bir büyüteç ile parodik bir şekilde büyür, müzik yapma ve izleyicinin davranışlarının da dahil olduğu alımlama süreçleri, müzik üretimindeki jestsel ve duygusal anlarla birleşir (Rozsak, 2013). Bu çalışmada 'Enstrümantal Tiyatro'da enstrümanın teatralleşmesi üzerinde durulmuştur. Öncelikle 'Enstrümantal Tiyatro'nun oluşumunu sağlayan Dadanın ve John Cage'in estetiğine, nesneyle olan bağları açısından bakılmış, ardından nesne teatralliğine odaklanılmış ve bu minvalde Kagel'in Staatstheater: Repertoire (1967-1970) isimli çalışması gerek 'Enstrümantal Tiyatro'nun içeriğini gerekse 'Enstrümantal Tiyatro'nun enstrümana bakış açısını yansıtmaları nedeniyle örnek olarak değerlendirilmiştir.

‘Enstrümantal Tiyatro’ nun Kökenlerinde Nesne Algısı ve Enstrüman

Dada, neyin sanat olup olmadığı sorgusu üzerinden, yaşamla sanat arasında keskin bir sınırı çizilemeyeceği fikrine dayanır. Dadacı sanatta geleneksel malzeme yerini gündelik ve sıradan malzemeye bırakır. Dadanın öncülerinden Marcel Duchamp, güzellik, estetik veya teklige karşı; sıradan, hiçbir özelliği olmayan seri üretim ürünlerini bir nevi şok etkisi yaratmak üzere kullanır ve nesnelere asıl işlevlerinden arındırıp yeni bir kimliğe ve kendine özgü, rahatsız edici bir değere dönüştürür, nesnelere gerçek anlamlarını yitirmesi ile dikkat düşünceye yönelir (Yüret, 2013, s.50,54-55). Duchamp şöyle der: “Eğer ben bir pisuarı tuvalette değil de galeride teşhir ediyorsam, üzerine imzama atmışsam ve siz onun içine işeyemiyorsanız bu sanattır (Antakyalıoğlu’ dan akt. Özer, 2019). ‘Dada Manifestosu’nun (1916) yazarı ve Dadanın doğup geliştiği mekân Cabaret Voltaire’in kurucusu Ball, Dadanın, Birinci Dünya Savaşı’nın sebep olduğu kaosa ve yıkıma, kültürel ve entelektüel bir uyumun sonucunda doğduğunu belirtir. Savaşın harap ettiği anlamsız bir dünyada sanatın içeriğini anlamsızlık ve hiciv belirler. Dadacılar, anlamsızlığı ve hicvi oluşturmak için yeni sanatsal teknikler ve efektler geliştirmişlerdir. George Grosz, Dadacı sanatın, "karşılıklı yıkım dünyasına karşı" bir protesto olarak tasarlandığını söyler. Dada, manadan vazgeçmeye yönelik bir çağrı, burjuva ve yönetici elite karşı bir eleştiridir (Sands 2017).

‘Cabare Voltaire’ sanatçıları, savaş koşullarında hem toplumda hem de sanatta anlamın ve değerinin yitirildiğini fark ederek güvenilir standartlara ve geleneklere isyan ederler. Ayrıca Dadacılar, içerisinde eleştirinin bulunduğu oyunlarda ve skeçlerde etkiyi arttırmak için çingiraklar, ısıklar, sirenler, pervaneler, daktilolar, davullar, alkışlar ve ayak sesleri kullanır (Alvarez, 2022, s. 55). Dadada ses kaynağı olarak sıradan nesne önem kazanır ve kompozisyonu gündelik ve anlamsız heceler oluşturur. Böylece Dadada müzik olan ve olmayan arasındaki sınır kalkar. Bu ayrımın kalkması ile deneysel kompozisyonlarda ısıktan, çingiraklara kadar gündelik ve kimi zaman rahatsız edici sesler kompozisyona dahil olur. Richard Huelsenbeck, 1920 tarihinde yazdığı Dada tarihçesinde, Dadacı müziği şöyle tanımlar: “Dada müziği (...) ham sese aşıktı ve anlamsız hecelere veya bağırıışların eşzamanlı olarak söylenmesinden oluşurdu. [Kısaca] Dada, metronun seslerini seviyor[du] (Huelsenbeck’ten aktaran Sands, 2017).

Besteci John Cage ise sese ve ses kaynağına deneysel olarak yaklaşır. Cage’in eserlerinde nesnelere teatrallığıne yapılan vurgu göze çarpar. Cage, herhangi bir nesnenin, ortamın atmosferi ile birleşince anlık olarak tiyatrunun kendisine dönüşebileceğini belirtir. Örneğin

plaktan bir müzik çalarken, aniden perdelerin havalanması o anı teatralleştirir ya da geleneksel bir senfoni orkestrası tarafından çalınan geleneksel bir parçada örneğin korno çalan kişinin zaman zaman borusunun tükürüğünü boşaltması anı teatralleştirir (Cage, Kirby, Schechner, 1965). John Cage'in 1958'de Avrupa'ya girişi, Kagel'in çalışmaları üzerinde belirgin bir etki yaratır. Kagel, Cage'in fikirlerinden etkilenerek, fiziksel aktiviteyi müziğe dahil eder. 'Enstrümantal Tiyatro'nun ilk aşamalarında günlük hareketlerin çalgılar üzerinde abartılı şekilde denendiği görülür. Çalgıcılar için sözlü metin kullanımı, müzisyenlerin günlük hareketlerinin performansın ana odağı haline getirilmesi gibi teknikler eserlerde kullanılır. Bu teknikler ile 'Enstrümantal Tiyatro'ya ait birçok eserde teatralliğin yanı sıra absürt, komik ve sarkastik bir tavır oluşur (Hübner, 2010). Kagel'in çalışmaları, müzikal ve teatral eylemler arasındaki farkın üstesinden gelme konusunda Cage'in çalışmalarını takip eder. Fakat, eserleri nadiren Cage'inki kadar heterojendir; eserlerinin çoğu tek bir müzik-tiyatro fikirlerinden türetilmiştir. Müzikal ve teatral performans arasındaki kesişimi araştıran sanatçılar arasında en sistematik olan, müzikal performansa en çok teatral boyut katan Kagel'dir. Kagel, teatralliği müzikal performans ile teatral performans, estetik algı ile anlamsal algı, sunum ve temsil arasındaki gerilim ve ilginç kombinasyonlar ile sağlar (Heile, 2016). Dolayısıyla 'Enstrümantal Tiyatro'da eylem ve oyuncu nesneyi teatral hale getirir.

Nesnelerin Teatralliği ve 'Enstrümantal Tiyatro'da Teatralleşen Enstrüman

'Enstrümantal Tiyatro'nun nesne tahayyülünü anlamak için öncelikle bir nesnenin teatral olma halini anlamak gerekir. Gündelik kullanımına benzer olsa dahi sahneye yerleştirilen bir nesne ontolojik ve işlevsel açıdan çeşitli katmanlar içerebilir. Oyun yazarı Cory Hinkle'in sahnede nesnelerin çalışma prensiplerine dair görüşleri bu konuda açıklayıcı olabilir. 'Prova Başarısızlığı' isimli çalışması için aldığı notlar özellikle nesnelerin dönüşümünü ve farklı şekillerde kullanımını anlamak açısından önemlidir. Örneğin bir puro hiçbir zaman sadece bir puro değil, aynı zamanda baştan çıkarmak için kullanılan müstehcen bir cinsel nesnedir. Hinkle'a göre sahnedeki nesnelerle ilgili genel kural şöyledir, sahnede ne kadar az şey varsa, nesnelerin o kadar potansiyel sembolik değeri ve anlamı vardır. Ibsen'in 'Bir Bebek Evi' oyununda kullanılan mektup sadece bir mektup değil, aynı zamanda geçmişin Nora'yı ezen ağırlığının simgesidir. Mamet, 'Bıçağın Üç Kullanımı' kitabında nesnelerin tiyatrodaki gücüne yönelik fikirlerinin ana hatlarını çizer. Baş kahraman ekmeğini kesmek için kullandığı bıçağı, kız arkadaşına güzel görünebilmek için tıraş olurken de kullanır ve sonunda aldatıldığını öğrenmesiyle bıçak bir cinayet nesnesine dönüşür. Bıçak olmadan, adam kendi sonunu

getiremez ama bıçak aynı zamanda onun günlük yaşamının ve hayatta kalmasının da simgesidir. Bu örnekte nesnenin gücü net bir şekilde görülür. Nesnelere, oyunları daha teatral ve zengin kılmak için yararlı bir yolu olabilir (Hinkle, 2023) Sofer ise sahneye yerleştirilen bir sandalyenin göstergebilimsel olarak hem kendisi hem de kendisinden başka bir şey olduğunu, sandalyenin hem kendisini işaret ettiğini hem de taht ve görkem gibi kavramları imlediğini belirtir. Tiyatro fenomenolojisine göre, sahne nesnesi hem bir açıklama hem de referans alanıdır: salt anlamlandırmayı aşan ampirik, duyuşsal bir mevcudiyettir. Tiyatro, makineden, insan bedenine kadar tüm nesnelere mevcudiyet ile yokluk, anlam ile maddesellik arasındaki algı oyununa sokar. Nesne, aktör ile dekor, gösterge ile öz, mimesis ile kinesis, canlılık ile ölü olma hali arasında gidip gelen performansın [eylemin] kendisi için kullanışlı bir sözdizimi olarak durur. Nesnenin baştan çıkarıcı ve yaratıcı kayganlığı ile performansın [eylemin] totolojik, politik ve metafiziksel konumu bağlantılıdır (Sofer, 2016, s.684-874).

Tiyatroda nesnelere sembolik geçişkenliği, değeri, işlevi, göstergeleri aksiyon üzerinden tanımlandığında teatraliteğin oluştuğu görülür. Tiyatroda aksiyonun bilgiyi seyirciye aktarma işlevi, sahnedeki her bir unsurun [her ne kadar deneysel tiyatrodaki geleneksel olandaki gibi asal unsurlar mevcut olmasa da] bir gösterge olmasına sebep olur. Göstergelerin varlıkları kadar yoklukları da anlam üretir. Göstergeler seyirci ve mevcut kültür arasındaki ilişki doğrultusunda şekillenir ve yorumlanır. Dolayısıyla teatral göstergeler dramatik aksiyona dahildir ve ikonik mimesis kapsamındadır (Sağlam, 2008). Oyun Yazarı W. David Hancock, nesnelere, teatral bir hikâye düzenlemek için mükemmel birer alternatif yöntem yarattığını ve hatta dramatik aksiyona katkıda bulunabileceklerini belirtir. Ona göre nesnelere normalde diyalog, çatışma ve duyguların hâkim olduğu bir sanatsal kültürde, sahneye yönelik işler yaratmanın alternatif bir yoludur (Hancock, 2021). Nesnelere geçişkenliği, sembolik geçişkenliği, işlev değişimi, Mauricio Kagel'de de görülür. Kagel'in nesnelere teatraliteğine olan ilgisi, aynı zamanda, bir nesne ile işlevi arasında tutmak istediği tarafsızlığın da bir göstergesidir. Kagel, nesnelere yorumun tüm olasılıklarına sunar ve izleyiciyi eylemlerin amacı ve onlarla bağlantılı nesnelere konusunda şaşırtır. Objeler, dinleyicinin müzik kadar dikkatini çeken çekici bir duruşa sahiptir. Örneğin Kagel'in Staatstheater: Repertoire (1967-1970) isimli çalışması içerik ve nesneye yaklaşımı açısından oldukça kapsayıcıdır.

Duchampçı olarak değerlendirmenin mümkün olduğu Staatstheater'da, kolaj tekniği ile sıradan nesnelere, işlevsellikleri değiştirilerek kullanılır. Staatstheater'da birbiriyle alakası olmayan

SONUÇ

Gündelik bir nesnenin veya insan bedeninin ses kaynağı olarak kullanılması ya da bir enstrümanın bilindik kullanımının dışında icra edilmesi enstrüman kavramına ve performansa yönelik tanımları değiştirir. Dada ve John Cage estetiğinde müziğin yanı sıra eylemin önem kazanması ve sahnede bir atmosfer oluşturma isteği klasik icranın teatral performansa dönüşmesine olanak verir. Dada ve John Cage estetiğinin kaynaklık ettiği 'Enstrümantal Tiyatro'da nesnelere, uygun atmosferle ve kompozisyondaki odağın ses üretici eylemlere yönelmesiyle teatralleşir. Müzik yaratımında nesnelere enstrüman olarak kullanılması yani işlevlerinin değişmesi teatralleşmelerindeki ilk adımdır. 'Enstrüman Tiyatro'da nesne, eylemle birleşerek sembolik değer üretir ve dramatik çatı içerisinde anlam katmanlarının oluşmasına sebep olur. Örneğin kullanılan bir nesne sayesinde tüketim toplumuna yönelik eleştirilerin doğmasının önü açılabilir ve böylece eserlerin kendiliğinden ortaya çıkan birer manifestosu olduğu düşünülebilir. 'Enstrümantal Tiyatro'da ses kaynağının işlevsel dönüşümünde ve sesin oluşumunda nesnenin konumu belirleyici olmuştur. Enstrümanlaşan nesneyi teatral kılan unsurlardan birisi de icracının ses yerine eyleminin altını çizmesidir. 'Enstrümantal Tiyatro'nun öncü isimlerinden Mauricio Kagel'in eserlerinde iki bin beş yüzden fazla farklı ses üreticisi kullanılmıştır. Müzik yaratımında bu kadar kapsamlı bir enstrüman deposuna başvurusu, eserlerindeki olası eylem çeşitliliğine dair fikir verir. Kagel, çalışmalarında çeşitli kültürlerden enstrümanlar, oyuncak enstrümanlar, akustik aksesuarlar, çoğunlukla kendisi tarafından yapılmış ses malzemeleri ve her türden nesnelere kullanır. Dolayısıyla 'Enstrümantal Tiyatro'da enstrüman kavramı oldukça geniş bir kapsam elde eder. "Ses üretebilen" her nesne potansiyel olarak enstrümandır. Özellikle günlük nesnelere grotesk kullanımı önemlidir (Rozsak, 2013). Kullanılan tüm enstrümanlar özellikle grotesk kullanımları ile eserlerdeki dramatik çatının ve atmosfer yaratımının merkezini oluşturur. Örneğin Kagel'in Staatstheater eserinde eylem, işlevsel değişim, potansiyel anlam katmanları ve eserin tasarımındaki dramatik yeri ve etkisi ile enstrüman teatralleşir. Kagel, eserde her türden gündelik nesneyi, çeşitli sesleri üretmek için teatral eylemlerle ve bir tiyatro sahnesinde kullanmıştır. Böylece müzisyenin performansını klasik icra alanından çıkarır ve değiştirir. Sıradan nesnelere, eylemlerle olan bağlantıları, anlam katmanları ve çalma pratiğinin bir performansa dönüşmesi ile teatralleşir.

ABSTRACT

Scientists and researchers have recently turned their attention to the soil's carbon sequestration potential (CSP) in their pursuit of mitigating climate change and its adverse effects. This emerging field within soil science offers promising strategies to combat rising atmospheric carbon dioxide (CO₂) levels and global warming. In this study, the CSP of surface soils in agricultural lands where sunflowers are grown under semi-arid climate conditions was determined, predicted using artificial neural networks (ANN), and their relationships with certain soil properties were evaluated. The organic carbon (OC) contents of the soils were found to range from 0.10% to 3.71%, and their CSP varied between 31.60 and 81.54 tons of C per hectare. The CSP of the soils showed low positive correlations with the sand and clay contents of the study area and low negative correlations with soil OC. It was observed that higher OC levels in soils used for sunflower cultivation led to lower levels of CSP. An increase in the amount of OC in agricultural soils was considered to enhance carbon retention in the soil, consequently reducing the CSP. ANN were employed to predict CSP using soil sand, silt, clay, and OC contents as inputs, and the CSP as the target. The results of the prediction indicated that ANN could be used with 99% accuracy in determining soil CSP.

Keywords: Organic carbon, carbon sequestration potential, artificial neural networks

INTRODUCTION

In pursuit of mitigating climate change and its adverse effects, scientists and researchers have shifted their focus to the potential of carbon sequestration in soil. In the field of soil science, this emerging area offers promising strategies to combat rising atmospheric carbon dioxide (CO₂) levels and global warming. Carbon sequestration in soil is a natural process influenced by complex interactions among various elements in ecosystems. Soil and plants are the most significant consumers of organic carbon in terrestrial ecosystems (Janzen, 2004). Plants play a crucial role in this process by absorbing CO₂ from the atmosphere through photosynthesis and converting it into organic compounds. Some of these compounds enter the soil through their root systems and decomposing plant matter. Soil microorganisms contribute to the process by breaking down these organic materials, leading to the formation of stable carbon-rich substances known as soil humus.

The success of carbon sequestration in soils depends on various factors, including soil type, land use practices, vegetation cover, and management techniques. Unfortunately, human activities such as deforestation, urbanization, and unsustainable agricultural practices can disrupt the natural carbon sequestration process and reduce the soil's carbon storage capacity (Yılmaz and Dengiz, 2021). Understanding the impact of different land use management on soil organic matter content and composition is crucial for soil's atmospheric CO₂ management (Guo and Gifford, 2002; Murty et al., 2002). Understanding the intricacies of carbon sequestration in soil science is highly important in our global efforts to effectively address climate change. Discovering and implementing strategies that optimize carbon storage in soil is considered a powerful tool for reducing greenhouse gas emissions and fostering a more sustainable and harmonious relationship with our environment.

In recent years, researchers have considered the use of artificial neural networks (ANN), which are widely used in many engineering fields such as climate prediction (Dikshit et al., 2022), water resource management (Wu and Wang, 2022; Alsaiari et al., 2023), energy and the environment (Lu et al., 2022), and land use (Girma et al., 2022; Geng et al., 2022), for various applications. ANNs are computational models composed of artificial neuron layers connected by weighted connections. They learn from data by adjusting these weights and biases to make accurate predictions or decisions, making them effective in solving complex problems in machine learning and artificial intelligence (Pacci et al., 2023).

In this study, the aim is to determine the carbon sequestration potential of areas where sunflower cultivation is carried out under semi-arid climate conditions and to predict it using artificial neural networks.

MATERIALS and METHODS

The study area is the Zile Plain, located approximately 70 km west of Tokat Province in the Central Black Sea Region of Turkey. It is one of the most important plains that allows for intensive agricultural activities in a semi-arid climate. The study area (Figure 1) covers an approximate area of 1667 hectares and is situated between the coordinates of 75° 18' 00" to 75° 42' 00" East and 45° 04' 00" to 45° 24' 00" North (UTM, 36 Zone-m).

Figure 1. Study area location map

For the study area, based on meteorological data for many years, the annual average temperature is 12.6°C, the annual average precipitation is 431.4 mm, and the annual average evaporation value is 726.3 mm. According to the Newhall model, when soil and temperature regimes are calculated, the soil moisture regime is determined as xeric, and the temperature regime is determined as mesic. Soil samples were collected from the study area in the year 2020. The area was divided into grids of 200m x 200m, and using the global positioning system

(GPS), the locations of soil samples were identified. Then, 175 disturbed and undisturbed soil samples from the surface (0-30 cm) were collected from each corner of each grid. Subsequently, the samples were brought to the laboratory. After air-drying the soil samples, they were pulverized using a wooden mallet and sieved through a 2 mm sieve to prepare them for analysis. It was analyzed according to the methods outlined in Table 1.

Table 1. soil analysis methods

Parameters	Unit	Protocol	Reference
Aggregate stability (AS)	%	Wet sieving	Kemper and Rosenau (1986)
Dispersion ratio (DR)	%	DR= (a/b)* 100	Lal and Elliot (1994)
Erodibility ratio (ER)	%	ER= (a/b)*(A/c)*100	Lal and Elliot (1994)
Clay ratio (CR)	%	CR=(100-c)/c	Bouyoucos (1935)
Clay, Silt and Sand)	%	hydrometer method	Bouyoucos (1951)
Organic Carbon (OC)	%	Walkley-Black	Nelson and Sommers (1982)
Total N	%	Kjeldahl	Bremner and Mulvaney (1982)
Bulk Density	g cm ⁻³	Undisturbed soil sample	Burt, 2014

a is the percentage of silt plus clay in suspension, b is the percentage of silt plus clay dispersed with chemical agent, A is the field capacity, c is the percentage of clay dispersed with chemical agent.

The carbon sequestration potential of the soils (CSP, t C ha⁻¹) was calculated by Equation 1 (Angers et al. 2011; Cao et al., 2016).

$$CSP = S_{def} \times \gamma \times H \times (1 - d_{>2mm}/100) \times 10^{-1} \quad \text{Equation 1}$$

S_{def}, g kg⁻¹: It is determined as a result of subtracting the organic carbon content from the soil carbon content in the saturation state. The potential saturation carbon content was determined according to Hassink, (1997). γ : bulk density (g cm⁻³) H: soil depth (cm), d_{>2mm} (%) coarse fraction >2mm.

Descriptive statistics of soil properties were performed using the SPSS program (IBM 2015). In ANN implemented with Matlab, Levenberg-Marquardt (LM) algorithm was implemented to train the network.

Figure 2. Single hidden layer network model

The created ANN is an integrated model for predicting carbon sequestration potential. Sand, silt, clay, and organic carbon values are used as input data, while soil carbon sequestration potential is used as the target. The total number of samples in the dataset is 175, with 123 samples (70%) used as training data, 26 samples (15%) as test data, and the remaining 26 samples (15%) as validation data. The single hidden layer network model in Figure... reveals the 4 input data, which include sand, clay, silt, and organic carbon; the hidden layer consisting of 10 neurons; and the output layer where data from the hidden layers are collected. Here, to evaluate the performance of the created ANN, Mean Squared Error (MSE) and Coefficient of Determination (R^2) have been taken into account. These criteria were calculated using equations (2) and (3). (Hosseinpour et al., 2016).

$$MSE = \frac{\sum_{i=1}^N (y_{ai} - y_{pi})^2}{N - 1} \quad \text{Equation 2}$$

$$R^2 = \frac{[\sum_{i=1}^N (y_{ai} - \bar{y}_a) (y_{pi} - \bar{y}_p)]}{\sum_{i=1}^N (y_{ai} - \bar{y}_a)^2 (y_{pi} - \bar{y}_p)^2} \quad \text{Equation 3}$$

Where, y_i and y_{pi} are measured and predicted CSP value.

FINDINGS and DISCUSSION

The physical and chemical properties of 175 soil samples collected from the study area were examined. The descriptive statistics of these properties are provided in the table. Generally, the soil samples were found to be low in salinity ("non-saline" with an electrical conductivity of 0-1.08 dS/m), and the soil reaction was determined to be neutral to slightly alkaline (pH 7.11-8.83).

The soil texture classes based on sand, silt, and clay content are as follows: clayey silt (14.85%), sandy clay silt (18.28%), clay (52%), sandy silt (3.42%), sandy clay (9.75%), silt (1.14%), and silty sand (0.57%). The nitrogen (N) content of the soils was determined to be at

varying levels between 0.05% and 0.51%. The organic carbon content of the soils was classified as low to high according to Kacar (2009), and aggregate stability content ranged from 10.62% to 96.30%, falling into low and high categories according to Wilding (1985). The carbon sequestration potentials of the soils were determined in the range of 31.50-81.61 tons C/ha. Hassink (1994) stated that the organic carbon sequestration potential of soils showed a positive correlation with silt + clay content. The coefficient of variation was classified as low (<15%), medium (15-35%), and high (>35%). According to this, among the soil properties of the study area, pH, BD, and CSP exhibit "low" variation (<15%) from the mean, while EC, sand, clay, silt, AS, and N showed "medium" variation. Two of the most important properties for carbon sequestration potential, organic matter, and organic carbon, exhibited "high" variation (>35%).

Clay, CSP and organic matter showed a left-skewed (-) distribution when compared to a normal distribution, while other properties exhibited a right-skewed (+) distribution. In a left-skewed distribution, the properties have higher levels of distribution frequency than the mean, whereas in a right-skewed distribution, the opposite is observed. The curves for all soil properties displayed a steeper (+) distribution compared to a normal distribution.

Table 2. Descriptive statistics of physical and chemical soil properties of study area.

Variable	Mean	StDev	CoefVar	Variance	Min	Max	Skewness	Kurtosis
pH	7.67	0.19	2.47	0.03	7.11	8.83	1.37	7.96
EC (dS/m ¹)	0.52	0.15	28.84	0.02	0.10	1.08	0.77	1.70
Sand (%)	42.97	9.50	22.10	90.25	27.81	83.86	1.38	2.41
Clay (%)	39.15	9.05	23.11	81.97	9.42	58.14	-0.65	0.333
Silt (%)	17.87	4.00	22.38	16.05	6.13	33.47	0.39	3.50
Organic Carbon (%)	1.22	0.66	54.09	0.44	0.10	3.71	1.01	1.89
Aggregate Stability (%)	54.92	14.87	27.07	221.26	10.62	96.30	-0.04	0.10
Bulk Density g/cm ³	1.44	0.06	4.16	0.004	1.32	1.62	0.52	0.07
Organic Matter (%)	2.11	1.15	54.50	1.32	0.17	6.40	1.01	1.89
N (%)	0.18	0.06	33.33	0.004	0.05	0.51	1.37	4.37
CSP-tC/ha	69.41	8.99	12.95	80.88	31.50	81.61	-1.62	2.94

Figure 3. Distribution of Clay% with CSP

As the clay content in the soil increases, it can be observed that the carbon retention potential also increases, as shown in the Figure 3. Clay particles have a large surface area and a strong negative charge, allowing them to draw in and preserve organic matter, including carbon (Yan and Eisenhal, 1999). This situation leads to an increase in the soil's ability to store carbon over time.

Figure 4. Distribution of Sand% with CSP

While sand content in soil can influence carbon sequestration potential to some extent, it is just one of many factors at play. The organic matter content of the soil, microbial activity, soil structure, land use practices, and environmental conditions all interact to determine how much carbon can be sequestered in a given soil. Therefore, it's essential to consider these factors collectively when assessing carbon sequestration potential in a specific soil type or ecosystem. As seen in Figure 4, it is observed that as the sand content increases in the workspace, the carbon sequestration potential has decreased. This is thought to be due to the increase in macro porosity between sand particles, making it more difficult to retain carbon.

Figure 5. The performance graph of the Levenberg-Marquardt combination.

As seen in the Figure 5, in predicting CSP with ANN, the model conducted 16 epochs of training, validation, and testing, all of which rapidly decreased up to the eighth iteration and then exhibited smoother progress. It achieved the best validation performance at the 10th epoch with a value of 1.3009.

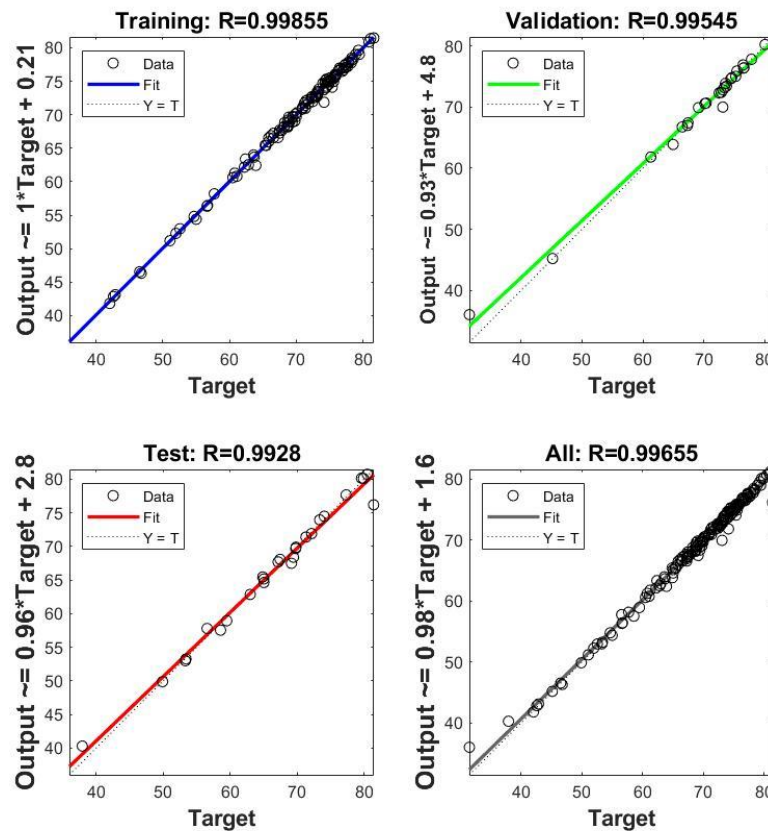

Figure 6. The regression results between the output data and targets for the Levenberg-Marquardt approach

The coefficient of determination (R^2) is an important indicator used to explore the suggested prediction performance of an artificial neural network. Thanks to this indicator, the accuracy of CSP has been predicted using physicochemical soil parameters. The results obtained demonstrate that CSP can be predicted with 99% accuracy using training, validation, testing, and all data (Figure 6).

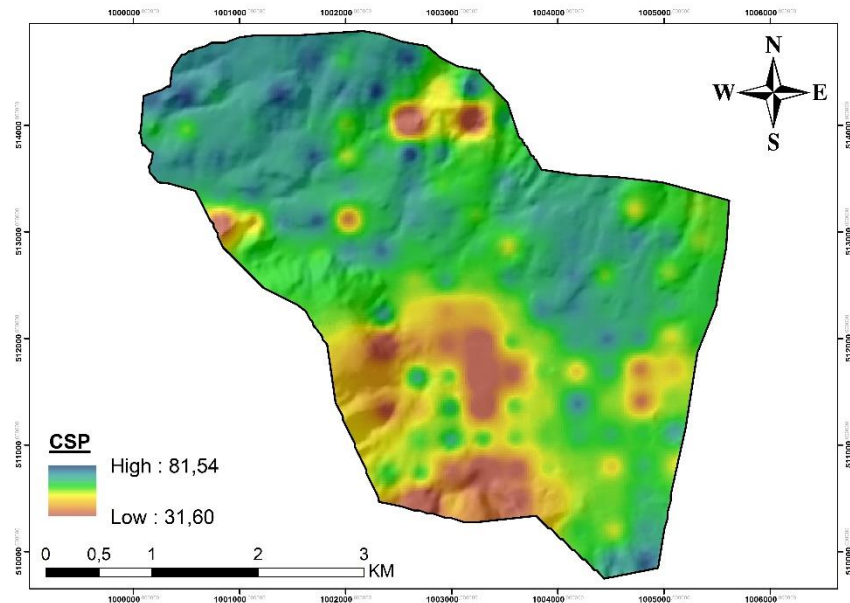

Figure 7. The carbon sequestration potential distribution map for the study area

As seen in Figure 7, the CSP values for the study area vary, with the lowest value being 31.60 tons of C per hectare and the highest being 81.54 tons of C per hectare. The southwestern part of the area has been identified as the region with the lowest CSP density due to human impact and erosion.

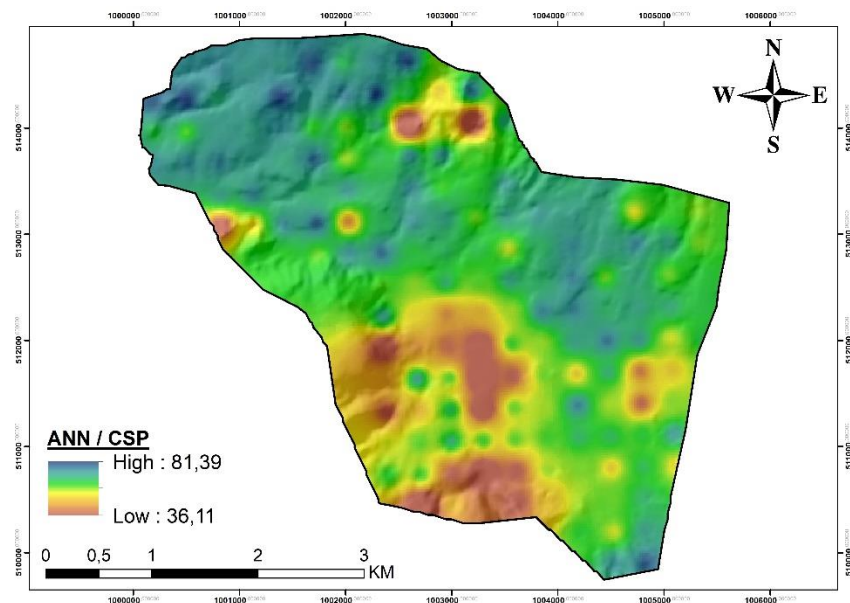

Figure 8. The predicted carbon sequestration potential distribution map for the study area

When examining the distribution map in Figure 8, which shows the predicted CSP values, it can be observed that the CSP values vary between a minimum of 36.11 tons of C per hectare

and a maximum of 81.39 tons of C per hectare. It is also evident that the calculated CSP value distribution map closely resembles the observed distribution map.

CONCLUSION and RECOMMENDATIONS

In the study, several physicochemical soil analyses were conducted on 175 soil samples collected from the study area. Using the obtained results, the carbon sequestration potential of the study area was determined. Four of the obtained results (clay, sand, silt, organic carbon) were used as inputs, and the calculated CSP was used as the target to predict the carbon sequestration potential of the study area with an Artificial Neural Network (ANN). The distribution maps for these two CSP values were created.

According to the results obtained, a significant portion of the study area was determined to have a high carbon sequestration potential. It was also found that the ANN can predict carbon sequestration potential with 99% accuracy.

ÖZET

Cnc makineler bilgisayarlar tarafından kontrol edilebilen cihazlardır. 3D olarak tasarlanmış parçalar bilgisayar ortamında G kodlarına dönüştürülür, bu G kodlarını Cnc makinelerdeki kontrolör program aracılığı ile çözümlenerek eksenlerin hangi doğrultuda ne kadar hızda ve ivme de gitmesine karar vermektedir. Gelen bu kodlar ile tezgâh en optimum hareketleri yaparak parça üzerinden talaş kaldırmaktadır. Çok karmaşık parçaları bile eksen sayısını arttırarak tek bağlamada son haline getirilebilmektedir. Bu makineler otomotiv, kalıpcılık, savunma sanayi gibi sektörde çok sık bir şekilde tercih edilmektedir. Cnc tezgah tasarımında yapılacak iş isterlerine göre tezgah kapasitesi ve ölçüleri belirlenir. Tezgah üzerinde kullanılan bir çok parçayı üretmek pahalı olduğu için yada üretilmediği için tasarıma uygun hazır olarak alınıp takılmaktadır. Bunlar genellikle lineer yatak, vidalı mil, servo motor gibi mekanik güç üretme ve aktarma parçalarıdır. Bu parçaların tasarıma göre statik ve dinamik hesaplamaları yapılarak çıkan sonuca göre katalogdan uygun ürün seçilir. Vidalı miller dönme hareketini lineer harekete çeviren düşük sürtünmeli hassas pozisyonlama yapabilen makine elamanlarıdır. Vidalı mil ve somundan oluşan sistemlerdir. Lineer arabalar eksenleri tek eksen, 2 yönde lineer hareket yapabilmesi için sınırlandırma yapabilen kızak ve arabadan oluşan sistemlerdir. Servo motorlar ise sürücüler sayesinde hassas kontrol edilebilen elektrik enerjisini dönme enerjisine çeviren sistemlerdir. Servo motorlarda konum ve eksen hızı hassas bir şekilde kontrol edilmektedir. Servo motordan çıkan mekanik dönme enerjisi vidalı mil ile doğrudan eksene verilir, eksen lineer arabalar ile sınırlandırıldığı için tek eksen 2 yönde istediğimiz gibi hareket eder. Bu makalede güç grubu olarak servo motor seçimi, hareket grubu olarak ise vidalı mil ve lineer araba seçimi üzerine hesaplamalar yapılarak katalog üzerinden optimum ürün seçimi yapılacaktır.

Anahtar Kelimeler: Cnc Makine, Vidalı mil, Lineer Araba, Servo Motor, Tasarım, Ürün seçimi.

POWER AND MOTION GROUP SELECTION IN CNC MACHINE DESIGN

ABSTRACT

CNC machines are devices that can be controlled by computers. The parts designed in 3D are converted into G codes in the computer environment, and by analyzing these G codes through the controller program on the CNC machines, it decides in which direction, at what speed and at what acceleration the axes should go. With these codes, the machine makes the most optimum movements and removes chips from the part. Even very complex parts can be finalized in a single clamping by increasing the number of axes. These machines are frequently preferred in sectors such as automotive, mold making and defense industry. Bench capacity and dimensions are determined according to the work requirements in the design of the cnc bench. Since it is expensive to produce many parts used on the bench or cannot be produced, it is bought and installed ready-made in accordance with the design. These are generally mechanical power generation and transmission parts such as linear bearing, ball screw, servo motor. The static and dynamic calculations of these parts are made according to the design, and the appropriate product is selected from the catalog according to the result. Screw shafts are machine elements that convert rotational motion to linear motion with low friction and precise positioning. They are systems consisting of a screw shaft and a nut. Linear trolleys are systems consisting of a slide and a trolley that can limit their axes in order to make linear movement in one axis and in 2 directions. Servo motors, on the other hand, are systems that convert electrical energy into rotational energy, which can be precisely controlled by drivers. Position and axis speed are precisely controlled in servo motors. The mechanical rotational energy from the servo motor is given directly to the axis by the ball screw, since it is limited by linear cars on the axis, a single axis moves in 2 directions as we wish. In this article, the optimum product selection will be made through the catalog by making calculations on the choice of servo motor as the power group and the selection of the ball screw and linear car as the motion group.

1.GİRİŞ

Cnc tezgahlar genellikle talaşlı imalatlarda kullanılmaktadır, tezgahlar bilgisayar destekli tasarımları bilgisayar destekli üretim yazılımları kullanarak eksenlere hareket verilir ve parça üzerinde işlemler yapılır. Bu eksenlere ilk hareketi Servo motorlar verir, servo motorlar elektrik enerjisini mekanik enerjiye dönüştüren yazılım yoluyla kontrol edilebilen sistemlerdir. Servo motorların ucuna redüktörler takılmaktadır, redüktörler dişli sistemleri ile tork ve hız ayarı yapılan sistemlerdir. Cnc tezgahlarda genellikle tork arttıran hız düşüren sistemlerdir. Redüktörler sayesinde daha düşük tork üreten motor seçimi yapılarak sistem ağırlığında ve maliyetinden tasarruf edilmektedir. Hassas çalışan eksenlere redüktörden sonra vidalı mil sistemleri takılmaktadır. Vidalı mil sistemleri redüktörlerdeki dönme hareketini hassas bir şekilde lineer harekete çeviren sistemlerdir. Hareket verilen sistemin istediğimiz yönde stabil çalışması için lineer yataklar kullanılmaktadır, bu lineer yataklar üzerine takılan kütleyi ileri ve geri yönde hassas pozisyonlayarak hareket etmesine izin vermektedir.

Yukarıda bahsedilen sistemler tasarlanan cnc tezgâhlarında genellikle hazır alınarak makine üzerine montajı yapılmaktadır. Bu hazır alınıp tasarımda kullanılacak hareket parçalarının seçimi hakkında bilgi verilmiştir.

2.Cnc Tezgâh Ekseni

Aşağıda örnek bir cnc tezgâhın 2 yöne hareket eden ekseni yer almaktadır. Bu eksen üzerinde bulunan vidalı mil, lineer araba, servo motor seçimi açıklanacaktır.

Motorun hareket ettirdiği kütle 320 Kg'dır. Eksen ivmelenmesi 10m/sn^2 olarak alınmaktadır, yatay yönde strok 600mm'dir.

Şekil 10. 4 serbestlik dereceli eksen

3.Cnc Tezgâh Güç ve Hareket Grupları

3.1. Vidalı Mil Seçimi

Vidalı mil seçiminde 3 kriter göz önünde bulundurulur. Bunlar hız, yük ve mil uzunluğudur.

Şekil 11. Vidalı mil görseli (URL-4)

Eksen hızının 30 m/dk olması için Servo motor 3000 d/dk' da dönünce vidalı mil adımı 10mm olması gerekmektedir.

320 kg yük taşıyacak 0,6 metre boyun 3000 d/dk hızda dönecek vidalı mil aşağıdaki tablodan seçtiğimiz zaman 25-10 (çap Ø25 adım 10) olmaktadır.

Şekil 12. Vidalı mil tablosu (URL-5)

3.2 Servo Motor Seçimi

Servo motorlar elektrik enerjisini dönme enerjisine dönüştüren hassas sistemlerdir. Sürücüleri vasıtasıyla kontrol edilerek cnc tezgahlarda hassas pozisyonlama yaparlar. Sistem üzerindeki kuvvetler hesaplanarak motor torku belirlenir bu torka göre katalogdan motor seçimi yapılır. Ayrıca yapılacak işin hassasiyetine göre encoder çözünürlüğü de önemlidir.

Şekil 13. Örnek servo motor ve sürücü görseli (URL-3)

F_t =somun çevirme kuvveti

h =vidalı mil hatvesi

$F_ö$ =eksenel kuvvet

d =vidalı mil çapı

Servo motor bu ekseninde sadece yatay ekseninde yük taşıdığı için sistemin ağırlığı sisteme dahil edilmez sadece ağırlıktan dolayı ivmelenme sırasında gerekli yük hesaplanır.

$$F_ö = Ma = 320 \cdot 10 = 3200 \text{ N}$$

$$\begin{aligned} F_t &= h \cdot F_ö / \pi \cdot d \\ &= 10 \cdot 3200 / (3,14 \cdot 20) \\ &= 509,55 \text{ N} \end{aligned}$$

M_s =Somunun çevirme momenti

$$\begin{aligned} M_s &= F_t \cdot d / 2 \\ &= 509,55 \cdot 10 \end{aligned}$$

$$=5095 \text{ Nmm}=5\text{Nm}$$

Güvenlik katsayısını 1,3 seçtiğimiz zaman ihtiyacımız olan tork değeri 6,5 Nm olmaktadır. Katalogdan bakıldığı zaman 1 Kw motor 4.7 Nm, 1.5 Kw motor 7.16 Nm tork göstermektedir. Mevcut kütle ve talaş kaldırmak için motor gücü ise 1,5Kw motor seçilmelidir.

PARAMETRELER / PARAMETERS	BİRİM / UNIT	SM13-DX-100BX	SM13-DX-150BX	SM13-DX-200BX

Şekil 14. Servo motor katalog görüntüsü (URL-3)

Servo motor seçimin de uygulamaya göre çalışma voltajları su ve toza karşı IP tipleri, çalışma sıcaklıkları gibi konularda vardır, konular genellikle hesaplama yapılmadan uygulamaya göre seçilmektedir. Ayrıca her servo motor bir sürücü ile çalışır genellikle her motorun kendi markasındaki sürücüler kullanılmaktadır.

3.3. Lineer Araba Seçimi

Eksen üzerimde 320 Kg yük bulunmaktadır.

Arabalara gelen ağırlıkta dolaylı moment= $mg+ma=(320.9,8+320 \times 10) \times 0,235=1504\text{Nm}$ 'dir.

4 araba kullanılmıştı her arabaya 0,37Knm moment gelmektedir.

Şekil 15. Örnek lineer kızak ve araba (URL-1)

Şekil 16. Lineer kızakların uzunluk hassasiyet grafiği (Özsoy, 2016)

Şekil 17. Örnek eksenin yandan görünüşü

Lineer arabalara yüke bindiği zaman dikey ekseninden 200N motor kuvveti gelmektedir. 250 Kg ağırlığındaki ekseninde ivmelenme anında 2500N kuvvet etki etmektedir. Dikey eksen en alt nokta da iken lineer arabalar ile spindle arasında 1 metre mesafe vardır. Arabalara gelen moment= $2700 \cdot 1 = 2700 \text{ Nm}$ 'dir. 4 araba kullanılmıştı her arabaya 0,67Knm moment gelmektedir.

Bu değerler göz önünde bulundurularak katalogdan HGW35 HC lineer arabalar seçilmiştir.

Şekil 18. Linear araba katalog sayfası (URL-2)

4.SONUÇLAR

Linear Araba seçimindeki önemli kriterler sistem ağırlığı ve ivmelenmelerdir.

Vidalı mil seçiminde önemli kriterler vidalı mil uzunluğu, sistem için gerekli hız ve sisteme ağırlık ve ivmelenmeden gelen yüküdür.

Servo motor seçiminde önemli kriterler ise sistem hassasiyetine göre encoder çözünürlüğü, sistemi hareket ettirmek ve durmak için motor miline gelen döndürme momentidir. Bazı sistemlerde hız problemi yoksa daha küçük motor kullanmak için motordan sonra redüktör de kullanılabilir.

Örnek tezgâh eksenini üzerindeki kuvvetlere göre hareket ve güç gruplarına gelen yükler hesaplanmıştır. Bu kuvvetlere göre servo motor, vidalı mil, lineer araba seçimi yapılmıştır. Seçimler satıcı firmaların katalogundan seçilmiştir. Katalogdan seçim yapılırken çıkan sonuçlara en yakın olan ürünlerden bir üstteki ürünler seçilmiştir.

ABSTRACT

Congo Red (CR), a benzidine-based anionic diazo dye, is commonly used in the fabric industry and benzidine is a toxic compound that causes bladder cancer in humans. Due to its hazardous impact on human and environmental health, it should be treated. In this study, this cancerogenic compound, CR, was degraded in the presence of Fe-ash under solar light irradiation. Firstly, Fe-ash was synthesized and a characterization study consisting of SEM and BET analyses was carried out. The results showed that Fe-ash was successfully synthesized. Then the impacts of pH (3-9), iron content (w.% 10 and %20), catalyst loading (CL, 0-0.2 g/L), and initial hydrogen peroxide concentration (HP, 0-10 mM) on the degradation efficiency of CR were investigated. The highest degradation of CR was almost %95, and the optimum reaction conditions for degradation of CR were determined as follows: pH=3, iron content (w%)=%10, CL=0.2 g/L, HP=10 mM. In addition, a kinetic study was carried out at three different reaction temperatures (25, 35, and 45 °C) and the reaction followed the order reaction kinetic model. The reaction rate constants were determined as 0.0365, 0.0438, and 0.0523 min⁻¹ for 25, 35 and 45 °C, respectively. The activation energy was calculated as 14.17 kJ/mol. Consequently, it could be concluded that Fe-ash is a promising photocatalyst for the degradation of CR under solar light irradiation.

Keywords: Congo Red, Photocatalytic Oxidation, Fe-ash

INTRODUCTION

The dyestuff used in the dye and textile industries is highly toxic and cancerogenic for living organisms and environmental health. Congo Red (CR) is one of the most commonly used dyes in the fabric industry and benzidine is a toxic compound that causes bladder cancer in humans. It could be detected in various water and wastewater streams because of the untreated discharge of CR. Due to its hazardous impact on human and environmental health, it should be treated. In literature, various methods (adsorption, coagulation, particularly photocatalysis) were applied to treat CR-containing wastewater streams (Sakkas et al., 2010; Magdalane et al., 2021; Güy and Özacar, 2016; Ong et al., 2016). Among them, solar-Fenton-like oxidation has some advantages: i. low-cost ii. high removal rate iii. easy operation iv. ability to induce complete mineralization (Lin et al., 2022; Jiang et al., 2022). Due to these remarkable features, solar-Fenton-like oxidation has recently gained interest and it could be employed to degrade CR. In literature, CR was treated in the presence of various photocatalysts such as TiO₂, ZnO, TiO₂/GO, TiO₂ doped CoFe₂O₄, chitosan/nano-CdS, etc. (Sakkas et al., 2010; Magdalane et al., 2021; Güy and Özacar, 2016; Jo et al., 2017; Zhu et al., 2009).

In this study, Fe-supported corn cob ash was synthesized and used for the degradation of CR. In this context, the effective reaction parameters (pH, iron content, catalyst loading, and initial HP concentration) were investigated to determine the optimum reaction conditions. In addition, the impact of reaction temperature on the degradation of CR was investigated and a kinetic study was performed.

MATERIALS and METHODS

HCl, NaOH, H₂O₂ (HP), and FeCl₃ were purchased from Sigma-Aldrich and corn cob (CC) was supplied from a local bazaar.

CC was supplied from a local bazaar and then, it was washed with distilled water to remove the dust particles and other soluble contaminants. Then, it was dried in an oven at 110 °C for 24 h. 15 g of the dried CC was refluxed with 10% HCl solution (250 mL) for 2 h by stirring constantly. It was then allowed to cool to room temperature, filtered then washed with distilled water until pH 7, and dried for 24 h in the oven at 110 °C. The product obtained was annealed at 700 °C for 2 h and this was designated as Corn Cob Ash (CCA). Fe-CCA (w.% 10 and %20) was briefly prepared 1 g of ash was added into a beaker consisting of 100 mL of distilled water and the required amount of FeCl₃. The mixture was stirred continuously for 2 h and filtered

before dried in the oven at 100°C. SEM and BET analyses were carried out for the characterization of Fe-CCA catalysts.

The synthesized photocatalysts were subsequently used for CR degradation study. The experimental study was carried out using 20 ppm CR solution (100 mL) for 1 h under simulated solar light irradiation. In this context, the effect of reaction parameters that are pH (3-9), catalyst amount (0-0.2 g/L), and initial hydrogen peroxide concentration (0-10 mM) was investigated. During the reaction, liquid samples were taken and analyzed every ten minutes via a UV-Vis spectrophotometer.

The degradation of CR was evaluated at 510 nm and it was calculated based on the following equation:

$$\% \text{ Degradation of CR} = \frac{A_{0at\ 510nm} - A_{t\ at\ 510nm}}{A_{t\ at\ 510nm}} \times 100$$

The kinetic study was performed at the optimum reaction conditions for 25, 35, and 45 °C and the data was analyzed with first and second-order reaction power law kinetic models.

FINDINGS and DISCUSSION

A characterization study consisting of SEM and BET analyses was carried out. SEM diagram of synthesized catalysts is given in Figure 1. The surface of Fe-ash catalysts appears to be non-porous and rough with irregularly shaped substances that can be assumed as the by-products formed during the combustion of corn cob. Fe and ash formed well-distributed and non-uniform shapes. BET areas of %10 and %20 Fe containing ash were determined as 38.79 and 36.58 m²/g, respectively. An increase in Fe content led to a decrease in the BET area.

Firstly, the impact of iron content (%10 and %20) and catalyst amount (0-0.2 g/L) on the degradation of CR were examined and the results are given in Figure 2. %10 and %20 Fe-containing ash showed almost the same degradation efficiency for 0.2 g/L of catalyst loading so, %10 of iron content was chosen as the optimum iron content. In this manner, almost the same degradation efficiency was observed for 0.1 g/L and 0.2 g/L of %10Fe-ash catalyst so 0.1 g/L was selected as the optimum catalyst amount.

After determining the optimum iron content and catalyst amount, the impact of pH (3-9) on CR degradation was investigated. The results are given in Figure 3. While the highest CR degradation was observed at pH 3, the lowest degradation was achieved at pH 9. Considering the results, the optimum pH was selected as 3.

Figure 1. SEM images of %10 (a) and %20 (b) Fe containing ash

Figure 2. Catalyst Amount and Iron Content Effect a) %10Fe-ash b) %20Fe-ash (Reaction Conditions: 20 ppm CR, pH 7, 0.1 mM HP, 1 h)

Figure 3. pH Effect (Reaction Conditions: 20 ppm CR, 0.1 g/L 10%Fe-ash, 0.1 mM HP, 1 h)

Lastly, the impact of initial HP concentration (0.1-10 mM) on CR degradation was investigated and results are given in Figure 4. As initial HP concentration increases, the degradation efficiency of CR enhances and the highest value was observed using 10 mM of HP. Thus, 10 mM was chosen as the optimum HP concentration. Consequently, optimum reaction conditions were selected as pH 3, 0.2 g/L (%10Fe-ash), 10 mM HP, and ~%95 CR degradation was achieved at these conditions.

Figure 4. Initial HP Effect (Reaction Conditions: 20 ppm CR, 0.1 g/L 10%Fe-ash, pH 3, 1 h)

After the selection of optimum reaction conditions, the effect of reaction temperature (25, 35, and 45 °C) on CR degradation was investigated at these conditions. The results of linearized first-order reaction model and Arrhenius plot are given in Figure 5 and Figure 6, respectively.

Figure 5. Linearized first order reaction kinetic model (Reaction conditions: 20 ppm CR, 0.1 g/L 10%Fe-ash, pH 3, 10 mM HP, 1h)

Figure 6. Arrhenius plot

Based on the kinetic study, the degradation of CR followed the first-order reaction kinetic model. Observed reaction kinetic rate constants were found as 0.0365, 0.0438, and 0.0523 min⁻¹ for 25, 35, and 45 °C, respectively. The activation energy was determined as 14.17 kJ/mol (gas constant R=8,3145 J/K mol).

CONCLUSION and RECOMMENDATIONS

In this study, the cancerogenic compound, CR, was degraded in the presence of Fe-CCA under solar light irradiation. Firstly, Fe-CCA was synthesized and a characterization study consisting of SEM and BET analyses was carried out. The results showed that Fe-CCA was successfully synthesized. Then, the impacts of pH (3-9), iron content (w.% 10 and %20), catalyst loading (CL, 0-0.2 g/L), and initial hydrogen peroxide concentration (HP, 0-10 mM) on the degradation efficiency of CR were investigated. The highest degradation of CR was almost %95, and the optimum reaction conditions for degradation of CR were determined as follows: pH=3, iron content (w%)=% 10, CL=0.2 g/L, HP=10 mM. In addition, a kinetic study was performed at three different reaction temperatures (25, 35, and 45 °C) and the reaction followed the first-order reaction kinetic model. The reaction rate constants were determined as 0.0365, 0.0438, and 0.0523 min⁻¹ for 25, 35 and 45 °C, respectively. The activation energy was calculated as 14.17 kJ/mol. Consequently, it could be concluded that Fe-ash is a promising photocatalyst for the degradation of CR under solar light irradiation.

ABSTRACT

Error analysis is a crucial aspect of the pedagogical process in English language learning (ELL) as it provides valuable insights into the cognitive processes, language acquisition patterns, and challenges faced by learners. This scholarly article aims to provide a comprehensive overview of error analysis in ELL, encompassing its theoretical foundations, methodologies, significance, and implications for effective language instruction. By analyzing and categorizing errors made by ELL students, educators can better tailor their teaching strategies to address specific linguistic difficulties and enhance the overall learning experience.

Keywords: Error analysis, language acquisition, pedagogical practice, linguistic excellence

1. INTRODUCTION

Error analysis in the context of English language learning (ELL) involves the systematic identification, classification, and examination of the errors made by language learners during the process of acquiring English as a second or foreign language. Understanding these errors is crucial for both educators and learners, as it provides valuable feedback on the effectiveness of teaching methods and aids in designing more targeted language instruction programs.

Error analysis stands at the crossroads of language acquisition and pedagogical practice, serving as a linchpin in the realm of English language learning (ELL). In this intricate journey towards linguistic proficiency, learners often navigate through a labyrinth of errors, pitfalls, and moments of enlightenment. This scholarly exploration delves into the multifaceted landscape of error analysis within ELL, where the scrutiny of linguistic missteps offers a window into the inner workings of language acquisition. (El-farahaty, 2017)

With the growing global significance of English as a lingua franca for communication, the pursuit of mastery in this language has become a transformative endeavor for millions worldwide. This pursuit, however, is marked by a continuum of linguistic blunders, misinterpretations, and idiosyncratic constructions. (James, 1998) It is precisely these linguistic missteps that form the cornerstone of error analysis, a discipline that seeks to unravel the complexities of language acquisition by dissecting the inaccuracies that learners inevitably encounter.

At its essence, error analysis is more than a mere cataloging of linguistic miscues; it is a dynamic process that underscores the intricate interplay of cognition, language transfer, and instructional methodology. This scholarly inquiry aims to elucidate the theoretical foundations that underpin error analysis, explore the diverse methodologies employed to unearth these linguistic artifacts, and shed light on the profound implications this discipline holds for both educators and learners. (Sermsook et al., 2017)

As we embark on this journey through the terrain of error analysis in ELL, we uncover not only the pitfalls but also the stepping stones towards linguistic excellence. By deciphering the patterns and nuances of errors, educators can illuminate the path to effective language instruction, creating a scaffolding that supports learners in their quest for English language proficiency. Through this scholarly exploration, we will navigate the labyrinth of errors to reveal the intricate tapestry of language acquisition, where missteps become stepping stones on the path to linguistic mastery.

2. Theoretical Foundations of Error Analysis:

2.1. Contrastive Analysis Hypothesis:

The Contrastive Analysis Hypothesis, a seminal theory in the field of error analysis, emerged in the 1950s as a groundbreaking framework for understanding language acquisition and error patterns in second language learning. This hypothesis, initially proposed by Robert Lado, has profound implications for comprehending the intricate relationship between a learner's native language and the target language, notably English in our context. Beyond its foundational principles, the Contrastive Analysis Hypothesis continues to influence the pedagogical landscape and shape language instruction practices. (Al-Khresheh, 2016)

a. Linguistic Transfer: Central to the Contrastive Analysis Hypothesis is the concept of linguistic transfer, a phenomenon where learners apply linguistic structures, vocabulary, and rules from their native language to the target language. This cognitive process is not inherently erroneous but can lead to errors when the structures of the two languages diverge significantly. Understanding linguistic transfer provides educators with a key insight into the source of many learner errors and guides them in addressing these issues effectively.

b. The Role of Native Language: The native language serves as both a foundation and a potential stumbling block in language acquisition. The hypothesis posits that the more similar the structures of the native language are to the target language, the fewer errors learners are likely to make. Conversely, significant structural differences between the two languages increase the likelihood of errors. (Darus & Subramaniam, 2009) Therefore, the Contrastive Analysis Hypothesis underscores the importance of identifying these structural disparities and tailoring instruction accordingly.

c. Predictive Power: One of the significant contributions of this hypothesis lies in its predictive power. By assessing the linguistic characteristics of both the native language and the target language, educators can anticipate and preemptively address potential error patterns. (Yin Mei and Ung T'Chiang, 2001) This proactive approach to language instruction is invaluable in creating a supportive learning environment that minimizes hurdles and maximizes language acquisition.

d. Evolving Perspectives: While the Contrastive Analysis Hypothesis was a groundbreaking theory in its time, subsequent research has nuanced our understanding of error analysis in ELL. Contemporary scholars recognize that errors may not solely result from linguistic transfer and that other factors, such as interlanguage development and sociolinguistic context, also play

pivotal roles. As such, the hypothesis serves as a foundational cornerstone upon which more nuanced and multifaceted theories of language acquisition have been built. (Mohammed, 2016) In summary, the Contrastive Analysis Hypothesis remains a foundational theory in error analysis, offering insights into the complex relationship between native and target languages in ELL. It underscores the role of linguistic transfer, highlights the influence of the native language, and provides a predictive framework for educators. While contemporary perspectives on error analysis have evolved, the Contrastive Analysis Hypothesis continues to inform our understanding of language acquisition, serving as a valuable reference point for both research and pedagogical practice.

2.2. Interlanguage Theory:

Selinker's Interlanguage Theory, a landmark contribution to the field of second language acquisition, has provided profound insights into the dynamic nature of language learning. At its core, this theory recognizes language acquisition as a journey, one marked by the development of an evolving linguistic system known as "interlanguage." Within the framework of Interlanguage Theory, error analysis emerges as an indispensable tool for uncovering the intricacies of language development, charting the course of interlanguage evolution, and addressing the challenges that learners encounter along the way.

a. Interlanguage as a Transitional System: Interlanguage is the linguistic bridge that learners construct as they progress from their native language to target language proficiency. It is neither a mere replication of the native language nor a mirror image of the target language. Instead, it represents a unique, transitional system characterized by evolving syntax, vocabulary, and pragmatic competence. Understanding interlanguage is fundamental for educators, as it provides insights into the developmental stages learners traverse. (Habibullah, 2010)

b. The Role of Error Analysis: Error analysis assumes a pivotal role within the context of Interlanguage Theory. It serves as a diagnostic tool to decipher the features of learners' interlanguage systems. By analyzing the errors made by learners, educators gain access to the underlying structures, strategies, and cognitive processes that shape interlanguage. (Hourani, 2008) Moreover, it helps identify persistent errors that may hinder learners' progress toward native-like proficiency.

c. Stages of Interlanguage Development: Error analysis, when applied within the framework of Interlanguage Theory, unveils the various stages of language development. From the initial stages characterized by overgeneralization of native language rules to the intermediate phases

marked by target language influence, and ultimately to the advanced stages where native-like competence emerges, error analysis provides a roadmap of interlanguage development. (Sermsook, Liamnimitr, and Pochakorn, 2017)

d. Tailoring Instruction: The insights gleaned from error analysis within the context of Interlanguage Theory guide instructional strategies. Educators can design curricula that address learners' specific developmental needs, offering targeted support to mitigate persistent errors and foster progression toward linguistic proficiency. (Limengka, P.E., Kuntjara, 2000)

e. Beyond Error Correction: Interlanguage Theory encourages educators to view errors not solely as problems but also as invaluable markers of growth. In this perspective, errors become opportunities for learners to refine their interlanguage systems, adapt to new linguistic contexts, and ultimately attain higher levels of language competence. (Mul, 2014)

In conclusion, Selinker's Interlanguage Theory, in conjunction with error analysis, offers a comprehensive framework for understanding the dynamic process of language acquisition. Interlanguage is not a stagnant entity but a fluid and evolving system that adapts as learners advance. Error analysis, as a guiding instrument, helps educators navigate this linguistic journey, pinpointing areas for improvement and facilitating more effective language instruction. Through this lens, errors are not mere missteps but essential signposts on the path to linguistic mastery.

3. Methodologies in Error Analysis:

Errors are typically categorized into three main types: phonological, syntactic, and semantic. Phonological errors involve pronunciation and articulation issues, syntactic errors relate to sentence structure, and semantic errors involve vocabulary and meaning. (Novita, 2014).

Methodologies in error analysis are essential for systematically identifying, collecting, and analyzing errors made by language learners. These methodologies provide a structured approach to understanding the nature and sources of errors, which, in turn, inform effective language instruction. Here are more details on methodologies in error analysis:

1. Error Categorization:

- **Phonological Errors:** These errors pertain to pronunciation and articulation difficulties. Phonological errors can involve mispronunciation, accent-related issues, or difficulties with specific phonemes and intonation patterns.

- **Syntactic Errors:** Syntactic errors relate to sentence structure and grammar. They encompass issues such as subject-verb agreement errors, word order problems, tense misuse, and sentence fragments.
- **Semantic Errors:** Semantic errors involve vocabulary and meaning. Learners may use incorrect words, select inappropriate synonyms, or misunderstand the context in which a word or phrase should be used.

2. Error Collection:

- **Written Assignments:** Collecting written assignments, essays, or compositions from learners is a common method for error analysis. These written texts provide a wealth of errors related to grammar, syntax, and vocabulary.
- **Oral Assessments:** Oral assessments, including recorded conversations, interviews, and speeches, offer insights into phonological errors, as well as syntactic and semantic errors that occur in spoken language.
- **Learner Diaries or Journals:** Encouraging learners to maintain diaries or journals in the target language allows for the collection of spontaneous written language that may reveal common errors and recurring themes.
- **Examination of Classroom Interaction:** Observing classroom interactions, discussions, and group activities can provide real-time insights into learners' language use, including errors in communication.

3. Error Evaluation:

- **Frequency:** Errors can be categorized by their frequency of occurrence. Frequent errors are likely to be more deeply ingrained in learners' interlanguage and may require targeted instruction.
- **Seriousness:** Some errors are more serious than others, as they can impede comprehension or communication. Evaluating the seriousness of errors helps educators prioritize which ones to address first.
- **Developmental Stage:** Understanding the developmental stage at which learners make specific errors is crucial. It allows educators to tailor instruction to match learners' evolving interlanguage.

4. Error Coding:

- Errors are often coded or annotated for analysis. Coding systems vary but typically involve symbols or abbreviations to represent specific error types. This

coding facilitates quantitative analysis and enables researchers to identify patterns and trends in learner errors.

5. Error Correlation:

- Correlating errors with specific linguistic features or contexts can provide deeper insights into the sources of errors. For instance, errors may be linked to the influence of the native language, specific grammar rules, or even the complexity of the content being discussed.

6. Error Feedback:

- Error analysis results can be used to provide feedback to learners. Constructive feedback should not only highlight errors but also explain why they occur and suggest corrections. Feedback should be tailored to individual learners' needs.

7. Longitudinal Analysis:

- Examining errors over an extended period, known as longitudinal analysis, helps educators and researchers understand how learners progress and whether certain errors persist or diminish over time.

8. Comparative Analysis:

- Comparative analysis involves comparing the errors made by different groups of learners, such as learners from various linguistic backgrounds or proficiency levels. This approach can reveal patterns and commonalities among learners.

9. Quantitative and Qualitative Analysis:

- Researchers may use both quantitative and qualitative approaches to analyze errors. Quantitative analysis involves counting and measuring errors, while qualitative analysis delves into the underlying reasons and contexts of errors.

Incorporating these methodologies into error analysis provides a systematic and comprehensive understanding of learners' language challenges. It equips educators with the tools to develop targeted instructional strategies that address specific error patterns, ultimately enhancing the effectiveness of language instruction in ELL contexts.

4. Significance of Error Analysis in ELL:

4.1. Diagnostic Tool:

Error analysis serves as a diagnostic tool, revealing areas of difficulty for individual learners. It allows teachers to tailor their instruction to target specific linguistic challenges.

4.2. Curriculum Development:

The data collected from error analysis can inform curriculum development. By identifying common errors, educators can create materials that proactively address these issues.

4.3. Assessment and Feedback:

Error analysis aids in the design of assessments that accurately measure a student's language proficiency. It also enables teachers to provide constructive feedback for improvement.

5. Implications for Effective Language Instruction:

Error analysis in English language learning (ELL) offers profound implications for the design and delivery of effective language instruction. By leveraging the insights gained from error analysis, educators can create a more supportive and tailored learning environment. Here are additional ideas on the implications for effective language instruction:

1. **Differentiated Instruction:** Error analysis reveals that learners often make distinct errors based on their individual linguistic backgrounds. Effective language instruction should, therefore, be differentiated to address the unique needs of each learner. Teachers can offer targeted interventions to address specific error patterns, ensuring that instruction is both challenging and appropriate for individual students. (Lennon, 2008)
2. **Error Awareness:** Implementing error analysis in language classrooms fosters greater error awareness among learners. When students understand the nature and patterns of their errors, they become more proactive in self-correction. Encouraging learners to identify and rectify their mistakes empowers them to take ownership of their language acquisition journey.
3. **Feedback Strategies:** Effective feedback strategies are critical for language improvement. Error analysis informs the development of constructive feedback mechanisms that focus on specific errors while also highlighting areas of strength. (Mungungu, 2010). Timely and targeted feedback can accelerate the learning process by helping students recognize and rectify errors.
4. **Scaffolding:** Error analysis helps educators identify the scaffolding needed for learners at different proficiency levels. Beginning learners may require more explicit instruction and error correction, while advanced learners benefit from opportunities to explore complex linguistic structures independently. (Tizazu, 2014) Effective instruction

involves providing the appropriate level of support and scaffolding to guide learners toward higher proficiency.

5. **Task-Based Learning:** Error analysis can inform the selection of language learning tasks and activities. Educators can design tasks that intentionally target areas where learners commonly make errors. These tasks not only provide practice but also serve as diagnostic tools to gauge progress and identify persistent issues.
6. **Cultural and Sociolinguistic Context:** Error analysis extends beyond language structure to consider cultural and sociolinguistic factors. Effective language instruction takes into account the cultural norms, pragmatics, and communication styles relevant to the target language. This approach helps learners not only master linguistic competence but also develop communicative competence within diverse contexts.
7. **Motivation and Confidence:** Understanding the developmental nature of errors through analysis can boost learners' motivation and confidence. When learners recognize that errors are a natural part of the language acquisition process and that they are making progress, they are more likely to remain engaged and persistent in their studies.
8. **Technology Integration:** Modern technology offers innovative ways to conduct error analysis, track learner progress, and deliver personalized instruction. Educators can leverage language learning apps, automated error analysis tools, and data-driven insights to enhance the effectiveness of language instruction.
9. **Long-Term Planning:** Error analysis provides a long-term perspective on language development. Educators can use this information to plan comprehensive language learning programs that extend beyond short-term goals. Long-term planning ensures that learners have a structured pathway to achieve higher proficiency levels.
10. **Learner Autonomy:** Effective language instruction should ultimately empower learners to become autonomous language users. Error analysis can guide the gradual transition from teacher-led correction to learner-led self-correction, fostering independence and lifelong language learning skills.

Incorporating these implications into language instruction practices not only helps learners overcome their errors but also promotes a deeper and more meaningful engagement with the target language. Error analysis, when used as a strategic tool, transforms errors into valuable stepping stones on the path to linguistic excellence.

CONCLUSION

Error analysis in English language learning is an essential tool for educators seeking to enhance the efficiency and effectiveness of language instruction. By examining errors in a systematic and rigorous manner, educators can gain valuable insights into the challenges faced by learners and adjust their teaching methods accordingly. In doing so, they can foster a more supportive and productive learning environment, ultimately facilitating learners' progress toward achieving proficiency in the English language.

ABSTRACT

Radar is a device that uses radio frequency signals to measure the distance, speed, and other important information of objects within high accuracy. Depending on the purpose of use, for the radars being active all the time, the power consumption is critical, especially at the radar front-end. Therefore, in this study, a low-cost Patch antenna and Wilkinson power divider are designed for the type of radar that performs measurements at low powers, the Frequency Modulated Continuous Wave (FMCW) radar in order to reduce power losses. For a high-resolution FMCW radar operating in the 4-8 GHz band, the high-power transmission is prioritized for the antenna, and high isolation between ports is achieved for the power divider. The microstrip-based patch antenna is chosen due to its low cost and easy integration with other components. For its design, the CST program is used to input physical parameters and perform simulations, allowing the variation of antenna characteristics based on parameters. The simulation results show that the S11 value is less than -40 dB. The Wilkinson Power Divider divides the transmitted power in the circuit into two with equal amplitude. Also, high isolation and good matching between ports are expected. For its design, the AWR program is used to input physical parameters and perform simulations. The isolation loss (S32) value is obtained as -39 dB which is better than that of acceptable -20 dB. Since results are achieved within the working range, the necessary basis for the production phase is established.

Keywords: Radar, Antenna, Power Divider, Isolation

INTRODUCTION

Radar is a device that uses radio frequency signals to detect objects within its observation area and to gather the essential information such as distance, speed, and other important data about these objects. Radars are divided into two main categories: pulsed radar and continuous wave radar. Continuous wave radars can be classified based on modulation. Frequency-Modulated Continuous Wave (FMCW) radar is an example where the modulation occurs by changing either the frequency or phase of the signal. Thanks to the variation in continuous frequency in predetermined bandwidth, FMCW radar can achieve measurements with lower power while maintaining the same signal-to-noise ratio. Another significant feature of FMCW radar is its capability to measure at very low wavelengths. On the other hand, FMCW radar also has some limitations. In the study conducted by Zhang and colleagues, these limitations were addressed. The research showed that Voltage-Controlled Oscillator (VCO) operating in nonlinear region affected the resolution dramatically (Zhang et.al., 2022). Anghel and colleagues addressed this issue for an X-band FMCW radar by ensuring VCO linearity and making enhancements in the Intermediate Frequency (IF) architecture (Anghel et.al., 2014). In addition, author studied on FMCW radar improvement, particularly on phase noise, range resolution, and optimization of the parameters (Brooker, 2005). The result indicates that accurately determining characteristics improves the radar resolution. It is also known that the RF front-end design affects the measurement capabilities of FMCW radar. Therefore, this paper examines an potential improvement by designing the RF front-end; considering antenna and divider separately. The microstrip-based patch antenna and wilkinson power divider are designed and simulated by CST and AWR programs. The results show that the power transmission and isolation loss have the potential to improve the FMCW radar's resolution and power consumption, which also establishes the necessary basis for the production phase.

MATERIALS and METHODS

The part of the FMCW radar where important components for signal acquisition are located is referred to as the RF Front-end, and it consists of the Voltage-Controlled Oscillator (VCO), transmitter and receiver antennas, Low Noise Amplifier (LNA), mixer, and power divider units. In this study, emphasis has been placed on the antenna and power divider, which have significant effects on FMCW radar parameters. Proper isolation and matching capability of the antenna are necessary for obtaining accurate results. Therefore, simulation studies using the CST program were conducted to analyze the required antenna parameters (return loss, reflection

coefficient, isolation loss), and these studies resulted in the optimization of antenna parameters. Additionally, necessary analyses were carried out for the power divider, another component under investigation. The power divider is expected to transmit the signal from the VCO to the mixer without loss or distortion by splitting it into two paths equally and without loss. Therefore, the analysis of antenna parameters was also conducted for the power divider to ensure the correct transmission. Analysis and simulation studies for the power divider were performed using the AWR program. In this study, the C band (4-8 GHz), which has not been widely discussed in the literature, was preferred. In FMCW radar design, low phase noise, consideration of signal-to-noise ratio, and operation in regions where the frequency signal is linear significantly affect radar performance. The radar design to be carried out in future studies has been designed to be compatible with active components. VCO (HMC505LP4), LNA (GRF2101), and Mixer (HMC218BMS8GE) have been selected to achieve this compatibility. Gain and noise figure values for each component were used to calculate the system's signal-to-noise ratio, determining the radar's feasibility. This study is designed to operate in the range of 2-16 meters, which is a very short distance. The signal-to-noise ratio values for the applied range were calculated as 48.31 dB and 38.31 dB, respectively. These values are expected to be above 25 dB in a normal FMCW radar. Therefore, the results obtained indicate that a high-resolution radar can be realized.

FINDINGS and DISCUSSION

In this study, a microstrip patch antenna was used. The reason for selecting a patch antenna is its low cost and ease of integration with other components. The three-dimensional representation of the designed antenna is shown in Figure 1.a. As seen in Figure 1.b, the S11 transmission parameter of the antenna was obtained. The results indicate that this parameter is less than -40 dB, which is expected to be below -10 dB for use in antenna applications. Therefore, the results suggest that the designed antenna provides high isolation and matching. The dimensions of the designed antenna are provided in Table 1.

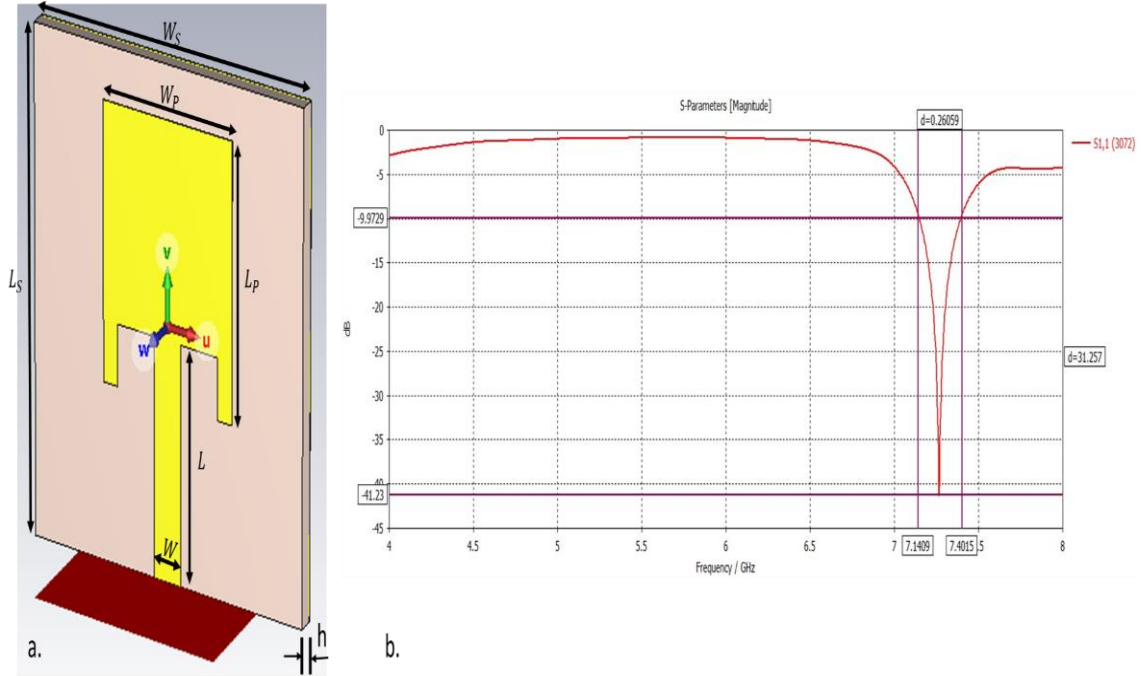

Figure 1.a. Dimensions of the designed antenna, b. S11 result

Table 1. Designed antenna parameters and values

Anten Boyutları	Değerler
W_S	32 mm
L_S	33 mm
W_P	15.35 mm
L_P	19.2 mm
W	3.14 mm
L	20 mm
h	1.3 mm

In radar design, the second aspect examined in this study is the power divider design. The power divider divides the power transmitted within the circuit into two equal parts with phase coherence (Wilkinson Power Divider), facilitating power transfer. While performing this operation, it is expected to provide high isolation and good matching between ports. Figure 2.a

illustrates the shape of the designed Wilkinson power divider, and Figure 2.b provides the results for frequency-dependent input loss, isolation loss, and return loss values.

To achieve effective isolation, the isolation loss (S32) value should be less than -20 dB. Within the operational range, this requirement has been met, with an S32 value of -39 dB obtained from the analysis of simulation results. Additionally, as another important parameter, the S22 and S33 values should be evenly distributed to enable the radar to process received and transmitted signals. As shown in Figure 2.b, the designed power divider meets these conditions.

Figure 2.a. Designed wilkinson power divider, **b.** Simulation results

CONCLUSION and RECOMMENDATIONS

In this study, designs for the antenna and power divider required for an FMCW radar with frequency range of 4-8 GHz were carried out. Verifying by the simulations, -40 dB of S11 values are achieved for working bandwidth, which means that the designed antenna demonstrates a significantly high power transmission capability. Furthermore, the designed Wilkinson power divider provided high isolation between ports, ensuring equal power transmission. Analysis of the Wilkinson power divider indicated that the isolation loss (S32) was less than -20 dB, and the input losses (S21, S31) were approximately -3 dB. With this study, the path has been opened for the production of a low-cost and high-resolution FMCW radar using the designed antenna and power divider. Progress is planned to be made in future studies in this regard.

ÖZET

Nefesli bir çalgının icrası esnasında, icracı psikolojik aktivitelerin yanı sıra birçok fiziksel aktiviteyi de eşzamanlı olarak gerçekleştirmektedir. Çalgı eğitiminde, doğru nefes kullanımı, ses oluşumu, sesin sürdürülmesi, sonlandırılması, artikülasyon kullanımı, rejistirler arası geçişler, tiz ve pes ses alanlarının etkili kullanımı gibi temel beceriler, öğrencilerin ve eğitimcilerin en çok zorlandığı alanları oluşturmaktadır. Nefesli çalgı eğitim sürecinde bireysel özellikler, özellikle hava akışı ve kas gerilimi gibi faktörler başarıyı etkileyen temel unsurlardır. Bu bağlamda, çalışmanın ana odak noktası, nefesli çalgıların icrası sırasında ortaya çıkan fiziksel zorluklardır. Bakır üflemleri çalgılarda ses oluşumu, dudak mekaniklerinin doğru ayarlanması ve solunum sistemi tarafından sağlanan aerodinamik uyarım ile gerçekleşirken; kamışlı çalgılarda dudak kaslarının yanı sıra kamışın titreşimi de önemli bir rol oynamaktadır. Bu iki durumda da solunum sistemi ve kas fizyolojisinin kritik önemi vardır. Ancak mevcut eğitim sisteminde temel beceriler olarak tanımlayabileceğimiz bu fiziksel süreçlerin ölçülmesi bireysel gözlem yeteneği ve tecrübe ile sınırlıdır. Bu nedenle temel becerilerin gelişimi hem öğretici hem de öğrenen kişi için büyük bir zorluk olarak karşımıza çıkmaktadır. Bu çalışma, nefesli çalgı eğitiminde bilimsel bir yaklaşımın geliştirilmesini amaçlamaktadır. Modern teknolojinin bu alanda sunduğu olanaklar, eğitici ve öğrenci arasında somut verilere dayalı bir gelişim süreci sağlama potansiyeline sahiptir. Sonuç olarak, bu çalışma müzik eğitiminde bilimsel bir tabanın oluşturulmasına katkıda bulunarak, nefesli çalgı eğitimini daha etkili ve sürdürülebilir hale getirme amacını taşımaktadır.

ESTABLISHING A SCIENTIFIC METHOD IN WIND INSTRUMENT EDUCATION

ABSTRACT

During the performance of a wind instrument, the performer simultaneously engages in various psychological and physical activities. "In instrumental education, fundamental skills such as proper breath utilization are the most crucial part of initiating, sustaining, and concluding sound production. These physical processes are also significant for shaping the timbre of the sound, register transitions, and effectively utilizing high and low pitch ranges, constituting the areas where both students and educators encounter the most challenges." Individual attributes in the process of wind instrument education, particularly factors like airflow and muscle tension, stand as fundamental elements influencing success. In this context, the main focal point of this study revolves around the physical difficulties arising during the execution of wind instruments. While sound formation in brass instruments occurs through the precise adjustment of lip mechanics and aerodynamic stimulation provided by the respiratory system, in reed instruments, in addition to lip muscles, the vibration of the reed plays a crucial role. In both cases, the respiratory system and muscle physiology hold critical significance. However, within the current educational system, the measurement of these physical processes, which we can define as fundamental skills, is limited to individual observation skills and experience. Therefore, the development of fundamental skills emerges as a substantial challenge for both the instructor and the learner. This study aims to foster a scientific approach in wind instrument education. The opportunities presented by modern technology in this field have the potential to establish a development process based on concrete data between the instructor and the student. In conclusion, this study contributes to the establishment of a scientific foundation in music education, with the aim of enhancing the effectiveness and sustainability of wind instrument education.

Keywords: Wind Instrument, Instrumental Education, Scientific Method in Music Education.

GİRİŞ

Nefesli bir çalgının icrası esnasında, icracı psikolojik aktivitelerin yanı sıra birçok fiziksel zorlukla da başa çıkmak zorundadır. Bunlar genel olarak solunum sistemi ve kas fizyolojisi alanları ile ilgilidir. Bakır üflemeli çalgılarda ses oluşumu temel olarak dudakların mekanik özelliklerinin doğru ayarlanması ve solunum sistemi tarafından sağlanan ve modüle edilen aerodinamik uyarım ile gerçekleştirilirken, kamışlı çalgılarda dudak kasları önemli olmakla birlikte sesin oluşumunda kamışın titreşimi ön plana çıkar. Ancak her iki durumda da solunum sistemi ve kas fizyolojisi önemlidir. Ses oluşumu ve ses geçişleri ile müzikal cümlelerdeki ifadenin ortaya çıkarılmasında ise artikülasyon organları etkilidir ve çalgı eğitiminde artikülasyon kullanımı gerçekten de performansın en zor öğrenilen ve kontrol edilen yönlerinden biri olarak bilinmektedir (Reyman, 2003). Çalgı eğitiminde “temel beceriler” başlığı altında değerlendirilebileceğimiz, nefesin doğru kullanımı, ses oluşumu, sesin sürdürülmesi ve sonlandırılması, artikülasyon kullanımı, rejistirler arası esnek geçiş, tiz ve pes ses alanlarının etkin kullanımı, ton ya da tını oluşturulması gibi çeşitli çalışmalar çalgı eğitiminde hem eğitici hem de öğrencinin en zorlandığı alanların başında gelmektedir. Usta-çırak yöntemine dayanan geleneksel eğitim yönteminde eğitmenin tecrübesi, öğrencinin yeteneği ve kararlılığı gibi olgular ön plandadır. Hava akışı veya kas geriliminin düzenlenmesi gibi bireysel özellikler nefesli çalgı eğitim sürecindeki başarıyı etkileyen faktörlerin başında gelmektedir. Nefesli çalgıların icrası için gerekli olan temel becerilerin gelişimi bu fiziksel farklılıkların tanımlanmasına ve görsel veriye dayalı bir eğitim stratejisinin ortaya konulmasına bağlıdır. Dolayısıyla, başarıya giden yolların gerçekten birden fazla olup olmadığı, bu başarının nihayetinde nasıl ölçüldüğü ve başarılı stratejiler arasındaki ortak paydaların ve/veya önemli farklılıkların neler olduğu soruları yanıt beklenmektedir. Bu bağlamda farklı hacimlere sahip nefesli çalgılarda, titreşimin oluşması için gerekli olan optimal düzeydeki hava basıncı ve titreşim sonucu enstrümanın içinde dolaşan hava akışı arasındaki ilişkinin ölçülebilmesi ve bu ölçüm neticesinde, eğitim esnasında öğrencinin bu optimal düzeyleri yakalayabilmesini sağlamak ya da müzikal anlatımın en önemli araçlarından biri olan artikülasyon kullanımının görselleştirerek gerekli eğitim modellerinin oluşturulması gibi çeşitli eğitim stratejilerinin meydana getirilmesi sağlanmalıdır.

Bu çalışma her ne kadar müzik pedagojisi ve müzik teknolojileri alanı ile doğrudan ilişkili olsa da son yıllarda müzikoloji ve müzik eğitimi alanlarının didaktik süreçler ile bir araya getirilmesi üzerine yapılan çalışmalar, müzik pedagojisinin uygulama yönü ile müzikolojinin teori temelli çalışmalarının bir arada kullanılmasının yararına değinmektedir (Cuomo and

Face, 2020). Çalışmada müzikoloji aracılığıyla, müzik eğitiminin önemli bir parçası olan çalgı eğitiminde bilimsel yöntem geliştirilmesine yönelik bir araştırma yapılmaktadır. Böylece nefesli çalgı eğitimi ve öğretimi konusunda teorik temellerin oluşturulması, geliştirilmesi ve böylece müzik yapma ile müziği anlama noktasında bir denge kurulması amaçlanmaktadır. Çalışmada nefesli çalgı eğitiminin fiziksel yönleri ele alınarak bu yönlerin geliştirilmesinde teknoloji kullanımının önemi ve çalgı eğitiminde bilimsel yöntemin oluşturulmasına yönelik araştırmalara değinilecektir.

Nefesli Çalgı Eğitiminde Bilimsel Gözlem ve Verinin Önemi

Nefesli çalgıların icrası esnasında fiziksel aktiviteleri ölçen çeşitli bilimsel araştırmalar bulunmaktadır. Jonathan Kruger, James McLean ve Mark Kruger (2012) tarafından kaleme alınan “More Air, Less Air, What is Air” başlıklı makale, Nefesli çalgıların icrası esnasında titreşim öncesi ağız içi (intraoral) hava basıncı ve titreşim sonrası enstrümanın içinde oluşan hava akışını ölçerek, aralarında ters orantılı bir ilişki olduğunu ortaya koymuşlardır. Bu durumda pes seslerin oluşumunda, titreşim öncesi meydana gelen ağız içi hava basıncı düşük düzeyde iken, titreşim sonrası çalgı içinde dolaşan hava akımının yüksek düzeyde olduğu gözlemlenmiştir. Bu ilişki sesin tizleşmesiyle tersine bir hal almaktadır (Bkz. Şekil 1).

Şekil 1. Trombon'da Üç Farklı Oktavda Seslendirilen Re Sesinin İcrası Esnasında Hava Akışı ve Ağız İçi Hava Basınçlarının Durumu (Kruger ve arkadaşları, 2012)

Kruger ve arkadaşları tarafından yapılan çalışmada profesyonel icracılar ile öğrencilerin performansları karşılaştırılmıştır. Çalışmada öğrencilerin ses üretimi esnasında hava

basınçlarının dengesiz ve nefes kontrolün dengesiz olduğu tespit edilmiştir (Kruger ve arkadaşları, 2012).

Hava basıncı üzerine yapılan diğer bir çalışma da N.H. Fletcher ve A. Tarnopolsky (1999) tarafından kaleme alınan “Blowing pressure, power, and spectrum in trumpet playing” başlıklı makaledir. Bu çalışmada bir grup trompet icracısının performansları esnasında ürettikleri ses ve bu sesin üretiminde kullanılan nefes (hava) basıncının ilişkisi ölçülmektedir. Çalışma, temel olarak sesin başlangıç hareketini veren, dudak titreşimi için gerekli olan hava basıncının eşik değerinin saptanması bakımından önem kazanmaktadır. Bu eşik, dudanın gerilimine (dudanın ilk titreşim noktası), akustik dirence ve icracının ağız boşluğuna bağlı olarak değişkenlik göstermektedir (Fletcher and Tarnopolsky, 1999). Çalışmada basıncın arttıkça dudanın esnekliğinin azaldığı, artan basınç ve direnç nedeniyle titreşimi başlatacak hava eşiği değerinin de yükseldiği görülmektedir (Fletcher and Tarnopolsky, 1999). Sesin oluşumunda ideal dudak pozisyonu ve hava basıncı dengesini yakalayan icracıların, bu dengeyi yakalamakta güçlük çekenlere göre daha iyi bir fiziksel performansa sahip oldukları sonucu çıkarılabilir.

Ağızlığın uygun pozisyonda ve dudaklara baskı uygulanmadan kullanılması, her çalgı öğretmenin öğrencisine hatırlattığı konuların başında gelmektedir. Ancak uygun pozisyon nedir? ne kadar basınç uygulanabilir? vb. sorulara verilen cevaplar her ne kadar teorik bağlamda verilmeye çalışılsa da pratikte yeterli cevaba ulaşılamamıştır. Bu konuda yapılan önemli çalışmalardan bir tanesi, Alexander Mayer ve Matthias Bertsch tarafından kaleme alınan, “A New 3D Transducer For Measuring The Trumpet Mouthpiece Force” isimli makaledir. Çalışmada icracının performans esnasında dudığına uygulanan ağızlık basıncının eşzamanlı olarak ölçülmesini sağlayan bir aparat aracılığı ile elde edilen veriler incelenmiştir. Veriler performansın icrası esnasında ses dalgaları halinde gösterilerek, performans esnasında icracının ağızlık basıncı hakkında bilgi edinmesini sağlamaktadır. Çalışmada en iyi icracıların bile ağızlık basıncından kaçınamadıkları, profesyonel ve amatör icracılar arasında çok yüksek farklılıklar bulunmadığı ortaya çıkmıştır (Mayer and Bertsch, 2005). Trompet için en pes alanda yer alan sol notası için dudığına uygulanan ağızlık basıncı yaklaşık 5 Newton (N), orta oktavda 10-20 N arası ve üst oktavda ise 20-40 N arasında değişmektedir (Bkz. Şekil 2) (Mayer and Bertsch, 2005).

Şekil 2. Ağızlık Kuvveti Ölçümlerinin Sonuçları (Mayer and Bertsch, 2005)

Nefesli çalgı icracısında en önemli faktörlerin başında gelen dudak ve ağız kaslarının davranışları üzerine birçok makale yazılmıştır. Bunlardan biri, Shigeru Yoshikawa tarafından yazılan, “Acoustical behavior of brass player’s lips” başlıklı makaledir. Bu makalede performans esnasında dudakların içten dışa doğru, ya da aşağıdan yukarıya doğru hareketinden hangisinin daha uygun olacağı üzerine çalışılmıştır. Netice de farklı çalgılarda ve farklı ses rejistirlerinde farklı dudak pozisyonlarının olduğu tespit edilmiştir. Geniş ağızlığa sahip çalgılarda dudak hem içten dışa hem de aşağıdan yukarıya hareket edebilmektedir (Yoshikawa, 1995). Bu hareket imkânı ağızlığın geniş olması ve dudağın ağızlık içinde daha rahat hareket edebilmesinden kaynaklanmaktadır (Yoshikawa, 1995).

Nefesli çalgılarda sesin oluşumunda hava basıncı ve dudak ilişkisi önemli olsa da ses ve tını (ton) oluşumunda çalgıların akustik davranışları da önemlidir. Tahta veya bakır nefesli bir çalgı ile üretilen ses, birçok basit ses kümesinden oluşmaktadır. Ses spektrumu olarak da tanımlanan bu ses kümeleri Fourier analizi gibi çeşitli yöntemler aracılığıyla analiz edildiğinde basit sinüs dalgalarına çevrilebilmektedir. Böylece çalgıların karakteristik farklılıklarını ortaya koyan tınısal yapıların özellikleri incelenebilmektedir (Zeren, 2003). Tını, ses spektrumunu oluşturan frekans, genlik ve bağıl fazlarının değişimlerinin yanı sıra, rezonatörün çeşitli frekanslara nasıl yanıt verdiğine göre değişiklik gösteren çok boyutlu psikofiziksel bir niceliğe sahiptir (Zeren, 2003). Uyarıcı frekans ile rezonatörün öz frekanslarının aynı değerde olması durumunda zorlanmış titreşimin genliği, uyarıcı sistemin genliğinden daha yüksek bir değer alır ki bu duruma rezonans adı verilir (Zeren, 2003). Bir

rezonatör, uyarıcı sistemden gelen sabit genlikli bir frekansa bir diğerinden farklı olarak rezonans etkileşimine girebilir. Bu durum rezonatörün seçimli ya da seçimsiz olmasına göre değişiklik gösterir. İdeal seçimli bir rezonatör tek bir frekansı güçlendirirken, seçimsiz bir rezonatör birden fazla frekansı güçlendirebilir (Zeren, 2003). Dolayısıyla bir çalgıda kullanılan rezonatörün, frekansları ve şiddetleri farklı olan birçok basit sestene meydana gelen müzik seslerini en etkin biçimde yansıtılabilmesi için seçimsiz olması gerekmektedir. Zeren'e göre (2003) bir çalgı, müzik sesini oluşturan farklı ses selenlerini kendi öz frekansına karşı gelen bir yanıt olarak farklı oranlarda kuvvetlendirir. Dolayısıyla sesin tınısı, hem uyarıcı frekansın ses spektrumlarının sayısı ve genliğine, hem de rezonatörün buna verdiği yanıtla bağlı olarak değişim gösterir (Zeren, 2003). Bir rezonatörün, belirli frekans aralığındaki selenleri kuvvetlendiren rezonans bölgelerine formant denilmektedir ve formantlar çalgıların değişmeyen karakteristik özelliklerini oluşturmaktadır (Zeren, 2003).

Aşağıda bir telin ses spektrumunun (Şekil 3), tele bağlı olan rezonatörün rezonans eğrisiyle (Şekil 4) etkileşimi sonucu ortaya çıkan ses spektrumunun (Şekil 5) grafiği verilmiştir (Zeren, 2003). Grafikte de görüleceği üzere telin ses spektrumu çalgının formantına göre şekillenmiştir. Buna göre temel frekans olan birinci selen zayıflarken, beşinci selen güçlenmiştir.

Şekil 3. Telin Ses Spektrumu (Zeren, 2003).

Şekil 4. Rezonatörün Rezonans Eğrisi (Formant) (Zeren, 2003)

Şekil 5. Çalgının Ses Spektrumu (Zeren, 2003)

Yukarıdaki örnekte de görüleceği üzere telli bir çalgıda oluşan sesin tınısal özellikleri o çalgının gövdesinde meydana gelen rezonans frekanslarına bağlı olarak değişim göstermektedir. Nefesli çalgılarda oluşan sesin tınısal özellikleri ise çalgının hava sütununda meydana gelen rezonans frekanslarına bağlı olarak değişim göstermektedir (Zeren, 2003). Nefesli çalgılarda hava sütunu, çalgının silindir ya da konik biçimli olmasının yanı sıra ağızlık, çan, parmak delikleri vb. nedenlerden dolayı karmaşık bir yapıdadır (Zeren, 2003).

Nefesli çalgıların akustik özelliklerine dair çalışmalar 19. yüzyılın sonlarına kadar uzanmaktadır. H.L.F. Helmholtz'un 1954 yılında yazdığı "On the Sensations of Tone" isimli çalışma, Nefesli bir çalgıda ton oluşumunun akustik parametrelerini inceleyen öncü çalışmaların başında gelmektedir. Benzer şekilde A.G. Webster ve H. Bouasse Nefesli çalgıların ses üretim mekanizmaları üzerine çalışmalar yaparak, ses üretiminde ortaya çıkan karmaşık süreçlerin aydınlatılmasında önemli bilimsel veriler ortaya koymuşlardır (Elliott, 1979). Yapılan çalışmalar, Nefesli çalgılarda özellikle giriş empedans ölçümlerinin belirli bir çalgının özelliklerini açıklamada son derece yararlı olduğunu göstermiştir.

Elliott (1979), giriş empedansının ve basınç transfer fonksiyonlarının, bilgisayar tarafından kontrol edilen basit bir sinüs dalgası aracılığıyla ölçümlendiği çalışmada, çalgıların ağızlık, çan ve geometrik özellikleri gibi çeşitli unsurlarının akustik empedans üzerindeki etkilerini araştırmıştır. Çalışmada ayrıca icracı tarafından kaynaklanan solunum ve dudak basıncı gibi değişkenlerin ses oluşumuna katkıları incelenmiştir.

Dickens vd. (2007) tarafından yapılan çalışmada klarnet gibi tek tarafı açık olan çalgı ile flüt gibi iki tarafı da açık olan çalgıların giriş empedansları ölçülerek farklı çalgı yapılarında oluşan akustik davranışlar incelenmiştir. Araştırmalar silindirik yapıdaki her iki çalgının da benzer sonuçlar sergilediğini ortaya koymaktadır. Buna göre silindirik yapıdaki çalgıların ses spektrumları incelendiğinde temel frekansın diğer frekanslara göre daha kuvvetli olduğu

gözlemlenmiş ve bu çalgılarda ses oluşumlarının daha yumuşak bir şekilde elde edilebileceği sonucu ortaya konulmuştur (Dickens vd. 2007).

Chen vd. (2009) tarafından saksafonlar üzerinde yapılan çalışma da ise tenor saksafon gibi konik biçimli çalgıların ses spektrumlarında temel frekansın ikinci frekanslardan daha kuvvetsiz olduğu gözlemlenmiştir (Bkz. Şekil 6).

Şekil 6. Soprano ve Tenor Saksafonların Ses Spektrumları (Chen vd. (2009))

Bu durum, konik biçimli çalgıların ses oluşum sürecinde silindirik yapıdaki çalgılara göre daha fazla güç kullanılması gerektiği sonucunu ortaya koymaktadır. Bu durum özellikle bakır Nefesli çalgılarda gözlemlenmektedir. Konik biçimli olan bakır Nefesli çalgıların ses spektrumları incelendiğinde ilk frekansların daha kuvvetsiz oldukları gözlemlenir. Zeren'e göre (2003), trompet benzeri bir boruya bir çan eklendiğinde, ilk rezonans frekansı dışındaki bütün rezonans frekansları değişir. Bunun nedeni, üst frekansların dalga boylarının temel frekansa göre kısa olmasıdır, böylece üst frekanslar çanın içine daha fazla girerek yansıtılırlar.

Şekil 7. Trompetin Rezonans Eğrisi (Zeren, 2003)

Şekil 8. Trombonun Rezonans Eğrisi (Zeren, 2003)

Yapılan literatür taramalarında görüldüğü üzere nefesli çalgıların anatomisi, ses fiziği, icracının fiziksel kondüsyonu, solunum sistemleri, kas fizyolojisi ve artikülasyon organları gibi pek çok fiziksel olgu bilimsel olarak incelenmiştir. Tüm bu incelemeler, nefesli çalgı eğitiminde fiziksel süreçlerin önemini kavramamızı sağlamaktadır. Özellikle çalgı eğitiminde “temel beceriler” olarak ele aldığımız nefesin doğru kullanımı, ses oluşumu, sesin sürdürülmesi ve sonlandırılması, artikülasyon kullanımı, rejistirler arası esnek geçiş, tiz ve pes ses alanlarının etkin kullanımı, ton ya da tını oluşturulması gibi süreçleri bilimsel veriler ışığı altında gözlemlemek mümkündür.

SONUÇ ve ÖNERİLER

Çalgı eğitiminde günümüz teknolojisi sayesinde daha bilimsel tabanlı bir metodolojinin geliştirilmesi mümkündür. Bu sayede eğitici ve eğitilen arasında daha somut verilere dayanan bir gelişim süreci gerçekleşecektir. Ayrıca profesyonel icracılar bu bilimsel araçlar sayesinde hem eksik oldukları yönleri keşfedebilecek hem de performanslarını daha uzun süre nasıl devam ettirebilecekleri üzerine yoğunlaşabileceklerdir. Müzisyenlerin meslek rahatsızlıklarına

maruz kalmaları ve uzun dönemde bu rahatsızlıklara karşı önleyici tedbirler almaları sağlanabilecektir.

Müzik ve biyomekanik iş birliği sayesinde spor biyomekaniği alanında olduğu gibi **müzik biyomekaniği** adı altında bir disiplin kurulabilir. Bu bağlamda;

Performans Geliştirme

Müzisyen Performansı; Teknik analiz, performans değerlendirilmesi, takip, motor hareketlerin kontrol ve geliştirilmesi çalışmalar vb.

Malzeme Performansı; Solunum sistemi ölçüm ve geliştirme cihazları, farklı alaşımlardan oluşturulan kullanıcı dostu ağızlık (anti-bakteriyel ve anti-viral malzeme, hafif alaşımlı, daha iletken, baskı azaltıcı vb.), ergonomik ağırlık taşıma sistemlerin geliştirilmesi (Tuba gibi yaklaşık 10-12 kg. ağırlığındaki çalgılar tören esnasında 40-60 dk. boyunca boyun ya da omuza asılı olarak ayakta seslendirilmektedir.)

Müzisyen Sağlığı; diş, el (tendonit), yüz ve diğer kaslar, omurga, solunum sistemleri vb. rahatsızlıkların önlenmesine yönelik çalışmalar, tedavi yöntemleri ve rehabilitasyon çalışmaları.

Eğitim Metodolojisi

Çalgı eğitimine başlama yaşı (çeşitli boy ve ağırlıklara sahip olan çalgıların hangi yaşlarda başlamaya elverişli olduğu araştırılmalıdır.)

Çalgı eğitiminde zaman/süre; Günde, haftada kaç saat çalışılmalı, kas gelişimi göz önüne alındığında gün aşırı ara verilmeli mi?, çalışma saatleri günün hangi saatinde daha verimlidir (öğleden önce/sonra,) vb.

Metot Yazımı; Bilimsel veriler ışığında kişisel çalışma egzersizlerinin ve metotlarının geliştirilmesi. Mevcut metotların güncel veriler ışığında test edilerek geçerliliğinin ve eksikliklerinin tespit edilmesi gerekmekte ve yeni metotların hazırlanması gerekmektedir. Özellikle ağız bölgesinde yer alan farklı kas gruplarının gelişimlerini net bir şekilde ortaya koyan teknik egzersizlerin hazırlanması, solunum sisteminde hacim, basınç ve süreklilik gibi parametreleri geliştirebilecek egzersizlerin hazırlanması gerekmektedir.

Çalışmaların temeli öncelikle verilerin doğru bir yöntem ve araç ile toplanmasına bağlıdır. Toplanan verilerin analizi çerçevesinde ihtiyaca uygun sistemlerin geliştirilmesi gerekmektedir. Bu bağlamda solunum ve kas sistemleri ile alakalı veriler mevcut olan ya da geliştirilecek hava akışı, basıncı ve şiddetini ölçebilecek sistemler ile ağız çevresinde bulunan kasların hareketlerini, ısısal değişimlerini, maruz kaldıkları çeşitli gerilim ve baskıları ölçebilecek sistemlere ihtiyaç duyulmaktadır. Aynı zamanda solunum sisteminin çalışmasını

hareket sensörleri ile takip ederek performans esnasındaki durumu ölçülmelidir. Elde edilecek veriler çeşitli seviyelerdeki icracıların performansları ile toplanarak belli bir standart oluşturulmalıdır. Daha sonra elde edilen bulgular ışığında performans geliştirme programı hazırlanmalıdır. Bu programın ardından performans esnasında verileri gözlemleyebileceğimiz teknik araçlar geliştirilerek program test edilmelidir. Tüm bu çalışmaların esasında çalgı eğitiminin küçük bir parçası olduğunu söylemek gerekmektedir. Zira bir sanatçının yetiştirilmesi yalnızca fiziksel gelişimle mümkün değildir, psikolojik durumların yanı sıra entelektüel birikim gibi birçok parametre bu gelişime katkıda bulunmaktadır. Ancak temel olarak insan fizyolojisinin en azından başlangıç seviyesinde ön planda olduğu çalgı eğitiminde bilim tabanlı bir eğitim metodolojisinin geliştirilmemiş olması ve müzisyen performansını teknik araçlar ile ölçebilecek bir merkezin mevcudiyetinin olmaması büyük bir eksiklik olarak karşımıza çıkmaktadır. Dünyada yapılmış çeşitli araştırmalar olmakla birlikte henüz tüm bu çalışmaları bir araya getiren bilimsel bir disiplin alanı bulunmamaktadır. Bu alanın eksikliği yapılacak çalışma ile giderilebilir. Kurulacak bir “müzik mükemmeliyet merkezi” aracılığıyla hem yeni teknolojiler geliştirilebilir hem de müzisyenlerin profesyonel yaşamlarını sürdürebilmeleri için gerekli fiziksel ve psikolojik destek verilebilir. Bu sayede pedagojik açıdan çeşitli yanlış alışkanlıkların önüne geçilebileceği gibi performansı arttırmaya yönelik çalışmalar da yapılabilir.

ABSTRACT

Cowpea, which belongs to the legume family, is a vegetable with high nutritional value, has various uses, and can provide various advantages in agricultural systems. It has an important place in both nutrition and agriculture. Cowpea cultivation can contribute to local economies and provide income to producers. Therefore, this study was carried out in 2022 to determine some agronomic traits of some cowpea pure lines in F₅ generation in the breeding study carried out to develop suitable cowpea genotypes that can adapt to the high calcareous soil structure of Central Anatolia region. The experiment was established with 3 replicates according to the Randomized Blocks Experimental design in the test field belonging to Selçuk University, Faculty of Agriculture, Prof. Dr. Abdülkadir AKÇİN Research and Application Station. In the study, 19 pure lines and 4 commercial varieties of cowpea with different characteristics were used as plant material. The differences among cowpea lines were found to be statistically significant in all traits except plant height. According to the results of the research, the plant height of cowpea lines ranged from 37.00 cm (Madagascar) to 57.67 cm (17EBSM), number of pods ranged from 11.40 number/plant (Amazon) to 25.94 number/plant (17EBKS), number of grains per pod ranged from 7.17 (17EBKM) to 14.50 (17EBKM), the number of grains per plant varied between 91.93 (Amazon) and 311.00 (17EBKM), grain yield varied between 158.38 kg da⁻¹ (Amazon) and 391.57 kg da⁻¹ (17EBSM) and hundred-grain weight varied between 17.50 g (17EBPK) and 26.50 g (17EBAK). As a result, according to the results obtained in this one-year study, 15 pure lines used in the experiment exceeded the average grain yield of standard varieties. Among these pure lines, 17EBSM, 17EBKM, 17EBKS, 17EBSP, 17EBPA, 17EBAP, 17EBPS, 17EBSA, and 17EBMP cowpea pure lines with high grain yield were determined to be promising variety candidates. These newly developed pure lines will allow cowpea production in the Central Anatolia region, providing additional income to producers and increasing the potential for food security in the region.

Keywords: Cowpea, agronomic characteristics, grain yield

INTRODUCTION

Cowpea (*Vigna unguiculata* (L.) Walp) is an important plant belonging to the legume family. Cowpea has high protein, fiber, vitamin, and mineral content. It contains high levels of vitamins A, C, and K and minerals such as iron, calcium, and potassium (Harmankaya et al., 2016). Therefore, it is important as a nutritious food source and makes a significant contribution to the healthy nutrition of people.

Cowpea is an annual plant and tends to grow better in warm climates. Leaves and young branches are damaged by low temperatures. The best-growing temperature of cowpea plants is between 20-30 °C. A difference of 5-10 °C between day and night temperatures is extremely important for plant development. In the Central Anatolia region, the average temperature between April and August, which is the vegetation period of cowpeas, is around 20 °C on average for many years and is extremely suitable for the growth of the plant (Özçelebi, 2021).

Cowpea plants can be grown in irrigated lands as well as in non-irrigated (arid) lands. The cowpea plant responds very positively to irrigation and grows well in arid conditions. Cowpea is an important legume plant in undeveloped world countries where drought is observed due to its drought resistance (Davis et al., 1991). Cowpea is a legume plant that can be grown as an alternative in the summer months in the Mediterranean and Aegean coasts and in the Southeastern Anatolia Region where beans cannot grow due to its resistance to high temperatures. Due to its drought resistance, it can be easily grown in the Central Anatolia Region where water problems are high.

Researchers reported that plant height, number of pods per plant, number of grains per pod, number of grains per plant, grain yield and hundred-grain weight of cowpea plants vary greatly according to the environment, cultural treatments and genotype structure of the variety (Karasu 1999; Peksen & Artık 2004; Sert & Ceyhan, 2012; Toğay et al., 2014; İdikut et al., 2015; İdikut et al., 2019; Özçelebi, 2021).

High-yielding cowpea lines will help to obtain more products and ensure food security. In a densely populated country like Turkey, it is extremely important to produce more food. This will support people to have a healthy diet. With the high-yielding cowpea lines developed here, more crops will increase the income of farmers. This in turn will raise the living standards of people living in rural areas and contribute to the development of the agricultural sector.

The importance of these newly developed high-yielding cowpea lines for our country will provide multifaceted advantages such as food security, economic development, environmental sustainability, and climate change adaptation. These lines will be an alternative crop, especially for Central Anatolian farmers, and may help them to better respond to future agricultural needs.

MATERIALS and METHODS

As a result of a preliminary selection among 547 genotypes in the F₄ generation, 19 genotypes with superior characteristics in terms of yield traits important for grain production of cowpea plants were selected. In this study, 19 selected cowpea pure lines (17EBAK, 17EBAM, 17EBAP, 17EBAS, 17EBKA, 17EBKM, 17EBKP, 17EBKS, 17EBMA, 17EBMP, 17EBMS, 17EBPA, 17EBPK, 17EBPM, 17EBPS, 17EBSA, 17EBSK, 17EBSM and 17EBSP) and 4 registered cowpea varieties (Amazon, Karagöz, Madagascar and Pekşen) were used as plant material. Most of these selected pure lines differed in at least one morphological trait.

According to the 20-year meteorological observations made in Konya province during the vegetation period in the year when the trials were established, the 20-year average temperature, total precipitation, and average relative humidity were 19.6 °C, 119.5 mm, and 46.9%, respectively. In 2022, when the experiment was established, it was realized as 19.8 °C, 72.7 mm, and 44.5%.

The genotypes in this study were evaluated in the trial conducted at the experimental field of Selçuk University, Faculty of Agriculture, Prof. Dr. Abdülkadir AKÇİN Research and Application Station. The experiment was established in 1.5 m x 4.0 m plots with 3 replications according to the Randomized Block Design. To eliminate the edge effect, no gap was left between the plots, and two rows of standard variety (Karagöz) were planted at the beginning of the block. Each plot consisted of 3 rows.

The experimental area was surface plowed in March and the soil was prepared for sowing with a hand hoe rotovator in April. Sowing was carried out on April 28, 2022, by hand sowing the seeds to a depth of 4 cm in the rows opened with a marker, with 50 cm between rows and 10 cm above rows. According to the previous soil analysis, 15 kg of DAP fertilizer was applied with the planting. Weed control was done by hand hoeing twice. Depending on the climatic conditions, irrigation was done 4 times to meet the water needs of the cowpea plant. Irrigations were carried out with micro-sprinklers. Harvesting of the plants was done manually on September 06, 2022.

Pure lines were evaluated at harvest time or after harvest and plant height, number of pods per plant, number of grains per pod, number of grains per plant, grain yield, and 100 grain weight were determined (Sert & Ceyhan, 2012).

Each of the agronomic traits examined in the experiment was subjected to separate statistical analyses and the differences in the means calculated for each treatment were grouped according to 1% according to the LSD test. Statistical analyses were performed by using the JUMP package program.

FINDINGS and DISCUSSION

According to the analysis of variance, the differences among cowpea lines were found statistically insignificant (Table 1). The mean values of plant height varied between 37.00 cm (Madagascar) to 57.67 cm (17EBSM) (Table 2). Plant height in cowpeas is highly influenced by the genetic characteristics of cultivars, environmental conditions, and growing conditions as in all cultivated plants. The results obtained were higher than those of Toğay et al. (2014) and Karasu (1999), lower than those of Pekşen & Artık (2004), İdikut et al. (2015) and İdikut et al. (2019), and similar to those of Sert & Ceyhan (2012) and Özçelebi (2021). The differences in climate and soil conditions and the varieties used, as well as the different growing conditions, were effective in the different results obtained from the studies.

According to the analysis of variance, when the number of pods in the plant was compared, a statistically significant difference was found between the pure lines (Table 1). When the cowpea lines used in the study were analyzed in terms of the number of pods per plant, the highest value in terms of the number of pods per plant was determined in the 17EBKS line with 25.94 and the lowest value was determined in the Amazon variety with 11.40 (Table 2). Pekşen & Artık (2004), Pekşen (2007), and Sert & Ceyhan (2012) reported that the number of pods in cowpeas is highly affected by the genetic structure of the varieties. The results obtained from our study were higher than the values obtained by Gülümser et al. (1989) as 6.67-10.00, and similar to the averages obtained by Pekşen & Artık (2004) as 8.20-16.06, Pekşen (2007) as 7.21-13.45 and Sert & Ceyhan (2012) as 2.0-14.59. While our research results were similar to some studies, they differed from other studies due to factors such as ecological conditions, variety, and application differences.

The differences among cowpea lines in the number of grains in pods were found statistically insignificant (Table 1), the highest number of grains in pods was determined in line 17EBKM with 14.50 and the lowest number of pods was determined in line 17EBKM with 7.17 (Table

2). Grain number in pods is an important yield element in cowpea cultivation. The methods and techniques applied should be aimed at increasing the number of grains in pods (Özkorkmaz, 2020). Our results were higher than the results of Sert & Ceyhan (2012) who reported a variability between 4.87-5.67, Ceylan & Sepetoğlu (1983) between 2.27-8.57, and similar to the results of Pekşen & Artık (2007) who reported a variability between 9-12, Ünlü and Padem (2005) between 5.9-11.1. The difference between the results obtained in the experiment and the result of some research is due to the differences in climate and soil characteristics and research practices.

Table 1. Mean squares of agricultural characteristics of cowpea bean lines investigated in the research.

Sources of Variation	DF	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight
Total	68						
Replication	2	55.110	1.279	0.667	236.698	2144.248	4.812
Lines	22	96.951**	80.371**	0.488	2339.526**	8836.963**	1496.145**
Error	44	42.958	5.479	0.541	426.040	1334.780	3.714

**%1 statistically significant level.

Statistically very significant differences were found among cowpea lines in terms of the number of grains per plant (Table 1). When the cowpea lines used in the study were examined in terms of the number of grains per plant, the highest value in terms of the number of grains per plant was determined in the 17EBKM line with 311.00 and the lowest value was determined in the Amazon variety with 91.93 (Table 2). Our experimental results regarding the number of grains per plant were found to be different from the findings reported by Toğay et al. (2014) as 19.8-32.8, Aremu (2014) as 5-9, and Erdoğan (2019) as 82.2-113.5, and similar to the findings reported by Akdağ (1995) as 73.3-231.3 under Tokat conditions.

According to the analysis of variance, a statistically significant difference was found between the lines in terms of grain yield (Table 1). When cowpea lines were analyzed in terms of grain yield, the highest value was determined in line 17EBMS with 391.55 kg da⁻¹, and the lowest value was determined in the Amazon variety with 158.38 kg da⁻¹. The grain yields of 14 lines were higher than the average of standard varieties (232.19 kg da⁻¹) (Table 2). The grain yield values obtained by Pekşen & Artık (2004) as 75.1- 680.2 kg da⁻¹ were lower than the values

we obtained in the trial. On the other hand, Özkorkmaz (2020) 97.66-165.3 kg da⁻¹, Sert & Ceyhan (2012)' 63.4-124.9 kg da⁻¹, Toğay et al. (2014) 96. 6-129.6 kg da⁻¹, Peksen (2007) 29.02-205.12 kg da⁻¹, Ünlü & Padem (2005) 112.4- 136.4 kg da⁻¹ and Gülümser et al. (1989) 129-169 41 kg da⁻¹. The differences between the results of the studies regarding grain yield are due to the ecological characteristics of the region where the research was conducted, the varieties used, and different treatments.

The cowpea genotypes examined in the study showed statistically significant differences in terms of hundred-grain weight (Table 1). When the cowpea lines used in the study were examined in terms of hundred-grain weight, the highest value in terms of hundred-grain weight was found in line 17EBAK with 26.50 g, and the lowest value was found in line 17EBPK with 17.50 g (Table 2). Hundred-grain weight was determined between 129.3- 219.4 g by Atış (2000) and 138.7 - 233.2 g by Başaran et al. (2011). Our findings are in harmony with these values.

Table 2. Averages of agricultural characteristics of cowpea lines investigated in the research.

Lines	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight

There is no statistical difference between the averages denoted by the same letter.

CONCLUSION and RECOMMENDATIONS

As a result of this study, according to the results obtained in this one-year study, 15 pure lines used in the experiment exceeded the average grain yield of standard varieties. Among these pure lines, 17EBMS, 17EBKM, 17EBKS, 17EBSP, 17EBPA, 17EBAP, 17EBPS, 17EBSA, and 17EBMP cowpea pure lines with high grain yield were determined to be promising variety candidates. These newly developed pure lines will allow cowpea production in the Central Anatolia region, providing additional income to producers and increasing the potential for food security in the region.

ABSTRACT

Forage cowpea is a plant with high nutritional value. It is a good source of protein and positively affects the performance of animals such as growth, reproduction, and milk yield. At the same time, cowpea is a legume forage crop that can be grown even under difficult conditions in some regions. Its resistance to stress conditions such as drought and high temperature makes it an alternative crop in terms of agriculture. It is very important to develop forage cowpea varieties that can be easily grown in areas with water problems such as Central Anatolia. For these reasons, this study aimed to determine some agricultural characteristics of some forage cowpea pure lines in F5 generation in the breeding study carried out to develop suitable cowpea genotypes that can adapt to the high calcareous soil structure of Central Anatolia region and resistant to drought. The study was carried out in the experimental field belonging to Selçuk University, Faculty of Agriculture, Prof. Dr. Abdülkadir AKÇİN Research and Application Station in 2022 with 3 replications according to the randomized blocks experimental design. The study used 10 forage cowpea pure lines with different characteristics and 1 commercial variety as experimental material. It was determined that the differences among forage cowpea lines were statistically significant in all traits except the number of branches. According to the results of the research, the number of branches per plant of cowpea lines ranged from 2.00 (17EYBÜM) to 3.17 (17EYBPÜ and 17EYBÜP), plant height ranged from 44.60 cm (17EYBKÜ) to 81.33 cm (17EYBAÜ), number of pods ranged from 8.00 number/plant (17EYBÜ) to 19.17 number/plant (17EYBÜP and 17EYBAÜ), grain yield ranged from 145.07 kg da⁻¹ (17EYBSÜ) to 320.17 kg da⁻¹ (17EYBAÜ), biological yield ranged from 509.83 kg da⁻¹ (17EYBÜP) to 1042.98 kg da⁻¹ (17EYBÜP) and hundred grain weight ranged from 14.50 g (17EYBÜK) to 25.17 g (17EYBÜP). In conclusion, according to the results obtained in this one-year study, the biological yield of 8 pure lines of forage cowpeas used in the experiment was higher than the biological yield of the standard variety. Among these pure lines, 17EYBÜP, 17EYBAÜ, 17EYBÜA, 17EYBÜA, 17EYBÜM, and 17EYBKÜ, which have high biological yields, were determined to be promising variety candidates. It is undeniable that these newly developed forage cowpea pure lines will play an important role in closing the forage deficit in the Central Anatolia region, especially in animal nutrition.

Keywords: Forage cowpea, agronomic characteristics, biological yield

INTRODUCTION

Cowpea (*Vigna unguiculata* L. Walp.), a member of the Fabaceae family in Africa, South America, parts of Asia, and the United States of America, is one of the most important legumes widely cultivated due to its resistance to abiotic conditions (Xiong et al., 2016). In our country, unlike other Fabaceae family vegetables, cowpea is cultivated mainly in the Aegean Region and also in the Marmara and Black Sea Regions (Pekşen and Artık, 2004). It is reported that cowpea is the most widely cultivated and consumed legume species in Africa (Diouf, 2011). Cowpea, which approaches animal proteins in terms of protein and especially amino acid composition and is rich in vitamins and mineral nutrients, is also very important as a forage crop. At different stages of plant development, fresh leaves, fresh pods, immature grains, and dry grains of cowpeas have an excellent place in human nutrition, and dry plant parts have an excellent place in animal nutrition. Cowpea is also used in animal nutrition as hay, silage, pasture plant, and as a soil protector in the form of cover crop and green manure plant (Blade et al., 1997). Forage crop production has a very important place in agricultural activities in terms of animal production. The grasses produced in agricultural lands are primarily used by animals, and people benefit from these products by converting them into products such as meat, milk, etc. (Soya et al., 2004). It is important for livestock farms to produce their own roughage in terms of the profitability of the enterprise. With the support provided by the Ministry of Agriculture and Forestry, it is aimed to increase the cultivation areas of fodder crops. Livestock farms are in search of different forage crops other than alfalfa, sainfoin, fodder peas, animal beet, vetch, vetch species, and silage corn in order to meet the roughage they need. Cowpea is an annual warm climate legume plant. It likes to heat due to its general character. It is known that the cowpea plant can be grown very easily in regions where the temperature is 20-30 °C, it completes its development in 1.5-2 months in the summer season and forms green grass reduces water evaporation on the soil surface, sends its roots very deep and is resistant to thirst (Günay, 1992). Today and in the future, when the temperature increases and water resources decrease due to global climate change, cowpeas will be a more demanded plant among forage crops. Because cowpea is one of the plants with the highest heat and drought resistance among legumes (Şehirali, 1988). In order to close the quality forage deficit in our country, cowpea varieties with high grass yield suitable for Central Anatolian ecological conditions are needed. In this study, it was tried to determine cowpea genotypes with high herbage yield and high quality that can be adapted to Central Anatolian ecological conditions.

MATERIALS and METHODS

As a result of a preliminary selection among 113 genotypes in the F₄ generation, 10 genotypes with superior characteristics in terms of yield traits important for cowpea production were selected. In this study, 10 selected cowpea pure lines (17EYBAÜ, 17EYBKÜ, 17EYBMÜ, 17EYBPÜ, 17EYBSÜ, 17EYBÜA, 17EYBÜK, 17EYBÜM, 17EYBÜP and 17EYBÜS) and 1 registered forage cowpea variety (Ülkem) were used as plant material. Most of these selected pure lines differed in at least one morphological trait. According to the 20-year meteorological observations made in Konya province during the vegetation period in the year when the trials were established, the 20-year average temperature, total precipitation, and average relative humidity were 19.6 °C, 119.5 mm, and 46.9%, respectively. In 2022, when the experiment was established, it was realized as 19.8 °C, 72.7 mm, and 44.5%. The genotypes in this study were evaluated in the trial conducted at the experimental field of Selçuk University, Faculty of Agriculture, Prof. Dr. Abdülkadir AKÇİN Research and Application Station. The experiment was established in 0.75 m x 4.0 m plots with 3 replications according to the Coincidence Blocks Experiment design. In order to eliminate the edge effect, no gap was left between the plots, and two rows of standard variety (Ülkem) were planted at the beginning of the block. Each plot consisted of 3 rows. The experimental area was plowed in March and the soil was prepared for sowing with a hand hoe rotovator in April. Sowing was carried out on April 28, 2022, by hand sowing the seeds to a depth of 4 cm in the rows opened with a marker, with 25 cm between rows and 5 cm above rows. According to the previous soil analysis, 15 kg of DAP fertilizer was applied with the planting. Weed control was done by hand hoeing twice. Depending on the climatic conditions, irrigation was done 4 times to meet the water needs of the cowpea plant. Irrigations were carried out with micro-sprinklers. Harvesting was done manually on September 18, 2022, and left to dry. In each plot, threshing of the pure lines that dried after one week was carried out. Pure lines were evaluated at harvest time or after harvest and the number of branches, plant height, number of pods per plant, grain yield, biological yield, and 100-grain weight were determined.

Each of the agricultural traits examined in the experiment was subjected to separate statistical analyses and the differences in the averages calculated for each treatment were grouped according to 1% according to the "LSD test". Statistical analyses were performed by using the JUMP package program.

FINDINGS and DISCUSSION

The differences among the pure lines of cowpea were found to be statistically insignificant (Table 1), the highest number of branches was determined in 17EYBPÜ and 17EYBÜP lines with 3.17 number, while the lowest number of branches was determined in 17EYBÜM line with 2.00 number (Table 2). Pekşen (2007) determined the number of branches per plant as 1.10-1.50, Toğay & Toğay (2010) as 2.95-3.40, Başaran et al. (2011) as 3.6-4.3, and İdikut et al. (2015) as 7.50-13.40. The results of the number of branches per plant were higher than the value determined by Pekşen (2007), lower than the findings of İdikut et al. (2015) and similar to the values determined by other researchers.

Table 1. Mean squares of agricultural characteristics of green bean lines investigated in the research.

Sources of Variation	DF	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight
Total	32						
Replication	2	0.019	129.462	6.820	580.562	51139.150	0.525
Lines	10	0.468	3041.981**	40.510**	8559.037**	88422.900**	24.952**
Error	20	0.335	29.370	3.135	1794.070	17330.500	4.557

**%1 statistically significant level.

According to the analysis of variance, the differences between the plant heights of the pure lines of cowpeas were found statistically insignificant (Table 1). The longest plant height was obtained from line 17EBAÜ with 81.33 cm and the shortest plant height was obtained from line 17EBKÜ with 44.60 cm (Table 2). Plant height in cowpeas is a trait that can be highly affected by the genetic characteristics of cultivars, environmental conditions, and growing conditions. The results obtained were higher than those of Toğay et al. (2014) and Karasu (1999), lower than those of Peksen & Artık (2004), Başaran et al. (2011), İdikut et al. (2015) and İdikut et al. (2019) and similar to those of Sert & Ceyhan (2012) and Özçelebi (2021). The different results obtained for plant height are due to the different climatic and soil conditions in which other studies were conducted and the different cultivars used, as well as the different growing conditions.

According to the analysis of variance, when the number of pods in the plant was compared, a statistically significant difference was found between the pure lines (Table 1). When the lines were evaluated in terms of the number of branches, the highest value was obtained in

17EYBÜP and 17EYBAÜ lines with 19.17 and the lowest value was obtained in 17EYBÜ line with 8.00 (Table 2). Researchers have stated that the difference between varieties in terms of pod number is due to genetic factors (Pekşen & Artık 2004, Pekşen 2007, Sert & Ceyhan 2012). Our results were higher than the values obtained by Gülümser et al. (1989) 6.67-10.00, Pekşen (2007) 3.2-8.0, and similar to the averages obtained by Pekşen & Artık (2004) 8.20-16.06, Pekşen (2005) 7.21-13.45, Sert & Ceyhan (2012) 2.0-14.59. While our research results are similar to some studies, the lack of similarity with other studies is due to factors such as ecological conditions, variety, and application differences.

Lsd _{0.01}		12.59	4.113	98.40	305.8	4.959

There is no statistical difference between the averages denoted by the same letter.

There were statistically significant differences among cowpea lines in terms of grain yield (Table 1). The highest grain yield was obtained from 17EYBAÜ line with 320.17 kg da⁻¹ and the lowest grain yield was obtained from 17EYBSÜ line with 145.07 kg da⁻¹ (Table 2). In some studies, the grain yield of cowpea was determined as 100 - 250 kg da⁻¹ by Gençkan (1983), 129 - 169 kg da⁻¹ by Gülümser et al. (1989) 129 - 169 kg da⁻¹, Akdağ (1995) 152.49-218.17 kg da⁻¹, Peksen & Artık (2004) 75.1-112.09 kg da⁻¹, Başaran et al. (2011) 101.0 - 142.0 kg da⁻¹. The grain yields we obtained are in harmony with the data of the studies given above.

There was a statistically significant difference between the lines in terms of biological yield (Table 1). When the biological yield values of cowpea lines were analyzed, the highest value was obtained from line 17EYBÜP at 1042.98 kg da⁻¹, and the lowest value was obtained from line 17EYBÜP at 509.83 kg da⁻¹ (Table 2). The biological yields of 6 lines were higher than the average of the standard variety. In the studies on biological yield in cowpea, Atış (2000) reported that it varied between 458 - 639 kg da⁻¹ under Hatay conditions, İdikut et al (2015) 1228 - 2053 kg da⁻¹ under Kahramanmaraş conditions, Beycioğlu (2016) 451.40-1338.00 kg da⁻¹ under Kahramanmaraş conditions. The biological yields we obtained are very similar to the data of the researchers.

The cowpea genotypes examined in the study showed statistically significant differences in terms of facial grain weight (Table 1). The highest value was obtained from the 17EYBPÜ line with 25.17 g and the lowest value was obtained from the 17EYBÜK line with 14.50 g (Table 2). Face grain weight was determined between 129.3- 219.4 g by Atış (2000) and 138.7 - 233.2 g by Başaran et al. (2011). Our findings are in harmony with these values.

CONCLUSION and RECOMMENDATIONS

As a result of this study, 17EYBÜP, 17EYBAÜ, 17EYBÜA, 17EYBÜ, 17EYBÜM, and 17EYBKÜ forage cowpea pure lines with high biological yields were determined to be promising variety candidates. It is an undeniable fact that these newly developed forage cowpea pure lines will play an important role in closing the forage deficit in the Central Anatolia region, especially in animal nutrition.

ABSTRACT

Dry beans are consumed worldwide and are rich in protein, fiber, vitamins, and minerals. Thanks to breeding studies, the productivity of dry bean plants can be increased. Food safety can be ensured by obtaining more products. At the same time, quality characteristics such as size, color, and flavor of bean grains can be improved. This study, it was aimed to determine some agronomic traits of dry grain bean pure lines in F₅ generation in the breeding study carried out to develop high-yielding and high-quality dry bean genotypes that can better adapt to the high calcareous soil conditions of Central Anatolia region. This study, which was conducted in 2022, was established with 3 replications according to the coincidence blocks experimental design in the test field belonging to Selçuk University, Faculty of Agriculture, Prof. Dr. Abdülkadir AKÇİN Research and Application Station. The study used 19 pure lines of dry grain beans with different characteristics and 3 commercial varieties as experimental material. It was determined that the differences among the dry grain bean lines were statistically significant in all traits considered in the research except the number of grains in pods. According to the results of the research, the plant height of dry grain bean lines ranged from 42.67 cm (17EKFGNO) to 64.60 cm (17EKFGNS), the number of pods ranged from 13.90 number/plant (17EKFSGN) to 34.80 number/plant (17EKFSG), the number of grains per pod ranged from 4.50 (17EKFGK) to 6.33 (17EKFGNO), number of grains per plant ranged from 73.67 (Great Northern 59) to 172.59 (17EKFSG), grain yield ranged from 292.97 kg da⁻¹ (17EKFGO) to 483.27 kg da⁻¹ (17EKFSG) and hundred-grain weight ranged from 25.83 g (17EKFKGN) to 44.40 g (17EKFSG). As a result, according to the results obtained in this one-year study, the grain yield of 15 pure lines used in the experiment was higher than the average of standard varieties. Among these pure lines, 17EKFSG, 17EKFGNS, 17EKFKG, 17EKFAGN, 17EKFOG, 17EKFAO, and 17EKFSGN dry bean pure lines with high grain yield were determined to be promising variety candidates. In conclusion, dry bean breeding is of great importance for the sustainability of agriculture, food security, and nutritional quality of people. The more productive, highly lime resistant, high quality, and rich in diversity bean varieties to be developed with this study will make great contributions to the farmers of the region and the Turkish economy.

Keywords: Dry bean, agronomic characteristics, grain yield.

INTRODUCTION

Dry bean farming and consumption are of great importance worldwide. Dried beans are a food source high in protein, fiber, vitamins (especially B vitamins), minerals (especially iron, magnesium, and potassium), and antioxidants. They are therefore an important part of a balanced diet. It is an important source of protein, especially for vegetarian and vegan diets. Consumption of dried beans supports heart health, helps balance blood sugar levels, improves the digestive system, and contributes to weight control. Therefore, it is part of a healthy lifestyle (Ceyhan, 2004).

Dried beans are an important product for food safety thanks to their ability to be stored for a long time. The COVID-19 pandemic has shown that it is extremely important as a food source, especially in times of crisis and emergencies. In addition, dried beans are an indispensable component of traditional dishes in many countries.

In recent years, practices carried out to increase the yield in agricultural areas, which have gradually decreased in recent years, and to meet the food needs of the increasing population bring many problems such as environmental pollution. Chemical inputs of agricultural origin, which are applied unconsciously to increase production, have led to the problem of agricultural environmental pollution, which is increasing day by day. Alternative agricultural systems that will eliminate agricultural environmental pollution should be determined and implemented. Within the framework of this understanding, the necessity of implementing sustainable agricultural systems, which are reliable agricultural practices for future generations, has emerged. Dry beans can be grown as part of sustainable agricultural practices. Bean production maintains soil health, keeps water consumption low, and can reduce the use of chemical fertilizers (Tekin & Ceyhan, 2022).

Beans are the most selective edible legume species in terms of ecological conditions. Physical (rainfall, temperature, day length, topography, soil type, etc.), biological (diseases and pests), and socio-economic factors affect bean cultivation, yield, and quality in a region (Voss et al., 1991).

The adaptation of each variety to different ecological conditions is different due to its genetic structure. Productivity is a quantitative character that is genetically influenced by many factors. There are significant differences among bean genotypes in terms of environmental requirements as well as yield differences. Important traits affecting yield in beans differ depending on genetic structure and growing conditions (Akçin, 1974; Şehirli, 1980).

Increasing the yield obtained from the unit area depends on the determination and cultivation of varieties suitable for ecological conditions as well as cultural practices.

Dry beans are a product of great importance in terms of human health, economy, trade, culture, and agriculture. It plays an important role in meeting the nutritional and economic needs of both individuals and societies. Considering all these, this study, it was aimed to determine the lines that will respond better to the needs of Central Anatolian farmers, especially among the newly developed high-yielding and high-quality dry bean pure lines.

MATERIALS and METHODS

As a result of a preliminary selection among 1123 genotypes in the F4 generation, 19 genotypes with superior characteristics in terms of yield traits important for grain production of bean plants were selected. In this study, 19 bean pure lines (17EKFAG, 17EKFAGN, 17EKFAK, 17EKFAO, 17EKFGK, 17EKFGO, 17EKFGNA, 17EKFGNG, 17EKFGNK, 17EKFGNO, 17EKFGNS, 17EKFKA, 17EKFKG, 17EKFKGN, 17EKFOA, 17EKFOG, 17EKFOGN, 17EKFSG and 17EKFSGN), two registered bean varieties (Great Northern 59 and Özmen) and one population (Alberto) were used. Most of these selected pure lines differed in at least one morphological trait.

According to the 20-year meteorological observations made in Konya province during the vegetation period in the year when the trials were established, the 20-year average temperature, total precipitation, and average relative humidity were 19.6 °C, 119.5 mm, and 46.9%, respectively. In 2022, when the experiment was established, it was realized as 19.8 °C, 72.7 mm, and 44.5%. The monthly average temperature values of the experimental year showed great similarities with the long-term average. When the total precipitation values are analyzed, it is seen that very little precipitation fell in the experimental year compared to the long-term average.

This research was conducted in 2022 at the Faculty of Agriculture Prof. Dr. Abdülkadir AKÇİN Research and Application Station located in Alaeddin Keykubat Campus of Selçuk University. The results of soil analysis revealed that the soils of the experimental site had a clayey-loamy texture, slightly alkaline reaction, no salt, very high lime, poor phosphorus, sufficient potassium, and poor organic matter (Küçük & Ceyhan, 2022; Karadaş & Ceyhan 2023).

The experiment was established according to the randomized block design with three replications. In the experiment, the plot area was arranged as 1.5 m x 4.0 = 6 m². Each plot

consisted of 3 rows. There were no gaps between the plots, only two rows of Alberto variety were planted at the beginning and end of the blocks as a side effect.

The experimental area was plowed in March and the soil was prepared for sowing with a hand hoe rotovator in April. Sowing was carried out on April 28, 2022, by hand sowing the seeds to a depth of 4 cm in the rows opened with a marker, with 50 cm between the rows and 10 cm above the rows. According to the previous soil analysis, 15 kg of DAP fertilizer was applied with the planting. Weed control was done by hand hoeing twice. Depending on the climatic conditions, irrigation was done 4 times in total, 1 time between emergence and flowering, 1 time during the flowering period, and 2 times during the pod and seed setting period to meet the water needs of the bean plant. Irrigations were carried out with micro-sprinklers. Harvesting was done manually on September 15, 2022, and left to dry. After one week in each plot, threshing of the dried pure lines was carried out.

Plant height (cm), number of pods per plant (number/plant), the number of grains per pod (number/plant), the number of grains per pod (number/plant), number of grains per plant (number/plant) were determined in 10 randomly selected plants from each plot and their averages were taken and values were calculated. 100-grain weight was determined in g. From each plot, 50 cm was removed from the beginning and end of the rows as a margin and the remaining area was harvested and unit area grain yields were calculated as kg da⁻¹ (Ceyhan, 2004).

The data obtained in the study were analyzed for variance in the MSTATC statistical package program according to the randomized blocks experimental design. The means of the significant traits were grouped according to the LSD test.

FINDINGS and DISCUSSION

Differences among bean lines in terms of plant height were found statistically significant (Table 1). The shortest plant height was 42.67 cm in the 17EKFGNO line, and the highest plant height was 64.60 cm in the 17EKFGNS line. In the study, significant variations were determined among dry bean lines in terms of plant height, and lines with higher averages than control varieties were determined (Table 2). Akçin (1974) measured plant height 17.67 - 49.71 cm in Erzurum ecological conditions, Bozoğlu (1995) 31.48 - 81.71 cm in Samsun ecological conditions, Önder & Şentürk (1996) 43.52 - 51.68 cm in Karaman ecological conditions, Pekşen (2005) 24.55-72.28 cm in Samsun ecological conditions, Sözen (2006) 20 - 310 cm in Samsun ecological conditions, Ülker & Ceyhan (2008) 38.56 - 86.72 cm in Konya ecology. The results of the above research and our research results are similar to a great extent. In

addition, in many studies conducted on dry beans, it was emphasized that there were positive and significant binary relationship coefficients between plant height and grain yield, plant yield, number of pods and grains per plant (Önder & Şentürk, 1996; Pekşen & Gülümser, 2005; Sözen, 2012).

According to the results of the analysis of variance, a statistically significant difference was found between the pure lines when the number of pods in the plant was compared (Table 1). According to the results of the experiment, the highest number of pods was obtained from the 17EKFSG line with 34.80 and the lowest number of pods was obtained from the 17EKFSGN line with 13.90. The pod lengths of the other genotypes used in the study varied between these values (Table 2). According to Şehirali (1980) and Düzdemir (1998), one of the most important yield factors affecting grain yield in beans is the number of pods in the plant. Saraç (1989) conducted research on this subject and found 7.637 pods per plant under Ankara ecological conditions, Önder & Sade (1996) found 13.50 pods per plant under Konya ecological conditions, Önder & Şentürk (1996) found 21.02 - 22.93 number/plant, Bozoğlu & Gülümser (1999) reported 9.43 - 15.73 number/plant under Samsun ecological conditions, Ülker & Ceyhan (2008) reported 11.61 - 25.17 number/plant under Konya ecological conditions. Our findings are in harmony with the research results of the above researchers. In legume breeding, the number of pods in the plant is one of the most important yield factors and it is very important to transfer the lines or genotypes with high pod numbers to the next breeding stage (Öcal, 2021).

Table 1. Mean squares of agricultural characteristics of dry bean lines investigated in the research.

Sources of Variation	DF	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight
Total	65						
Replication	2	55.110	1.279	0.667	236.698	2144.248	4.812
Lines	21	96.951**	80.371**	0.488	2339.526**	8836.963**	1496.145**
Error	42	42.958	5.479	0.541	426.040	1334.780	3.714

**%1 statistically significant level.

The differences among the lines in terms of the number of grains in pods were found statistically insignificant (Table 1). According to the results of the experiment, the highest number of grains in pods was determined in the 17EKFGNO line with 6.33 and the lowest number of grains in pods was determined in the 17EKFGK line with 4.50. The number of grains in pods of other genotypes used in the study varied between these values (Table 2). Bozoğlu (1995) reported that the number of grains in pods is one of the most important

characteristics determining grain yield and the effects of this trait on yield vary among genotypes. Önder and Sade (1996) reported that the number of grains in pods varied between 2.67 under Konya ecological conditions, Önder & Şentürk (1996b) reported 3.61 - 5.90 under Karaman ecological conditions, Anlarsal et al. (2000) reported 1-9 under Çukurova conditions, Ülker & Ceyhan (2008) reported 3.53 - 4.89 under Konya ecological conditions. The results of these studies are in harmony with our results.

According to the results of the analysis of variance, the difference between genotypes in terms of the number of grains per plant was found to be statistically very significant (Table 1). According to the results of the research, the highest number of grains per plant was obtained from the 17EKFSG line with 172.59 and the lowest number of grains per pod was obtained from the Great Northern 59 variety with 73.67. The number of grains per plant of the other lines used in the research was between these values (Table 2). Özçelik & Gülümser (1988) found that the number of grains per plant varied between 25.7 - 38.8 in Samsun ecological conditions, Ülker & Ceyhan (2008) found that it varied between 46.50 - 116.45 in Konya ecological conditions. We believe that the differences between these results and our results may be due to genetic structure as well as environmental conditions.

Table 2. Averages of agricultural characteristics of dry bean lines investigated in the research.

Lines	Plant Height	Number of Pods per Plant	Number of Grains per Pod	Number of Grains per Plant	Grain Yield	Hundred-grain Weight

Lsd _{0.01}	14.44			45.47	80.48	4.245

There is no statistical difference between the averages denoted by the same letter.

Statistically significant differences were found among the bean lines in terms of grain yield (Table 1). As in all other plants, grain yield in beans is highly affected by genetic structure (Akçin, 1974; Önder, 1993; Önder & Şentürk, 1996; Düzdemir, 1998). Akçin (1974), Şehirali (1980), and Pekşen (2005) reported that many factors have an effect on the productivity of bean genotypes and genetic structure is the most important of these factors. In this study, the highest grain yield was obtained from the 17EKFSG line with 483.27 kg da⁻¹, and the lowest grain yield was obtained from the 17EKFGO line with 292.97 kg da⁻¹. The difference between

the 17EKFSG line with the highest grain yield and the 17EKFGO line with the lowest grain yield was 172.70 kg per decare. 17EKFSG, 17EKFGNS, 17EKFKG, 17EKFAGN, 17EKFOG, 17EKFAO, and 17EKFSGN bean pure lines yielded more than 420 kg per decare. It is very important to emphasize these genotypes (Table 2). In this study, the grain yield of 12 of the newly developed lines was higher than the average grain yield of standard varieties (345.40 kg/ha) (Table 2). The different yields among the lines are due to genetic, physiological, and morphological characteristics specific to each line evaluated (Tekin & Ceyhan, 2022).

Özçelik & Gülümser (1988) reported 115 - 226 kg/da under Samsun conditions, Bozoğlu (1995) 162.7 - 237.7 kg/da under Samsun ecological conditions, Önder & Sade (1996) 231 kg/da under Konya conditions, Önder & Şentürk (1996) 377.69 - 389.41 kg da⁻¹ under Karaman ecological conditions. This literature and our values are very similar.

In addition to grain yield, the 17EKFSG line had the highest values in terms of the number of pods per plant, number of grains per plant, and hundred-grain weight compared to other genotypes, and ranked first in terms of plant height and number of grains per pod. The high averages of the traits determining the grain yield caused this line to have a high grain yield.

The bean genotypes examined in the study showed statistically significant differences in terms of hundred-grain weight (Table 1). The highest hundred-grain weight was 44.40 g in the 17EKFSG line, and the lowest hundred-grain weight was 25.83 g in the 17EKFKGN line. The hundred-grain weight of 11 of the pure lines in the study was higher than the average of the standard varieties (29.67 g) (Table 2). One of the most important yield components affecting grain yield in beans is the hundred-grain weight (Bozoğlu, 1995). Bozoğlu (1995) 159.58 - 520.93 g under Samsun conditions, Önder & Sade (1996) 403.3 g under Konya conditions, Önder & Şentürk (1996) 173.34 - 463.32 g under Karaman conditions, Bozoğlu & Gülümser (1999) obtained 159.58 - 520.93 g under Samsun ecological conditions, and Ülker & Ceyhan (2008) obtained 249.07 - 455.00 g under Konya ecological conditions. It is seen that these results are in harmony with our findings.

CONCLUSION and RECOMMENDATIONS

Bean growers and breeders desire high grain yield. As a result of this study, it was determined that the 17EKFSG line was the most superior variety in terms of grain yield and many other traits. In addition, according to the results obtained in this study, the grain yield of 12 pure lines used in the experiment was higher than the average of standard varieties. Among these pure lines, 17EKFSG, 17EKFGNS, 17EKFKG, 17EKFAGN, 17EKFOG, 17EKFAO, and 17EKFSGN bean pure lines with high grain yield were determined to be promising variety candidates. In conclusion, dry bean breeding is of great importance for the sustainability of agriculture, food security, and nutritional quality of people. The more productive, highly lime resistant, high quality, and rich in diversity bean varieties to be developed with this study will make great contributions to the farmers of the region and the Turkish economy.

ABSTRACT

Green beans are an essential part of a healthy diet. Its high fiber content regulates digestion, provides a feeling of satiety, and contributes to the digestive system. It is also low in calories and helps with weight control. The rich vitamin C content strengthens the immune system, while minerals such as iron and folic acid contribute to blood health. Green beans are full of natural antioxidants and offer cellular anti-aging effects. This study, it was aimed to determine some agronomic traits of dry grain bean pure lines in F₅ generation in the breeding study carried out to develop high-yielding and high-quality fresh bean genotypes that can better adapt to the high calcareous soil conditions of Central Anatolia region. This study, which was conducted in 2022, was established with 3 replications according to the coincidence blocks experimental design in the test field belonging to Selçuk University, Faculty of Agriculture, Prof. Dr. Abdülkadir AKÇİN Research and Application Station. In the study, 12 pure lines of green beans with different characteristics and 3 commercial varieties were used as experimental material. It was determined that the differences among green bean lines were statistically significant in all traits except the number of grains in pods. According to the results of the research, the plant height of green bean lines ranged from 37.00 cm (17ETFLB) to 53.00 cm (17ETFGL), number of pods ranged from 14.00 number/plant (17ETFRL) to 23.33 number/plant (17ETFLJ and 17ETFBR), number of grains per pod ranged from 4.00 (Riberia) to 6.17 (17ETFRL and 17ETFBJ), number of grains per plant varied between 64.67 (17ETFRL) and 138.50 (17ETFLJ), grain yield varied between 194.83 kg da⁻¹ (17ETFBR) and 352.57 kg da⁻¹ (17ETFLG) and hundred grain weight varied between 26.67 g (17ETFLR) and 39.67 g (17ETFRL). As a result, according to the results obtained in this one-year study, the grain yield of 9 pure lines used in the experiment was higher than the average of standard varieties. Among these pure lines, 17ETFLG, 17ETFLJ, 17ETFBJ, 17ETFLB, 17ETFBR, and 17ETFGL bean pure lines with high grain yield were determined to be promising variety candidates.
